FY 2012 NH-NRCS WETLAND RESERVE PROGRAM GARCs

To estimate your GARC value:
Step 1: Determine your town's community tier (see page 2)
Step 2: Determine your parcel's physical characteristics (see page 3)
Step 3: Multiply the Value/Acre (in red) with your parcel size. This is your estimated GARC.

Example: A 100 acre parcel in Bristol (Community Tier II) with High Physical Characteristics would yield an estimated GARC of $180,000 ($1,800 x 100 acres).

Note: Any GARC greater than $5,000 per acre (in red) will be reviewed by NRCS National Headquarters on a case-by-case basis to justify the ecological importance of enrolling these high value lands.

FY 2012 NH-NRCS WETLAND RESERVE PROGRAM GARCs

COUNTY	WRP GARC ALL PARCELS		
	Community Tier	Physical Characteristics	Value/ Acre
Grafton	I	High Density	$13,110
		Single Family House Lot	$8,808
		High	$1,900
		Moderate	$1,520
		Limited	$665
		Restricted	$190
	II	High Density	$12,420
		Single Family House Lot	$8,345
		High	$1,800
		Moderate	$1,440
		Limited	$630
		Restricted	$180
	III	High Density	$11,730
		Single Family House Lot	$7,881
		High	$1,700
		Moderate	$1,360
		Limited	$595
		Restricted	$170
	IV	High Density	$13,800
		Single Family House Lot	$7,418
		High	$1,600
		Moderate	$1,280
		Limited	$560
		Restricted	$160

Grafton Community Tiers

Tier I Communities (average residential values > $300,000)
Tier II Communities (average residential values $200,000-$300,000)
Tier III Communities (average residential values $100,000-$200,000)
Tier IV Communities (average residential values < $100,000)

Tier I Communities	Tier II Communities	Tier III Communities	Tier IV Communities
Bridgewater	Alexandria	Ashland	
Easton	Bristol	Bath	
Franconia	Lincoln	Benton	
Hanover	Monroe	Bethlehem	
Hebron	Orford	Campton	
Holderness	Waterville Valley	Canaan	
Lyme		Dorchester	
Sugar Hill		Ellsworth	
		Enfield	
		Grafton	
		Groton	
		Haverhill	
		Landaff	
		Lebanon	
		Lisbon	
		Littleton	
		Lyman	
		Orange	
		Piermont	
		Plymouth	
		Rumney	
		Thornton	
		Warren	
		Wentworth	
		Woodstock	

PARCEL PHYSICAL CHARACTERISTICS

I: Parcels with High Development Potential:

1) Greater than 50% of the soils are moderately well drained (or better) with average slopes of less than 20%, and the map unit areas and locations of these soils within the parcel facilitate a high potential for development. Example: Upland soils are directly accessable from town maintained road frontage.

2) The parcel contains adequate frontage on a Class V (or better) road, or is accessible by proven rights of way, and is free of any emcumberances, such that it is economically feasible and legal (meets the subdivision requirements of the given municipality) **at this time** for the parcel to be developed for commercial, industrial, or residential use.

For parcels meeting this criteria, multiply the County Base Rates by a factor of 1.0 when calculating final GARC.

II: Parcels with Moderate Development Potential:

1)Between 10% and 50% of the soils are moderately well drained (or better) with average slopes of less than 20%, and the map unit area and location of these soils within the parcel facilitates a moderate potential for development. Example: Parcel contains adequate road frontage but wetlands must be crossed to access the developable soils.

2)The parcel contains adequate frontage on a Class V (or better) road, or is accessible by proven rights of way, and is free of encumberances, such that it is economically feasible and legal (meets the subdivision requirements of the given municipality) **at this time** for the parcel to be developed for commercial, industrial, or residential use.

For parcels meeting this criteria, multiply the County Base Rate by a factor of 0.80 when calculating final GARC.

III: Parcels with Limited Development Potential:

1) Less than 10% of the soils are moderately well drained (or better) with average slopes of less than 20%, and the map unit area and location of suitable soils within the parcel facilitates limited potential for development. Example: Parcel contains limited upland soils and significant restrictions such as wetlands, ledge, etc. must be overcome to access developable soils.

2) The parcel contains adequate frontage on a Class VI (or better) road, or is accessible by proven rights of way, and is free of encumberances, such that it is economically feasible and legal (meets the subdivision requirements of the given municipality) **at this time** for the parcel to be developed for commercial, industrial, or residential use.

For parcels meeting this criteria, multiply the County Base Rate by a factor of 0.35 when calculating final GARC.

IV: Restricted Parcels:

1) None of the soils are moderately well drained (or better) with average slopes of less than 20%, and the map unit areas and locations within the parcel facilitate no potential for development. Example: Parcel contains some developable soils but they are inaccessible.

2) The parcel does not contain adequate frontage on a Class VI (or better) road, is not accessible by proven rights of way, or is not free of encumberances (Example: Deed language stipulates the land must be maintained as a wildlife refuge), such that it is not economically feasible and legal (does not meet the subdivision requirements of the given municipality) **at this time** for the parcel to be developed for commercial, industrial, or residential use.

For parcels meeting this criteria, multiply the County Base Rate by a factor of 0.10 when calculating final GARC.

V: Special Considerations:

1) If a parcel has a high density approved residential plan or town-approved subdivision on record containing 3 or more single family house lots (<10 acres each), the parcel will receive the corresponding GARC rate as established by the market analysis. For parcels meeting this criteria, only the acreage assigned to the footprint of the planned subdivision will be assessed at this rate. The remaining acres will be assessed according to their physical characteristics as listed above.

2) If a parcel falls within the focus area for the New England Cottontail Special Initiative AND meets the zoning requirements for commercial or industrial, the parcel will receive the corresponding GARC rate as established by the market analysis.

3) If a landowner has an active application to multiple NH-NRCS Easement Programs, the parcel shall qualify under the highest physical charactersitics category of the eligible acreage.

4) NH-NRCS will require a Uniform Standards for Professional Appraisal Practices (USPAP) appraisal for any property with a GARC or landowner offer higher than $750,000. The NRCS easement compensation will then represent the lowest of the following three values: GARC, USPAP Appraisal, or landowner offer.
