APPENDIX 1

Summary
(OMB Fact Sheet)

Summary (OMB Fact Sheet)

Summary Watershed Project Plan-Environmental Assessment Document
for
Lower Grand River Watershed
Kent County, Michigan

Congressional District MI-03

Authorization: Public Law 83-566 Stat. 666 as amended (16 U.SC. Section 1001 et. Seq.) 1954
Sponsor: City of Grand Rapids

Proposed Action: Improve aquatic habitat in the Lower Grand River where it flows through downtown Grand Rapids, Kent County, Michigan.

Purpose and Need for Action: The purpose of the proposed Project, which aligns with Watershed Protection (NWPM 500.3B(ii)), is to restore the rapids in the lower reach of the Grand River (300 feet upstream of Bridge Street to Fulton Street), improve public safety, restore aquatic habitat diversity and suitability for native Great Lakes fish and mussel species, and enhance river access and use. The need for the proposed Project action arises from the degraded condition of the river, including construction of low-head dams and removal of natural substrate, which impacts native and listed species of fish and mussels, and alters habitat. Four low-head dams were constructed circa 1927 downstream of the 6th Street Dam to maintain channel width during low flow periods to prevent concentration of the raw sewage that was discharged into the river in that era. The original purpose of these dams is no longer relevant in the context of healthy river ecology, and raw sewage is no longer discharged to the river from the City of Grand Rapids.

Description of the preferred alternative/plan: Primary factors in the selection of the Preferred Alternative were that it met the project's purpose and needs by addressing river and habitat degradation, restoring beneficial habitat to TES species, and removing or reducing dam safety concerns, while minimizing effects. The new design will result in improved aquatic habitat; removal of the safety risks caused by the four existing low-head dams; improved fish passage hydraulics. Thus, once constructed, the Project will have positive effects on regulated resources. The Preferred Alternative meets the Purpose and Need for the Project while providing the most environmental and social benefits.

Describe the number and kinds of project measures: Project measures include the following two practices: 1) Stream Habitat Improvement (395). Definition: Maintain, improve or restore physical, chemical and biological functions of a stream, and its associated riparian zone, necessary for meeting the life history requirements of desired aquatic species. Its purpose is to provide suitable habitat for desired aquatic species. This practice will be implemented on 7 acres within the project reach of the river, installation of boulder arches, constructed riffles, emergent habitat boulder fields, and bank vanes that will create more diverse habitat similar to the historic rapids; 2) Aquatic Organism Passage (396). Definition: Modification or removal of barriers that restrict or impede movement of aquatic organisms. Its purpose is to improve or provide passage for aquatic organisms. This practice will be used to remove four low-head dams and provide fish passage.

Resource Information:
Latitude and Longitude: Lat 42.968502, Long -85.675251
Eight-Digit Hydrologic Unit Number: 04050006

Climate and topography: The area has a predominantly humid continental climate, with very warm and humid summers, cold and snowy winters, and autumn and spring seasons that are quick but mild. Mean precipitation within the Grand River watershed is approximately 31 inches, whereas annual snowfall can range from as low as 30

inches to more than 100 inches, depending on proximity to the lake (Hanshue and Harrington, 2017). Based on records obtained from 1981 to 2010, the mean annual total precipitation and mean annual temperature within Grand Rapids are 38.1 inches and 48.5 degrees Fahrenheit (°F), respectively (GLISA 2018). The topography is influenced by glacial deposition of sediment and the effect of water deposition and drainage over time. Watershed topography is undulating and dissected by water courses with occasional small plains studded with bogs and small lakes. The watershed ranges from fairly rugged topography in the entrenched main stem of the Grand River (in the Grand Rapids area) to a low, flat plains area along the lower reaches of the river toward Grand Haven.

Watershed information: This project is within the lower, downstream section of the larger Grand River watershed, known as the Lower Grand River Watershed. The Grand River is Michigan's longest river, with a combined drainage area of 14,256 km2 (5,504 mi2). It begins in northern Hillsdale County as a series of lakes and ends at Grand Haven, Michigan, in Lake Michigan. Hanshue, S. K., and A. H. Harrington, 2017 (H&H, 2017) divided the river into five mainstem valley segments based on common channel and landscape features: headwaters, upper, middle, lower, and mouth segments (Figure 1). Ecological benefits from the Project will be realized throughout the Grand River watershed, specifically the segment downstream of the Project. Over 20% of Project benefits would accrue to agricultural areas as approximately 60% of the Grand River watershed from the Project Area downstream to Lake Michigan is agricultural land (including forested agricultural lands), and the proportion of agricultural lands in the upstream portion of the watershed is similar, if not higher (H&H, 2017)

Project Benefit Area – Land Use

Benefit Area	Use	Percentage	Area (acres)
Watershed Information	Project and Impact Watershed Areas, Combined	100%	483,450
	Downstream Impact Watershed	87%	422,970
	Project Impact Analysis Watershed	13%	60,480
Land Use	Agricultural/Forest	55%	233,090
	Open Land	1%	3,189
	Wetland	12%	47,127
	Water	9%	39,226
	Urban	23%	100,338
Land Ownership	Private	84%	
	State/Local	15%	
	Federal	1%	

Population and demographics: Within the Plan analysis watershed, population 182,463 – of which: 49% is male and 51% is female, 83% are White alone, not Hispanic or Latino, 10% African American, and 7% other nationalities, 90% are educated at a high school or college level, and 90% employment rate for those over the age of 16 years old.

Population Demographic Information

Demographic	City of Grand Rapids	Kent County	State of Michigan
Population	196,904	659,083	10,034,118
Median household income ($)	65,660	77,028	66,986
Percentage minority residents	38%	29%	27%
Percentage age 65 and over	18%	21%	25%
Median age	33.1	35.9	40.3
Percentage in poverty	15.8%	10.6%	13.4%
Unemployment rate[1]	3.1%	3.1%	4.0%
Top three industries by number of positions	1. Educational services / health care / social assistance 2. Manufacturing 3. Entertainment / visitor services

Relevant Potential Resource Concerns Identified through Scoping

Item / Concern	Rationale for Relevancy and Inclusion in Plan-EA
Aesthetics/Scenic beauty	Bankside clearing for river access associated with construction of cofferdam and instream work would reduce aesthetic value temporarily.
Air quality and noise	Direct impacts to air quality and noise from machinery emissions and airborne dust may slightly degrade air quality and increase ambient noise levels during construction activity. Indirect impacts to noise is expected to be concentrated around the Project Area. Indirect impacts on air quality are expected to be less than measurable and to be spread across the greater Grand Rapids metropolitan area,. Both would occur over a long period.
Threatened and endangered species (TES)	TES are present within the Project Area and therefore, analysis of effects is required by ESA.
Health and human safety	Dam hydraulics are safety risk.
Fishery habitat	In-stream work would affect habitat.
Shellfish bed habitat	In-stream work would affect habitat.
Water quality	Increased sedimentation, turbidity, and other water quality impacts are possible.
Invasive species	Sea lamprey are present and could potentially breach in-place barrier and access upstream portions of the watershed.
River flow	Removal of dams and installation of substrate enhancement materials would change hydraulics.
Fish Passage	In-stream work and change in hydraulics could potentially affect fish passage.
Land use, recreation, and visual resources	Dam removal and rapids restoration would alter recreation access and safety.
Wetlands	Wetland delineation survey confirms there are wetlands present within the Project Area.
Water and Riverine Resources	Sediment transport and flood control are potential concerns.
Soils & Geology	Soil erosion is a potential issue.
Terrestrial Vegetation and Wildlife	Proposed Project activities would potentially generate impacts to terrestrial vegetation and wildlife resources
Socioeconomics	Consideration of Project impact on overall economic benefits factor into decision making.
Cultural resources	SHPO and tribal consultation is being conducted as required by the National Historic Preservation Act (NHPA). Analysis of effects to cultural resources reflects the importance of local culture and national context.
Flood control and Protection	Dam removal and substrate enhancement would change river hydraulics. Ability of existing flood protection barriers currently protecting development along the riverbanks must not be negatively impacted.
Civil rights	Consideration of Project impact on civil rights issues factor into decision making.
Essential fish habitat	In-stream habitat restoration work will increase fish habitat.
Fish and wildlife (including coordination requirements)	Project coordination with state and federal agencies led to the development of the Biological Assessment and issuance by USFWS of the Biological Opinion.
National Economic Development (NED) P&G	As a non-water resource project, a NED is not required.
Natural areas	The in-stream habitat restoration will result in an increase in natural areas.
Riparian areas	Access to the river will be required to perform in-stream work and restored following implementation.
Waters of the United States, including special aquatic sites	In-stream project is not a special aquatic site, and permitting authority is under State of Michigan
Wild and scenic rivers	In-stream improvements take place within the Lower Grand River.

Alternative plans considered: Alternatives that did not align with the proposed Project purpose and need, would not likely meet fish passage requirements, involved other unacceptable environmental effects that would have prevented permitting, or were not feasible due to site constraints have been eliminated from detailed study and are not carried forward. Those alternatives included the removal of the low-head dams only; substrate

enhancement with no dam removal; restoration of original rapids to former natural conditions; and dam removal with substrate enhancement and whitewater recreation.

Briefly describe the components of each alternative: Alternatives considered for detailed study included the Proposed Action and a No Action Alternative. In the **Preferred Alternative**, the four dams would be removed. Hydraulic gradient would be controlled, fish passage improved, and aquatic habitat enhanced. Specific restoration activities include riverbed grading, installation of boulder arch structures, constructed riffles, emergent habitat boulder fields, and bank vanes. The **No Action Alternative** would leave the current conditions as they are. One alternative considered but subsequently eliminated from detailed study consisted of **removing the low-head dams only** and not adding any substrate to enhance habitat or distribute the hydraulic gradient. Removal of the four low-head dams would reduce or eliminate public safety hazards related to these features; however, without substrate enhancement, the removal of these features alone would not distribute the gradient of the reach in a controlled manner. Another alternative considered was to perform **substrate enhancement but not remove the low-head dams**. This alternative would not fully meet the purpose of enhancing habitat diversity, as the natural flow regimes disrupted by the existing low-head dams would remain disrupted. Another alternative that was considered but subsequently eliminated from further detailed study consisted of **fully restoring the original rapids to former natural conditions**. The river in downtown Grand Rapids is currently confined to an armored channel that is approximately half of its estimated natural width. In addition, major developments along both sides of the riverfront render an expansion of the current channel width infeasible. As such, this alternative is not feasible and was eliminated from further detailed study. The final alternative that was considered and eliminated was **dam removal with substrate enhancement and whitewater recreation**. Under this alternative, a series of four boulder drop structures with connected riffles were considered to control the hydraulic grade after dam removal with substrate enhancements between them. In addition, rock vanes along the edge of the channel would protect river access points. Of the total 31.5-acre project area, this option would affect 22 acres, nearly two-times the area of the preferred alternative.

Include mitigation measures: The project includes 0.01 acres of unavoidable wetland loss. This loss impact area is minimal and under the threshold typically requiring wetland mitigation. The low flow wetted area, flow diversity, and habitat diversity will be positively affected as a result of the Project. The project will result in more habitat; therefore, mitigation for instream impacts is not required. State and federal TES mussel species will be directly and indirectly affected along with other species of mussels not listed as threatened or endangered. A Biological Opinion was issued by USFWS, which outlines appropriate mitigation measures. As part of the proposed conservation measures, a mitigation fund would be established to offset the take for the mussels that were unable to be translocated under the USFWS Project. The objective of the mitigation fund would be to fund projects that provide a direct benefit to mussels to achieve the USFWS “no net loss” policy and offset any potential effects from mussels that were unable to be translocated. The work performed through the mitigation fund would help inform future conservation and habitat restoration efforts. On March 4, 2021, NRCS provided MI SHPO with an evaluation of the NRHP eligibility of the four low-head dams on the Lower Grand River Habitat Restoration Project, finding that the dams are eligible and will be adversely affected. SHPO asked that NRCS include input from local parties in their mitigation design, and public discussions of mitigation options and development of a mitigation plan have been completed. A Memorandum of Agreement (MOA) was developed to document the agreed upon mitigation measures and how each will be implemented.

Project Cost by Purpose

Works of Improvement	Number		Estimated Costs		
	Unit	Non-Federal Land	PL 83-566 Authority	Sponsor Funds	Total
			Non-Federal Land	Non-Federal Land	
Stream Habitat Improvement (395)	Acres	7	$7,113,132.27	$7,113,132,27	**$14,226,264.54**
Aquatic Organism Passage (396)	Number	4	$3,913,563.16	$3,913,563.16	**$7,827,126.32**
			$11,026,695.43	$11,026,695.43	**$22,053,390.86**

Project monetary benefits in terms categories shown in::

- 390-NWPM, Part 506, Subpart B, Section 506.19, "Economic Table 5—Estimated Average Annual Flood Damage Reduction Benefits" – N/A
- 390-NWPM, Part 506, Subpart B, Section 506.20, "Economic Table 5a—Estimated Average Annual Watershed Protection Damage Reduction Benefits" – N/A
- Number of direct beneficiaries (Onsite – Offsite): Improved habitat diversity and suitability over 2,756 feet and 30 acres of the Grand River; increased Great Lakes native fish and mussel diversity and productivity; protection of threatened and endangered fish and mussel species including the lake sturgeon, river redhorse, and snuffbox mussel; scour protection for the existing bridge structures.
- It was determined that no businesses would be adversely affected by restoration outcomes. Substantial development interest after construction was found (namely real estate developers) due to increased shoreline availability in close proximity to the river. These increases in business opportunities were found to mostly serve recreational users and monetary benefits associated with those were captured in monitization of recreational uses.

Describe other beneficial effects in physical terms - Implementation of the Preferred Alternative will restore the rapids by creating and restoring in-stream habitat in the Grand River. This effort would revitalize an approximately 2,756-foot stretch of the river flowing through the City of Grand Rapids by restoring aquatic connectivity and improving habitat for fish and aquatic life, including Michigan threatened and endangered species and the federally-listed endangered mussel *Epioblasma triquetra* (Snuffbox). Removal of the existing low-head dams will restore hydaulics in the river and alleviate many safety concerns.

Benefit to Cost Ratio (authorized rate) – N/A

Benefit to Cost Ratio (current rate) – N/A

Net beneficial effects (NED) – N/A

Funding schedule (budget year + 5)

Funding in FY 2024-2025 (10/1/2024 – 9/30/2025)	$11,026,695.43
Funding in FY 2025-2026 (10/1/2025 – 9/30/2026)	$11,026,695.43
Funding in FY 2026-2027 (10/1/2026 – 9/30/2027)	$0.00
Funding in FY 2027-2028 (10/1/2027 – 9/30/2028)	$0.00
Funding in FY 2028-2029 (10/1/2028 – 9/30/2029)	$0.00
	$ 22,053,390.86

Federal funds: $11,026,695.43
Non-Federal funds: $11,026,695.43

Period of analysis: The Period of Analysis represents the Project Life, anticipated at 50 years.

Environmental effects, impacts:

Environmental Effects and Impacts

Resource Area	Potential Unavoidable Adverse Impact of the Proposed Action
Air Quality and Noise	• Temporary increases in dust, combustion/exhaust pollutants, and noise during construction
Soils and Geology	• Temporary shallow soil disturbance by construction equipment and activities in staging areas and at the river banks
Water and Riverine Resources	• Temporary increase in bed mobility and downstream turbidity and sediment transport during construction
Wetlands	• Potential minor adverse impact on wetland communities from increased foot traffic and littering on wetlands adjacent to the river during the operational phase
Terrestrial Vegetation and Wildlife	• Temporary impacts on terrestrial wildlife from noise and vibration during construction • Damage to vegetation and wildlife through the planned removal of several trees during construction
Aquatic Species and Habitat	• Temporary impacts on both listed and other unionid mussel species during construction resulting from mussels being physically crushed as a result of machinery use and placement of substrates, and to a lesser extent from increased turbidity, shear stress or water velocity • Temporary impacts on fish species during construction as a result of physically crushing fish that are not able to easily escape during construction, temporary habitat loss, increased turbidity, and temporary loss of spawning areas
Floodplain Management	•Slight increases in water surface elevation for 2-year to 50-year flood events, but contained within the existing flood protection system
Land Use, Recreational and Visual Resources	• Temporary restrictions on river access for recreational use during construction • Temporary impairment of visual quality during construction
Socioeconomics	• Temporary hindrances to river-oriented activities could result in slightly fewer customers for businesses near the river during construction
Cultural Resources	• Removal of the low-head dams considered eligible for listing on the National Register of Historic Places (NRHP)--to be mitigated • No other impacts as currently proposed, but if the Project design changes to include grading in areas (and to depths) that may contain culture-bearing soil horizons, potential impacts could be mitigated through further testing, avoidance, and presence of a qualified archaeological monitor during construction activity
Public Health and Safety	• New hydraulic features would present different safety risks and new safety hazards
Urban Dynamics	• Increased congestion due to improved safety

Major conclusions: Only 1% of the river habitat in the lower peninsula of Michigan comprises rapid-type habitat, which is important to the life cycle of many aquatic species (Daugherty et al., 2009). Rapid-type habitat is defined as a river area with a relatively steep energy gradient (6% or more), coarse bed substrates, and non-uniform distribution of flow velocities. The ecosystem processes of the rapids-type habitat present within the project reach have been degraded by dams, channelization, dredging, and urban development for over 150 years. High gradient areas have been eliminated and fragmented in many Michigan watersheds and their rehabilitation is highly desirable (Dodge, 1998; Wesley, 2005).

Controversial Issues: None

Issues to be resolved: None

Evidence of Unusual Congressional or Local Interest: This effort is being viewed as a transformational project for the City of Grand Rapids and an asset to the region.

Watershed Program planning must comply with applicable Federal, State and local laws, regulations and Executive Orders. A complete list included below:

Applicable Regulation
Public Laws
Public Law 96-95, the Archaeological Resources Protection Act of 1979
The Clean Air Act (42 U.S.C. Sections 7401 to 7671q)
Public Law 92-500, the Clean Water Act, as amended
Public Law 92-583, the Coastal Zone Management Act of 1972, as amended
Public Law 104-231, the Electronic Freedom of Information Act Amendments of 1996
Public Law 93-205, the Endangered Species Act of 1973
Public Law 97-98, the Farmland Protection Policy Act of 1981, as Amended (FPPA)(7 U.S.C. Section 4201 et seq.)
Public Law 104-127, the Federal Agriculture Improvement and Reform Act of 1996
Title 33, U.S. Code, Chapter 15, Section 701b-11, "Flood protection projects navigation and navigable waters"
Public Law 101-624, the Food, Agriculture, Conservation, and Trade Act of 1990 (FACTA)
Public Law 99-198, the Food Security Act of 1985 (FSA)
Public Law 89-487, the Freedom of Information Act of 1966
Public Law 93-502, the Freedom of Information Act, as amended in 1974
Public Law 99-570, the Freedom of Information Reform Act of 1986
Public Law 94-265, the Magnuson-Stevens Fishery Conservation and Management Act
The Migratory Bird Treaty Act of 1918 (16 U.S.C. Sections 703 to 712, 40 Stat. Section 755)
Public Law 91-190, the National Environmental Policy Act of 1969 (NEPA)
Public Law 89-665, the National Historic Preservation Act of 1966 (NHPA), as amended
The Protection of Bald and Golden Eagles Act of 1940 (16 U.S.C. Sections 668a to d, 54 Stat. Section 250)
Public Law 86-523, the Reservoir Salvage Act of 1960
The Rivers and Harbors Act of 1899 (33 U.S.C. Section 403, 30 Stat. Section 1121)
Public Law 95-192, the Soil and Water Resources Conservation Act of 1977
Public Law 91-646, the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (42 U.S.C. Section 4601 et seq.)

APPENDIX A

Public Plan, Summary, Comments and Responses

Public Outreach Plan, Summary & Comments

PUBLIC PARTICIPATION PLAN

INTRODUCTION

The purpose of the Public Participation Plan (PPP) is to outline methods for encouraging the involvement of citizens, organizations and other interested parties in the development of the Grand Rapids Watershed Project Plan (WPP). The objective of this PPP is to:

1. To create awareness among the public about the rapids restoration project and alternatives considered.
2. To educate the public about the purpose and need for the draft Grand River WPP goals and objectives.
3. To establish a process which encourages members of the public and other interested parties to participate in the development of the Grand River WPP.
4. To ensure all interested stakeholders can review and comment on the draft Grand River WPP.

PUBLIC PARTICIPATION EVENTS

Public participation events will be hosted in three (3) locations within the project area to provide opportunities for the public to obtain information, ask questions, and express any concerns they may have regarding the proposed project. These events may include community/business forums, public meetings or other scheduled community events such as farmer's markets. Any concerns brought forth through this process will be noted in the WPP and addressed as necessary.

ADVERTISEMENT OF PPP EVENTS

The public and other interested parties will be notified of the WPP and the PPP events using one or more of the following tools:

- Printed Information – Printed flyers about the WPP and the PPP event dates.
- Web Sites – Information about the WPP and the PPP event dates will be made available for existing websites and online calendars.
- Social Media – Information about the WPP and the PPP event dates will be made available for use on Twitter, Facebook, Instagram or other social media outlets.
- Press and Media – Information about the WPP and the PPP event dates will be provided to local press and media for print, radio or online dissemination.

The above tools will be used for distribution of notices through partner and stakeholder agencies and organizations including, but not limited to:

- Grand Valley Metro Council
- City of Grand Rapids
- Grand Rapids White Water
- West Michigan Environmental Action Council
- West Michigan Sustainable Business

- Grand Rapids Public Library
- West Grand Neighborhood Organization
- Grand Rapids Community Foundation
- Lower Grand River Organization of Watersheds
- Grand Rapids Press
- The Grand Rapids Times
- MLive.com
- Radio: WBLU, WYCE, WGRD, WFGR

PPP EVENT ENGAGEMENT TOOLS

An Open House format will be used to introduce the purpose and need for the WPP, introduce the rapids restoration project, and offer opportunities to ask questions and express concerns. Content will be focused around the following four aspects of the project.

- Physical
- Biological
- Economical
- Social

PPP OUTCOMES

The questions and concerns received through the public participation events will be documented for WPP planning efforts. Additional information documented for each public participation event will include the date, type and purpose of the activity, as well as the names of the participating organizations and the public. Questions and concerns received at the events will be used to focus the scope of the WPP, and specific concerns will be addressed in the WPP.

Lower Grand River Watershed Project Plan Comments

Date of Event	Citizen or Organization	Name:	Comments
9/18/18	Citizen	Vern Jones	Very informative! Love this Project, Thanks.
9/18/18	Citizen	Irene Jones	Great info…
9/18/18	Citizen	Anne Larson	Great information! Spoken so we could understand. Thank you.
9/18/18	Citizen	Megan Blauwkamp	Wish there was more time for questions and open discussion.
9/18/18	Citizen	Jan Erlewein	Great information! Thank you.
9/18/18	Citizen	Jody Ringnalda	Very informative! I appreciate the invitation to this lunch and learn!
9/18/18	Citizen	Wanita Provenzo	Information provided on the numerous organizations involved and what involvement they provide/provided was great
9/18/18	Organization	Family Futures	I've heard about this project for years as a resident. I am very excited for it!
9/18/18	Citizen	JR Vidro	Restoration of habitat for mussels-good thing. Won't that basically get wiped out once there are thousands of people in the river stiring them up/harvesting?
9/18/18	Organization	Family Futures	I personally like the education aspect and the environmental aspects of this project. As far as the recreational aspect, I think there needs to be something done to break the stigma of the "dirty river". I'm sure you have something planned for this, but I feel this is needed. In addition, I think the recreational aspects (as well as the activities in the river and the activities done ont he edges of the river) will be a great asset to Grand Rapids. I am excited to see this project succeed.
9/18/18	Citizen		Very intersting; especially all the research that is taking place to ensure safety of endanagered species; very important to share this info with as may residents as possible to eliminate misconceptions based on "hear-say"
9/18/18	Anonymous		The presentation was very informative, but I think there should be more time left at the end for the community to ask questions they may have
9/18/18	Anonymous		I thought the presentation was very informative. I hope the project can go forward without opposition
9/18/18	Citizen	Jessa Challa	Thoughts-valuing the rapids and connecting to the community; why is this project important to connect the communty? How will it impact the westside of the river and the community there? How will the project include current residence and our diversity? Is there information provided in Spanish? Rerouting the Dash or the Rapid bus systems to include lower income communities? Public restrooms? Having core values will lead the community to value the rpaids and lead to valuing the environment, leading to the community being more self-aware of its impact on the environment. THis project needs to value every aspect and demographic of its community in order for its community to value it.
9/28/18	Organization	John Gebhart	I don't know much of the end project short of putting the rapids back, but I am excited for the project and anything that makes Grand Rapids a better palce to live for my kids and bring in additional income
11/1/18	Organization	Mathison Architects	Very excited for the new opportunities to engage with the river, one of our greatest resources in this area
12/31/18	Citizen	Nikki Macedo	I was at a community event and saw the project boards (ex. Tour on farmers market)
2/15/19	Citizen	Sandra Sanders	I was at a community event and saw the project boards (ex. Tour on farmers market)
9/12/19	Citizen		I was at a community event and saw the project boards (ex. Tour on farmers market)
9/12/19	Citizen		Excited to see the change. I was at a community event and saw the project boards (ex. Tour on farmers market)
9/14/19	Citizen		I was at a presentation about the project (ex. Business forum, meeting or public meeting)
9/14/19	Citizen		I was at a presentation about the project (ex. Business forum, meeting or public meeting)
9/14/19	Citizen		I was at a community event and saw the project boards (ex. Tour on farmers market)
9/14/19	Citizen		I was at a community event and saw the project boards (ex. Tour on farmers market)
9/14/19	Citizen	Joey Parks	I was at a community event and saw the project boards (ex. Tour on farmers market)

Lower Grand River Watershed Project Plan Comments

Date of Event	Citizen or Organization	Name:	Comments
9/14/19	Citizen	Jenny Ferrell	I was at a community event and saw the project boards (ex. Tour on farmers market)
9/14/19	Citizen		I was at a community event and saw the project boards (ex. Tour on farmers market)
9/15/19	Citizen		I'm very concerned about the safety of water contact with the Grand River. The highly contaminated Rouge River empties into the Grand just North of the restoration proejct. Known to contain unsafe levels of PFAS, this must be affecting the Grand as well. No one maskes body contact with the Grand at this time. People used to swim and tube in the Grand. Contamination is the reason they don't. Returning to the river to it's roots with rapids is great but what will be done to mitigate the current contamination and make it swimmable? I was at a community event and saw the project boards (ex. Tour on farmers market)
9/15/19	Citizen	Joe Simon	I was at a presentation about the project (ex. Business forum, meeting or public meeting)
9/15/19	Citizen		I was at a community event and saw the project boards (ex. Tour on farmers market)

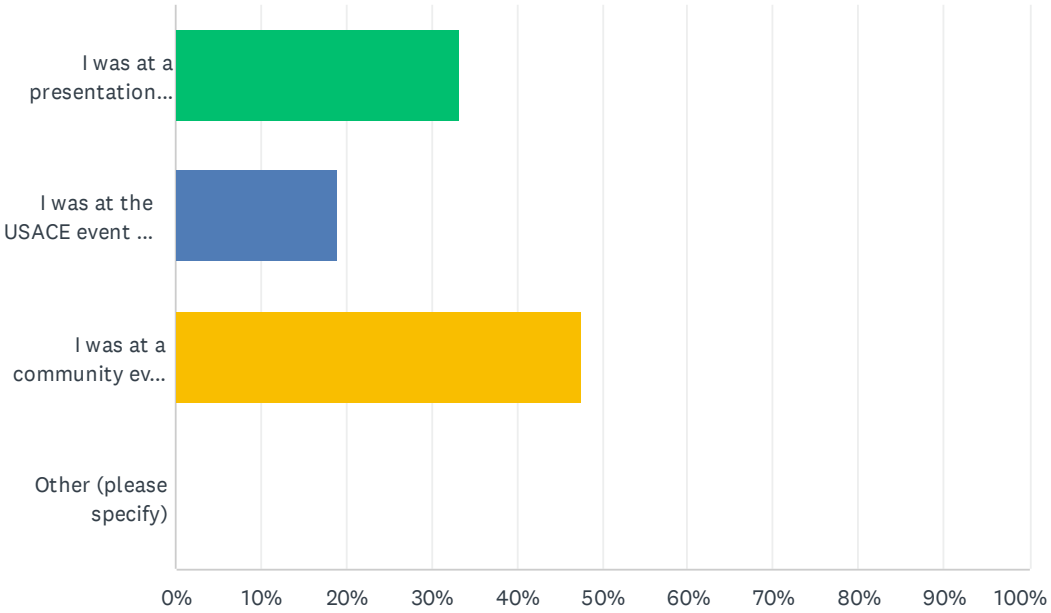
Q1 Please leave any questions, concerns or comments for us on the Lower Grand River Watershed Project Plan. We are eager to get your feedback!

Answered: 9 Skipped: 12

#	RESPONSES	DATE
1	Nice progress so far	9/15/2019 8:48 AM
2	I'm very concerned about the safety of water contact with the Grand River. The highly contaminated Rogue River empties into the Grand just North of the restoration project. Known to contain unsafe levels of PFAS, this must be affecting the Grand as well. No one makes body contact with the Grand at this time. People used to swim and tube in the Grand. Contamination is the reason they don't. Returning the river to it's roots with rapids is great but what will be done to mitigate the current contamination and make it swimmable?	9/15/2019 8:43 AM
3	Excited to see the change!	9/14/2019 8:31 AM
4	No comments at this time.	2/15/2019 9:52 AM
5	In addition to removing the dam(s) (or not) - is there another alternative?	12/31/2018 2:24 PM
6	Very Excited for the new opportunities to engage with the river, one of our greatest resources in this area.	11/1/2018 1:36 PM
7	I don't know much of the end project short of putting the rapids back, but I'm excited for the project and anything that makes Grand Rapids a better place to live for my kids and bring in additional income.	9/28/2018 9:02 AM
8	The presentation was very informative, but I think there should be more time left at the end for the community to ask questions that they have.	9/18/2018 1:19 PM
9	I thought the presentation was very informative. I hope the project can go forward without opposition.	9/18/2018 1:16 PM

Q2 Where did you learn about the Lower Grand River Watershed Project Plan?

Answered: 21 Skipped: 0



ANSWER CHOICES	RESPONSES	
I was at a presentation about the project (example: business forum, meeting or public meeting)	33.33%	7
I was at the USACE event on April 8, 2019 and saw the project boards	19.05%	4
I was at a community event and saw the project boards (example: farmers market or tour)	47.62%	10
Other (please specify)	0.00%	0

25 June 2024

Memorandum for Record

Purpose: This memorandum serves as the administrative record for the decision made by the Michigan NRCS State Conservationist not to renegotiate and potentially amend the Memorandum of Agreement (MOA) between the Michigan State Office of the U.S. Department of Agriculture, Natural Resources Conservation Service and the Michigan State Historic Preservation Officer regarding the Removal of Four Beautification (Low-Head) Dams in the Grand River, Grand Rapids, Kent County, Michigan, a component of the Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project.

On October 10, 2023, the NRCS reinitiated consultation with the Michigan State Historic Preservation Officer (SHPO) concerning changes to the funding, scope of work, and an expansion of the area of potential effects (APE) for the Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project. The proposed Project has been updated to include the following activities:

- installing boulder clusters to diversify flow and restore lost habitat in the wetted channel;
- installing two grade control structures in the wetted channel to replace 60% of the existing grade control provided by the low-head dams in addition to improving aquatic habitat;
- installing three j-hook boulder structures in the wetted channel to enhance flow diversity and public access opportunities;
- and expanding the grading limits within the wetted channel that are associated with the demolition of existing low-head dams.

After additional coordination with state and federal regulatory agencies, the grading area associated with the demolition of the four low-head dams was expanded within the wetted channel of the Grand River from 130 feet north (upstream) to approximately 300 feet north (upstream) of the upstream face of the Bridge Street Bridge.

The NRCS' findings conclude that no further affects exist in the expanded APE that have not already been considered in the current memorandum of agreement. Additionally, the addition of boulder clusters, boulder structures, and grade stabilization structures in the wetted channel will also not have any added affects to historic properties. The NRCS recommended to the MI SHPO that no amendments to the existing memorandum of agreement were needed at this time.

The MI SHPO responded to the consultation request on November 20, 2023, with a request for further information. Specifically, the request was regarding how the

USDA is an equal opportunity provider and employer.

revised design will impact water flow and river hydrology in the APE and immediately down river from the APE. The MI SHPO, in particular, wanted to know how any hydrological changes made by the proposed project would impact riverbank erosion and stability. [redacted] The MI SHPO asked if a hydrological study had been conducted for the design changes and, if so, could that information be shared with them.

The NRCS provided this information to the MI SHPO on December 14, 2023. On January 18, 2024, the MI SHPO notified the NRCS that they agreed with our determination that the proposed changes to the APE would not have any added affects to historic properties that had not already been considered in the previous studies, which had already been addressed in the MOA, and that an amendment to the MOA was not needed at this time.

On December 19, 2023, the NRCS informed the Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians (a.k.a. Gun Lake Tribe) informing them of the changes to the funding, scope of work, and the expansion of the APE. The Tribal Historic Preservation Officer (THPO) of the Gun Lake Tribe responded with a request for a formal meeting between the applicant, NRCS, EGLE, and the MI SHPO. This meeting was held on March 26, 2024, via Microsoft Teams. The applicant discussed the proposed changes with the tribe [redacted] The NRCS representative stated that there were no downstream affects and that there was no reason to open the MOA for amendment. The THPO then asked if it would be possible to have the hydrological report that had been shared with the MI SHPO and to have a future meeting with the NRCS to discuss the potential for downstream affects. The NRCS representative agreed to send the hydrological study and then requested the THPO to review the study and then contact the NRCS to schedule a meeting if the Tribe felt that there were any potential affects downstream of the APE after reviewing the study.

Immediately after the March 26, 2024, the NRCS Cultural Resources Coordinator sent the Gun Lake THPO the hydrological study that had been previously shared with the MI SHPO. To date, the Gun Lake THPO has not contacted the NRCS to express interest in scheduling a meeting to discuss potential downstream affects.

On March 28, 2024, the MI NRCS cultural resources staff met with the NRCS National Water Management Center's cultural resources staff and the NRCS Deputy Federal

Preservation Officer (DFPO), Charles Carrig, to discuss the appropriate action to take regarding the MOA. The DFPO advised the Michigan Cultural Resources staff that it would not be prudent to open the existing MOA for further consultation and potential amendment at this time, provided that the NRCS had done their due diligence and documented that there were no downstream affects caused by the limited design changes to the project. Furthermore, he advised that, whatever decision the MI State Conservationist made about the existing MOA, this decision should be documented in a memorandum for record, which should be kept in the administrative record for the project.

After some deliberation and careful consideration of the advice received from the National Water Management Center's cultural resources staff, the NRCS DFPO, and the Michigan Cultural Resources staff, t Garry Lee, MI State Conservationist, determined on June 25, 2024 that the Memorandum of Agreement between the MI NRCS and the MI SHPO does not need to be opened up for consultation and potential amendment at this time and has authorized the State Cultural Resources Specialist, Dr. Quates, to draft and sign this memorandum for record.

If there are questions regarding this decision, all inquiries should be addressed to Dr. Duane Quates, MI NRCS Cultural Resources Specialist / Archaeologist by telephone at 517-324-5261 or by email at Edward.Quates@usda.gov.

Sincerely,

E.W. Duane Quates, Ph.D.
State Cultural Resources Specialist / Archaeologist

RE: ER20-876 Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, (USDA-NRCS)

Dear Dr. Quates:

We have reviewed the information regarding the hydraulic modeling results for the Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, submitted to our office on December 14, 2023. Based on the information provided in "Table 1: Comparison of hydraulic modeling results downstream of project", it appears that there is no elevated risk of downstream erosion associated with this project. Based on this information, the State Historic Preservation Officer (SHPO) concurs with the determination of USDA-NRCS that **no *archaeological* properties are affected** within the area of potential effects of this undertaking.

The revised project information does not change our earlier concurrence (March 21, 2021) of **adverse effect** on the Grand Rapids, Grand River Beautification Dams, which appear to meet the criteria of listing in the National Register of Historic Places. We will continue to consult with the NRCS on implementation of the stipulations outlined in the Memorandum of Agreement among the NRCS, SHPO, the Michigan Strategic Fund, the City of Grand Rapids, Michigan, Grand Rapids Whitewater, Inc., and the Grand Valley Metropolitan Council that was executed on September 30, 2022.

We remind you that federal agency officials or their delegated authorities are required to involve the public in a manner that reflects the nature and complexity of the undertaking and its effects on historic properties per 36 CFR § 800.2(d). The National Historic Preservation Act also requires that federal agencies consult with any Indian tribe and/or Tribal Historic Preservation Officer (THPO) that attach religious and cultural significance to historic properties that may be affected by the agency's undertakings per 36 CFR § 800.2(c)(2)(ii).

The opinion of the SHPO is based on the materials provided for our review. If you believe that there is material that we should consider that might affect our finding, or if you have questions, please contact If you have any questions, please contact Scott Slagor, Cultural Resource Protection Manager, at 517-285-5120 or by email at slagors2@michigan.gov. For questions regarding archaeological resources, please contact Dr. Sarah Surface-Evans, Senior Archaeologist at 517-282-7959 or by email at frederickk1@michigan.gov.**Please reference our project number in all communication with this office regarding this undertaking**.

APPENDIX A

Public Plan, Summary, Comments and Responses

RRO Response Letter to SHPO 12/14/23

RIVER RESTORATION.ORG
970.947.9568 P.O. Box 248, Carbondale, CO 81623

To whom it may concern, December 14, 2023

In response to a request from SHPO, included in a letter dated November 20, 2023, for more information on potential impacts to bank erosion and stability, we have presented a summary table of hydraulic modeling results downstream of the project. We compared hydraulic calculations approximately 300 yards downstream, 1 mile downstream, and 5 miles downstream between existing conditions and post project conditions.

These comparisons show that the project will not affect hydraulic conditions downstream of the project to result in any adverse impacts to bank erosion or stability. Hydraulic modeling of the river downstream of the project shows no changes in depth, velocity, or shear stress. To demonstrate this, these hydraulics parameters are compared at three cross sections in Table 1 below.

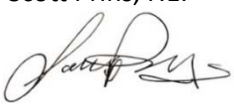
Table 1: Comparison of hydraulic modeling results downstream of project

Cross Section and Location	Flow Rate (cfs)	Calculated Flow Depth (ft)			Calculated Flow Velocity (ft/s)			Calculated Shear Stress (lb/sf)		
		Existing Conditions	Post Project Conditions	Diff.	Existing Conditions	Post Project Conditions	Diff.	Existing Conditions	Post Project Conditions	Diff.
2118+68.1 Downstream face of Fulton Street Bridge	2,500	3.96	3.96	0.00	1.8	1.8	0.00	0.05	0.05	0.00
	3,900	5.89	5.89	0.00	1.65	1.65	0.00	0.03	0.03	0.00
	5,000	7.18	7.18	0.00	1.65	1.65	0.00	0.03	0.03	0.00
	10,000	11.43	11.43	0.00	1.92	1.92	0.00	0.04	0.04	0.00
	18,000	15.75	15.75	0.00	2.42	2.42	0.00	0.05	0.05	0.00
2069+88 Downstream of Oxford Trails Railroad Bridge	2,500	8.44	8.44	0.00	1.26	1.26	0.00	0.02	0.02	0.00
	3,900	10.43	10.43	0.00	1.47	1.47	0.00	0.02	0.02	0.00
	5,000	11.73	11.73	0.00	1.6	1.6	0.00	0.02	0.02	0.00
	10,000	15.91	15.91	0.00	2.15	2.15	0.00	0.03	0.03	0.00
	18,000	20.03	20.03	0.00	2.91	2.91	0.00	0.06	0.06	0.00
1837+33.9 Near Johnson Park	2,500	10.98	10.98	0.00	1.32	1.32	0.00	0.02	0.02	0.00
	3,900	12.82	12.82	0.00	1.61	1.61	0.00	0.03	0.03	0.00
	5,000	14.01	14.01	0.00	1.8	1.8	0.00	0.02	0.02	0.00
	10,000	17.93	17.93	0.00	2	2	0.00	0.01	0.01	0.00
	18,000	21.67	21.67	0.00	2.07	2.07	0.00	0.02	0.02	0.00

As shown in Table 1, at all cross sections examined, there are no calculated changes in either flow depth, velocity, or shear stress at any flow rates. Based on these hydraulic modeling results, there is no anticipated adverse impact to erosion or stability of the channel or banks downstream of the project as a result of the proposed actions. Please let me know if you have any questions.

Kind Regards,

Scott Prins, P.E.



River Engineer

RE: ER20-876 Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, (USDA/NRCS)

Dear Dr. Quates:

We have reviewed the updated information regarding the Project Design for the Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, submitted on October 10, 2023. The information submitted has prompted us to ask for additional details, as the redesigned grade control structures, boulder structures, and boulder clusters represent a significant change from previously reviewed designs.

We request additional information regarding how the revised design will impact water flow and river hydrology in the area of potential effect (APE) and immediately down river from the APE. In particular, how will any hydrological changes made by the proposed project impact riverbank erosion and stability? [redacted] Without a hydrological study, we cannot assess how the design change will affect these cultural resources, many of which are located along the banks of the Grand River.

The requested additional information can be submitted through online through our Additional Information Portal.

Please note that the Section 106 review process cannot proceed until we are able to consider the information requested above. This letter does not clear the project. If you have any questions, please contact Scott Slagor, Cultural Resource Protection Manager, at (517) 285-5120 or by email at slagors2@michigan.gov. For questions regarding archaeological concerns, please contact Senior Archaeologist, Sarah Surface-Evans, surfaceevanss1@michigan.gov, (517) 282-7959. **Please reference our project number in all communication with this office regarding this undertaking.** Thank you for this opportunity to review and comment, and for your cooperation.

Sincerely,

Sarah Surface-Evans
Senior Archaeologist

NRCS-Mi LGRWHR ER20-876 Section 106 Case Study- Updated 3-2-2022

February 2022

Case Study of Alternatives to Address Adverse Effects to the Grand River Beautification Dams in Grand Rapids, MI, as part of the Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project (SHPO ER20-876)

USDA Regional Conservation Partnership Program
Lower Grand River Watershed in Kent County, Michigan

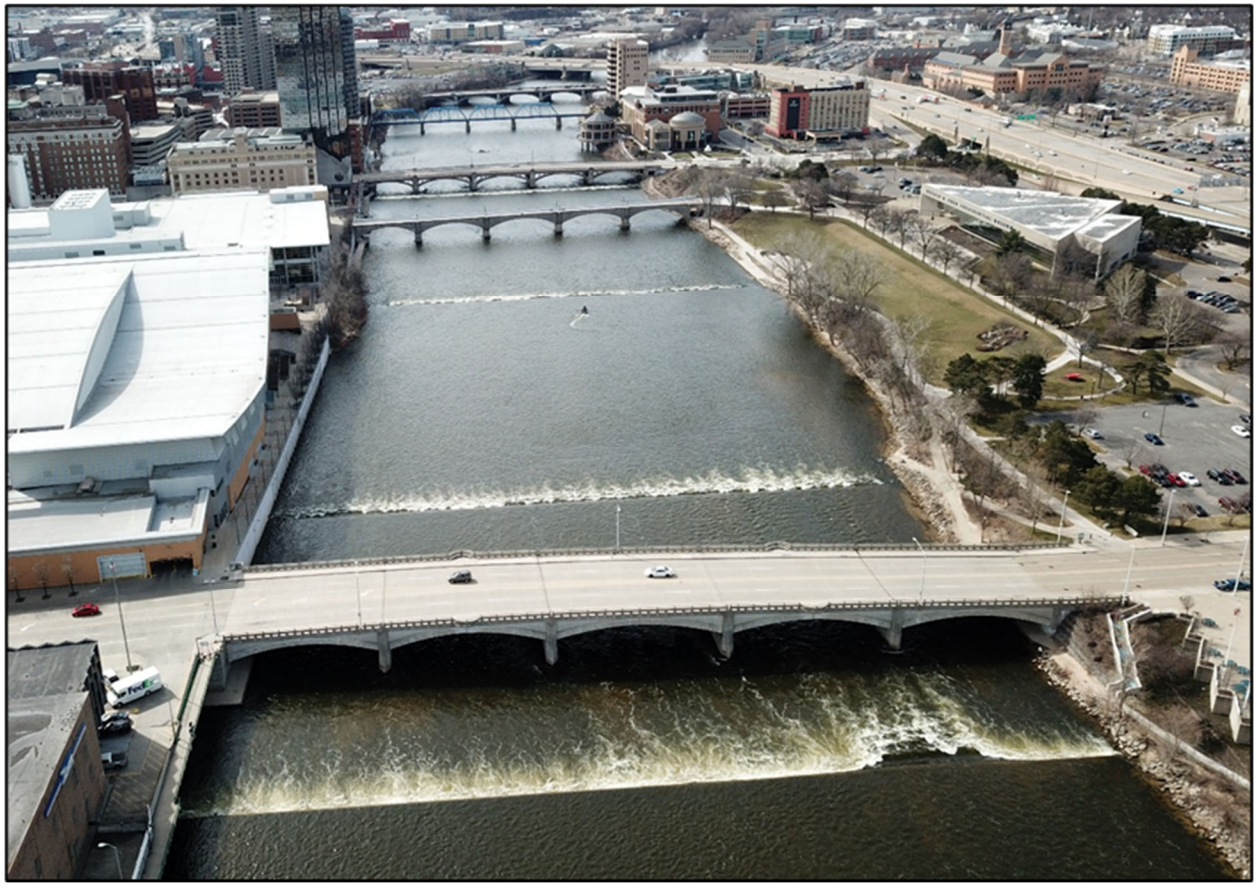

Image of the Grand River, City of Grand Rapids – Proposed Project Reach (looking downstream)

Prepared by:

Lead Federal Agency: Natural Resources Conservation Service

In Cooperation with: Grand Valley Metropolitan Council, Grand Rapids Whitewater, Environmental Consulting & Technology, Inc., Environmental Resources Management

Sponsoring Local Organization: City of Grand Rapids

The following information has been prepared for the State Historic Preservation Office regarding ER20-876 Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project using several existing documents that are also provided as attachments to this Case Study. The narrative below is structured by 36 CFR 800.11(e) required documentation. Attached documentation includes the following:

- *NRHP Evaluation document (ERM)*
- *DRAFT Environmental Assessment*
  - *Section 1 Introduction and Background*
  - *Section 2 Purpose and Need for Action*
  - *Section 4.8 Affected Environment – Cultural Resources*
  - *Section 5 Alternatives*
- *Tribal Consultations letters sent*
- Mitigation Plan *(Final Mitigation Plan GRWW 102621.pdf)*
- Copies or summaries of any views provided by ACHP, SHPO, consulting parties and the public.
  - ACHP response notification (6-21-2021)
  - *SHPO response letter to finding of Adverse Effect (3-23-2021)*

PROJECT DESCRIPTION

Description of the undertaking, specifying the federal involvement

*** Please reference the DRAFT Environmental Assessment (DRAFT EA) document, Section 1.2 for more information ***

A Regional Conservation Partnership Program (RCPP) grant was awarded by the U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) to the Grand Valley Metropolitan Council (GVMC) in 2017 to improve aquatic habitat in the Lower Grand River (runs from Portland, at the confluence of the Looking Glass River, to Grand Haven, at the mouth of the river). This grant provides $8 million in funding for the Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project. Of that amount, about $4.1 million was allocated to support instream habitat restoration of the Grand River where it flows through the City of Grand Rapids in Kent County under the USDA NRCS Watershed Protection and Flood Prevention Act, PL 83-566 program. Specifically, the $4.1 million would be used for revitalizing the rapids in downtown Grand Rapids from 130 feet upstream of Bridge Street to Fulton Street (the proposed Project).

The purpose of the proposed Project is to:

1. Restore aquatic habitat diversity and suitability for native Great Lakes drainage fish and mussel species, especially threatened, endangered, and special concern native species, in the Grand River from 130 feet upstream of Bridge Street to Fulton Street
2. Reduce or eliminate public safety hazards generated by the existing low-head dams; and
3. Install diversified hydraulic features that would improve aquatic habitat and scenic resources in the Grand River.

The need for the proposed Project action arises from the degraded condition of the river, which is an important natural resource for Grand Rapids and the State of Michigan, and several recognized safety problems associated with that degraded condition. Historic physical changes made to the Grand River as it flows through downtown Grand Rapids, including construction of four low-head dams and removal of natural substrate, have impacted native and listed species of fish and

mussels, and altered habitat. Studies have concluded that the diversity and productivity of fish and mussel communities in the Project Area and surrounding portions of the Grand River are currently much lower than what is possible.

The proposed Project would include the following activities:

- Demolition of four low-head dams (also referred to as "Beautification Dams")
- Restructuring the channel through excavation (dredging), grading, and importing boulders, cobble, and gravel substrate
- Installing additional scour protection on existing bridge structures and
- Installing four diversified hydraulic features

The Project is being funded by the NRCS under the watershed Protection and Flood Prevention Act (PL-566) and RCPP in combination with private and public funding obtained through project fundraising efforts. NRCS is the Lead Federal Agency. The Grand Valley Metropolitan Council (GVMC), in partnership with the City of Grand Rapids (the Sponsoring Local Organization (SLO), has prepared a Plan-EA pursuant to NRCS PL-566 requirements. In addition, a Biological Assessment was prepared in consultation with the U.S Fish and Wildlife Service (USFWS) and Michigan Department of Natural Resources (MDNR); the USFWS subsequently issued a Biological Opinion (BO) (issued October 22, 2020) covering multiple state and federal threatened and endangered species, including freshwater mussels.

Area of Potential Effect (APE)

* Tables & Figures referenced below can be found on pages 3-14 of the attached document "*4-6-2021 NRCS-LGRWHR consultation update United Tribes of MI.pdf*" (4-6-2021 Consultation Update letter), which was used along with the Draft EA to provide much of the information for this Case Study. *

The proposed Project's Area of Potential Effect (APE) is defined for direct effects as the Construction Area and Project Area (total direct APE of 48 acres), and for indirect effects as areas immediately adjacent to the Construction Area. Indirect effects, primarily visual, will only be considered for properties from which the channel modifications will be visible. The proposed Project includes the following 2 APE's:

- ❖ Construction Area – the area within the wetted channel of the Grand River from approximately 130 feet upstream of the Bridge Street Bridge to the upstream edge of the Fulton Street Bridge (see Figure 1); and

- ❖ Project Area – the areas where proposed Project activities would occur:
  - Portions of the land on both sides of the Grand River from the 6th Street Dam to Fulton Street (where construction access or staging areas would occur as shown on Figure 1)
  - The wetted channel of the river from 130 feet upstream of the Bridge Street Bridge to the upstream face of the Fulton Street Bridge (the Construction Area) and
  - Three recipient sites in the river for the placement of relocated unionid mussels. The three recipient sites are: mussel beds near Ada, Michigan; at Riverside Park just upstream of Grand Rapids; and between Plaster Creek and the M-11 (28th Street) Bridge (see Figure 1).

Potential impacts may result from demolition of four low-head dams; restructuring the channel through excavation, grading, and importing boulders, cobble, and gravel substrate; development and use of staging areas; and installing additional scour protection on existing bridge structures. Proposed earth disturbance is not planned beyond the confines of the active river channel except for construction access points and temporary staging areas on the banks. Temporary access ramps leading from the bank into the river are anticipated to be placed on the existing land surface. There will be little to no alteration or

grading and the sites of the temporary ramps will be restored to their original state upon completion; therefore, no impacts to historic properties from these temporary ramps are expected. The staging area located south of Bridge Street will have lighting fixtures and 6 to 8 inches of topsoil temporarily removed and stored. Geotextile blanket and stone will be placed to provide temporary driving and storage surfaces. Upon completion of the proposed Project, the stone and geotextile blanket will be removed, and the lighting fixtures and soil replaced. The staging area located northeast of I-196 will be utilized with limited alteration.

SECTION 106 REVIEW AND EVALUATION

Steps taken to identify historic properties

*** 4-6-2021 Consultation Update letter and DRAFT EA were used in preparation of this information ***

The early phases of Section 106 activities included a background search for previous cultural resource surveys and reported cultural resources. This search, conducted on February 21, 2018, included a 1-mile buffer for archaeological resources and a 2,000-foot buffer for historic and architectural resources. Results of this research have been revised based on the updated APE (see 4-6-2021 Consultation Update letter – Pages 3-14, Tables 1 and 2 and Figures 2 and 3). Background research is based on information provided by the Michigan State Historic Preservation Office (SHPO), including the Archaeological Site File. The 4-6-2021 Consultation Update Letter contains information on:

- Results from 2018 background research,
- 11-6-2018 Scoping Field View/Reconnaissance,
- Recommendations including that the mitigation process would be used to address the adverse effects to the 4 low-head dams

On December 17, 2020, SHPO requested a formal eligibility study of the four low-head dams to be removed by the proposed Project (DM 16 through DM 19). NRCS provided the NRHP Evaluation of Four Beautification Dams in the Grand River conducted by ERM dated February 18, 2021 (attached) to SHPO on March 4, 2021, with the finding that the four low-head dams are eligible for listing on the NRHP under criterion A & B, and that their removal will be an adverse effect. A letter with SHPO's concurrence that the dams are eligible for inclusion on the National Register with clarification on the applicable eligibility criteria of A and C was received on March 24, 2021.

In response to the SHPO's concurrence letter and request for information on survey size, "the acreage of the area surveyed as part of this effort for reporting purposes" is 48 acres.

Description of the affected historic properties

The following are excerpts from the NRHP Evaluation document. Please refer to that document and SHPO's response letter for citations, figures, and more information.

The four low-head or beautification dams were constructed in 1927 as part of a plan to beautify the river through downtown. The creation of canals on both sides of the river for power and Industrial use had led to low water levels in the river during dry periods, creating fetid pools and the growth of brush in the channel (Figure 2.0-5). The idea of a series of low-head dams on the Grand River in order to maintain water in the river bed and prevent the accumulation of trash and brush in the river was proposed by city planner Harland Bartholomew, whose firm was hired by the Grand Rapids Planning department in the early 1920s to develop a master plan for the city (GRPL 2017). The low-head dams would maintain the flow of the river and would "add greatly to the appearance and provide ample water surface for boating," according to Bartholomew (Bartholomew 1925; Biolchini 2019; GRPM ca. 1926).

The dams consist of four low-head concrete dams ranging from 1.5 to 3 feet in height and approximately 425 to 440 feet in length, located in the Grand River between the Interstate 196 Bridge and the Pearl

Street Bridge. The four dams together constitute the evaluated resource and are collectively referred to as the Beautification Dams in the Grand River. Details including specific dimensions and photographs of each can be found in section 4 of the NRHP Evaluation document.

The dams were also intended to prevent concentration of the raw sewage that was discharged into the river in that era. The original purpose of these dams is no longer relevant in the context of healthy river ecology, and raw sewage is no longer discharged to the river from the City of Grand Rapids. The dams impact the ability of fish and other creatures to thrive and limit fish and other aquatic organism passage.

Based on the NRHP Evaluation document and the SHPO response letter, the dams meet the requirements for listing in the National Register of Historic Places under Criterion A as a series of structures that conveys the long history of the City of Grand Rapids with the Grand River and for their role in the emergence of city planning and the development of the riverfront as a focal point of downtown development in Grand Rapids. Criterion C requirements are applicable to the dams since they are works of architecture and engineering and embody the distinctive characteristics of a type, period or method of construction.

Description of the undertaking's effects on historic properties.

While several archaeological resources are known to exist within the Project Area and vicinity, earth disturbance is not planned beyond the confines of the active river channel except for construction access points and staging areas. The NRCS field view supported the fact that the Project Area has been heavily urbanized and occurs within a portion of the Grand River that has been historically channelized for flood control purposes. Given the extensive existing land disturbance, and the fact that the majority of the planned activities are limited to the stream channel and some upland areas (for temporary staging and access), the Proposed Action is unlikely to result in impact to stratigraphically intact portions of the soil profile or, therefore, significant archaeological sites or potential culture-bearing soil horizons.

However, if the proposed Project design would change to include grading or significant earth disturbance in upland areas, further archaeological evaluation and possibly testing may be required prior to construction to avoid areas possibly maintaining deeply buried pre-contact or historic archaeological remains. Tribes and THPOs would be consulted if plans change to include such earthmoving or grading. A qualified archaeological monitor may be recommended. With the planned avoidance of Site [redacted] and no planned ground disturbance occurring in its vicinity, a finding of no adverse effects to archaeological historic properties is recommended.

Architectural resource assessment and survey identified both previously recorded resources as well as new resources. Three previously recorded resources, P23718, P23733, and P51124, were found to be significant under NRHP criteria. While these resources are adjacent to the proposed Project, a finding of no adverse effects to these resources is recommended due to a lack of visual change as well as a lack of physical changes that could impact resource integrity.

In addition to the three previously recorded resources, 16 new resources were identified during the field survey effort (Table 3). These resources consisted of six buildings (DM 1, DM 2, DM 3, DM 4, DM 7, DM 8), four bridges (DM 9, DM 11, DM 12, DM 13), one historic resource associated with the Grand River (DM 14), one riverwalk (DM 15), and four low-head dams (DM 16, DM 17, DM 18, DM 19). Of these resources, ten are considered to be ineligible for listing on the NRHP. Resources DM 11 and DM 12 are recommended

eligible for inclusion on the NRHP; however, due to lack of visual change from the Proposed Action, a finding of no adverse effects to these two resources is recommended. Any visual effects of the proposed Project are planned to be limited to the Grand River channel and properties adjacent to the Project area.
The Project plan as currently proposed requires removal of all four low-head dams evaluated and found to be eligible for listing. The removal of the dams, while causing an adverse effect, is an important part in realizing the Project purpose of improving aquatic habitat diversity and improving public health and safety. The Project plan does not allow for avoidance or minimization of adverse effects.

Explanation of why the criteria of adverse effects were found applicable or inapplicable;

As part of the Proposed Action, the four low-head dams would be demolished. Resources subject to direct effects (limited to the four low-head dams) has required additional study to determine NRHP significance, potential effect, and the potential need for mitigation of adverse effects to these structures. ERM's evaluation of the 4 low-head dams has resulted in NRCS' recommendation that they are eligible for the NRHP and SHPO has concurred with the determination of eligibility. Since removal of the dams is an integral part of the proposed undertakings and would be an adverse effect, the mitigation process is being used to address these adverse effects.

The proposed Project would have no effect on the remaining previously recorded and newly recorded architectural resources adjacent to the Project Area. Given that the proposed Project would include the demolition of low-profile dams whose structures are not currently visible above the water surface, and the restoration of rapids that are historic to the natural landscape of the area, there would be no adverse change in the historic viewshed of the identified resources. Additionally, any proposed staging areas for the proposed Project would not directly impact the resources identified within the viewshed, nor would they cause permanent impact on the immediate surroundings that may tie into the significance of that resource. However, should earthmoving, tree-clearing, or terracing activities be proposed as Project planning and design progresses, such viewshed changes may need to be re-evaluated in consultation with SHPO, THPOs and tribes.
A mitigation plan (*Final Mitigation Plan GRWW 102621.pdf*) has been developed to address the removal of the 4 low-head dams in cooperation with the applicant, SHPO, and any interested tribes. The plan addresses basic background of the adverse effects and how information will be provided to inform the public, with the end goal being development and execution of a Memorandum of Agreement.

Alternatives

The DRAFT EA prepared for the project addresses effects on resources and Section 5 specifically addresses alternatives to the removal of the 4 low head dams.
Alternatives considered for detailed study included the Proposed Action and a No Action Alternative. Several other alternatives were initially considered but subsequently eliminated from further study as described in Section 5.2. The Proposed Action includes the demolition of all four low-head dams and the creation of riffles, runs, glides, and pools in the Construction Area. Large substrates including boulders, cobbles, and gravel would be added to create rapids that would distribute the river's gradient and enhance fish and mussel habitat.

The No Action Alternative would leave the current conditions as they are. The low-head dams would be left in place, and the related public safety issues would remain. There would be no substrate enhancement; therefore, habitat quality would not be improved.

The alternatives have been assessed regarding their alignment with the defined Project purpose.
As stated earlier, the Project plan as currently proposed requires removal of all four low-head dams evaluated and found to be eligible for listing.

Summary of Consultation Efforts

SHPO has been involved in the project from 2018 up through the present by reviewing the initial information and field visit, assisting with ideas for additional consulting parties, and requesting more information on the history of the low head dams that led to the formal Evaluation and finding of Adverse Effect.
Prior to NRCS involvement in this project, Grand Rapids Whitewater conducted outreach and public meetings that included organizations listed in the attached document '***2014-2018 GRWW Consultation Efforts.pdf***'.

NRCS sent initial tribal & community consultation in July 2019 to the 12 federally recognized tribes (addressed to the cultural contact & tribal leader), 2 state historic tribes, and 1 tribal organization (United Tribes of Michigan) currently located in MI, and 5 environmental or community organizations listed in the attached spreadsheet (NRCS-MI LGRWHR ER20-876-Consultation.xlsx – 'Consultation-Groups Contacted' tab).

In April 2021 a consultation update was emailed to the cultural contact for each tribe contacted previously, the United Tribes of Michigan, and additionally to the Miami of Oklahoma. Information provided includes APE map, listing of documented sites and structures in the area, evaluation of the low head dams, finding of adverse effect, and invitation to provide comments and participate in the mitigation process. We received 4 responses, 1 with concerns in the area and a request to be kept informed, and the other 3 with interest in the area and the request to be notified in response to their offer to assist if something is discovered after the review and environmental evaluation have been completed or during construction. If there is a discovery, tribes request that construction will stop until any artifacts, significant properties or remains can be evaluated and tribes notified and contacted to assist as needed.

To address the response of concern, NRCS held a consultation meeting in May 2021 via Teams with the THPO staff to identify specific questions and concerns. The meeting was followed up by a site visit with Grand Rapids Whitewater, City of Grand Rapids, NRCS and the Tribe's THPO staff and Environmental Department representative in June 2021. Tribal concerns identified in May were discussed during the site visit/tour of the area and documented to be addressed in construction plans. Items discussed further with the Tribal representatives included requests to have a tribal monitor present and site monitoring plan to help address any potential discoveries during construction, protecting existing sites in the staging area prior to construction, more information on the extent of the physical disturbance within the river when the low-head dams are removed, and to determine what vegetation and aquatic species both in and near the river are being considered in development of the construction schedule. In response to

discussing the above issues, notes were provided to all parties that participated, the city provided a tree inventory of Ah-Nab-Awen park at the THPO's request. Arrangements for a tribal monitor are under development.

In October 2021 the draft mitigation plan was sent to the cultural contact or THPO for each of the 16 tribes/tribal organization contacted previously and inviting tribes to provide any comments. Letters were followed up by phone conversations where representatives were available.
A public comment period was held November 10, 2021, to December 10, 2021, to gather comments on the proposed mitigation measures to address the adverse effect of dam removal. The public comment period began with a public notice on the NRCS website and extensively shared via posting in a local news outlet (MLive), social media and email communications. The mitigation plan was posted online and made available in hard copy at Grand Rapids Public Library branches. Two public meetings were held online via Microsoft Teams. Meeting information directed interested parties to request to attend a meeting via a link on the NRCS website. Comments collected during the public comment period can be found on the "Public Comments" tab of the attached spreadsheet. 47 public comments were collected and 8 of those were related to or addressed the mitigation plan for the removal of the low-head dams. Several comments were related to the overall project and NEPA concerns and can be better addressed during the future NEPA public comment period.

The goal once mitigation measures are finalized, is execution of a Memorandum of Agreement to address removal of the dams and all associated concerns. NRCS, SHPO, GVMC, GRWW, the City of Grand Rapids, the Grand Rapids Public Museum, and any tribes or further interested consulting parties will be signatories of the MOA.

ACHP Notification & Response

The ACHP was provided with similar information regarding this project and the finding of adverse effect on the 4 low-head dams that are eligible for listing on the NRHP. The ACHP was notified on June 11, 2021, of the finding of adverse effect. The project was assigned ACHP Project Number 17025 in their response letter dated June 21, 2021. According to their response, the ACHP does not believe their "participation in the consultation to resolve adverse effects is needed." but may reconsider if the SHPO, a THPO, affected Indian tribe or other party requests their involvement. The ACHP has also offered to provide NRCS with advisory assistance upon request.

https://grandrapidswhitewater.org/ NRCS is involved in the "Lower Reach" area and undertakings of the project as referred to under "The Plan" tab.

Lower Grand River Watershed Habitat Restoration Project
Draft Mitigation Plan—Removal of Four Low-Head Dams

October 2021

Background and Context

On December 20, 2018, the Michigan State Historic Preservation Office (MI SHPO) was provided an initial request for Section 106 consultation regarding the Lower Grand River Watershed Habitat Restoration Project ("the Project"). On June 18, 2020, the Natural Resources Conservation Service (NRCS) submitted an update to that submittal. MI SHPO responded on June 29, 2020 with a request for additional information regarding the four low-head dams to be removed as part of the Project. NRCS provided the requested information on November 2, 2020. In response, MI SHPO requested that further additional information be provided about the dams to be removed by the Project, along with historical context that would help frame their potential eligibility for the National Register of Historic Places (NRHP).

On March 4, 2021, NRCS provided MI SHPO with an evaluation of the NRHP eligibility of the four low-head dams, finding that the dams are eligible and will be adversely affected. In a letter dated March 23, 2021, SHPO agreed with this evaluation, but clarified the applicable eligibility criteria. MI SHPO concurs that the four low-head dams are eligible for listing on the NRHP under Criterion A based on their role in the history of the city and the emergence of city planning. MI SHPO does not concur the association of the dams with city planner Harland Bartholomew warrants eligibility under Criterion B. In addition, MI SHPO finds that the dams are eligible under Criterion C, as the dams may embody the distinctive characteristics of a type, period, or method of construction. The Project as currently proposed requires removal of all four low-head dams and does not allow for avoidance or minimization of adverse effects; therefore, the adverse effect must be mitigated. Once a mitigation is agreed upon, a Memorandum of Agreement (MOA) will be developed to document the selected mitigation and its proposed implementation. The MOA will also incorporate an inadvertent discovery plan. Based on tribal responses specific to the Grand River Watershed Habitat Restoration consultation, as well as standard NRCS policy, if during the work, there is an inadvertent discovery made that involves any disturbance to a site of cultural, historic, or religious importance, work will stop and NRCS will contact tribal representatives and government agencies to determine further action. The MOA will be incorporated into the Environmental Assessment (EA) being prepared for the Project.

Because the four low-head dams are eligible based on their role in the history of Grand Rapids and the development of its waterfront, their role in early city planning, and possibly for their embodiment of distinctive characteristics of a type, period, or method of construction, the mitigation should align as closely as possible with these elements.

Because the plans on file for the dams show that they are constructed of solid concrete, their design and construction are unlikely to offer significant information. The plans do show a "Wilcox Angle Drain Valve" which has apparently never been operated or maintained. The purpose of this drain valve, and whether it was actually installed or was ever utilized, are unclear, but may be clarified through observation of dam removal.

Proposed Mitigation Measures

- Conduct selective monitoring of removal of dam 1 within the coffered de-watered area by a qualified architectural historian, who will work in coordination with a qualified archaeologist
    - Focus on identifying and documenting the form and content of the dam with sketch drawings and high-resolution photographs
    - Focus on how the dam was constructed and any evidence of maintenance or modifications post-construction
    - While monitoring dam removal, the architectural historian will also attempt to recover any diagnostic artifacts identified within the coffered area as feasible and safe within the constraints of construction site activities and schedule
    - The architectural historian (who will be on-site) will consult the archaeologist (who will be remote) to assure any diagnostic artifacts identified within the river bed are appropriately handled, as directed by NRCS
    - Coordinate with the Grand Rapids Public Museum for curation and display if significant cultural artifacts are recovered
- Include photos of the dam removal in the River Restoration Photo Monitoring Project (https://www.lgrow.org/river-restoration) and make available for incorporation into educational programming
- Coordinate with Grand Rapids Public Museum to assure that they have access to any documentation of the Project and removal of the dams that they would like to incorporate into their educational programming, collections, or exhibits
    - Interpretation of the dams, including their removal, is central to Grand Rapids Public Museum programs that reach 6,000 students annually, in partnership with the Lower Grand River Organization of Watersheds
- Update River For All interpretive signage in kiosks in public areas along river (https://www.riverforall.com/)
    - Content to be determined in coordination with River For All and Grand Rapids Public Museum, for example:
        - Design drawings and plans
        - Documentation of removal of dams
        - Historic photographs or articles

Once mitigation measures have been agreed upon by all interested parties, the mitigation plan will be documented in a Memorandum of Agreement; with signatories to include NRCS, MI SHPO, City of Grand Rapids, Grand Rapids White Water (project proponents), Grand Valley Metro Council (project sponsor), and other consulting parties as applicable.

RE: ER20-876 Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County (USDA/NRCS)

Dear Ms. Gutierrez:

Under the authority of Section 106 of the National Historic Preservation Act of 1966, as amended, we have reviewed the proposed undertaking at the above-noted location. We have recently reviewed the report entitled NRHP Evaluation of Four Beautification Dams in the Grand River, Grand Rapids, Michigan submitted to fulfill the U.S. Department of Agriculture's Natural Resource Conservation Service's (NRCS) cultural resource management obligations under Sections 106 and 110 of the National Historic Preservation Act of 1966, as amended.

After review of the eligibility information presented in the report, we concur with the recommendations for the four beautification dams as eligible under Criterion A as series of structures that conveys the long history of the City of Grand Rapids with the Grand River and for their role in the emergence of city planning and the development of the riverfront as a focal point of downtown Grand Rapids. The dams may be individually eligible for listing in the National Register, or as a contributing of a larger historic district associated with the total design of Harland Bartholomew, depending on the extent of the implementation of Bartholomew's design and whether any larger, potential district possesses historic integrity. The lack of a larger historic district or loss of integrity of the larger district does not diminish the individual significance, and thus eligibility, of the dams.

We do not concur that the dams are eligible under Criterion B for their association with city planner Harland Bartholomew. Though Bartholomew may be a significant historical figure, National Register Bulletin 15 states, "architects, artisans, artists, and engineers are often represented by their works, which are eligible under Criterion C." Bulletin 15 further guides that rather than the works of architects, artisans, artists, and engineers, the "homes and studios... can be eligible for consideration under Criterion B, because these usually are the properties with which they are most personally associated" (emphasis added). For these reasons, the structures are not eligible under Criterion B.

Likewise, we do not concur with the recommendation of not eligible under Criterion C. Given these are works of architecture and engineering, they should be more thoroughly examined under Criterion C. We believe these dams embody the distinctive characteristics of a type, period or method of construction and are therefore eligible under Criterion C.

While there are some differences between the SHPO's opinion of eligibility above in terms of the applicable Criterion, it appears that SHPO and NRCS agree that the dams are resources eligible for inclusion in the National Register and requesting additional changes to the report now would be inappropriate. The only additional information that SHPO requires for the NRHP Evaluation report at this time is the acreage of the area surveyed as part of this effort for reporting purposes. Please be sure to include that in all future survey efforts as well.

Therefore, based on the information provided for our review, the State Historic Preservation Officer (SHPO) concurs with the determination of USDA/NRCS that the proposed undertaking will have an **adverse effect** on the Grand Rapids, Grand River Beautification Dams, which appear to meet the criteria for listing in the National Register of Historic Places.

This undertaking meets the criteria of adverse effect because: *the undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association,* 36 CFR § 800.5(a)(1). Specifically, the undertaking will result in physical destruction of or damage to all or part of the property.

Federal agencies are required to avoid, minimize, or mitigate adverse effects. Please note that if the federal agency and the SHPO concur that the adverse effect cannot be avoided, the Section 106 process will not conclude until the consultation process is complete, an MOA is developed, executed, and implemented, and, if applicable, the formal comments of the Advisory Council have been received, 36 CFR § 800.6. For more information on your responsibilities and obligations for projects that will have an adverse effect on historic properties under 36 CFR § 800.6, please review the enclosed materials.

We remind you that federal agency officials or their delegated authorities are required to involve the public in a manner that reflects the nature and complexity of the undertaking and its effects on historic properties per 36 CFR § 800.2(d). The National Historic Preservation Act also requires that federal agencies consult with any Indian tribe and/or Tribal Historic Preservation Officer (THPO) that attach religious and cultural significance to historic properties that may be affected by the agency's undertakings per 36 CFR § 800.2(c)(2)(ii).

The opinion of the SHPO is based on the materials provided for our review. If you believe that there is material that we should consider that might affect our finding, or if you have questions, please contact Brian Grennell, Cultural Resource Management Coordinatoe, at (517) 335-2721 or by email at GrennellB@michigan.gov. **Please reference our project number in all communication with this office regarding this undertaking.**

Finally, the State Historic Preservation Office is not the office of record for this undertaking. You are therefore asked to maintain a copy of this letter with your environmental review record for this undertaking. Thank you for this opportunity to review and comment, and for your cooperation.

Sincerely,

Martha MacFarlane-Faes
Deputy State Historic Preservation Officer

APPENDIX A

Public Plan, Summary, Comments and Responses

Cultural Resources Memorandum of Agreement 9/30/2022

NRCS Agreement N2622MOU0012399

MEMORANDUM OF AGREEMENT
AMONG
THE NATURAL RESOURCES CONSERVATION SERVICE,
THE MICHIGAN STATE HISTORIC PRESERVATION OFFICER,
THE MICHIGAN STRATEGIC FUND,
THE CITY OF GRAND RAPIDS, MICHIGAN,
GRAND RAPIDS WHITEWATER, INC.,
AND THE GRAND VALLEY METROPOLITAN COUNCIL

REGARDING

Removal of Four Beautification (Low-Head) Dams in the Grand River, Grand Rapids, Kent County, Michigan, a component of the Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project

WHEREAS, the Natural Resources Conservation Service (NRCS) plans in cooperation with the Grand Valley Metropolitan Council (GVMC), the City of Grand Rapids (City) and Grand Rapids Whitewater, Inc. (GRWW) to carry out the Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project (Project) located in the City of Grand Rapids, Michigan pursuant to the Watershed Protection and Flood Prevention Act of 1954, Public Law 83-566, as amended (WPFPA) (16 U.S.C. Sections 1001-1008, 1010, and 1012)through NRCS's Regional Conservation Partnership Program (RCPP) agreement number 1603 with GVMC; and

WHEREAS, the Project consists of (1) restoring aquatic habitat diversity and suitability for native Great Lakes drainage fish and mussel species, especially threatened, endangered, and special concern native species, in the Grand River; (2) reducing public safety hazards generated by the existing four beautification (low-head) dams (each, a "low-head dam", and, collectively as, the "low-head dams"); and (3) installing diversified hydraulic features that would improve aquatic habitat and aesthetics. Restoration of the site will require the demolition and removal of the low-head dams; and

WHEREAS, NRCS has determined that the removal of the low-head dams is an undertaking (Undertaking) subject to review under Section 106 of the National Historic Preservation Act (NHPA), as amended, 54 U.S.C. §306108 (Section 106), and its implementing regulations, 36 C.F.R. Part 800; and

WHEREAS, NRCS is the responsible federal agency with funding authority over the Undertaking pursuant to the WPFPA; and

WHEREAS, GVMC is the applicant for federal assistance through the RCPP and is responsible for ensuring the habitat restoration requirements of the RCPP agreement between the NRCS and the GVMC are met. GVMC will be signing this Memorandum of Agreement (MOA) as an invited signatory; and

WHEREAS, the City is the sponsoring local organization and permit applicant, and will be responsible for establishing contracts for demolition of the low-head dams and resulting habitat restoration and will be signing this MOA as an invited signatory; and

WHEREAS, GRWW is leading the design and engineering of the Project and will closely coordinate with the City and other partners to ensure the original intent of the design is accomplished and will be signing this MOA as an invited signatory; and

WHEREAS, the State Historic Preservation Officer is part of the State Historic Preservation Office (SHPO) which was transferred to the Michigan Strategic Fund (MSF) pursuant to Executive Order 2019-13; and

WHEREAS, NRCS has defined the Undertaking's Area of Potential Effects (APE) as the footprint of the low-head dam removal, an 840 m (2,756 feet) stretch of the Grand River flowing through the City from 40 m (130 ft) upstream of Bridge Street to Fulton Street and staging areas along the river; the low-head dams to be demolished are located between I-196 and Fulton Street and installation of substrate improvements within an area approximately 121,800 m^2 (30 acres) in size as further shown in the APE map attached hereto as Appendix A; and

WHEREAS, NRCS has determined, and the SHPO has concurred in their response letter regarding the Undertaking also referred to as SHPO Environmental Review 20-876, that the Undertaking will have an adverse effect on the low-head) dams in the Grand River due to their demolition and removal from the river. The low-head dams are eligible for listing on the National Register of Historic Places (NRHP) as documented in the NRHP Evaluation attached hereto as Appendix B, and NRCS has consulted with the SHPO and the Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians Tribal Historic Preservation Officer (THPO) to develop this MOA pursuant to 36 Code of Federal Regulations Part 800 (36 C.F.R. Part 800), the regulations implementing Section 106 of the National Historic Preservation Act (54 U.S.C. § 306108); and

WHEREAS, the low-head dams are eligible for listing on the NRHP under the following eligibility criteria: Criterion A as a series of structures that conveys the long history of the City with the Grand River and for their role in the emergence of city planning and the development of the riverfront as a focal point of downtown Grand Rapids and Criterion C, given that the low-head dams are works of architecture and engineering and embody the distinctive characteristics of a type, period or method of construction. The mitigation measures documented in the stipulations below must address the criteria that qualify the low-head dams for listing on the NRHP; and

WHEREAS, NRCS has reached out to the 12 Federally Recognized Tribes, and the two State Historic Tribes within Michigan as well as the Miami Tribe of Oklahoma with information and updates regarding the planned Undertaking. The Little River Band of Ottawa Indians, the Miami Tribe of Oklahoma, the Pokagon Band of Potawatomi, and the Saginaw Chippewa Indian Tribe of Michigan, responded to NRCS consultations and indicated that they should be contacted in the event a post review discovery is made; and

WHEREAS, the Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians, [redacted] responded to NRCS consultations with interest and NRCS pursued consultation through the THPO**;** and

WHEREAS, NRCS has consulted with the Grand Rapids Public Museum (GRPM) regarding the effects of the Undertaking on historic properties and has invited GRPM to sign. GRPM will be signing this MOA as a concurring party; and

WHEREAS, in accordance with 36 C.F.R. § 800.6(a)(1), NRCS has notified the Advisory Council on Historic Preservation (ACHP) of its adverse effect determination with specified

documentation, and the ACHP has chosen not to participate in the consultation pursuant to 36 C.F.R. § 800.6(a)(1)(iii); and

WHEREAS, NRCS has provided the public the opportunity to comment on the Undertaking and proposed mitigation measures by issuing a public notice through local media, on the NRCS Michigan website, partner websites and posting at local public libraries. Two public meetings were held virtually on November 10th and 29th, 2021, to provide information on the original purpose and present mitigation measures to address the removal of the low-head dams. Over the course of 30 days, 47 public comments were received and provided to the SHPO. Seven comments specifically addressed the removal of the low-head dams. These seven were reviewed and considered in development of this MOA. Remaining comments addressed other issues not related to the low-head dams; and

WHEREAS, an architectural historian will be present to monitor and document the low-head dam removal since the historic structures eligible for listing on the NRHP are extant engineered structures. An archaeologist will not be onsite during low-head dam removal for monitoring below ground disturbance because the riverbed was significantly disturbed when the low-head dams were installed and planned ground disturbance for the Undertaking will be limited. Dredging or scraping of the river for demolition of the dams will not exceed the previous level of disturbance associated with construction of the dams. Ah-Nab-Awen Park, a staging area, has three to five feet of fill. An archaeologist will be available to respond in the event a post review discovery is made during construction in accordance with the Inadvertent Discovery Plan for Cultural Resources or Human Remains attached hereto as Appendix E (Inadvertent Discovery Plan); and

WHEREAS, the term "Signatory" is defined in this MOA to include both Signatories and Invited Signatories; and

WHEREAS, nothing in this MOA shall be construed as requiring a Signatory or Concurring Party to expend funds in violation of the Anti-deficiency Act, codified at 31 U.S.C. § 1341, as amended; and

WHEREAS, terms and parties not otherwise defined in this MOA shall have the meaning assigned to them in the Glossary of Terms attached hereto as Appendix G.

NOW, THEREFORE, NRCS, SHPO, MSF, the City, GRWW, and GVMC agree that the Undertaking shall be implemented in accordance with the following stipulations in order to take into account the effect of the Undertaking on historic properties.

STIPULATIONS

NRCS shall ensure that the following measures are carried out:

I. MONITORING OF LOW-HEAD DAM REMOVAL BY ARCHITECTURAL HISTORIAN

The City and GRWW will provide a qualified architectural historian to conduct monitoring of the removal of one of the low-head dams within the coffered de-watered area to document the resource as it exists in accordance with SHPO's Documentation Standards attached hereto as Appendix C (Documentation Standards). As the plans show that the low-head dams are identical in design and construction, observation of one removal is expected to provide sufficient information on construction of the low-head dams. Note that if the field conditions at the time of removal of the

first coffered low-head dam do not facilitate the desired observations, NRCS may request that the removal of the second low-head dam within a coffered area, also be monitored as described below. The architectural historian will be monitoring demolition of a low-head dam since the historic property being removed is an extant engineered structure. An archaeologist will not be onsite during monitoring because ground disturbance will be limited. Dredging or scraping for demolition of the dams will not exceed the previous level of disturbance associated with construction of the dams. Ah-Nab-Awen Park, a staging area, has three to five feet of fill. An archaeologist will be available to respond in the event a post review discovery is made during construction in accordance with the Inadvertent Discovery Plan. The monitoring will:

A. Focus on identifying and documenting the form and content of the low-head dam with sketch drawings and high-resolution photographs

B. Focus on how the low-head dam was constructed and any evidence of maintenance or modifications post-construction

C. Allow the City's architectural historian to attempt to recover any significant architectural elements identified within the coffered area as feasible and safe within the constraints of low-head dam removal site activities and schedule

D. Include application of the Inadvertent Discovery Plan as needed during all Project activities. During monitoring of removal of the low-head dams, the architectural historian on site will implement the Inadvertent Discovery Plan if needed and NRCS shall engage archaeological and tribal representative assistance as appropriate.

E. Allow the City's architectural historian to coordinate with NRCS to arrange for curation and display if significant architectural elements and/or archaeological remains are recovered.

The final report from the City's architectural historian shall follow the Documentation Standards and will be submitted to NRCS within 90 days of completion of the monitoring work. NRCS will then submit the final report to the SHPO for deposit in the State Archives of Michigan, and with the City's Community Archives and Research Center. The historic documentation developed from monitoring shall adhere to the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (48 Fed. Reg. 44716 (Sept. 29, 1983)).

II. PRESENTATION OF INTERPRETIVE MATERIALS

The following actions will be completed within one year of completion of low-head dam demolition.

A. Interpretive Panel(s)

i. The City and GRWW, in consultation with NRCS, will provide interpretative panel(s) to be placed along the river walkway in Ah-Nab-Awen Park or on the GRPM grounds (Panel(s)).

ii. The Panel(s) will be constructed on a durable outdoor product with UV resistant, graffiti resistant, and burn resistant material. Examples can be found at: http://www.pulsedesign.com/outdoor-interpretive-signs-historic-preservation-site-educational-exhibits

iii. The City and GRWW in consultation with NRCS and the other consulting parties will develop an interpretive design to describe the content of the Panel(s).

iv. Content, including text and images, for the Panel(s) will be reviewed by NRCS, in consultation with the SHPO, to ensure the content meets the Secretary of the Interior's Professional Qualifications Standards. NRCS will provide a draft image of all Panel(s)

to the signatories for comment for a period of 30 days. NRCS will consider all timely comments in developing final designs and text for the Panel(s).

v. The City and GRWW will install the Panel(s) during site restoration of Ah-Nab-Awen Park. The City shall ensure maintenance of the Panel(s). A digital copy of the Panel(s) will also be provided to the SHPO and the City for archiving.

B. River Restoration Photo Monitoring Project

i. GVMC is collecting photos of the current conditions and future low-head dam removal locations in the River Restoration Photo Monitoring Project. (https://www.lgrow.org/river-restoration)

ii. GVMC will create a timelapse video from these photos to document the entire low-head dam removal and watershed restoration process and make the video available to the public. The final product will be archived with the State Archives of Michigan and the City.

C. Museum Collections, Exhibits

The City will coordinate with a local historical institution to assure they have access to any appropriate documentation of the Project and removal of the low-head dams that they would like to incorporate into their educational programming, collections, or exhibits. Educational materials and exhibits shall comply with Federal Curation Regulations found at 36 C.F.R. § 79 as attached hereto as Appendix D (Federal Curation Regulations).

III. QUALIFICATIONS STANDARDS

NRCS shall ensure that all work carried out pursuant to this MOA shall be done by or under the direct supervision of historic preservation professionals who meet the Secretary of the Interior's Professional Qualifications Standards found at 36 C.F.R. § 61 (SOI Standards). NRCS shall ensure that all consultants retained for services pursuant to the MOA Agreement meet the SOI Standards.

The Section 106 regulations (36 CFR § 800.4(c)(1)) acknowledge that Indian tribes and Native Hawaiian organizations (NHOs) possess "special expertise" in assessing the eligibility of historic properties that possess religious and cultural significance to them. Individuals recognized by a tribe or NHO as possessing this special expertise do not have to meet the SOI Standards for purposes of Section 106 review.

IV. CURATION STANDARDS

Any artifacts collected and accessioned will be curated according to the Federal Curation Regulations.

V. PROJECT MODIFICATIONS AND CHANGES

Neither the NRCS, GVMC, the City nor GRWW shall alter any plan, scope of services, or other document that has been reviewed and commented on pursuant to this MOA (except to finalize documents commented on in draft form), without first affording the signatories to this MOA the opportunity to review the proposed change and determine whether it shall require that this MOA be amended. If one or more such signatory determines than an amendment is needed, the signatories to this MOA shall consult in accordance with Stipulation XIV to consider such an amendment.

VI. COMPLIANCE WITH OTHER FEDERAL, STATE, TRIBAL AND LOCAL LAWS

A. NRCS shall coordinate its compliance with Section 106 with other applicable federal, state/tribal, and local laws and reviews as appropriate.

B. Historic and prehistoric human remains from non-federal, non-tribal lands are subject to protection under Michigan burial/unmarked grave/cemetery law(s), the Michigan Attorney General's Opinion No. 6585 and Michigan Penal Code, Act 328 of 1931 Chapter XXVI, Section 750.160. As such, if human remains are discovered during removal of the low-head dams and watershed restoration, work in that portion of the Project shall stop immediately. The remains shall be covered and/or protected in place in such a way that minimizes further exposure of and damage to the remains, and NRCS shall immediately consult with the SHPO and THPO. If the remains are found to be Native American, in accordance with applicable law, a treatment plan shall be developed by NRCS and SHPO in consultation with appropriate federally recognized Indian tribes. NRCS shall ensure that any treatment and reburial plan is fully implemented. If the remains are not Native American, the appropriate local authority shall be consulted to determine final disposition of the remains. Avoidance and preservation in place is the preferred option for treating human remains.

VII. POST-REVIEW DISCOVERIES

If properties are discovered that may be historically significant or unanticipated effects on historic properties found, once notified of the discovery, NRCS shall continue to implement the Inadvertent Discovery Plan.

VIII. COMMUNICATION AMONG MOA PARTIES

Electronic mail (email) will serve as the official correspondence method for all communications regarding this MOA and its provisions. A list of all Signatory contacts and email addresses is attached hereto as Appendix F (Contact Information). Contact Information may be updated without an amendment to this MOA. It is the responsibility of each Signatory or Concurring Party to immediately inform NRCS of any change in name, address, email address, or phone number of any point-of-contact. NRCS shall forward updated Contact Information to all Signatories and Concurring Parties by email.

IX. ANTIDEFICIENCY ACT

NRCS's obligations under this MOA are subject to the availability of appropriated funds, and the stipulations of this MOA are subject to the provisions of the Anti-deficiency Act. NRCS shall make reasonable and good faith efforts to secure the necessary funds to implement this MOA in its entirety. If compliance with the Anti-deficiency Act alters or impairs NRCS's ability to implement the stipulations of this MOA, NRCS shall consult in accordance with the amendment and termination procedures found at Stipulations XIV and XV of this MOA.

X. EMERGENCY SITUATIONS

Should an emergency situation occur which represents an imminent threat to public health or safety, or creates a hazardous condition, NRCS shall immediately notify the SHPO, THPO and the ACHP of the condition which has initiated the situation and the measures taken to respond to the emergency or hazardous condition. Should the SHPO, THPO or the ACHP desire to provide technical assistance to NRCS, they shall submit comments within seven (7) calendar days from receipt of the notification, if the nature of the emergency or hazardous condition allows for such coordination.

XI. DURATION

This MOA will expire if its terms are not fully carried out within five (5) years from its execution. Prior to such time, NRCS may consult with the other Signatories to reconsider the terms of this MOA and amend it in accordance with Stipulation XIV below.

XII. AGREEMENT MONITORING AND REPORTING

A. On each anniversary following the execution of this MOA, until it expires or is terminated,

NRCS shall provide all Signatories and Concurring Parties to this MOA a summary report detailing work undertaken pursuant to its terms. Such report shall include any scheduling changes proposed, any problems encountered, and any disputes and objectionsreceived in NRCS's efforts to carry out the terms of this MOA.

B. The City, GRWW, and GVMC shall submit quarterly summary reports (Quarterly Reports) to NRCS detailing (1) any scheduling changes proposed, (2) any problems encountered, (3) any disputes and objections received and (4) all efforts to carry out the responsibilities and terms of this MOA.

C. NRCS shall create annual reports based on the Quarterly Reports and distribute to all Signatories and Concurring Parties.

XIII. DISPUTE RESOLUTION

Should any Signatory or Concurring Party to this MOA object (Objection) at any time to any actions proposed or the manner in which the terms of this MOA are being implemented, NRCS shall consult with such Signatory or Concurring Party to resolve the Objection. If NRCS determines that such Objection cannot be resolved, NRCS will:

A. Forward all documentation relevant to the Objection, including the NRCS's proposed resolution, to the ACHP. The ACHP shall provide NRCS with its advice on the resolution of the Objection (Advice) within thirty (30) days of receiving adequate documentation (Advice Period).

1. If the ACHP provides its Advice within the Advice Period, NRCS shall prepare a written response (Response) prior to reaching a final decision on the Objection (Final Decision) that takes into account any timely advice or comments regarding the Objection from the ACHP, Signatories and Concurring Parties, and provide them with a copy of the Response. NRCS will then proceed according to its Final Decision.

2. If the ACHP does not provide its Advice within the Advice Period, NRCS may make its Final Decision and proceed accordingly. Prior to reaching the Final Decision, NRCS shall prepare a Response that takes into account any timely comments regarding the Objection from the Signatories and Concurring Parties, and provide them and the ACHP with a copy of the Response.

B. NRCS's responsibility to carry out all other actions pursuant to the terms of this MOA that are not the subject of the Objection remain unchanged.

XIV. AMENDMENTS

This MOA may be amended when such an amendment is agreed to in writing by all Signatories. The amendment will be effective on the date a copy signed by all the Signatories is filed with the ACHP.

XV. TERMINATION

If any Signatory to this MOA determines that its terms will not or cannot be carried out (Objecting Signatory), the Objecting Signatory shall immediately consult with the other Signatories to attempt to develop an amendment pursuant to Stipulation XIV, above. If, within thirty (30) days (or another time period agreed to by all Signatories), an amendment cannot be reached, any Signatory may terminate the MOA upon written notification to the other Signatories.

Once the MOA is terminated, and prior to work continuing on the Undertaking, NRCS must

either (a) execute a new MOA pursuant to 36 CFR § 800.6 or (b) request, take into account, and respond to the comments of the ACHP under 36 CFR § 800.7. NRCS shall notify the Signatories as to the course of action it will pursue.

XVI. USDA STIPULATIONS

A. The Signatories and their respective agencies will handle their own activities and utilize their own resources, including the expenditure of their own funds, in pursuing these objectives. Each signatory will carry out its separate activities in a coordinated and mutually beneficial manner.

B. Nothing in this MOA shall obligate either the Department of Agriculture or any of the Signatories to obligate or transfer any funds Specific work projects or activities that involve the transfer of funds, services or property among the Signatories and their respective agencies will require execution of separate agreements and be contingent upon the availability of appropriated funds. Such activities must be independently authorized by appropriate statutory authority. This MOA does not provide such authority. Negotiation, execution and administration of each such agreement must comply with all applicable statutes and regulations.

C. This MOA is not intended to, and does not create, any right, benefit, or trust responsibility, substantive or procedural, enforceable at law or equity, by a party to this MOA against the United States, its agencies, its officers, or any person.

Execution of this MOA by the NRCS, SHPO and MSF and implementation of its terms is evidence that NRCS has taken into account the effects of this Undertaking on historic properties and afforded the ACHP an opportunity to comment.

ABSTRACT

The Michigan State Historic Preservation Office (MI SHPO) has requested a National Register of Historic Places (NRHP) evaluation of the eligibility of four low-head dams in the Grand River in Grand Rapids, Michigan that would be affected by the Grand Rapids Whitewater Project (Project), which proposes the removal of these dams. With the support of the City of Grand Rapids and Grand Rapids Whitewater (GRWW), Environmental Resources Management (ERM) prepared this report evaluating whether the beautification dams constructed along the Grand River in the early twentieth century are eligible for the NRHP, and if so, whether the Project may result in adverse effects to these cultural resources. The U.S. Department of Agriculture's Natural Resources Conservation Service (NRCS) is the lead federal agency with funding authority over the undertaking.

The Project spans approximately 0.7 miles along the downtown portion of the Grand River, and includes the removal of four low-head, historic-aged dams associated with the early industrial and commercial growth of Grand Rapids, as well as other changes in the river. Another dam in the Grand River upstream of the Project, the Sixth Street Dam and Fish Passage, has already been recommended eligible for the NRHP, and has been addressed as a separate undertaking. This report evaluates the four dams located from just north of Bridge Street to just north of Pearl Street. In order to evaluate the significance of the dams, ERM collected information on the dams and their context within the history of Grand Rapids from experts knowledgeable in local history, city planning, and historical public works. Documents, maps, and photographs were collected from the Grand Rapids City Archive and Record Center, the Grand Rapids Public Museum, the Grand Rapids Public Library, and the Grand Rapids Historical Commission.

Based on the information gathered, ERM recommends that the four low-head dams, referred to as the Beautification Dams in Grand River, are potentially eligible for the NRHP. The dams meet the requirements for listing under Criterion A for their role in the emergence of city planning and the development of the riverfront as a focal point of downtown development in Grand Rapids, and under Criterion B for their association with city planner Harland Bartholomew, whose ideas on city beautification influenced the development of Grand Rapids during the twentieth century. ERM also recommends that the Project would have an adverse effect on the properties. The Project plan as currently proposed requires removal of all the dams and does not allow for avoidance or minimization of adverse effects. ERM recommends that, should MI SHPO concur with this assessment, a plan be developed to mitigate the adverse effects of the Project on the four low-head dams.

1. INTRODUCTION

1.1 Overview

Michigan State Historic Preservation Office (MI SHPO), in the course of consultation regarding the Project, has requested an evaluation of National Register of Historic Places (NRHP) eligibility of four low-head dams in the Grand River in Grand Rapids that would be affected by the Project, which proposes the removal of these dams in an effort to restore the river to a more natural state. With the support City of Grand Rapids and Grand Rapids Whitewater (GRWW), Environmental Resources Management (ERM) prepared this report evaluating whether the beautification dams constructed along the Grand River in the early twentieth century are potentially eligible for the NRHP, and if so, whether the Project may result in adverse effects to these cultural resources.

The Project requires funding authorization from the NRCS, and must comply with the provisions of the National Environmental Policy Act (NEPA) of 1970 and the National Historic Preservation Act (NHPA) of 1966. The need for federal authorization requires Project review under Section 106 of the NHPA, as amended. Section 106 of the NHPA (54 United States Code § 306108) requires federal agencies, including NRCS, to take into account the effects of their undertakings on historic properties and to afford the Advisory Council on Historic Preservation (ACHP) an opportunity to comment. Historic properties are defined as cultural resources that are listed or eligible for listing in the NRHP (36 Code of Federal Regulations [CFR] 60). GRWW, as a non-federal party, is assisting the Natural Resources Conservation Service (NRCS) in meeting its obligations under Section 106 by preparing the necessary information, analyses, and recommendations as authorized by 36 CFR § 800.2(a)(3).

On December 20, 2018, ERM, on behalf of NRCS, submitted a request for initial consultation regarding the Lower Grand River Watershed Habitat Restoration Project. On June 18, 2020, NRCS submitted an update to that submittal. MI SHPO responded on June 29, 2020 with a request for more information regarding the four low-head dams to be removed as part of the river restoration. Additional information was provided on November 2, 2020, to which MI SHPO responded with a request for further information regarding the known history and current condition of the four low-head dams (December 17, 2020, ER20-876). MI SHPO requested that additional information be provided about the dams to be removed by the Project, along with historical context that would help frame their potential eligibility for the NRHP. The current report was prepared to satisfy that request.

The Project includes the following:

- The Construction Area—the area within the wetted channel of the Grand River from approximately 130 feet upstream of the Bridge Street Bridge to the upstream edge of the Fulton Street Bridge
- The Project Area—the areas where Project activities would occur:
  - Portions of the land on both sides of the Grand River from the 6th Street Dam to Fulton Street (where construction access or staging areas would occur)
  - The wetted channel of the river from 130 feet upstream of the Bridge Street Bridge to the upstream face of the Fulton Street Bridge (the Construction Area)
  - Three recipient sites in the river for the placement of relocated unionid mussels. The three recipient sites are mussel beds near Ada, Michigan; at Riverside Park just upstream of Grand Rapids; and between Plaster Creek and the M-11 (28th Street) Bridge.

The Project's Area of Potential Effect (APE) is defined for direct effects as the Construction Area and Project Area, and for indirect effects as areas immediately adjacent to the Construction Area. Direct effects on the four low-head dams scheduled for removal are the subject of this report. Proposed earth

disturbance is not planned beyond the confines of the active river channel except for construction access points and temporary staging areas on the banks.

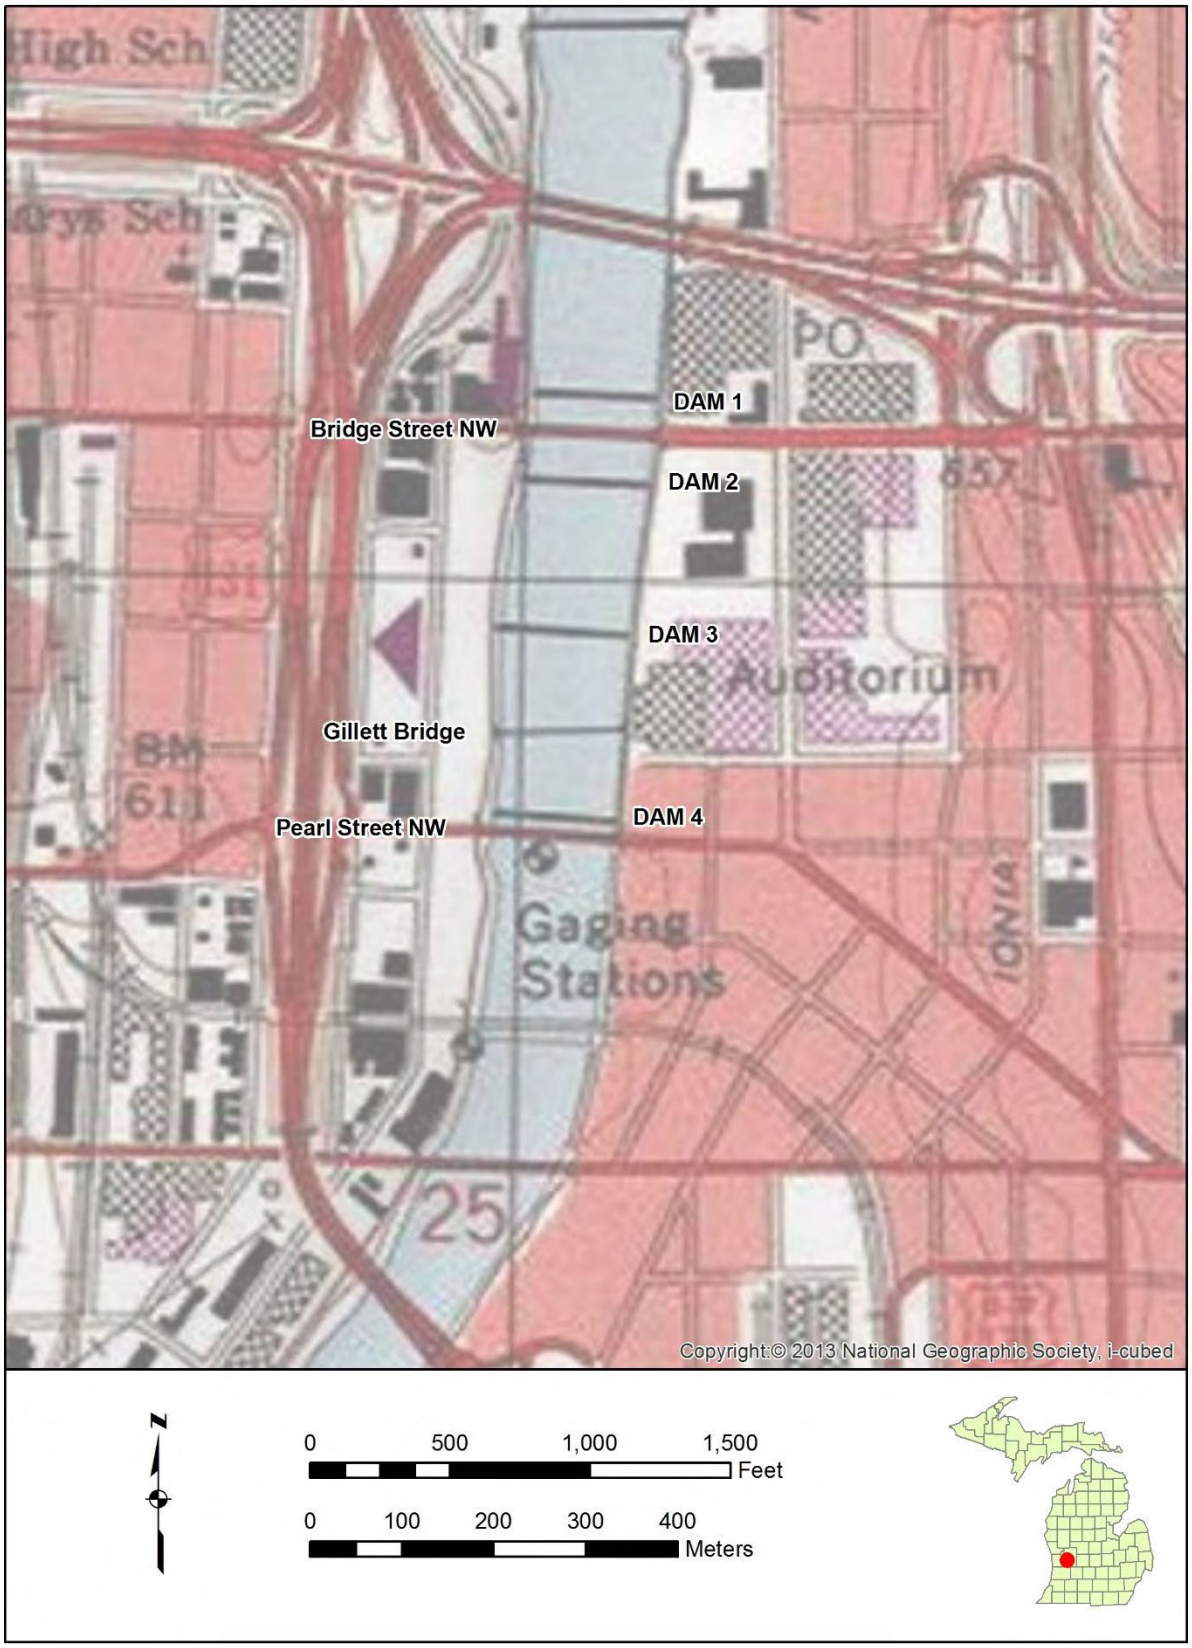

Figure 1.1-1: Topographic Map Showing Location of Dams

Figure 1.1-2: Current Aerial Imagery of Beautification Dams

The Project spans approximately 0.7 miles along the downtown portion of the Grand River, and includes the removal of four low-head, historic-aged dams associated with the twentieth century commercial growth of Grand Rapids, as well as other changes in and near the river (Figures 1.1-1 and 1.1-2). Another dam in the river at Grand Rapids, the Sixth Street Dam and Fish Passage, was constructed earlier than the other four, and was originally intended for water power. It was repaired and improved in 1926 as part of the planned improvements to the river recommended by city planner Harland Bartholomew. This dam has already been determined eligible for the NRHP (Robinson et al. 2020; B. Grennell to C. Sedlacek, letter dated 6 October, 2020). The current report evaluates the four dams located from just north of Bridge Street to just north of Pearl Street. In order to evaluate the significance of the dams, ERM collected information on the dams and their context from online sources and experts knowledgeable in local history, city planning, and historical public works. Documents, maps, and photographs were collected from the Grand Rapids City Archive and Record Center (GRCARC), the Grand Rapids Public Museum (GRPM), the Grand Rapids Public Library (GRPL), and the Grand Rapids Historical Commission (GRHC).

The four dams were constructed in 1927 as part of a plan to beautify the river through downtown. The creation of canals on both sides of the river for power and industrial use had led to low water levels in the river during dry periods, creating fetid pools and the growth of brush in the channel. The construction of low-head dams to create run-of-the-river pools had been recommended by Harlan Bartholomew as part of the 1925 City Plan (Bartholomew 1925). The proposed undertaking would entail removal of all four dams to reinstitute rapids in the riverbed, improving aquatic habitat diversity, improving public health and safety, expanding use of the river, and improving recreational use of the river. This report will evaluate the potential NRHP eligibility of the four Beautification Dams proposed for removal as part of the Project.

1.2 Management Recommendations

Based on the information gathered, ERM recommends that the four low-head dams, referred to as the Beautification Dams in Grand River, are eligible for the NRHP. The dams meet the requirements for listing under Criterion A for their role in the emergence of city planning and the development of the riverfront as a focal point of downtown development in Grand Rapids, and under Criterion B for their association with city planner Harland Bartholomew, whose ideas on city beautification influenced the development of Grand Rapids during the twentieth century. ERM also recommends that the Project would have an adverse effect on the properties. The Project as currently proposed requires removal of all the dams and does not allow for avoidance or minimization of adverse effects. ERM recommends that, should MI SHPO concur with this assessment, a plan be developed to mitigate the adverse effects of the Project

2. HISTORIC CONTEXT

When settlers began to congregate around the Baptist Mission on the west bank of the Grand River and the trading post established by Louis Campau on the east side of the river at what is now Grand Rapids in the 1820s, the river was described as a mile-long cascade of rapids that was 300 yards wide and dropped a total of 10 to 15 feet. A map made in 1830 (Grand Rapids Public Library 1830) shows the rapids that spanned the length of the city's street grid (Figure 2.0-1). The potential water power that the river could provide was immediately recognized, and by at least 1833, the river was being used for power. In 1835, the first dam was constructed on the river. The stone wing dam was located near Eleventh Street to the north of the Project area, and diverted water into the East Side Power Canal to provide waterpower to a sawmill and gristmill. The canal was extended for a mile along the river and was completed in 1842, providing power to a number of industries until it was abandoned in 1925. In 1849, a log and stone dam was constructed across the width of the river in an attempt to expand the canal for navigation. The canal project was a failure, but the horseshoe-shaped dam near Sixth Street remained until after 1878 (Figure 2.0-2) (Biolchini 2019; Robinson, et al. 2020).

Figure 2.0-1: Map of Grand Rapids in 1830 Showing the Rapids through the City (North is to the right) (GRPL)

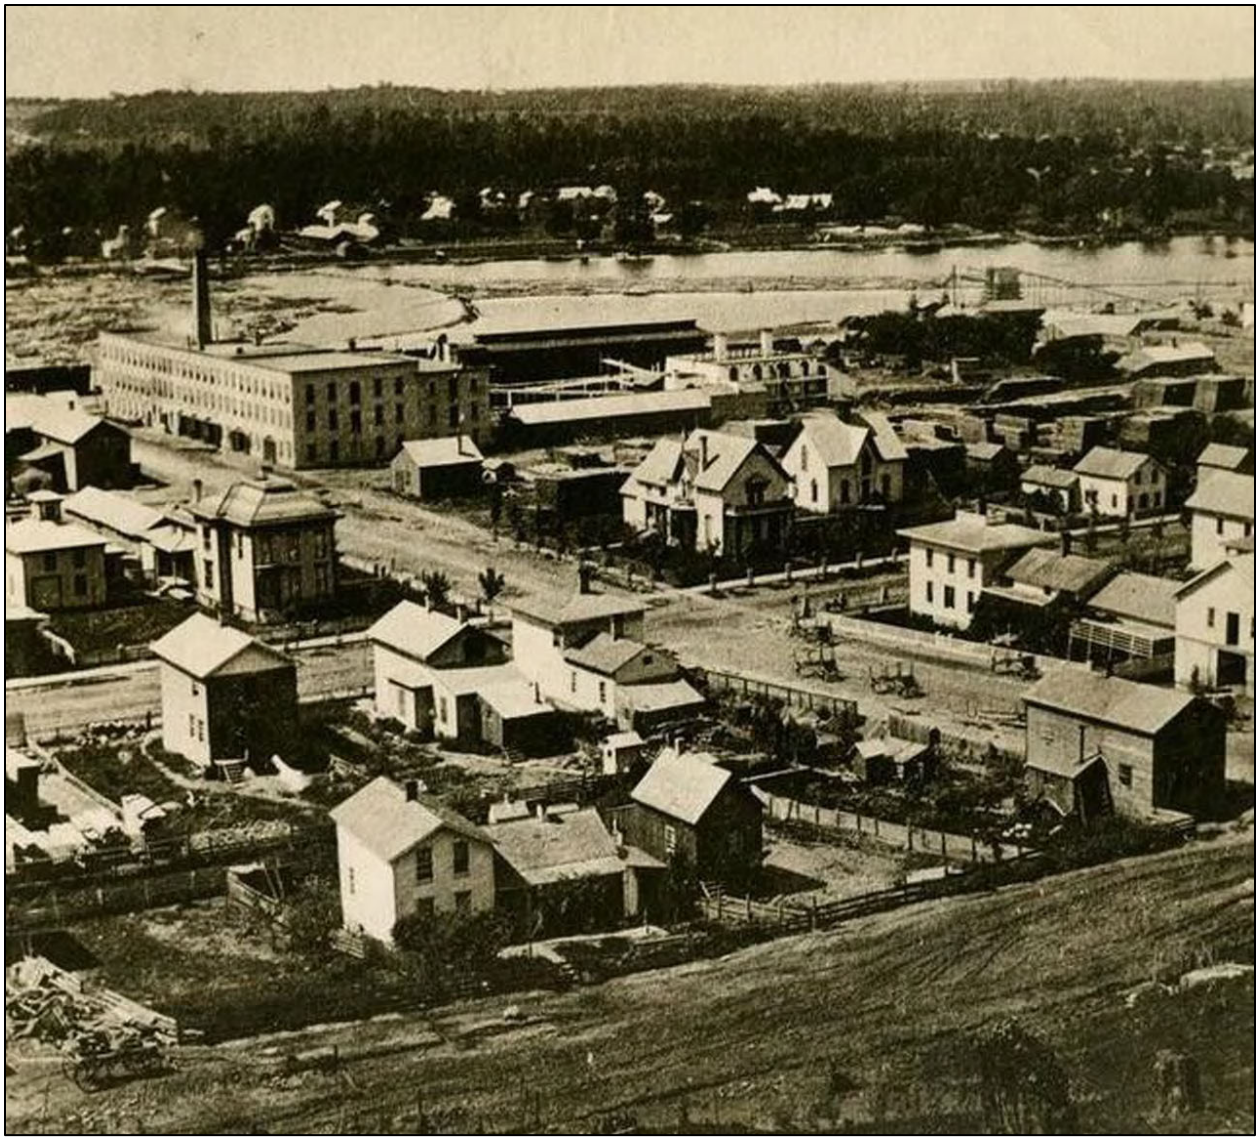

Figure 2.0-2: View of Grand Rapids in 1865 with the 1849 Horseshoe Dam in the Background (GRPL)

In 1866, the West Side Water Power Association began construction on the West Side Canal. Through an agreement with the East Side Water Power Company, the water rights would be split between the two companies, and a new, more permanent timber crib dam would be constructed across the river at Fourth Street that would serve both canals. This was known as the water power dam, or Fourth Street Dam (Figure 2.0-3). It was located a few blocks south of the earlier horseshoe dam, which remained in place until at least 1878 but was gone by 1888 (GRCARC 1873, 2019; Sanborn Map Company 1888). The Fourth Street Dam was later known as the Sixth Street Dam (Robinson et al. 2020).

In the early twentieth century, Grand Rapids experienced a series of disastrous floods. The first of these in 1904 damaged a 150-foot section of the Fourth Street Dam. At that time, it was suggested that a concrete dam replace the 1866 timber crib dam, although it appears that the dam was simply repaired (*Grand Rapids Herald* 1904). The city hired Lyman E. Cooley, an engineer from Chicago, to make recommendations regarding flood control and improving water power. Cooley proposed in 1904 that flood

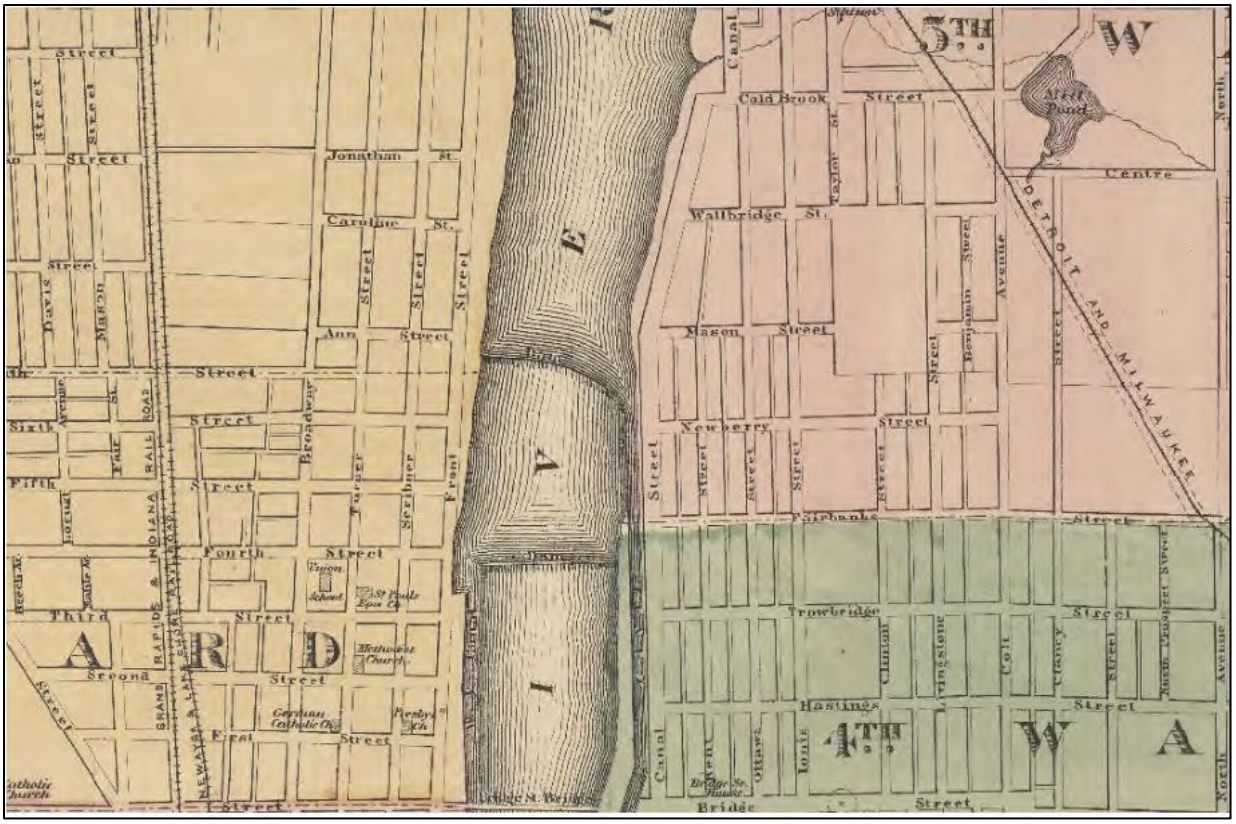

Figure 2.0-3: Map of Grand Rapids in 1873 Showing the 1866 Fourth Street Dam, the 1849 Horseshoe Dam, and the East and West Side Canals (GRCARC)

walls be constructed through the city, and work on these was begun soon after (Figure 2.0-4; Lydens 1966:122). In 1909, Cooley proposed that a new dam be constructed 300 feet north of Bridge Street. This dam was apparently not constructed (Biolchini 2019; Cooley 1909; Forist and Gleisner 2015).

In 1915, another major flood took out a 100-foot section of the western part of the Fourth Street Dam. Plans were proposed for the repair of the dam, with both a timber crib replacement and an upgrade to concrete being considered. The design of the concrete section is nearly identical to the plans later used for the Beautification Dams downstream. It appears from later plans that the damaged section was replaced with concrete, and the remaining timber crib section was replaced in 1926 when the beautification project was undertaken (GRCARC 2019).

The idea of a series of low-head dams on the Grand River in order to maintain water in the river bed and prevent the accumulation of trash and brush in the river was proposed by city planner Harland Bartholomew, whose firm was hired by the Grand Rapids Planning Department in the early 1920s to develop a master plan for the city (GRPL 2017). The diversion of water for the East and West Side Canals and city water works had resulted in the river often lacking a constant flow, resulting in the accumulation of trash and brush in the riverbed (Figure 2.0-5). The low-head dams would maintain the flow of the river and would “add greatly to the appearance and provide ample water surface for boating,” according to Bartholomew (Bartholomew 1925; Biolchini 2019; GRPM ca. 1926). An appropriation was approved for the beautification project in March 1926, but it was not until May 1927 that a bid of $24,112 was accepted from a Grand Rapids firm for the construction, with an expected completion date of

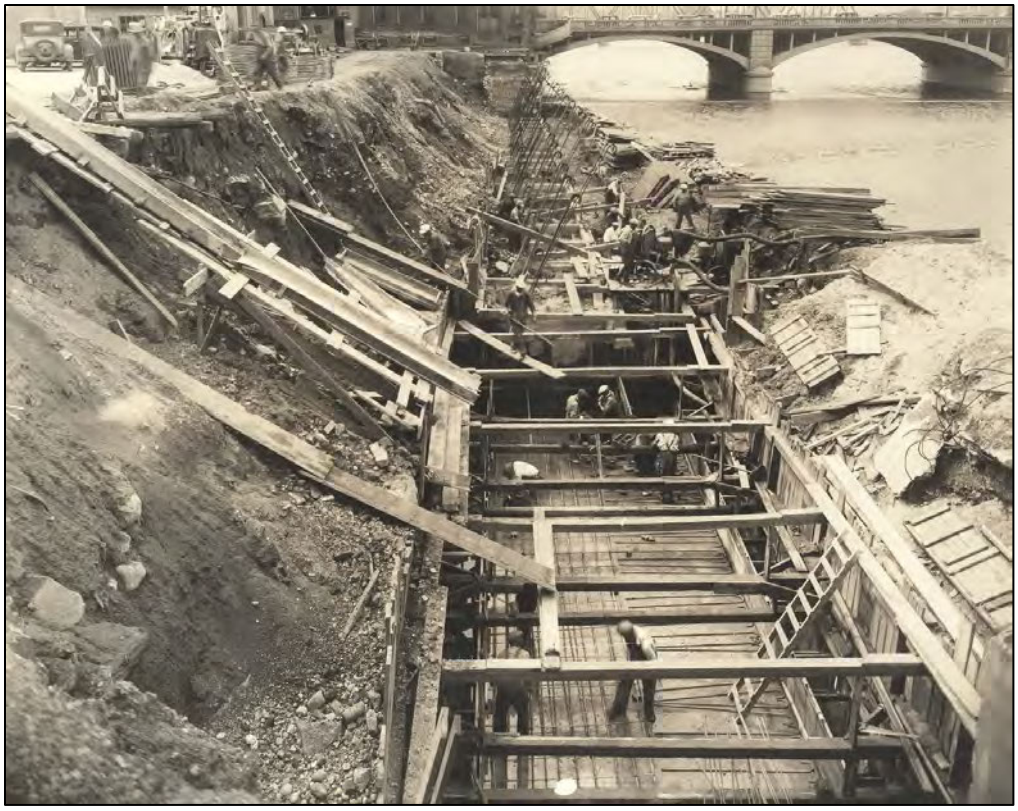

Figure 2.0-4: Construction of Flood Walls on the East Side of the River above the Pearl Street Bridge (GRCARC)

Figure 2.0-5: View of Downtown and the River Showing Brush Growing in the Riverbed Downstream of the Fourth Street Dam (GRPM)

January 1, 1928. The *Grand Rapids Press* praised the city for approving the plan, which would help the river "take on some of the beauty which existed before drought and the west side canal removed all liquid attractions" (*Grand Rapids Press* 1927a, 1927b).

The dams were constructed by diverting water using a coffer dam, leaving the riverbed dry (Figure 2.0-6) (*Grand Rapids Herald* 1927). They were completed by January 2, 1928, when a report of the Engineers' Office noted that it had overseen the placement of the dams at a cost of $37,000. In April 1928, the mayor remarked that the dams had "improved the appearance of the river 100 percent." In July 1928, the *Grand Rapids Press* remarked, "By expenditure on a series of carefully placed dams Grand Rapids has succeeded, without increasing its flood hazard in restoring some of the beauty of Grand river between the main dam at Fourth street and a point two or three hundred feet north of Pearl Street bridge" (*Grand Rapids Press* 1928a, 1928b).

The dams have remained in place to the present, with no known significant changes. The purposes of the dam construction project were well realized, as the water level was maintained, and public and private development became more focused on the river in the twentieth century. Numerous parks and public and private attractions have been established on both sides of the river, including the Gerald R. Ford Presidential Museum, Grand Rapids Public Museum, the Civic Auditorium (now part of the DeVos Place Convention Center), Ah-Nab-Awen Park, and Sixth Street Park.

Details related to the conception, design and construction of the Beautification Dams, as well as their place within the context of city planning in general and the work of Harland Bartholomew in particular, are discussed in greater detail in Section 4.

3. METHODS

3.1 Survey Methods

The current investigation was prompted by a request from the MI SHPO for additional information about the four low-head dams and their historical context to assist in a determination of eligibility. In a comment letter dated December 17, 2020, MI SHPO requested survey information about the nature and condition of the dams and a discussion of their potential NRHP eligibility within a proper historical context.

Because of accessibility issues due to the COVID-19 pandemic and the fact that the dams are currently covered by water, ERM architectural historians undertook a remote survey of the properties based on historical plans and historical and current photographs from a variety of sources including the GRCARC, GRWW, GRPL, Google Earth, and previous site visits. The photographs were used to record the structures' overall appearance and details. Topographic maps and aerial photographs were used to record the relationship of the structures to each other and the surrounding landscape features and infrastructure.

A Michigan State Architectural Properties Identification Form was completed as part of the recordation process, which is attached in Appendix A.

3.2 Documentary Research

In order to assess the significance of the dams, ERM collected information from knowledgeable experts in local history, city planning, and historical public works. ERM conducted online research to identify historic themes, events, and patterns important in the development of local, regional, and national significance. Local government records and information provided by knowledgeable local organizations also were examined to establish a context for the development of the water control systems in Grand Rapids, as well as specific details relating to the system as built and as it exists today. Documents, maps, and photographs were collected from the GRCARC, the GRPM, the GRPL, and the GRHC.

3.3 NRHP and Effects Evaluation

The four dams were evaluated with respect to their eligibility for listing on the NRHP using published guidance from the National Park Service. According to 36 CFR 60.4 (Andrus and Shrimpton 2002), cultural resources eligible for listing on the NRHP are defined as buildings, structures, objects, sites, and districts that have "integrity" and that meet one or more of the criteria outlined below. Criterion D is typically relevant to archaeological sites. Historic resources are generally evaluated in relation to Criteria A, B, and C. Criterion C is typically applicable to architectural resources but also may be relevant in the case of resources that are associated with landscape architecture (like cemeteries or battlefields) or engineering (like dams, bridges, railroads, and mines).

- Criterion A (Event). Association with one or more events that have made a significant contribution to the broad patterns of national, state, or local history
- Criterion B (Person). Association with the lives of persons significant in the past
- Criterion C (Design/Construction). Embodiment of distinctive characteristics of a type, period, or method of construction; or representation of the work of a master; or possession of high artistic values; or representation of a significant and distinguishable entity whose components may lack individual distinction
- Criterion D (Information Potential). Properties that yield, or are likely to yield, information important in prehistory or history. Criterion D is most often (but not exclusively) associated with archaeological resources. To be considered eligible under Criterion D, sites must be associated with specific or

general patterns in the development of the region. Therefore, sites become significant when they are seen within the larger framework of local or regional development.

"Integrity" is perhaps the paramount qualification of NRHP eligibility, and can be related to any or all of the following (Andrus and Shrimpton 2002):

- Location: the place where the historic property (or properties) was/were constructed or where the historic event(s) occurred
- Design: the combination of elements that create the form, plan, space, structure, and style of a property (or properties)
- Setting: the physical environment of the historic property (or properties)
- Materials: the physical elements that were combined to create the property (or properties) during the associated period of significance
- Workmanship: the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory
- Feeling: the property's (or properties') expression of the aesthetic or historic sense of the period of significance
- Association: the direct link between the important historic event(s) or person(s) and the historic property (or properties).

The four dams were evaluated in relation to these criteria and attributes, and then the criteria of adverse effect were applied for the proposed undertaking in accordance with ACHP regulations at 36 CFR 800.5. Specifically,

> An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation of the property's eligibility for the National Register. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative.

4. SURVEY RESULTS

This section presents the findings of the historic architectural investigation carried out for the Project. One resource, consisting of four low-head dams in the Grand River at Grand Rapids, known as Beautification Dams, was evaluated as part of the Section 106 review for the Project. The dams would be removed as part of the Project, and thus would be subject to direct effects from the Project.

4.1 Previous Investigations

A literature review of previously recorded resources determined that the Beautification Dams had not been previously recorded as historic resources. An Architectural Properties Identification Form was completed as part of the current investigations (Appendix A).

4.2 Current Survey Findings

The Beautification Dams consist of four low-head concrete dams ranging from 1.5 to 3 feet in height and approximately 425 to 440 feet in length, located in the Grand River between the Interstate 196 Bridge and the Pearl Street Bridge. The four dams together constitute the evaluated resource, and are collectively referred to as the Beautification Dams in the Grand River. They are recommended eligible for the NRHP and are summarized in Table 4.2-1. A view of each dam is shown in Figures 4.2-1 through 4.2-4.

Table 4.2-1: Summary of Beautification Dams in the Grand River

Number	Location	Length*	Height†
Dam #1	135–155 feet north of the center of the Bridge Street Bridge	437 feet	3 feet
Dam #2	148–175 feet south of the center of the Bridge Street Bridge	440 feet	1.5 feet
Dam #3	336–373 feet north of the center of the Gillette Pedestrian Bridge (Interurban Bridge)	440 feet	2 feet
Dam #4	85 feet north of the center of the Pearl Street Bridge	425 feet	1.5 feet

* Estimated length based on aerial photographs

4.2.1 Beautification Dams History

Low-head or low-stage dams typically run the width of a river or stream and allow the water flow to pass over all or most of its length. They can be as high as 15 feet, but are more commonly just a few feet in height. These types of dams are common throughout the United States and are usually constructed to raise the water level for civic, industrial, or agricultural use. They also enhance recreational opportunities. Many low-head dams were constructed across the U.S. in the eighteenth and nineteenth centuries to power gristmills and small industries (Tschantz and Wright 2011:8).

The use of low-head dams for beautification and recreation, rather than commercial and industrial uses, coincided with the emergence of city planning as a professional pursuit in the early twentieth century, and a shift in public attitudes toward the environment and the revitalization of urban areas through public improvement projects and regulatory policy (Hill 2000:153). Harland Bartholomew was a prominent city planner from the 1920s to the 1980s, known for advocating for zoning laws and creating the concept of the “City Efficient.” His firm, Harland Bartholomew & Associates (HB&A) developed more than 500 city plans and more than 300 zoning proposals for cities in the U.S. and internationally (Barone 2018:438).

Bartholomew began working on a plan for Grand Rapids as early as 1921 (GRPL 2017). His plan for Grand Rapids was based on similar principles to those he applied in other cities, both large and small. The plans were based on zoning, a concept that was being recognized by city leaders as the most efficient way to maintain property values and grow their cities in a controlled manner. Bartholomew’s zoning classes were based on variations on three factors: use, building height, and lot size. Industrial uses were zoned to the outskirts of the city, along rail lines and waterways, while the downtown area was designated for commercial use. Planning firms worked with city planning commissions to develop a plan that the commission could promote to city officials, civic groups, and business leaders. The planning commissions also worked to build public support for the plans. The goal was to get buy-in from a variety of interests in the city by highlighting the economic advantages that would accrue from a comprehensive zoning plan. In Grand Rapids, the City Planning Commission presented their early planning work at a municipal fair called “City Show” in 1920 (Moskowitz 1998:308–309).

Bartholomew produced a number of documents for the City of Grand Rapids between 1921 and 1927. His overall vision was presented to the public in 1924 through the *Grand Rapids Press* (1924a), which published a rendering of the “Future Grand Rapids” produced by Bartholomew (Figure 4.2-5). The Grand River occupied the prominent spot in the oblique aerial view and was flanked by a tree-lined esplanade on the east bank and a park with trees, open spaces, and walkways on the west bank. The bridge at the bottom of the drawing is the Bridge Street Bridge, with the next two bridges being the interurban rail bridge (Gillette Pedestrian Bridge) and the Pearl Street Bridge. No dams are evident in the view, but the river is full from bank to bank, with no obstructions. Eventually, the esplanade along the river was constructed in the form of the Riveredge Trail, and parks were established along the west side of the river, as envisioned in the plan. The changes proposed in the plan, including a “beautiful river front,” were praised by the paper as “outstanding” (Grand River Press 1924b).

Bartholomew’s City Plan for Grand Rapids included a section on riverfront improvement (Bartholomew 1925:100–103). He stated that the river was the city’s “raison d’etre,” but had fallen into insignificance in the commercial age. However, Bartholomew maintained that opportunities for development were available, and that the city should purchase as much of the riverfront property as possible. The flood walls in place along portions of the river were seen as a positive influence that would permit linear parks adjacent to the river. He recommended the construction of additional walls and the reclaiming land adjacent to the east side of the river that was occupied by the East Side Canal and constructing a road alongside the river. This would separate the buildings from the riverside docks and encourage more aesthetic architecture. The improvements would not interfere with the commercial or industrial activities of

the city, because the river no longer had value to those interests. The plan for the river was plainly laid out, including improving the appearance below the existing 6th Street dam:

> Grand Rapids must complete its flood wall as a protective measure. It would seem that this work would offer the best opportunity to carry out a more thorough riverfront improvement program. Not only should the banks be improved by the use of wall, terraces, small parks and plazas, but the appearance of the river below the dam should be improved. During the dry seasons certain stretches of the rapids have the appearance of an abandoned stone quarry overgrown with weeds and littered with tin cans, crates and rubbish. Several low-stage dams could be constructed at intervals which would maintain water constantly in the river. This would add greatly to the appearance and provide ample water surface for boating [Bartholomew 1925:102].

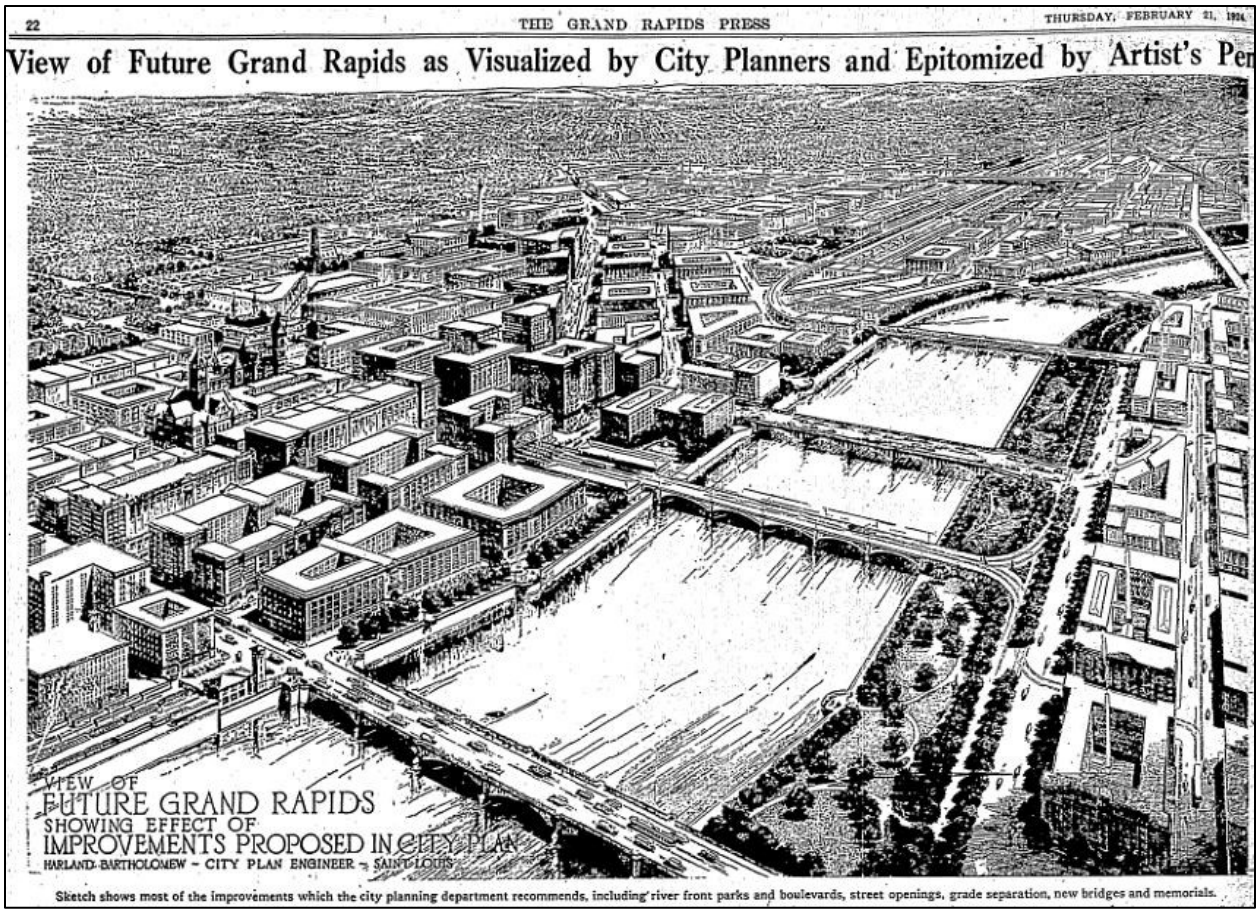

Figure 4.2-5: Artist Rendition of Harland Bartholomew's City Plan (1924)

In October 1925, the city reached an agreement with the Consumers Power Company (the former West Side Water Power Association) and the East Side Power Company to purchase the rights to the East Side Canal, which would be closed to form a sewer and a riverside park. The city had held an option on the rights to the canal for some time, and it appears that the acquisition of the property was part of the effort to carry out the plans for beautification of the river. The agreement stipulated that the city "reserved perpetual right to sufficient water for all city purposes, and that "sufficient water must be kept running over

the large dam to keep a series of smaller dams filled the year around" (*Grand Rapids Press* 1925). The story in the *Grand Rapids Press* stated that the city would keep the river clean, and "To this end it has secured the necessary options for construction of three dams, one just north of Bridge-st., one just south of Bridge-st., and third just north of Pearl-st., calculated to hold enough water to hide the ugly bottom, now strewn with all manner of debris and overgrown with weeds." According to the article, the "pretentious program of beautification, as sketched by Harland Bartholomew of St. Louis, city planning expert responsible for Grand Rapids' zoning ordinance, now approaches a step nearer realization."

The value of improving the river both economically and aesthetically was not lost on observers, even in the planning stages. The *Grand Rapids Press* noted of the plan in 1925 that, "Advantage will be taken of the open sloping west bank, which now is a mass of weeds, and a modest program of landscaping and care is expected to do wonders." The acquisition of the canal land allowed for a reorganized street plan and the availability of valuable land. "When this wilderness of rubbish, old iron and decrepit buildings has been cleared away the increased value of the property, according to the analysis of [assistant to the city's consulting engineer] Mr. Tenlloor, will have justified the trouble, and the city will be rid of perhaps its greatest fire menace" (*Grand Rapids Press* 1925).

The original plan apparently included five dams, but only four were constructed due to water rights of the last user of the West Side Canal for a water wheel (*Grand Rapids Press* 1927a, 1928b). The city appropriated $7,500 in March of 1926 for "…beautification of Grand River through the erection of dams intended to create a greater depth of water inside the city limits" (*Grand Rapids Press* 1926). However, it was not until May of 1927 that a bid was accepted for the project. The $24,000 bid of Peninsular Construction Company of Grand Rapids was over the city's estimate for the work, but was less than the only other bid received. The plans at that time were for the dams to be constructed of concrete and approximately 470 feet long. The dams were to be located 100 feet north of Bridge Street, 36 feet south of Bridge Street, at Brumrich Street, 50 feet north of Pearl Street, and 35 feet south of Pearl Street (*Grand Rapids Press* 1927a). The locations given approximate the final placements, which are detailed in Table 4.2-1.

Profile plans of the dams are shown in Figure 4.2-6 (GRCARC ca. 1927). It is not clear if the dams were built to these exact specifications, as no as-built drawings have been located. The profiles indicate that Dam #1 would have a height of 3 feet, Dam #2 and Dam #4 would be 1.5 feet high, and Dam #3 and Dam #5 would each be 2 feet high. Dam #5 was eventually dropped from the plan. A profile map of the river made in 1928 indicates that the actual dams were lower (GRCARC 1928). Current elevations taken across the dams show irregular heights across the width of the dams and only about a 1–1.5-foot drop between them. This may be due to erosion of the tops of the dam as a result of water scouring. The profiles in Figure 4.2-6 show a typical low-head concrete dam shape that has a slightly sloping upstream face with a beveled cap and a ramp-like downstream face to break the fall of the water. Each dam would have a flap or drain valve at the base. Figure 4.2-7 shows the profile of the dams after construction, which is consistent with the plans. The valve appears to have been constructed as a gated opening rather than an outlet in the base of the dam, as can be seen in Figure 4.2-8.

Work on the coffer dam to divert the river during construction began by July 1927 (*Grand Rapids Herald* 1927). As noted above, the dams were completed on schedule by January 1, 1928, although the $37,000 cost was considerably more than the $24,000 bid. Figure 4.2-9 shows Dam #1 after construction, looking north, with the Sixth Street Dam in the background.

Figure 4.2-9: Dam #1 after Construction, 1927, with Water Flowing in the River Bed (GRCARC)

4.2.2 Beautification Dams: Architectural Description and Evaluation

The Beautification Dams in the Grand River are four low-head, concrete dams that run the width of the river in downtown Grand Rapids. They vary in height from 1.5 to 3 feet, and in length from approximately 425 feet to 440 feet. They are anchored in bedrock to a depth of approximately 1 foot. Historical drawings and photographs indicate that a gated opening was located in each dam, but the nature and location of these openings in the current dams is not clear due to the dams being obscured by water. The dams have the same basic profile as shown in Figures 4.2-6 and 4.2-7. The form and construction technique is typical of low-head dams constructed throughout the United States during the period.

NRHP Evaluation: ERM recommends that the Beautification Dams in Grand River are potentially eligible for the NRHP under Criterion A for their association with events important to the history of Grand Rapids. The dams reflect efforts in the early twentieth century to improve the city through planning, zoning, and public works projects. The result was a shift in the orientation of the downtown area to embrace the river as an attraction for enjoyment and recreation. Parks and trails were established along the banks, and new buildings were constructed with an emphasis on attractive architecture that encouraged public use of the surrounding spaces. ERM recommends that the dams are also significant under Criterion B for their association with Harland Bartholomew, one of the most influential city planners of the twentieth century.

Beginning in St. Louis in 1916, Bartholomew and his firm developed plans for hundreds of cities, influencing zoning decisions and promoting urban renewal and beautification. Bartholomew's plan for Grand Rapids specifically called for the installation of the dams, which consequently influenced the development of the downtown area in the way in which he intended. Although the Beautification Dams retain sufficient architectural integrity to convey the resources' historical significance, their design is utilitarian and common to contemporary structures across the country. As a result, they do not represent exceptional design or engineering and do not constitute an outstanding example of architecture associated with historic water control features. Therefore, ERM recommends the Beautification Dams in Grand River are not potentially eligible for the NRHP under Criterion C. For similar reasons, ERM recommends that the dams are not likely to yield information important to history and are thus not potentially eligible under Criterion D.

Assessment of Effects: The function of the Beautification Dams would not be retained as a result of their removal, although the Project is intended to restore the beauty of the original rapids that once characterized the river. The placid, quiet waters created by the dams would be replaced by faster moving water that would create a different atmosphere than that which characterized the river between 1927 and the present. Although the goal of the Project, in part, is similar to that of the 1925 Bartholomew plan in making the river attractive for expanded recreation and use, the nature of the experience for those using the river space would be different from that intended by Bartholomew. Therefore, it is ERM's opinion that the proposed removal of the dams would compromise the character-defining features of the dams that make them historically significant, and the action would constitute an adverse effect.

5. CONCLUSION AND RECOMMENDATIONS

ERM conducted an evaluation of the NRHP eligibility of four low-head dams in the Grand River in Grand Rapids, which would be affected by the Grand Rapids Whitewater Project. With the support of the City of Grand Rapids and GRWW, ERM prepared this report evaluating whether the beautification dams constructed along the Grand River in the early twentieth century are potentially eligible for the NRHP, and if so, whether removal of the dams as part of the Project would result in adverse effects to these cultural resources. The findings of the current study are intended to support the Section 106 review of the proposed undertaking, which is subject to funding by the NRCS.

Based on the information gathered and presented here, ERM recommends that the four low-head dams, referred to as the Beautification Dams in Grand River, are potentially eligible for the NRHP. The dams meet the requirements for listing under Criterion A for their role in the emergence of city planning and the development of the riverfront as a focal point of downtown development in Grand Rapids, and under Criterion B for their association with city planner Harland Bartholomew, whose ideas on city beautification influenced the development of Grand Rapids during the twentieth century. Although the Beautification Dams retain sufficient architectural integrity to convey their historical significance, their design is utilitarian and common to contemporary structures across the country, and is not likely to yield information important to history. Therefore, ERM recommends that the Beautification Dams are not potentially eligible for the NRHP under Criteria C and D.

The function of the Beautification Dams to maintain water levels across the width of the Grand River would not be retained as a result of their removal. Although the goal of the Project, in part, is similar to that of the 1925 Bartholomew plan in making the river attractive for expanded recreation and use, the nature of the experience for those using the river space would be different from that intended by Bartholomew. Therefore, it is ERM's opinion that the proposed removal of the dams would compromise the character-defining features of the dams that make them historically significant, and the action constitutes an adverse effect. The Project plan as currently proposed requires removal of all of the dams and does not allow for avoidance or minimization of adverse effects. It is ERM's recommendation that, should MI SHPO concur with this assessment, a plan be developed to mitigate the adverse effects of the Project.

Form date: 2/28/2020

Narrative Architectural Description

Provide a detailed description of the property, including all character-defining features and any accessory resources. This is required for all properties.

The Beautification Dams in the Grand River are four low-head, concrete dams that run the width of the river in downtown Grand Rapids. They vary in height from 3 feet to 1.5 feet, and in length from approximately 425 feet to 440 feet. They are anchored in bedrock to a depth of approximately 1 foot. The only feature of the dams is an opening, presumably for flow and debris control. The dams have the same basic profile. The form and construction technique is typical of low-head dams constructed throughout the United States during the period.

History of the Resource

Provide information on previous owners, land use(s), and construction and alteration dates in a narrative format. This is required for all intensive level surveys, NRPQs, and nominations, and recommended for other identification efforts.

(see Figures at end of form)

Low-head or low-stage dams typically run the width of a river or stream and allow the water flow to pass over all or most of its length. They can be as high as 15 feet, but are more commonly just a few feet in height. These types of dams are common throughout the United States and are usually constructed to raise the water level for civic, industrial, or agricultural use. They also enhance recreational opportunities. Many low-head dams were constructed across the U.S. in the eighteenth and nineteenth centuries to power gristmills and small industries (Tschantz and Wright 2011:8).

The use of low-head dams for beautification and recreation, rather than commercial and industrial uses in the early twentieth century coincided with the emergence of city planning as a professional pursuit, and a shift in public attitudes toward the environment and the revitalization of urban areas through public improvement projects and regulatory policy (Hill 2000:153). Harland Bartholomew was a prominent city planner from the 1920s to the 1980s, known for advocating for zoning laws and creating the concept of the “City Efficient.” His firm, Harland Bartholomew & Associates (HB&A) developed more than 500 city plans and more than 300 zoning proposals for cities in the U.S. and internationally, making it likely the largest city planning firm in the country (Barone 2018:438).

Bartholomew began working on a plan for Grand Rapids as early as 1921 (GRPL 2017). His plan for Grand Rapids was based on similar principles to those he applied in other cities, both large and small. The plans were based on zoning, a concept that was being recognized by city leaders as the most efficient way to maintain property values and grow their cities in a controlled manner. Bartholomew’s zoning classes were based on variations on three factors: use, building height, and lot size. Industrial uses were zoned to the outskirts of the city, along rail lines and waterways, while the downtown area was designated for commercial use. Planning firms worked with city planning commissions to develop a plan that the commission could sell to city officials, civic groups, and business leaders. The planning commissions also worked to build public support for the plans. The goal was to get buy-in from a variety of interests in the city by highlighting the economic advantages that would accrue from a comprehensive zoning plan. In Grand Rapids, the City Planning Commission presented their early planning work at a municipal fair called “City Show” in 1920 (Moskowitz 1998:308–309).

Bartholomew produced a number of documents for the City of Grand Rapids between 1921 and 1927. His overall vision was presented to the public in 1924 through the *Grand Rapids Press* (1924a), which published a rendering of the “Future Grand Rapids” produced by Bartholomew (Figure 1). The Grand River occupied the prominent spot in the oblique aerial view and was flanked by a tree-lined esplanade on the east bank and a park with trees, open spaces, and walkways on the west bank. The bridge at the bottom of the drawing is the Bridge Street Bridge, with the next two bridges being the interurban rail bridge (Gillette Pedestrian Bridge) and the Pearl Street Bridge. No dams are evident in the view, but the river is full from bank to bank, with no obstructions. Eventually, the esplanade

along the river was constructed in the form of the Riveredge Trail, and parks were established along the west side of the river, as envisioned in the plan. The changes proposed in the plan, including a "beautiful river front," were praised by the paper as "outstanding" (Grand River Press 1924b)

Bartholomew's City Plan for Grand Rapids included a section on riverfront improvement (Bartholomew 1925:100–103). He stated that the river was the city's "raison d'etre," but had fallen into insignificance in the commercial age. However, Bartholomew maintained that opportunities for development were available, and that the city should purchase as much of the riverfront property as possible. The flood walls in place along the river were seen as a positive influence that would permit linear parks adjacent to the river. He recommended reclaiming land adjacent to the east side of the river that was occupied by the East Side Canal and constructing a road alongside the river. This would separate the buildings from the riverside docks and encourage more aesthetic architecture. The improvements would not interfere with the commercial or industrial activities of the city, because the river no longer had value to those interests. The plan for the river was plainly laid out:

> Grand Rapids must complete its flood wall as a protective measure. It would seem that this work would offer the best opportunity to carry out a more thorough riverfront improvement program. Not only should the banks be improved by the use of wall, terraces, small parks and plazas, but the appearance of the river below the dam should be improved. During the dry seasons certain stretches of the rapids have the appearance of an abandoned stone quarry overgrown with weeds and littered with tin cans, crates and rubbish. Several low-stage dams could be constructed at intervals which would maintain water constantly in the river. This would add greatly to the appearance and provide ample water surface for boating. (Bartholomew 1925:102)

In October 1925, the city reached an agreement with the Consumers Power Company (the former West Side Water Power Association) and the East Side Power Company to purchase the rights to the East Side Canal, which would be closed to form a sewer and a riverside park. The city had held an option on the rights to the canal for some time, and it appears that the acquisition of the property was part of the effort to carry out the plans for beautification of the river. The agreement stipulated that the city "reserved perpetual right to sufficient water for all city purposes,"…and that "sufficient water must be kept running over the large dam to keep a series of smaller dams filled the year around" (*Grand Rapids Press* 1925). The story in the *Grand Rapids Press* stated that the city would keep river clean, and "To this end it has secured the necessary options for construction of three dams, one just north of Bridge-st., one just south of Bridge-st., and third just north of Pearl-st., calculated to hold enough water to hide the ugly bottom, now strewn with all manner of debris and overgrown with weeds." According to the article, the "pretentious program of beautification, as sketched by Harland Bartholomew of St. Louis, city planning expert responsible for Grand Rapids' zoning ordinance, now approaches a step nearer realization."

The value of improving the river, both economically and aesthetically was not lost on observers, even in the planning stages. The *Grand Rapids Press* noted of the plan in 1925 that, "Advantage will be taken of the open sloping west bank, which now is a mass of weeds, and a modest program of landscaping and care is expected to do wonders." The acquisition of the canal land allowed for a reorganized street plan and the availability of valuable land. "When this wilderness of rubbish, old iron and decrepit buildings has been cleared away the increased value of the property, according to the analysis of [assistant to the city's consulting engineer] Mr. Tenlloor, will have justified the trouble, and the city will be rid of perhaps its greatest fire menace" (*Grand Rapids Press* 1925).

The original plan apparently included five dams, but only four were constructed due to water rights of the last user of the West Side Canal for a water wheel (*Grand Rapids Press* 1927a, 1928b). The city appropriated $7,500 in March of 1926 for "…beautification of Grand River through the erection of dams intended to create a greater depth of water inside the city limits" (Grand Rapids Press 1926). However, it was not until May of 1927 that a bid was accepted for the project. The $24,000 bid of Peninsular Construction Company of Grand Rapids was over the city's estimate for the work, but was less than the only other bid received. The plans at that time were for the dams to be constructed of concrete and approximately 470 feet long. The dams were to be located 100 feet north of Bridge Street, 36 feet south of Bridge Street, at Brumrich Street, 50 feet north of Pearl Street, and 35 feet south of Pearl Street (*Grand Rapids Press* 1927a).

Profiles plans of the dams are shown in Figure 2 (GRCARC ca. 1927). It is not clear if the dams were built to these

exact specifications, as no as-built drawings have been located. The profiles indicate that Dam #1 would have a height of 3 feet, Dam #2 and Dam #4 would be 1.5 feet high, and Dam #3 and Dam #5 would each be 2 feet high. Dam #5 was eventually dropped from the plan. A profile map of the river made in 1928 indicates that the actual dams were lower (GRCARC 1928). Current elevations taken across the dams show irregular heights across the width of the dams and only about a 1–1.5-foot drop between them. This may be due to erosion of the tops of the dam as a result of water scouring. The profiles in Figure 2 show a typical low-head concrete dam shape that has a slightly sloping upstream face with a beveled cap and a ramp-like downstream face to break the fall of the water. Each dam would have a flap or drain valve at the base. Figure 3 shows the profile of the dams after construction, which is consistent with the plans. The valve appears to have been constructed as a gated opening rather than an outlet in the base of the dam, as can be seen in Figure 4.

Work on the coffer dam to divert the river during construction began by July 1927 (*Grand Rapids Herald* 1927). As noted above, the dams were completed on schedule by January 1, 1928, although the $37,000 cost was considerably more than the $24,000 bid. Figure 5 shows Dam #1 after construction, looking north, with the Sixth Street Dam in the background.

Statement of Significance/Recommendation of Eligibility

Provide a detailed explanation of the property's eligibility for the National Register. Include an evaluation under at least one of the four National Register Criteria and one Area of Significance. Include a discussion of the seven aspects of integrity, and make a recommendation about eligibility. This is required for all properties.

The Beautification Dams retain integrity of location, as they have not moved from their original location. In addition, the associated bridges and the river have remained unchanged, and most of the buildings surrounding the dams are original to the construction of the dams, which means the dams still retain integrity of setting. The Beautification Dams do retain their design and material integrity as no alterations to the utilitarian structures are known. Furthermore, the dams retain integrity of workmanship and association as a structure that conveys the craftsmanship of a utilitarian design tied to water control and public works improvement projects. Finally, the Beautification Dams retain integrity of feeling when viewed as a whole, with the river and surrounding bridges. For these reasons, ERM recommends that the Beautification Dams in Grand River are potentially eligible for the NRHP under Criterion A for their association with events important to the history of Grand Rapids. The dams reflect efforts in the early twentieth century to improve the city through planning, zoning, and public works projects. The result was a shift in the orientation of the downtown area to embrace the river as an attraction for enjoyment and recreation. Parks and trails were established along the banks, and new buildings were constructed with an emphasis on attractive architecture that encouraged public use of the surrounding spaces. ERM recommends that the dams are also significant under Criterion B for their association with Harland Bartholomew, one of the most influential city planners of the twentieth century. Beginning in St. Louis in 1916, Bartholomew and his firm developed plans for hundreds of cities, influencing zoning decisions and promoting urban renewal and beautification. Bartholomew's plan for Grand Rapids specifically called for the installation of the dams, which consequently influenced the development of the downtown area in the way in which he intended. Although the Beautification Dams retain sufficient architectural integrity to convey the resources' historical significance, their design is utilitarian and common to contemporary structures across the country. As a result, they do not represent exceptional design or engineering and do not constitute an outstanding example of architecture associated with historic water control features. Therefore, ERM recommends the Beautification Dams in Grand River are not potentially eligible for the NRHP under Criterion C. For similar reasons, ERM recommends that the dams are not likely to yield information important to history and are thus not potentially eligible under Criterion D.

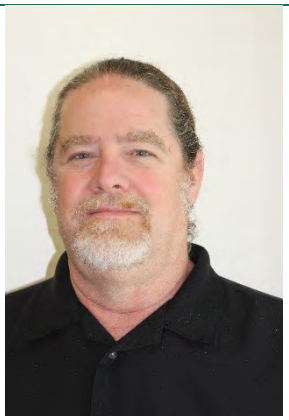
APPENDIX B RESUMES

Jeffrey L. Holland

Historian

Mr. Holland has over 30 years of experience on Cultural Resources Management projects throughout the eastern United States, the Midwest, and Texas. He has conducted historical research and documentation for National Register properties and districts, HABS/HAER recordation, Assessments of Effects reports, and cultural resources survey, testing, and data recovery projects. He has also authored popular histories for major industrial facilities and summaries of archaeological projects for public education. Mr. Holland's specialties include slavery, African American history, nineteenth century agriculture, the Civil War, and the history of military installations, utilities, and infrastructure in the twentieth century.



Experience: 30+ years' experience in Section 106, NEPA, and Historic Preservation Planning for government, energy, and industrial sectors

Key Projects at ERM

Energy Client, Pipeline Project, 2015–2019
Conducted cultural resource investigations as part of the permitting of a 600-mile natural gas pipeline in three states. Prepared historical contexts, conducted research on properties, assessed effects of project on resources, prepared mitigation plans for NRHP-eligible properties. Federal Energy Regulatory Commission issued Programmatic Agreement approving implementation of mitigative measures to complete compliance with Section 106 of the National Historic Preservation Act.

Energy Client, Wind Energy Project, 2019–2020
Prepared a Cumulative Visual Effects Assessment for a proposed off-shore wind energy installation of 800-megawatts in the waters of Rhode Island and Massachusetts. The analysis incorporated 17 lease areas and 761 wind generating turbines from the proposed project and reasonable foreseeable future projects. The assessment focused on three historic properties, including a Traditional Cultural Property and a National Historic Landmark.

Energy Client, Wind Energy Project, 2017–2019
Developed context and assessed historic significance for resources in three county area of northeast Pennsylvania that might be affected by a series of proposed wind turbines sites. The context addressed thematic resource types of primary significance in the region including coal industry related sites, railroads, and agricultural properties.

Energy Client, NRHP Evaluation of LNG Terminal, 2019
Developed context and assessed historical significance of an LNG terminal in Alaska completed in 1969 that was the first to export LNG from the United States. The research addressed the process involved in liquefying natural gas and changes to the plant over time. The plant was recommended as eligible for the NRHP.

Energy Client, NRHP Evaluation of Abandoned Pipeline, 2018
Served as author of reports for four western states assessing the historical significance of a 700-mile former oil pipeline converted to natural gas that was slated for abandonment. The assessment was conducted in accordance with a Notice of Exemption issued by the Advisory Council on Historic Preservation regarding abandoned historic natural gas pipelines.

Manufacturing Client, NRHP Evaluation of Historic Orchard Property, 2018
Conducted historical research and produced historical context for historic apple orchard and other historic properties in Jefferson County, West Virginia. Assessed significance of properties and potential direct and visual effects of a fiber manufacturing facility.

Energy Client, Wind Energy Project, 2016–2017
Developed context and assessed historic significance for resources in four county area of northeast West Virginia that might be affected by a series of proposed wind turbines sites. The context addressed a number of resource types including historic coaling and lumber communities, railroads, and industrial sites. Assessed architectural resources for NRHP eligibility under Criteria A and B through local history sources, deed research, and genealogy. Prepared inventory forms for data entry.

Key Projects Prior to Joining ERM

Energy Client, NRHP Documentation, 2014
Researched the ownership history and development of the William Evans farmhouse and associated buildings using county records, historical maps, census returns, and other primary and secondary sources as part of a Memorandum of Agreement to mitigate the effects of a transmission line with a permanent archival record of the property

Government Agency, Nuclear Power Program History, 2013
Conducted historical research using documents from the agency's corporate libraries, records in the National Archives, contemporary newspaper articles, and secondary sources on the nuclear power industry to produce a fully-referenced, illustrated history of what was for many years the nation's largest nuclear power program. The agency commissioned this historical overview of its nuclear power program to provide a concise reference for the agency.

Government Agency, HABS Documentation, 2012
Examined project records and historic photographs, along with other primary and secondary sources to establish the history of the former project offices of the Falcon Dam Project on the Rio Grande, constructed in 1951.

Government Agency, NRHP Assessment, Levees and Water Control Features, 2010–2011
Researched the records of the U.S. Boundary and Waters Commission and the Bureau of Reclamation to assess the significance of two levees constructed on the Rio Grande to control flooding. The levees interfaced with irrigation systems constructed prior to the levees, which also had historic features.

Government Agency, Oral History Documentation of Federal Housing Project, 2009
Conducted historical research on two housing projects slated for demolition using records at the local historical societies and libraries. Current residents of the developments were interviewed about their experiences in public housing. The documentation was part of a recordation of the two facilities intended to produce a comprehensive history of the public housing prior to the sale of the properties by the city.

Energy Client, Pipeline Project, 2008
Produced statewide contexts for five states, as well as more specific histories for dozens of counties and parishes along a 507-mile natural gas transmission pipeline in the southeast U.S. Historical research was also conducted on identified architectural resources to aid the assessment of their NRHP significance. The project was conducted on a short time schedule.

Military Agency, Air Force Facility History, 2006
Served as Historian and Author for the production of a pictorial history of Air Force Plant 6, an aircraft assembly plant operated by Bell Aircraft Company during World War II and later by Lockheed Aeronautics Company and its successors. The book is a fully-illustrated, perfect-bound history of the plant intended for a general audience and was distributed to libraries, government agencies, and other interested organizations.

Government Agency, Cultural Resources Survey of Redevelopment Property, 2006
Researched agency records and photographs on site and at the National Archives Southeast Region Branch in Atlanta, as well as local facilities to document the history and historic significance of a portion of the agency's reservation. The site included numerous industrial properties related to weapons manufacture in World War I, New Deal agricultural programs, and hydroelectric power. The assessment of the facilities was later used to develop an adaptive reuse plan for the property.

Government Agency, Archaeological Data Recovery in Historic District, 2006
Served as a Historian for this investigation of two blocks of a commercial and residential street in a historically black neighborhood of Savannah, Georgia. Using Sanborn Fire Insurance maps, city directories, and a variety of historical sources, documented neighborhood development, racial and social composition, and landscape characteristics over a period of approximately 100 years. The information was applied to the archaeological evidence from the excavation of features related to domestic and business activities on the street during the early twentieth century. A popular pamphlet on the results of the investigation was also produced.

Government Agency, Historical Research for NRHP Historic District Nomination, 2005
Conducted background research on the history of town in West Georgia, the evolution of the built environment within the district, and the construction date of the buildings, as part of a survey of 60+ properties for this historic downtown historic district. The information was used for an NRHP nomination submitted to the Georgia SHPO, and the district was listed in 2007.

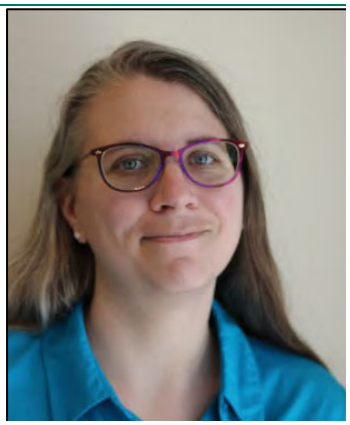
Energy Client, NRHP Assessment of Hydroelectric Power System, 2004
This project involved a review of historical documents related to the design and construction of 11 dams and powerhouses along two major rivers in North and South Carolina. Published histories, company documents, contemporary accounts were consulted, and similar large-scale power and flood-control projects in the Southeast and in the United States were studied to assess the significance of a series pf projects that spanned two states and included multiple facilities along an entire river system.

Military Agency, Context and NRHP Assessment of Korean War and Cold War Structures, 2003
Conducted background research to develop historic contexts to aid in the interpretation and assessment of BASOPS structures from the Korean War and Cold War periods at Fort Bliss and Briggs Army Airfield, Texas. The assessment of the facilities required the application of NRHP guidelines for properties of exceptional significance but less than 50 years old.

Emily Tucker-Laird

Senior Architectural Historian and Archaeologist

Ms. Tucker-Laird is Secretary of the Interior Qualified as an architectural historian and archaeologist. Emily is based in ERM's Duluth Georgia office, and attached to the cultural resources field services group. Emily has extensive experience working as a Principal Investigator. Her projects have included intra and interstate pipelines, electrical transmission lines, wind projects, solar projects, microwave towers, and treatment plans. In addition to fieldwork, Emily has experience supervising and coordinating for complex projects, and developing treatment plans for historic property concerns. Emily's has consulted with a wide range of state and federal agencies, as well as local stakeholders and interested parties.



Experience: 15 years of experience in the field of Cultural Resource Management

Key Projects

Energy Client, Wind Project, 2016
Architectural historian 2016 for a 72-turbine wind project in Grant and Tucker County West Virginia. Key tasks included field survey and reporting, and analysis of visual simulations. Project met the requirements of the West Virginia Public Service Commission, and Section 106.

Energy Client, Pipeline Project, 2015-present
600-mile-long natural gas pipeline extending from West Virginia to North Carolina. Architectural Historian and Principal Investigator for historic architecture survey and assessment of effects and Historic Architecture Task Manager responsible for overseeing treatment plans to mitigate project effects. Task Manager for FCC tasks. Responsibilities also include consultations with the FERC, SHPO, and consulting parties.

Energy Client, Transmission Line Project, 2017
Six transmission line alternatives in Fairfax County, Virginia. Cultural resource specialist who prepared sections of the routing study, SCC application, and pre-application analysis, and conducted the technical review for the cultural resource investigations conducted for a proposed line to be sited in northern Virginia.

Energy Client, Pipeline Project, 2016
Architectural Historian for a 96-mile natural gas pipeline in Calcasieu, Jefferson Davis, Acadia, and Evangeline parishes. Completed architectural survey to meet the requirements of the FERC and LASHPO.

Telecommunications Client – Nationwide 2014-2015
Architectural Historian and Archaeologist for a nationwide NEPA Program Management Team serving a major national telecommunications carrier. Provide QA/QC oversight on cultural resources submittals and client deliverables. Tasks include assuring that all compliance submittals conform to regulatory requirements as well as meeting client standards, and assuring that required documentation of compliance is included in all client deliverables.

Key Projects before Joining ERM

Energy Projects, 2012
Muscle Shoals Reservation, Alabama: Architectural Historian for the HABS Level II documentation of selected resources of the Tennessee Valley Authority Muscle Shoals Reservation. The architectural survey included a detailed survey of both the interior and exterior of 20 resources. Final products included a photographic record, historical context of each resource, and architectural descriptions.

City Planning Project, 2010
Georgetown, SC Historic District Survey: One of a team of Architectural Historians recording 900 resources within the National Register-listed historic district. Final products included a comprehensive historic district inventory, maps which identified building by period of construction and contributing status, South Carolina Department of Archives and History Intensive-level historic structure forms and photographs, and a report.

Macon Cemetery Preservation Corporation, 2007
Cemetery Preservation Plan in Georgia: Architectural Historian for a conditions assessment of the 13-acre Linwood Cemetery. Containing over 4,000 burials. Identified the extent of interments, overall conditions across the cemetery, and specific graves and markers requiring repair and stabilization. The product of the work was an assessment of the cemetery's condition and a preservation plan.

Energy Client, Lateral Pipeline Project, 2013-2015
75-mile crude oil pipeline in Illinois and Indiana: Principal Investigator for historic structures, Field Director and Crew Coordinator for the project. Managed several crews, and subcontractors, met with the land office to determine what was available for survey, and acted as the health and safety officer.

ERM has over 160 offices across the following countries and territories worldwide

MICHIGAN ABOVE-GROUND SURVEY MANUAL

UPDATED BY
KATIE KOLOKITHAS AND DIANE TUINSTRA

2018

STATE HISTORIC PRESERVATION OFFICE

ACKNOWLEDGMENTS

The creation of this 2018 version of the Michigan Above-Ground Survey Manual, published by the State Historic Preservation Office (SHPO), was a joint effort between Katie Kolokithas, survey and information coordinator, and Diane Tuinstra, inventory coordinator. This manual is an update of the 2001 manual written by Robert O. Christensen and Barbara Wyatt. Much of the text from that manual remains. Many thanks are given to Mr. Christensen and Ms. Wyatt, plus the other individuals who contributed to that manual's creation. Laura Rose Ashlee edited the entire manual as well as offered helpful suggestions on examples and content. Photographs used in the manual come from the Michigan SHPO's statewide inventory.

This manual has been financed in part with federal funds from the National Park Service, U.S. Department of the Interior. However, the contents and opinions do not necessarily reflect the views or policies of the Department of the Interior.

This program receives federal financial assistance for identification and protection of historic properties. Under Title VI of the Civil Rights Act of 1964 and Section 504 of the Rehabilitation Act of 1973, and the Age Discrimination Act of 1975, as amended, the Department of the Interior prohibits discrimination on the basis of race, color, national origin, or disability or age in its federally assisted programs. If you believe you have been discriminated against in any program, activity, or facility as described above, or you desire further information, please write to:

THE MICHIGAN ABOVE-GROUND SURVEY PROGRAM

INTRODUCTION

This manual provides standards and guidelines for conducting surveys of above-ground historic resources in Michigan. The State Historic Preservation Office (SHPO) recommends that this manual guide those individuals planning and carrying out surveys and requires compliance with the requirements identified in this manual for projects funded by SHPO grant funding or requiring review or approval from SHPO. This manual provides information regarding approaches to identification, documentation, and evaluation of historic above-ground sites, buildings, and features in accordance with the *Secretary of the Interior's Standards for Identification, Evaluation, and Preservation Planning*. This manual is designed to provide guidance for all types of above-ground surveys, including:

- Surveys funded by the federal Historic Preservation Fund and administered by the State of Michigan;
- Surveys required by the State Historic Preservation Office (SHPO) under Section 106 of the National Historic Preservation Act; and
- Surveys intended to provide an informational database for the establishment of local historic districts under Michigan's local historic districts enabling act, Public Act 169 of 1970, as amended, or for other preservation planning purposes, including preparation of National Register of Historic Places nominations.

This manual does not provide instruction for archaeological surveys. For information about archaeological surveys, please contact SHPO's archaeologists at 517-373-1618.

SURVEY IN MICHIGAN

The Michigan statewide survey program was started in the late 1960s under the direction of SHPO, but with the participation of numerous partners including local communities, regional planning agencies, and citizens around the state. In the 1980s, SHPO created *Surveying Michigan's Historic and Architectural Resources: A How-To Guide*, which directed the survey program for a number of years. In the 1990s, a series of eight survey manuals were used as the guide for the program. In 2001 a new survey manual was written by Robert Christensen and Barbara Wyatt called *Manual for Historic and Architectural Surveys in Michigan*. This 2018 manual replaces the 2001 manual.

In 2016 the Michigan SHPO initiated a project to make the survey data collected over the past fifty years more accessible to the public by creating a GIS-based program to collect, store, and map data. The project, called MiSHPO, will allow for online submission of survey reports and data as well as Section 106 applications, National Register nominations, and more. When MiSHPO is complete and ready to accept online submission of surveys, this manual will be updated with the necessary information to guide the electronic submission of surveys through that portal.

RECONNAISSANCE-LEVEL AND INTENSIVE-LEVEL SURVEYS

Survey refers to the process of identifying and gathering data on a community's historic resources. There are two main types of survey for above-ground resources: Reconnaissance-level and Intensive-level Survey. Survey can include field survey, the physical search for and recordation of historic properties; background research to establish historic context for the properties within the project area; and historical research on surveyed properties. The final products of a survey should include the following:

- Survey Report
- Color-photographs of the historic properties
- Inventory or data information on each property

Reconnaissance-level survey identifies properties of architectural significance and updates existing information in SHPO files. The reconnaissance survey documents properties using photographs, brief descriptions, condition, and location information. Limited research on the history of the buildings, sites, and features is undertaken. Reconnaissance-level surveys look primarily at the architectural integrity of the properties or National Register criteria C. This type of survey is the first step in the preservation planning process and can be undertaken in a limited or broad geographic area. The products of a reconnaissance-level survey include information entered into the survey report, survey forms, and the MiSHPO system. Reconnaissance-level surveys should be used as a means to determine where to focus intensive-level survey efforts.

Intensive-level survey seeks to identify and thoroughly document significant properties and districts through research and evaluation of the National Register of Historic Places criteria within the broader historic context. Intensive-level surveys are more complex, time-consuming, and represent a larger financial commitment for a community. These surveys also provide the most detailed information about an area's history and historic properties. Intensive-level survey begins with a reconnaissance survey or an update of an older survey. The survey then continues with research on potentially significant properties using primary sources, researching the community history, evaluating the properties for National Register significance, identifying historic districts, and completing MiSHPO submission information. Finally, many intensive-level surveys provide recommendations for future preservation activities.

PURPOSE OF SURVEY

The National Historic Preservation Act of 1966, as amended, requires all SHPOs to direct and conduct survey. The act states, "It shall be the responsibility of the State Historic Preservation Officer to administer the State Historic Preservation Program and to—in cooperation with Federal and State agencies, local governments, and private organizations and individuals—direct and conduct a comprehensive statewide survey of historic properties and maintain inventories of such properties."

Survey can serve many purposes including but not limited to the following:

- To provide a basis for local planning
- To provide data to support locally designated historic districts, National Register of Historic Places districts, or individual property designations
- To comply with environmental review requirements under Section 106 of the National Historic Preservation Act
- To achieve or maintain Certified Local Government (CLG) status
- To develop heritage tourism initiatives
- To provide information for thematic studies
- To provide a permanent record for the future

FREQUENTLY ASKED QUESTIONS ABOUT SURVEY

WHAT IS THE DIFFERENCE BETWEEN A RECONNAISSANCE-LEVEL SURVEY AND AN INTENSIVE-LEVEL SURVEY?

A reconnaissance-level survey identifies properties based on their architectural significance and provides basic property information for SHPO files. Reconnaissance surveys include limited historical research on the individual buildings and are used as a tool to determine where to concentrate more intensive research. Intensive-level survey seeks to identify and thoroughly document properties and districts through research and evaluation of the National Register criteria. These surveys provide a more extensive context for the area and research on each individual building.

SHOULD WE DO A RECONNAISSANCE-LEVEL SURVEY OR AN INTENSIVE-LEVEL SURVEY?

The purpose of the survey helps to determine the appropriate level of research. Reconnaissance-level surveys are a good first step and preservation planning tool while intensive-level surveys provide a more complete picture of the surveyed area. Determination of the level of review required for your project can be made through consultation with SHPO.

THERE ARE TREES/BRUSH/UTILITY LINES BLOCKING MY PHOTOGRAPH, WHAT SHOULD I DO?

We ask surveyors to do their best to take photographs without obstructions such as vegetation and utility lines, but we understand that in certain conditions obtaining a good photograph of a building may be difficult. Surveys should be conducted in the spring or fall when the leaves are not on the trees. If the surveyor is not able to obtain a clear photograph of the building they should be sure to describe the architectural characteristics in detail.

IS IT OKAY TO TRESPASS IN ORDER TO SURVEY A PROPERTY AND TAKE PHOTOGRAPHS?

No. Surveyors are required to stay in the public right of way while conducting their fieldwork. Permission from the property owner must be obtained in order to access the property.

WHY CAN'T I USE MY PHONE TO TAKE PHOTOGRAPHS?

While there have been many advances in the technology of smart phone cameras, SHPO is asking surveyors to continue to use a high quality digital camera to take their official photographs. Many phones do not allow users to change the resolution while taking photographs.

WHAT IS MISHPO? HOW DO I GET ACCESS TO THE SYSTEM?

MiSHPO is SHPO's new database and online submission system that will eventually allow consultants, federal agencies, and members of the public to submit their surveys, Section 106 applications, National Register nominations, Tax Credit applications, and other items directly to SHPO online. Any individual will be able to obtain a log-in through the website for the online submission portal. In order to get access to the database to conduct research on known sites, individuals and agencies or companies must purchase a license to gain access to SHPO's data. This manual will be updated once the system is fully operational.

WHAT DOES ELIGIBILITY MEAN? WHO DETERMINES THIS?

Eligibility is the assessment of whether a historic property meets the criteria for listing in the National Register of Historic Places. Persons meeting the professional qualifications as identified in the Code of Federal Regulations 36 CFR Part 61 can make recommendations based on their research of the eligibility of a property or district and SHPO will review the research and agree or disagree with the recommendations.

HOW DO I FUND A SURVEY IN MY COMMUNITY?

Surveys are funded by a variety of sources including private funding, grant funding, and municipal funding. Grant funding is occasionally offered through SHPO's Certified Local Government (CLG) grant program to eligible communities. SHPO uses its federal allocations to fund surveys as well and these are presented as RFPs for consultants. Sometimes a local municipality will utilize their general funds to conduct a survey, usually under the direction of a qualified consultant. Survey is a fundable activity for federal projects in which a survey is required under Section 106 of the National Historic Preservation Act of 1966. At this time SHPO does not offer grant funding to individuals to conduct survey work.

SURVEY PLANNING AND FIELDWORK

Survey is often initiated by a few people and undertaken to address a specific need in a community, but the survey planning process needs to include a much larger group of interested participants. Planning should be a community effort with qualified architectural historians and historians listening and being actively involved with community members to determine what areas are significant to them. Many surveys involve a planning committee that includes any or all of the following:

- Community organizations
- Local historians or representatives of local historical societies, historical commissions, or historic district commissions
- Faculty of local educational institutions with relevant expertise
- Representatives of executive and legislative branches of local government
- A member of the community's planning staff
- Members of the local board of realtors

Surveys should be publicized to the community through different avenues. The surveyor should also notify local law enforcement to explain the nature of the survey activity and make them aware of their presence. Surveyors should also carry identification at all times.

QUALIFICATIONS

Reconnaissance-level surveys must be undertaken by a lead investigator who meets the Secretary of Interior's Professional Qualifications Standards in the Code of Federal Regulations, 36 CRF Part 61. Lead investigators should be trained architectural historians and have experience with research and photography. The investigator should also be well versed in the National Register criteria. For Intensive-level surveys, the researcher or research team should be qualified as architectural historians and historians. An individual may qualify as both.

SHPO maintains a list of qualified consultants and while this list is not exhaustive of the consultants in the state of Michigan, it does provide a list of individuals who have submitted their credentials to the office for review. **Inclusion in this list does not constitute endorsement by SHPO or guarantee that any work product carried out by persons on the list will necessarily meet federal and state requirements.** Before engaging the services of any consultant, it is always advisable to contact references named by the consultant— especially those people for whom a consultant has worked. Inquiring about the nature of the project and the quality and timeliness of the work performed may provide an indication of a consultant's ability to successfully complete your project.

WHAT TO SURVEY

One of the fundamental issues in planning a survey is determining what to include in the project. This determination should be guided by the purpose for which the survey is being carried out, yet tempered by the need to complete the project within a defined budget. Surveys typically fall into two categories:

- Survey everything within the set boundaries, regardless of age, and
- Survey everything more than forty years old within the set boundaries

Surveying everything within the boundaries regardless of age is the most thorough documentation method, but it is also the most expensive and time consuming. This type of survey is appropriate for smaller municipalities or neighborhoods with several hundred properties or fewer. Surveying only what is known to be over forty years old is appropriate for cities and larger municipalities. The forty-year date range is to allow for the National Register's fifty-year age criterion and additional time so the survey is not outdated as soon as it is complete.

The goal of every survey should be to document a full range of types of historically significant properties in the survey area. Historic resources come in many forms—some are not as obvious. The National

Register property types are to be used for surveys in the State of Michigan. For full definitions of these terms according to National Register Bulletins 16A and 24, please see Appendix A, the Architectural History Survey Glossary of Terms.

- Buildings
- Site
- Structure
- Object
- District

Many historic resources such as parks, cemeteries, farms, mill and factory complexes, and residential properties can be complex properties that contain a variety of individual historic features. In an intensive-level survey, the property as a whole and each of its historic features should be surveyed. In a reconnaissance-level survey, it may be appropriate to survey only the entire property and key historic features rather than each and every historic element. Examples of this would include houses and grounds, farms, government complexes, churches, cemeteries, parks, factory and mill complexes, and utilities.

Churches in particular rarely stand alone, and the complexes often include cemeteries, educational buildings such as schools, teachers' residences, parsonages, or rectories, along with additions to the main building. The whole complex may be fronted by ornamental fencing or a gate. All of the various components of such church complexes should be surveyed. Farmstead Survey is discussed further in Appendix B Farmstead Survey Standards.

Questions often arise on whether features such as roadways and walkways; bridges; trees, boulders and other natural features; and mobile home parks or manufactured home developments should be included in the survey.

- For roadways and walkways, only intact, well-preserved examples surfaced with paving brick or other materials not commonly used today, should be included in the survey. Historic examples of public stairways should also be included in the survey.
- Many bridges in Michigan have been previously surveyed in the statewide highway bridge surveys, but some local highway bridges, particularly those no longer in highway use may have been missed. SHPO can provide you with a list of the bridges that have been previously surveyed. Historic culverts, pedestrian bridges, and railroad bridges should be included in the survey.
- Natural features are normally not included in the survey. If they are directly associated with historic events—not merely planted or placed at the site to commemorate them—they should be surveyed. Examples would be witness trees the original surveyors of Michigan used to describe corners of sections or quarter-sections, and trees associated with important persons or events.
- Mobile home and manufactured communities should be included in the survey if they are more than forty years old as they may possess significance in terms of landscape design, social history, and architecture.

CONTRACTING SURVEYS

A few communities will find themselves in the fortunate position of having persons with the requisite background, experience and skills to take on their surveys as volunteer projects, but most will need to contract for some or all of the work. SHPO maintains a list of consultants interested in survey work who meet the basic federal qualifications for historian and/or architectural historian. The list is updated frequently and is available on SHPO's website. This list should not be considered all-inclusive; there may be other consultants in your area who are not listed. It must also be emphasized that inclusion on the list is not a guarantee of high-quality work, and credentials and experience should be reviewed and references consulted. For additional detail regarding the hiring of a consultant and the RFP process please see Appendix C Contracting Surveys.

USING VOLUNTEERS

Some survey projects have been carried out entirely as volunteer projects, and volunteers can certainly assist in specific tasks such as the field survey work and property-specific research. Using volunteers in contracted survey projects, however, should be done with caution and a clear knowledge of the level of commitment of each volunteer. SHPO's experience has been that volunteers are sometimes not sufficiently motivated to carry out assigned tasks without defined deadlines.

ADVISORY BOARD

An advisory board comprising local historians, planners, members of a local historic district commission, and interested citizens can be an asset in a survey. The board may suggest resources for research, people to interview, and collections of information. A valuable role of the board is to be an emissary of good will during the project and an advocate for the survey's use after it is complete.

FIELD WORK

Field work is one of the most important steps in the survey process. Field work should:

- Record locational and descriptive data on each property
- Photograph properties and context views
- Map the property locations

One of the important steps before beginning fieldwork is the preparation of maps. Maps should be obtained from the local community to create base maps that will be used in the field and then in the preparation of the final map. The more detailed the maps, the more useful they will be in precisely locating the surveyed resources and in assisting users of the survey materials in their comprehension of the survey area's historic resources. Maps should show all streets and current property lines and/or building outlines.

More information on mapping in the MiSHPO system will be provided later in this manual.

RECORDING DATA IN THE FIELD

The collection of field survey data is one of the most important steps in the survey process. Field survey will provide locational and descriptive information—and perhaps some historical background information obtained by informants—about each property, which will ultimately form part of the record for the property. Prior to beginning field work, surveyors should review the list of required fields or data categories and instructions for the MiSHPO system. Surveyors should also include as much information as possible in each of the fields. Some examples of required fields include:

- Address (number, street direction and street name)
- City/village or township
- County
- Survey date and surveyor
- Historic name and current name
- Current building materials
- Additions, removals, and condition of the property

Many surveyors use paper survey forms and enter the data into the system at a later date. Many surveyors also create their own paper forms for use in the field. The SHPO Survey and Information Coordinator or the National Register Coordinator are available to review survey forms prior to the

commencement of field work. See Appendix D for a sample field form that can be customized and reproduced.

At this time, the use of survey applications for smart phones is not available for use with the MiSHPO program, but SHPO hopes to develop one in the coming years so surveyors will be able to utilize the technology in the field.

PHOTOGRAPHIC DOCUMENTATION

Every property included in the survey, including each building and other surveyed feature in a complex property or district, requires a minimum of one high quality photograph to show as much of the property as possible. Each surveyor is required to use a digital Single Lens Reflex (SLR) camera with a minimum capture size of eight mega-pixels. Images must be shot at the highest photo resolution possible.

Images must be delivered as an unaltered JPEG image on disk or thumb drive. Each image must be a minimum of 2000 pixels and 3000 pixels. Please consult with SHPO staff regarding file naming conventions for survey photos.

Survey photography is documentary. Good photographs can be taken if the photographer keeps several things in mind beyond the normal photographic considerations. These include composition, clarity, lighting quality and direction, and perspective distortion. Prior to beginning photography, a plan should be made based on the direction the building faces relative to sunlight, timing of possible obstructions (holiday decorations, leaves, vehicles, etc.), daylight, and weather.

CLARITY

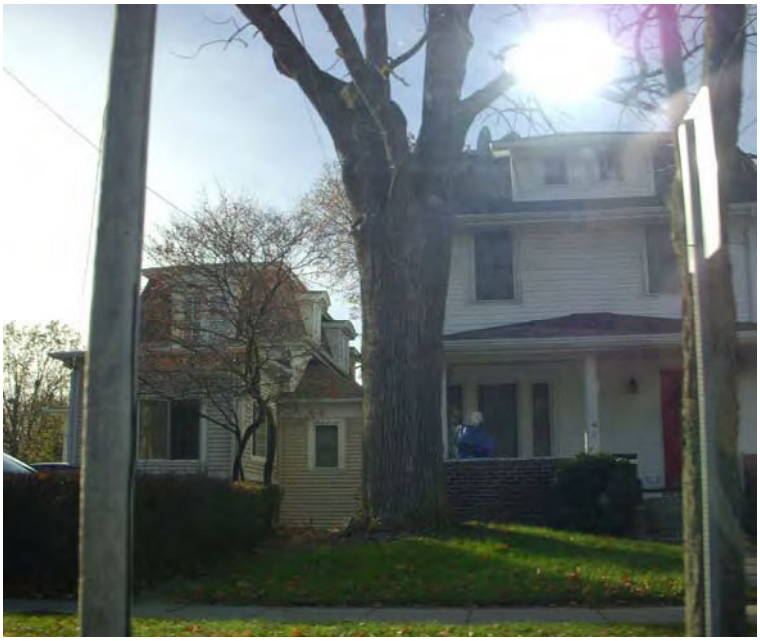
The major cause of unclear photographs is camera movement. The best way to avoid this is to place the camera on a firm support or tripod when the photograph is being taken. If a tripod is unavailable, using a faster shutter speed and gently squeezing the shutter button can enhance image clarity.

COMPOSITION

Generally, a ¾-view of a building is preferred, to show as much building detail as possible in a single view. Since a record is produced for each property, do not include the adjacent buildings in the inventory photographs. If necessary, more than one photograph should be taken to document large or complicated buildings.

LIGHTING QUALITY AND DIRECTION

A building is modeled and described by the sunlight, and the relationship of the sun to the property varies from case to case. A photo of a rusticated building, for example might be enhanced by sun using direct light to bring out the texture. A building with a broad overhang is sometimes best photographed in hazy sun because deep shadows can obliterate details. It is difficult, therefore, to generalize, except to say that the photographer should study the subject and make a determination based on a building's inherent characteristics.



Be careful about backlighting, or placing the sun directly behind the camera, because such flat lighting can obscure the shadow lines that give a building character and depth.

PERSPECTIVE DISTORTION

An otherwise well-thought-out photograph can be ruined by perspective distortion. The only way to get rid of this distortion completely is to have the film plane of the camera exactly vertical when taking the photograph. Tipping the camera up to capture the top of the building is the most common perspective distortion, this makes the building appear to be falling over backwards. The best way to limit the impact of this distortion is by using a perspective-control (PC) lens. Those without access to such equipment, however, should follow a few simple tips. The easiest solution is to back up far enough from the subject to include the entire building without tilting the camera upward. This can be accomplished by either moving away from the subject or by changing the camera to a wide-angle setting. Surveyors should use caution when using a wide-angle lens as this can exaggerate any tilting of the camera.

A telephoto lens that tends to flatten buildings can be used to reduce the impact of the perspective distortion. Users of a telephoto lens should be aware that the lens can also exaggerate camera motion, so a tripod is recommended.

Surveyors can also stand on a rise, truck, ladder or other equipment to elevate themselves and reduce the perspective distortion.

More information on photography is available in National Register Bulletin 23 *How to Improve the Quality of Photos for National Register Nominations*.

Other photography tips include the following:

- Avoid signs, cars, people, trees, and poles in the foreground as much as possible
- Lens filters and shields should be used to minimize glare
- Use imagination in finding the position that will allow the best view of the property

DESCRIBING HISTORIC PROPERTIES

Architecture should be described using appropriate terminology for architectural styles, building forms, and other characteristics. Surveyors should make use of architectural style guides, studies of specific building types, and other source material that provide background information about the architecture they are surveying. The following resources should prove useful for nearly every survey:

- Architectural Dictionaries and Terminology Guides:
  - Phillips, Steven J. *Old-House Dictionary*. NY: John Wiley & Sons, Inc., 1994.
  - Burden, Ernest. *Illustrated Dictionary of Architecture*. Third Edition. NY: McGraw-Hill, 2012.
  - Roth, Leland M. *American Architecture: A History*. Second Edition. CO: Westview Press, 2016.
- Houses:
  - McLennan, Marshall. "Common House Types in Southern Michigan." In Michigan Folklife Reader, edited by C. Kurt Dewhurst and Yvonne R. Lockwood, 15-45. East Lansing: Michigan State University Press, 1987.
  - McAlester, Virginia and Lee McAlester. *A Field Guide to American Houses (Revised).* NY: Alfred Knopf, 2015.
- Farms and Agricultural Buildings:
  - Michigan Agricultural Experiment Station bulletins and Michigan Cooperative Extension

Service bulletins, found at the Michigan State University Library, contain useful background information on farm and building layouts and design.

- *The Agricultural Landscape of Michigan: An Historic Context for the Theme of Agriculture*. Lansing, MI: Michigan State University for Michigan Department of Transportation, 2004. On file at SHPO and MDOT.
- Dandekar, Hemalata C. *Michigan Family Farms & Farm Buildings: Landscapes of the Heart & Mind*. Ann Arbor: The University of Michigan Press, 2010.
- Noble, Allen G. *Wood, Brick & Stone: The North American Settlement Landscape.* 2 vols. Amherst, Ma: University of Massachusetts Press, 1984. Volume 2 deals with barns and farm structures.
- Noble, Allen G., and Hubert G. H. Wilhelm, eds. *Barns of the Midwest*. Athens, OH: Ohio University Press, 1995.
- Visser, Thomas Durant. *Field Guide to New England Barns and Farm Buildings*. Hanover, NH: University Press of New England, 1997.

- Mid-Century Modern Resources
  - APT Building Technology Heritage Library. https://archive.org/details/buildingtechnologyheritagelibrary. Includes house plan books for postwar housing companies.

  - Jester, Thomas C. *Twentieth-Century Building Materials: History and Conservation*. Los Angeles: Getty Conservation Institute. 2014.
  - *A Model for Identifying and Evaluating the Historic Significance of Post-World War II Housing*. National Cooperative Highway Research Program Report 723. Transportation Research Board Washington, DC. 2012.
  - *The Ranch House in Georgia. Guidelines for Evaluation.* Stone Mountain, Georgia: New South Associates.
  - Statewide Search for Subdivision Plats. www.dleg.mi.us/platmaps/sr_subs.asp. Michigan Department of Licensing and Regulatory Affairs (LARA).
- Schools
  - Michigan State Historic Preservation Office. *An Honor and an Ornament: Public School Buildings in Michigan*. Lansing, Michigan: Department of History, Arts and Libraries, 2003.
  - Michigan Superintendent of Public Instruction. Superintendent of Public Instruction Annual Reports. Lansing, MI: State of Michigan Superintendent of Public Instruction. The annual reports of 1859, 1864, 1869, 1893, 1913-1914, 1915-1916, and 1916-1917 contain illustrated material on school building design and furnishings, including standard plans.
- Commercial Architecture
  - Longstreth, Richard. *The Buildings of Main Street: A Guide to American Commercial Architecture.* Walnut Creek, CA: AltaMira Press, 2000.
- Industrial Architecture
  - Bradley, Betsy Hunter. *The Works: The Industrial Architecture of the United States.* NY: Oxford University Press, 1999.

For specific questions concerning architectural terminology, contact the Survey and Designation staff at SHPO.

HISTORICAL RESEARCH

All surveys should include a historical research component. Historical research in survey provides the framework for evaluating the historic significance of the surveyed properties and their eligibility for inclusion in the National Register of Historic Places.

The primary difference between reconnaissance-level survey and intensive-level survey is that intensive-level survey includes in-depth historical research on each of the surveyed properties. Reconnaissance-level survey only records property-specific information from readily available sources. Both levels of survey should include research in two areas: 1) the general history of the survey area or community and 2) study of historical themes applicable to the survey area. Intensive-level survey will include the individual property history information as well.

The survey report must include a summary history of the area that introduces the important historic themes and places them in a broader context. The history should be written as a narrative rather than in timeline format. It should include key dates in the area's chronology and introduce the area's early settlement history, driving forces behind its growth and economy (including significant people or ethnic groups) and other developmental factors. An example for Port Hope (see below), taken from the Port Hope multiple property nomination for the National Register, introduces each of the significant historic themes represented by properties included in the nomination: lumbering, forest fires of 1881 and relief efforts, agriculture, transportation, ethnic history, and architecture.

Thematic narratives should be identified through consultation with National Register Bulletin 15, "How to Apply the National Register Criteria for Evaluation" (page 8), which defines a theme as "a means of organizing properties into coherent patterns based on elements such as environment, social/ ethnic groups, transportation networks, technology, or political developments that have influenced the development of an area during one or more periods of prehistory or history."

ARCHITECTURAL NARRATIVE

For most survey projects, architecture will prove a relevant theme, and an architectural narrative will be necessary. Architectural narratives too often tend to be generic discussions focusing on style that provide little detail about the specific survey area. This should be avoided! It may be worthwhile for the person preparing the architectural narrative to begin with a fresh review of architecture while in the field. Working from only the survey photos months after the completion of the field survey may hinder insightful analysis of the architecture.

The purpose of the architectural narrative is to place the survey area's architecture in the broader context of the community and region in which it is located. The architectural narrative should discuss the architecture in terms of property types. Property types should be defined using the list in Appendix E.

The architectural narrative should discuss all property types within the broad categories (residential, commercial, or agricultural) for which a substantial number of properties are present. For example, for rural survey areas containing numerous farms, the broad range of agricultural building and structure types present should be discussed and analyzed. For older, in-town neighborhoods containing many old stable/carriage house buildings, the architectural narrative should include some discussion of this building type. Conversely, property types represented in the survey area by only one or a very small number of properties—typically churches, schools, and other institutional resources—need not be included in the architectural narrative. For the few institutional properties present in most survey areas, any needed architectural analysis can be presented within the narratives for the themes with which the properties are associated, such as religion or education.

Just as for the entire survey report, an important purpose of the architectural narrative is to educate public officials, planners, property owners, and the general public about what is interesting and significant from an architectural standpoint about the survey area's properties. A relatively small number of high-style properties in the survey area certainly merit discussion and analysis, but the narrative should focus on

the common property types and forms generally represented by the vast majority of surveyed properties whose significance will not be obvious to the report's readers.

The narrative should be organized by broad property type, such as residential and commercial. The discussions of property types should be arranged in the overview in the approximate order of their predominance. In most survey areas, residential properties will form by far the greatest proportion of the surveyed resources; in such cases, the residential section should come first in the architectural narrative.

In the discussion of each property type, discussion and analysis of the issues of form and massing should almost always precede any discussion of style. For example, in a section of an architectural narrative that discusses single-family houses within a broad category of domestic (i.e. residential) architecture, the houses should be discussed in terms of the specific house forms present, such as bungalow or upright-and-wing, before they are discussed in terms of their architectural style. Building forms characteristic of the survey area and broader community, such as a certain house form prevalent in a survey area, but less common elsewhere, should be identified. Any locally distinct varieties of standard architectural styles and the common use of distinctive decorative elements in the local architecture, such as a polychromatic brickwork found in many houses in the Dutch settlement area of West Michigan, should be noted and discussed.

Examples of pattern-book, pre-cut, and manufactured architecture should be discussed, if possible, as part of the architectural narrative. While originals of old pattern and plan books and catalogs are hard to come by, many of these books have been reprinted by a variety of publishers, and more are being done every year. Dover Publications, Inc., the publisher of by far the greatest number of reprints, is the architectural historian's friend, having reprinted dozens of old plan and pattern books since the 1960s, with most of them still in print in inexpensive paper editions. These pattern books—especially those by the Aladdin Company and Sears, Roebuck and Company—will be useful for survey in Michigan.

The narrative should provide information about architects, engineers, artisans, craftspeople, and contractors who worked in the survey area. Biographical data, such as birthplace and birth and death dates, educational background, firm affiliations and dates, and important commissions are important pieces of information that should be sought and included in the narrative. Newspaper obituary notices are an important source of information. In addition, the following can be useful sources of information on architects and engineers:

- *American Institute of Architects Historical Directory of AmericanArchitects*
- *Avery Obituary Index of Architects.* Microform/Columbia University. Boston, MA: G.K. Hall, 1984.
- Downs, Winfield Scott, ed. *Who's Who in Engineering. A Biographical Dictionary of the Engineering Profession.* New York: Lewis Historical Publishing Co., Inc. (Editor, title and publisher vary between editions). Eight editions were published between 1922 and 1959.
- Koyl, George S., ed. *American Architects Directory*. New York: R. R. Bowker Co. Editions were issued in 1956 and 1962.
- Withey, Henry F., and Elsie Rathburn Withey. Biographical Dictionary of American Architects (Deceased). Los Angeles: New Age Publishing Co., 1956.

RECONNAISSANCE-LEVEL SURVEY

The level of research for a reconnaissance-level survey will be limited to those documents and resources that are easily accessible including old county and fire insurance maps and published histories, as well as information such as historic name and date, gleaned from inspections of the property. The recording of specific information from directories, tax assessors' records, and other more detailed sources is generally not a part of a reconnaissance survey. For some of the properties, no historical information will be located.

INTENSIVE-LEVEL PROPERTIES

For properties surveyed at the intensive-level at least a basic level of information should be gathered for each of the properties forty-or-more-years-old, with more in-depth research performed on those that appear to possess more than typical historical or architectural significance. The surveyor must provide a basic, standard level of historical documentation for all of the surveyed properties and help determine which of them possess significance according to the National Register criteria.

The amount of time spent on research for a given property in an intensive-level survey should correspond to the property's apparent historic significance. Property-specific research can be the most time-consuming aspect of a survey project, but it is the most important. Surveyors should have realistic expectations about what information is available, so that research efforts can be appropriately directed. Sometimes finding basic information for a property, such as the precise date of construction and an architect or builder, will be impossible.

SOURCES OF INFORMATION FOR HISTORICAL RESEARCH

The sources of information that will be used for general history, thematic, and property-specific research will vary with the nature and location of resources, but the following will generally be useful tools.

- Published and unpublished histories
- County maps and atlases, plat books, and fire insurance maps
- City and county directories
- State gazetteers and business directories
- Tax assessors' records
- Tax records
- Building permit records
- Local historians and knowledgeable informants, including long-term property owners
- Federal census records
- State census records
- Rural property inventories
- Vertical and newspaper clippings files
- Photograph collections
- Birdseye views
- Biographical albums and records
- Newspapers
- Property abstracts
- Public land records
- Federal land patent records

While secondary sources can be useful to begin your research and uncover potential primary sources, they should be used with caution and primary sources should be used as the main documentation whenever possible.

SUMMARY HISTORY FOR PORT HOPE

EXAMPLE

Port Hope began in 1858 with a sawmill and dock constructed by William R. Stafford, a partner in a firm established to log the area and market its products to Cleveland. Lumber continued to be the area's chief industry until forest fires in 1871 and 1881 destroyed most of the remaining timber. The 1881 fires, coming after decades of logging had left mountains of timber debris in their wake, not only destroyed most of the remaining forests in the area, but also cleared much of the debris left from logging activities, opening the Port Hope area and much of the Thumb to farming far more than the lumber industry itself. The land was fertile. As a result, in the 1880s and 1890s agriculture became the major livelihood of Port Hope's residents. Many early settlers in Port Hope in the 1860s and 1870s were Germans and in the late nineteenth century the Germans became Port Hope's largest ethnic group. Cheap water transportation on the lakes made possible the community's economic growth in the nineteenth century. Lumber and, later, agricultural products were shipped to market exclusively by boat prior to the construction of a railroad line to the town. The opening of a rail link to the existing line at Harbor Beach in 1903 took place at the same time that commerce on the lakes was in decline because of competition from the ever-growing railroad network. The railroad line gave Port Hope a greater market for its agricultural products and encouraged further development of agriculture in the area. Port Hope's architecture in the nineteenth and early twentieth centuries reflected the development of the town and the contemporary architectural tastes of the nation at large and of Michigan's Thumb region.

LUMBER INDUSTRY THEMATIC NARRATIVE FOR PORT HOPE

EXAMPLE

Commercial logging in Michigan began in the 1830s, 40s, and 50s with the development of improved sawmilling technology and the introduction of steam-powered sawmills. Extensive logging began along the east shore of Lake Michigan and the west shore of Lake Huron in the Lower Peninsula and gradually worked its way inland along the major waterways. The sawmills were located at the mouths of the streams and the logs driven downstream to them during the spring high waters. Chicago was the first the principal destination of timber cut along Michigan's west shore, while the mills on the Lake Huron side of the state served Detroit, Toledo, Cleveland, and Buffalo for the most part. In 1860 there were nearly one thousand sawmills operating in Michigan producing in that year about 800 million board feet of lumber, principally white pine. The fine quality of the wood and the phenomenal growth of Michigan's and the Midwest's population in the years after 1860 led to rapidly expanding lumber production in Michigan. Production statewide reached a maximum of 4,292,000,000 board feet in 1888. Production began to decline thereafter because of the depletion of timber lands; however, Michigan continued to be the leading producer of lumber in the nation in 1900.

Commercial logging along the west shore of Lake Huron began in the 1830s and was well underway at Port Huron, Saginaw, Bay City, and other places by the late 1840s. Port Huron reached its high point of lumber production—56 million board feet—in 1873. The Saginaw Valley reached its high point of production of more than one billion board feet in 1882. More northerly points such as Alpena and Cheboygan reached their peak production in the late 1880s and early 1890s. Much of the production from the east shore mill towns was sent to market in ships and barges, and Bay City and Saginaw in particular became large shipbuilding centers in the late nineteenth century.

Eastern investors, a number from Maine and New Hampshire, played an important role in the Michigan lumber boom beginning as early as the 1840s, if not before. These investors witnessed the gradual depletion of the northern New England pine woods in the mid-nineteenth century and the consequent rise in value of the remaining timber lands. They recognized the opportunities for profit from Michigan timber lands, which could still often be bought at bargain prices from Uncle Sam and the lumber inexpensively shipped by water to an ever-growing market. Single investors often bought thousands of acres of land, logged them off over many years, and then resold as much land as possible while developing some themselves for agricultural purposes.

Huron County, at the tip of the Thumb between Lake Huron and Saginaw Bay, was established as a county in 1859. The first sawmills—small, water-powered affairs—were established in 1838 and 1839. John Hopson put up the first steam sawmill in 1850 at Rock Falls south of Harbor Beach. Lumber and shingle manufacturing quickly became the county's chief industries. The principal woods were pine, hemlock, cedar, basswood, beech, maple, birch, and ash. A series of forest fires burned over much of the county in October 1871, at the same time that the Chicago Fire raged. Nevertheless, in 1874 the county produced 36 million board feet of lumber. In 1876 several planks cut at Verona Mills in the county were displayed at the Centennial Exposition in Philadelphia. The planks were sixteen feet long, five feet two inches wide, four inches thick, and without knots or other flaws. In September 1881, however, another series of disastrous fires burned over the bulk of Huron and much of several other counties and put an end to large scale logging in the county. Small scale operations continued for a few more years here and there.

In Port Hope William R. Stafford was a pioneer lumberman. Stafford (1829-1916) came to Michigan from Bath, New Hampshire, in 1849 and settled in Lexington, on the Lake Huron shore between Port Huron and Huron County. In 1852, Stafford became a partner in a mercantile business that apparently involved lumber. The business was reorganized in 1854 with Clark Haywood, another New Hampshire native and a former employee of Stafford's, as his partner.

In 1851, Stafford, Reuben B. Dimond, William Southard, and Josiah F. Wilson, all (with probably the exception of Dimond) New Hampshire natives who were personal friends and business associates, made a purchase of timber lands in the area near what became Port Hope. In 1857 or 1858, Stafford, Haywood, and a third New Hampshire native, former U.S. senator B. W. Jenness, then a resident of Cleveland, formed a partnership to exploit the timber resources of the Port Hope area. Stafford had charge of the sawmill the partners built in 1858 at what became the settlement of Port Hope. The mill produced lumber,

lath, and shingles. Jenness ran a lumberyard in Cleveland that the Port Hope mill supplied. During some years prior to the 1871 fires the mill produced 7 million board feet of lumber. The 1871 fire destroyed the mill, dock, and lumber on hand, a loss of $100,000 to Stafford & Haywood (Jenness had withdrawn in 1868). Stafford & Haywood rebuilt the mill and dock in 1872. As of 1874 they produced 1.4 million board feet out of the 36 million produced in the county. At least four operations in the county were larger. The 1881 fire burned the mill and dock again, a $40,000 loss, and, in 1884, Haywood also withdrew from the firm, leaving Stafford as sole owner. Stafford built a third, smaller sawmill and planing mill and sash and door factory to supply primarily local needs.

In 1880, R. C. Ogilvie built a second sawmill and dock at a cost of eight-thousand dollars. The mill and dock also burned in 1881. Ogilvie rebuilt in 1993, but the mill apparently closed for the lack of timber by about 1889. Stafford's sawmill is listed in the Michigan State Gazetteer and Business Directory as late as the 1893 edition, and probably closed in the early 1890s. Perhaps some lumber and other wood building products were shipped to Cleveland until the very end of local sawmilling operations. Mrs. C. J. Bisbee in her 1915 historical sketch of Port Hope states that "The mill operated until every bit of virgin timber was nailed into Ohio houses."

A by-product of logging in Michigan was salt manufacturing. What is known to geologists as the Michigan Basin, which includes the Lower Peninsula, is one of the greatest areas of halite concentration in the world. Subsurface deposits of rock salt and brine occur in many places. In 1859 the Michigan legislature, hoping to encourage salt production, authorized a bounty of ten cents per bushel produced. This bounty was soon repealed, but not before it had done its work in generating real interest in salt manufacturing. Michigan soon became the nation's leading salt producer, and by 1884 was producing half of the nation's salt.

Salt production in Huron County and elsewhere in Michigan was encouraged by the plentiful supply of wood. Wood fueled the engines that pumped the brine from which salt was obtained up to the surface and powered the furnaces that evaporated water from the great pans or vats of brine. Cheap fuel made Michigan salt the most inexpensive in the nation. In Huron County salt manufacturing began in 1863 in Port Austin and continued until about 1890. In 1884 the county had eleven salt-manufacturing operations, several of them using more than one well. The decline coincided not with the depletion of the brine deposits, but with the destruction of the forests that provided the cheap fuel.

In Port Hope the first salt-manufacturing enterprise, the Port Hope Salt Company (in which W. R. Stafford was the principal owner) was established in 1874. Its plant appears to have been typical of the Huron County salt "blocks." The first year the company produced 16,000 barrels of salt at 280 pounds per barrel. In 1884 the company used 10,000 cords of wood to produce 60,000 barrels. It had a well 800 feet deep (Huron County wells ranged from 600 to nearly 2,000 feet in depth) and four and one half inches in diameter. The brine was pumped to the surface into five evaporating "pans" and the brine settled to the bottom. So-called "bitter water" at the top was drained off. Furnaces provided the chief means of evaporation. A force of twenty coopers produced the needed barrels. Much of the salt produced went for dairy purposes, but the company also shipped much of its product to the mining regions of Montana. The Port Hope Salt Company closed in 1890.

Robert G. Ogilvie established a second salt-manufacturing concern in Port Hope in 1883. His operation had its own sawmill and barrel factory and produced 150 barrels of salt daily in 1884. Ogilvie's operation apparently closed by 1890.

The remains of the Port Hope Salt Company plant were dismantled in 1913-14, but the site has not been developed and some remains are still present. At the site of the Ogilvie salt block, some development has taken place and no remains are visible. No archaeological testing of either site has been done.

EVALUATION AND MAKING ELIGIBILITY RECOMMENDATIONS

Evaluation of the historic significance of the surveyed properties is the very heart of the survey project since the properties evaluated as historically significant are the ones to which future historic preservation planning efforts will be geared and the rest of the properties will likely be excluded from future preservation planning. Evaluation criteria for surveys of any kind should use the National Register of Historic Places Criteria for Evaluation.

CRITERIA: The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or
B. That are associated with the lives of persons significant to our past; or
C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D. That have yielded, or may be likely to yield, information important in history or prehistory.

CRITERIA CONSIDERATIONS: Ordinarily cemeteries, birthplaces, or graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years shall not be considered eligible for the National Register. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following categories:

A. A religious property deriving primary significance from architectural or artistic distinction or historical importance; or
B. A building or structure removed from its original location but which is significant primarily or architectural value, or which is the surviving structure most importantly associated with a historic person or event; or
C. A birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building directly associated with his productive life; or
D. A cemetery which derives its primary significance from graves of persons or transcendent importance, from age, from distinctive design features, or from associations with historic events; or
E. A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived; or
F. A property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own exceptional significance; or
G. A property achieving significance within the past 50 years if it has exceptional importance.

EVALUATION PROCESS

Evaluating historic resources should involve assessing historic properties from three perspectives:

- Historic context
- Historic significance
- Historic integrity

HISTORIC CONTEXT

Historic resources must be understood within the framework of the historic themes with which they are associated and the place and time in which they occurred. The theme, geographic parameters, and temporal definition provide the context for understanding a property, for example, popular music (theme) in Detroit (place) from 1920 to 1975 (time frame). Evaluations need to include:

- Comparison with properties that are similar in terms of function, form or style
- Relationship to a historic event
- Comparison with other properties associated with the same historic theme(s) and in the same geographic area and time frame

The geographic area that forms one of the bases for evaluation may need to be larger than the survey area to provide an adequate context for evaluation. In general, evaluations should be made, at a minimum, within the context of the entire community.

The historical significance of an above-ground property refers to its importance in the history, architecture, or culture of the local area, state, or nation. Significance is defined in terms of the four National Register criteria: historic events, important people, distinctive physical characteristics, and information potential.

Historical integrity of a property refers to the extent that the physical components have survived from the historic period—in other words, how much the property reflects its historic appearance. The National Register criteria defines seven qualities of integrity that properties must meet: location, design, setting, materials, workmanship, feeling, and association.

If the history of a property is deemed important within one or more historic themes and if the property possesses a high degree of integrity, it is generally considered eligible for listing in the National Register of Historic Places. The surveyor makes recommendations on the eligibility of resources, which are then reviewed by SHPO staff, who make the final determination.

In addition to these instructions, survey personnel should review the *Secretary of the Interior's Standards for Evaluation*; *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation*; and other National Register bulletins, as appropriate to the surveyed resources.

Evaluations should be done through the identification of the applicable themes and the related properties in the surveyed area through the creation of lists for inclusion in the survey report. The list for each theme should include not just properties that clearly possess historic significance but also a more representative sampling of all of the types of properties that reflect the theme. When placing these lists in the report, the properties should be organized by a broad property type category (such as Commercial or Domestic). Districts identified in the survey and properties such as farms, industrial complexes, parks, and cemeteries should each be listed and evaluated as whole complexes. Components should not be listed and evaluated separately unless the entire district or complex property turns out not to meet the criteria. Some properties will relate to more than one theme; these should be listed under all appropriate themes. The property list for architecture should be organized by styles, building forms, and other aspects of the survey area's architecture defined in the narrative as significant.

Using the National Register criteria, standards should be developed for evaluating properties associated with the survey area's defined historic themes. For each theme, define the following:

- Property types that are important in illustrating the theme
- How the National Register criteria apply to each property type on the basis of the important events, people, and patterns, etc., developed in the narratives (In some cases several property types may be grouped together.)
- The level of physical integrity a property must possess to be eligible for listing as an example of the property type

The following are examples of specific criteria established for individual property types or groupings of property types within a theme:

- The criteria under the theme of commerce might define a commercial building as eligible for the National Register if it housed a leading commercial enterprise by virtue of its size and role in the community (a department store in a large community or a general store in a small community, for example) or if it housed a specific business or business use for a long period of time (a hardware or clothing store, or a succession of shoe stores or ice cream parlors, that remained in business at the same location, for example).
- The criteria under the commerce theme might define a house as eligible for the National Register if it is associated with a pioneer merchant or businessperson who owned an important business or a business that remained in operation for a long time.

Criteria should be tailored to the survey area's historic themes and to the surveyed properties and property types. Avoid using a standard, "canned" criteria that applies to all themes.

EVALUATION AND RECONNAISSANCE-LEVEL SURVEY

Every reconnaissance-level survey should include at least a measure of evaluation based on the criteria and a recommendation of eligibility for the properties in the survey area. In order for a reconnaissance-level survey to be useful in future planning efforts, the surveyor should use available information, including basic historic information and the level of architectural integrity. For those resources with widely available histories, the surveyor should undertake the evaluation process in the manner described above utilizing all four National Register criteria. For those without a well-documented history, the survey report should include an eligibility recommendation for National Register criterion C: architecture. Reconnaissance-level surveys should be considered locally as the first step in a two-step process; however, funding often limits the ability of a community to complete the second step— intensive-level survey—in a timely manner.

EVALUATION AND INTENSIVE-LEVEL SURVEY

Evaluation of resources for an intensive-level survey should be undertaken utilizing all four National Register Criteria.

IDENTIFYING AND DOCUMENTING POTENTIAL HISTORIC DISTRICTS

One purpose of survey is to identify and document any potential historic districts located within a survey area. According to National Register Bulletin 15, "A district possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development. . . . A district derives its importance from being a unified entity even though it is often composed of a wide variety of resources. The identity of a district results from the interrelationship of its resources, which can convey a visual sense of the overall historic environment or be an arrangement of historically or functionally related properties."

Historic districts can encompass business districts, residential neighborhoods, rural villages or agricultural districts. These areas must possess significance under one or more of the National Register criteria and retain an adequate degree of architectural integrity. The boundaries of the potential historic district must include the full extent of the historic resources related to the applicable historic themes and time frames while excluding adjacent areas whose properties bear no strong relationship to them.

APPLYING THE CRITERIA

A CASE STUDY ON THE HOME OF A SETTLER FROM NEW YORK STATE

Robert O. Christensen

A building that was the Michigan home of a pioneer settler from New York State should be reviewed in terms of the broad pattern of migration to the area from upstate New York and the settler's importance as a reflection of that migration and as a member of the community, and conceivably, the importance of the building itself in reflecting the architectural tastes of the date in that area.

In reviewing eligibility, the history of the area should be considered. For the settler's house, it is important to know whether or not the migration from upstate New York to this area was a common pattern. If it was, the house can be viewed as possessing some significance through the connection with this broad pattern of local history. It is also important to know whether the settler played a significant role in local history. Was he or she a businessperson who established a general store that served the community for a long period of time, for example, or a farmer who played a key role in introducing a new and ultimately important crop? In other words, was the subject someone who made a definable contribution to local history?

Architectural significance also may be a factor in the evaluation. Does this upstate New York settler's house fall into a broad architectural pattern in illustrating the use of building forms or materials characteristic of upstate New York that were used by other early settlers who came from that area? Does the building exemplify commonly used traditional house forms or high-style design of its period, or is it an important example of its designer's work—whether the designer was a fashionable architect of national reputation or a local carpenter-builder?

Once some conclusions concerning how the building fits into the patterns of local history have been reached, an attempt should then be made to determine whether the house is of sufficient importance within these historical patterns to merit designation. For example, perhaps the settler was but one of a great number of such people who settled in the same general area and many of the houses these settlers built have survived. The evaluation of this particular building's importance in representing the theme of the eastern migration to the area might be much less than it would be if only a few of the early settlers' homes had survived, say in an urban area.

Here, the issue of physical integrity becomes important. If fifty houses that relate to the settlement of the area of New Yorkers survive, certainly some of them—all other things being equal—illustrate better than others what it was like for these New Yorkers to establish their lives in Michigan in the early days. Those that retain enough of their historic appearance and character to provide a clear illustration are of greater importance than those that have lost this ability.

Synthetic siding, major renovations that result in the loss of original materials such as trim, and moving from the original site reduce the ability of a building to convey its significant history. Most buildings do not remain in pristine form, and many have been moved. How much the alterations have reduced the overall ability of the building to illustrate the history must be evaluated. In effect, the standards for physical integrity for properties possessing historical significance only mildly related to the architecture differ somewhat from those of properties whose significance is primarily architectural.

The New York settler's house loses a strong measure of significance if it is moved off the property on which the pioneers actually settled. The house loses some measure of significance if synthetic siding is installed or other changes are made, but may retain sufficient integrity to be eligible if the changes made are reversible ones that do not change the fundamental character of the property.

On the other hand, a building that is viewed as eligible primarily because of its architectural value in illustrating high style or vernacular tastes of its time period may not be viewed as losing integrity by being moved (as long as the new setting is appropriate), but may be viewed as losing a substantial amount of integrity by being sided or changed in other ways that reduce the building's ability to illustrate the historic architectural finishes and materials.

SURVEY PRODUCTS AND REPORT

A final survey report is required for all survey projects. This report must be uploaded to the MiSHPO "My Applications" tab. The survey report should provide information on the purpose, parameters, methodology, limitations, findings, background, historical context, and descriptions on the findings. SHPO requires that report authors adhere to the most recent edition of the *Chicago Manual of Style and the* *Michigan State Historic Preservation Office Style Guide*.

SURVEY REPORT COMPONENTS: SECTION ONE

- COVER OR TITLE PAGE: Include the name of the survey, municipal unit(s) and counties, sponsoring agency, completion date of the final report, names and location of the person or firm responsible for carrying out the survey, and names of the report author and primary project personnel, if different.
- ACKNOWLEDGMENTS/FUNDING CREDIT: Most projects are funded by federal, state, or local funding and the source of funding should be acknowledged in the report. For project funded through the Historic Preservation Fund, the following acknowledgment of federal assistance is required behind the title page and before the executive summary:

The activity that is the subject of this project has been financed in part with Federal funds from the National Park Service, U.S. Department of the Interior, through the Michigan State Housing Development Authority. However, the contents and opinions herein do not necessarily reflect the views or policies of the Department of the Interior or the Michigan State Housing Development Authority, nor does the mention of trade names or commercial products herein constitute endorsement or recommendation by the Department of the Interior or the Michigan State Housing Development Authority.

This program receives Federal financial assistance for identification and protection of historic properties. Under Title VI of the Civil Rights Acts of 1964, Section 504 of the Rehabilitation Act of 1973, and the Age Discrimination Act of 1975, as amended, the U.S. Department of the Interior prohibits discrimination on the basis of race, color, national origin, disability, or age in its federally assisted programs. Michigan law prohibits discrimination on the basis of religion, race, color, national origin, age, sex, marital status, or disability. If you believe you have been discriminated against in any program, activity, or facility as described above, or if you desire further information, please write to:

Chief, Office of Equal Opportunity Programs
United States Department of the Interior
National Park Service
1849 C Street, NW
Washington, DC 20240

- EXECUTIVE SUMMARY: Briefly describe the scope of the survey project, its purpose and goals, and the results in terms of the survey products, evaluations of eligibility for the National Register of Historic Places, and recommendations for local districting and other actions. Provide a summary of National Register eligibility recommendations and any other recommendations for action from the Evaluation Results and the Planning Needs and Recommendations sections. The executive summary should direct the reader to the appropriate sections of the report (include page numbers) where more detailed information can be found. This information will be copied into the MiSHPO survey submission as the abstract. **As part of the executive summary, the following information is required for all surveys submitted to SHPO.**
    - Number of properties surveyed at the reconnaissance level and at the intensive level: break this down by municipal unit if survey work took place in more than one and break it down by area if survey activities took place in more than one survey area.
    - Number of acres and hectares surveyed (SHPO requires this information as it must be reported to the National Park Service).

- TABLE OF CONTENTS
- CREDITS AND CREDENTIALS: Indicate who worked on each part of the project, their areas of expertise, and how they qualify as historians or architectural historians according to the federal qualifications set forth in 36 CFR 61. This part of the report can also be used to acknowledge funding or other assistance rendered the surveyor or team.
- PROJECT OBJECTIVES AND METHODOLOGY: Explain why the survey was undertaken and the goals and objectives that the survey project was intended to fulfill. What situations, conditions, planning needs, or other circumstances led to the survey and how and by whom were the objectives developed. List any previous surveys or studies relating to the survey area and define any data gaps or outdated information in these studies that warranted new study. Describe in reasonable detail the work program that was developed to carry out the goals and objectives. Provide a verbal description of the survey area boundaries and set forth the various tasks and components of the project and the order in which they were undertaken. Identify sources—such as the local libraries, university archives, county register of deeds, or interviews and personal records of residents—of historical information to be used in the project.
- DATA LOCATION: List repositories for survey material, such as libraries, archives, planning departments, and SHPO. Indicate where copies of the full set of survey materials, photographs, and copies of the report have been deposited for future access.
- EVALUATION RESULTS SUMMARY:
    - RECONNAISSANCE-LEVEL SURVEY: The evaluation results section will contain recommendations concerning individual properties and areas deemed worthy of further study because of some potential for National Register of Historic Places eligibility. For each individual property, complex property, and district recommended for intensive level survey, provide at a minimum a single paragraph statement that contains a summary description of the resource and rationale for why it is viewed as worthy of intensive level study followed, in the case of resources consisting of multiple properties, by a specific boundary description. Provide a map illustrating the boundaries of areas recommended for intensive level survey (See Maps section of this chapter).
    - INTENSIVE-LEVEL SURVEY: The Evaluation Results section should contain specific recommendations concerning individual and complex properties and districts that appear to meet the National Register criteria along with clearly defined boundaries. For each individual or complex property evaluated as National Register eligible, list the property and its street address (or latitude/longitude to six digits) and municipal unit (if the survey included more than one municipal unit). For a district, provide a detailed boundary description and a rationale for the boundaries selected. For each individual and complex property and districts evaluated as National Register eligible, include a short summary description and significance statement that is similar to the summary paragraphs in National Register nominations. For each proposed district, provide a map that shows the boundaries for the district for inclusion in the Evaluation Results section of the report. The map should be no larger than an 8 ½'' x 11'' format or must be able to be folded to that size in a hard copy of the report.
- PLANNING NEEDS AND RECOMMENDATIONS: If appropriate, include recommendations for other measures that should be undertaken to encourage the future preservation of the survey area's historic resources. These can include recommendations for local historic district designation, for educational programs to increase public awareness (books, videos, websites, programming, etc.), for establishing financial incentive programs to encourage historically sensitive rehabilitations of downtown commercial buildings or

homes in historic districts, for zoning changes, etc. This may be more appropriate for surveys conducted during the Section 106 process. Information should also be included regarding Section 106 recommendations and information on avoiding Adverse Effects on the historic properties.

- PRESERVATION ISSUES AND THREATS: In considering the local preservation environment, the surveyors should note any known threats to buildings in the area and the nature of those threats. The surveyor will also be expected to provide information regarding threats to individual buildings.
- SURVEY MAPS: Provide a complete, final set of survey maps. These maps should be reproducible without color copying capabilities.

SURVEY REPORT COMPONENTS: SECTION TWO

Section Two of the report contains a descriptive overview of the survey area, the historical overview and context narratives, plus evaluation sections relating to the historic themes. This section should be arranged in the following order:

- DESCRIPTIVE OVERVIEW: Provide a summary description of the survey area that defines its physical character, including features such as location and setting, topography, land uses, and general character of the historic resources present. For survey areas that comprise several sections, provide a descriptive overview for each section. The description should begin with general information, including a description of the boundaries (if the survey doesn't encompass an entire community) and a discussion of the area's general character, including the setting and topography. More detailed information about the survey area's physical form and layout and its architectural character should follow. The length of the overviews will vary depending on the size and character of the survey areas. Paradoxically, it seems that for a large survey area, such as an entire community, a relatively short overview will generally make sense, while for a relatively small area, such as a neighborhood, a lengthier overview will often be warranted.
- HISTORICAL CONTEXT: See historical overview section above. This section should include a historical sketch of the development of the community that focuses on settlement patterns, immigrant groups, important industries, and dominant architectural traditions. This section should also include information on themes.
    - o THEMATIC NARRATIVES: The thematic narratives should be prepared as described in the Thematic Narratives section of Chapter 4 and should follow the historical overview for the survey area. Each historical narrative should be followed by evaluation standards for the theme and a list of properties associated with it.
- BIBLIOGRAPHY: The required citation style of Michigan SHPO is the most recent edition of the Chicago Manual of Style. The bibliography should contain a list of all references consulted during the course of the survey.

SURVEY REPORT COMPONENTS: SECTION THREE

Section Three of the report comprises the survey data itself, as well as the following components:

- INDEX LIST OF SURVEYED PROPERTIES: This should be organized by street and number in alphabetical and numerical order. The entry in each surveyed property should

reference the map on which the surveyed property is found (if there is more than one survey map). Individual properties and complex properties at single addresses (generally houses or estates, farms, industrial or institutional complexes, or parks or cemeteries) should be listed alphabetically by street and then numerically by address number. Historic districts should be listed alphabetically by historic name at the beginning of the index list.

- INVENTORY FORMS: Provide a complete set of printed Historic Resource Inventory Forms and a Historic District Inventory Form for all surveyed properties. The forms should be arranged in the same order as the index list. The Michigan SHPO has created a template that includes the mandatory terms for survey in the state (See Appendix D).
- SURVEY PHOTOS: Photographs should be taken in accordance with the above standards.

A survey report is an official document summarizing the results of an important planning activity that will hopefully promote and influence the course of historic preservation activities in the survey area for years to come. The credibility of the report and its conclusions and recommendations can be enhanced by a professional appearance or reduced by an appearance that is less than professional. The final version of the report should be free of typographical and grammatical errors. Reports prepared for SHPO will not be accepted if they contain typographical errors and other unprofessional characteristics. The overall layout and graphics, including mapping, should have a polished, professional appearance.

The survey report is not an academic exercise that will never see the light of day, but rather a public document that will likely be scrutinized for years to come not only by preservationists but also by those seeking to demolish historic properties. The report should be written in an objective tone that clearly demonstrates the significance of the historic resources. Avoid damning historic properties with faint praise. For example, the same building was described in earlier and later versions of the same report as follows:

“In contrast to the Ottawa Street Power Station is the extremely modest Art Deco store at 1136 S. Washington Avenue.”

“In contrast to the grandeur of the Ottawa Street Power Station is the modestly sized Art Deco store front at 1136 S. Washington Avenue. Although the building itself is very small, almost tiny, the unique octagonal windows and pencil-line concrete detailing above the twin entries make this building a distinguished and elegant part of the lively South Washington streetscape.”

The first of these statements says nothing to indicate that this building is significant; in fact, the implication is that it is unimportant, and thus expendable. The second statement, especially when read in combination with another statement about the building on a different page in the report makes unmistakeably clear the importance of the building as evaluated by the report’s authors: “One of the city’s unique structures is the diminutive but jewel-like Art Deco building at 1136 S. Washington.”

DISTRIBUTING SURVEY REPORTS

Every survey should be viewed as an opportunity to help preserve Michigan’s significant cultural resources. The survey products provide an explanation of a community’s development and constitute documentation regarding the location and significance of above-ground resources associated with various themes in a community’s history and architecture. These materials can be a tool for a variety of groups besides SHPO, including:

- Planners, to develop strategies to minimize the impact of development projects on significant resources; to facilitate their responsibilities, under federal law, regarding the protection of cultural resources; and to provide a basis for establishing priorities for the rehabilitation or conservation of neighborhoods
- Historic interest groups that promote local history and the preservation of significant properties or areas, that serve an educational role in the community, and that may be a repository for local historic collections

- Property owners desiring information about their houses or businesses
- Teachers, who use local history and the built environment in classes ranging from social studies to history to art
- The media, which needs background information for news coverage and special reports and programming
- Neighborhood organizations that work to enhance the quality of life in specific areas, and
- Youth groups that may sponsor projects that enhance the environment, including historic resources

Thus, survey reports should be widely available to both governmental and planning agencies and members of the general public. A sufficient number of survey reports should be produced to allow for distribution. The following agencies or organizations should receive a copy of the report:

- Local planning department
- County or regional planning agency
- SHPO (One digital copy and one paper copy)
- Local libraries
- Library of Michigan, Lansing
- Local or regional archives and repositories nearest the survey area, such as
    - Burton Historical Collection, Detroit Public Library
    - Michigan Historical Collections, Bentley Library, University of Michigan
    - Clark Historical Library, Central Michigan University
    - The university archives at Michigan Technological University, Oakland University, and Western Michigan University

We also encourage discussing with the local planning department the possibility of incorporating the survey data into a local Geographic Information System (GIS). These discussions should include SHPO staff.

RECOMMENDATION FOR INTENSIVE LEVEL SURVEY FOR AN AREA RESULTING FROM RECONNAISSANCE LEVEL SURVEY

EXAMPLE: "Island" Survey Area, Sault Ste. Marie

This primarily residential area located on the island formed by the St. Mary's River and the power canal contains a potential National Register-eligible historic district for which precise boundaries should be established as a result of intensive level survey work. The potential district extends east from the county courthouse along portions of Maple, Cedar, Spruce, Carrie, Dawson, Kimball, and Brady Streets and St. James Place in the general area bounded on the west by Bingham, north by Portage, east by Johnston, and south by the power canal and Lyon Street. The area contains a rich concentration of large and often high-style late nineteenth- and early twentieth-century houses, including most of the city's most architecturally distinguished Queen Anne houses plus notable examples of "Free Classic," Tudor, Arts-and-Crafts-influenced, and other styles of houses. It contains two substantial houses built with walls of local pinkish-brown sandstone. A row of very fine Arts-and-Crafts houses lines the south side of Carrie west from Johnston. The area also contains the Neoclassical former Carnegie Library building on Cedar Street plus the Gothic Revival (Catholic) St. Mary's Pro-Cathedral complex, which includes the Art Deco St. Mary's School directly behind the church between Maple and Cedar and the large schoolyard that extends west to Spruce.

The area that appears to merit intensive-level survey is bounded by Portage on the north, Bingham on the west, the power canal on the south, and Johnston on the east, and the two brick bungalows on the east side of Johnston south of Carrie.

RECOMMENDATION FOR NATIONAL REGISTER-ELIGIBLE DISTRICT RESULTING FROM INTENSIVE LEVEL SURVEY

EXAMPLE: Schoolcraft Historic District, Schoolcraft

DESCRIPTION: The recommended Schoolcraft Historic District comprises portions of nine blocks on the village's west side and is centered in the area bounded by Haywood on the east, Eliza on the south, West on the west, and Vienna on the north. It contains many of the community's oldest houses, dating from the 1830s and 40s, and some of its most architecturally distinguished houses, including Greek and Gothic Revival, Italianate, Eastlake, and "Free Classic" buildings. Many of the finest of these houses are located along the two blocks of West Cass Street.

SIGNIFICANCE: The proposed Schoolcraft Historic District occupies much of the original plat of Schoolcraft, laid out in 1831 for owner Lucius Lyons and named by him in honor of his friend, Henry R. Schoolcraft, explorer and Indian agent for the Michigan Territory. The commons Lyons set aside for church and school sites survives, having been made into a park in the 1890s after the only building ever constructed there, a church, was removed. The district, comprising almost the entire village before additional areas were platted beginning in 1835, contains the homes of many of the village's earliest white settlers. These include the person who platted the area for Lucius Lyons; the village's and county's first physician (and later the local Underground Railroad conductor); an owner and a proprietor of the village's first hotel, which stood in this area before Grand Street (US-131) was laid out and became the main street; a part owner of the village's first store; the village's first postmaster; and a participant in Michigan's constitutional convention (and later mayor of Kalamazoo). Anumber of these houses date from the early 1830s and are among the oldest buildings in the southwestern part of Michigan. The district's early

building stock contains examples of a broad range of house forms characteristic of the southern part of Michigan and of the New England and New York State origins of the earliest settlers. They include the I-house, gable-front, upright-and-wing, upright-and-double-wing, and gabled-ell forms. Examples of Greek Revival, Italianate, Gothic, Eastlake, and "Free Classic" houses are present, and some of them, especially along West Cass Street, are unusually distinguished examples of their styles within the overall context of the region's building stock.

BOUNDARY DESCRIPTION: the district boundary begins at the NW corner of lot 57; thence S to NW corner of lot 69; th W along N line of lot 68 to center of West St.; th S to center of Clay St.; th W to rear (W) line of lot 78; th S along rear (W) lines of lots from 78 to 139 and to center of Eliza St.; th E to center of West St.; th S along W line of lot associated with 322 W. Eliza to SW corner of property; th E to SE corner of property; th N to center of Eliza St.; th W to E line of lot 140; th N along E linesof lots 140, 137, 128, and 125 to SE corner of lot 116; th E along S line of lots 117 and 118 to SE corner of lot 118; th N along E line of lot 118 to SE corner of lot 111; th E along S line of lot 110 to center of Hayward St.; th N in center of Hayward to a point in line with N line of lot 62; th W along N line of lots 62 and 63 to center of Center St.; th N to a point in line with N line of lot 57; th W to Point of Beginning. All in Original Plat of the Village of Schoolcraft.

BOUNDARY RATIONALE: This boundary was drawn to include the areas within the original plat containing a concentration of houses relating to the village's earliest days as well as other historically and architecturally significant houses while avoiding those areas in which concentrations of historically and architecturally significant properties are not present.

SURVEY AREA DESCRIPTION FOR A COMMUNITY

EXAMPLE

Port Hope is a small village (population of 360 as of 1980) located on the shore of Lake Huron in the Thumb region of Michigan's Lower Peninsula. The Thumb, bounded on the east by Lake Huron north of Port Huron and on the northwest by Saginaw Bay, is a rural, agricultural area generally of low, slightly rolling topography. The principal part of Port Hope from approximately Main Street west lies on a nearly level plain that extends inland in all directions. East of Main Street the land drops off a short distance to a lower terrace along the lakeshore itself. The village is surrounded on the land side by farm country with scattered stretches of forest. A modern county park and several campgrounds and trailer parks occupy much of the lake frontage in the village, but to the north and south the shoreline is wooded and in some cases swampy. US-25 is the principal commercial street, passing through the small central business district, with its handful of clapboards and brick Late Victorian buildings, in the two blocks between School Street and Portland Avenue. US-25 southeast of the point where Main Street cuts off from it follows a modern alignment that cuts diagonally across the historic platted patterns of streets. Main Street on either side of the business district and the streets to the west—First, Second, Third, State, and School—is the residential portion of town and contains a mixture of mostly modest late nineteenth- and twentieth-century houses plus two older churches. The lakeshore terrace to the east historically was the site of mills and elevators, and presently contains several elevator complexes and other commercial enterprises, plus free-standing chimney stacks from long-ago-destroyed saw and planing mills. It appears that many of the streets in the north and southeast parts of town shown in the 1890 map as platted were never opened.

SURVEY AREA DESCRIPTION FOR A NEIGHBORHOOD

EXAMPLE

River Point is bounded on the north and west by the Grand River, east by the Red Cedar River, and south by the railroad line south of South Street, which forms the southern edge of the original part of Lansing platted in 1847. The neighborhood comprises two components, the commercial corridor along South Washington, which spills over slightly onto the side streets, and the larger residential area along Hazel, Elm, South, Grand, and Platt to the east. River Point's distinct edges define the neighborhood's character and make it a place apart from the rest of the city.

The South Washington corridor between the river and the railroad tracks possesses much visual interest because of the variety of older buildings present—from one of the city's largest early twentieth-century apartment buildings to a Spanish Mission-style former gas station to a Moderne enameled metal panel bowling alley to a Neoclassical bank building to one of Lansing's Art Deco jewels to a turn-of-the-century railroad station. The station is located just outside of the survey area; it is listed in the National Register of Historic Places.

The corridor's buildings have survived reasonably intact and restorable despite years of neglect and underutilization. Much of the commercial building stock consists of early twentieth-century two-story Commercial Brick blocks in which the facades rely for their decorative interest not on historical styling but on the brickwork itself. The most commonly seen trademarks of Commercial Brick are panels of brickwork and corbelled brickwork below the upper cornices or roofline. The range of buildings at 1131-1149 S. Washington, although as simply detailed as any Commercial Brick block in the city, are unusual for the uniform façade design with slightly recessed brickwork panels in the friezes carried throughout. The four-store front building at 1000-1006 displays the most intricate brickwork paneling of any of the area's numerous examples. Alternating panels of horizontal stretcher bricks and diagonal stretchers flanking central lozenge ornaments—the panels outlined by bands of headers with square blocks at the corners—stretch across the façade at frieze level. The three-storefront building at 1202-1206 S. Washington (each section of the building today is treated differently, with the central third clad in 1960s-looking metal sheathing that should come off one day) displays a robust Commercial Brick corbelled cornice in which projecting stretchers alternate with recessed headers. The Popoff Meat Co.'s northerly building employs an even more eye-catching corbelling technique in its cornice. In the alternating tiers of projecting and recessed corbelled brickwork, the recessed tiers begin one course above the projecting ones. This results, when sunlight falls on the façade, in a checkerboard-like appearance. Like Commercial Brick buildings elsewhere in Lansing, the South Washington ones exhibit considerable variety in brick hues and textures.

One of the city's unique structures is the diminutive but jewel-like Art Deco building at 1136 S. Washington. This symmetrical two-storefront limestone-clad building displays octagonal shop windows, fluted horizontal banding, chevrons, and dramatic striping on the façade. The façade is completely intact, including the doors with their streamlined push bars.

Another landmark, although not a commercial building, along South Washington is the Washington Arms Apartments located just south of the Grand River. Along with the Porter, located on Townsend at Lenawee, the massive red brick Washington Arms is probably the largest early twentieth-century apartment building in a city which until well into the twentieth-century century was almost exclusively a community of single-family houses, with only a relatively small number of two-family and townhouse buildings.

The streets east of Washington comprise the bulk of the River Point residential neighborhood (a few residential buildings are also found west of Washington, and notice will be taken of one of them in a few paragraphs). The River Point neighborhood is characterized by narrow streets and, except north of Hazel, small lot sizes. Houses stand close by one another and close to the street. Far from being drawback,

these factors along with the abundant shade from large trees give the neighborhood an intimate scale that is one of its most appealing features.

The houses in River Point appear to date primarily from the 1890s to the 1920s. There are none of the larger and more elaborately detailed houses found in some other Lansing neighborhoods. The houses are generally simple and of modest scale. Some of the larger of the oldest houses are narrow-fronted and deep two story, cross-gable houses such as 1135 S. Grand and a brick example at 1145 S. Grand. A number, such as 215 Hazel and 1134 Platt, are gable-front buildings where the entrance stands at the back of a shed-roof side porch. Among the neighborhood's early twentieth-century homes, the two-story square-plan "foursquares" found in other Lansing neighborhoods are present along with a small number of bungalows. The bungalows tend to display simple Arts-and-Crafts-inspired detailing including exposed rafter ends below the broadly projecting roofs and, in the case of 1140 S. Grand, door and window trim with elongated lintels and slanting sides. A small number of Colonials, including narrow and deep Dutch Colonials with their gables to the street such as the one at the southeast corner of Hazel and Grand, are also present. A gable-front turn-of-the century-looking Colonial house at 222 Elm stands out among the neighborhood's dwellings because of its tripartite, with arched center, Palladian-inspired window in the front gable.

Most houses in River Point occupy narrow-fronted and deep lots and thus embody similarly narrow and deep forms. Elm Street presents virtually the only exceptions to this general pattern. A stuccoed, hip-roof, two-family house of Arts-and-Crafts inspiration—the only building constructed as a two family house noted in the neighborhood, at the southwest corner of S. Grand—and a broad-fronted gambrel-roof Dutch Colonial with shed dormer, located on Elm's north side between Grand and Platt, are highly visible buildings because of this broad-fronted orientation.

The neighborhood's only church building stands at the south end of the area on South Street between Grand and Platt. It is a cross-gable, early twentieth-century, auditorium-type church building with a square-plan tower near the façade's midpoint. Simple bargeboards mark the eaves.

The short east-west streets west of Washington retain few buildings. The most notable of them—really one of the outstanding buildings of the neighborhood—stands at 117 S. South. This two-story, symmetrical-front building, presumably once an apartment house, sports an Arts-and-Crafts façade of brick of various hues from red orange to brown that is divided into three vertical bays by boldly projecting piers, the central ones rising well above the tiled pent roofs that top the bays. The central bay's entry and broad windows in either side bay, set within segmental arches and panels of header brick outlined by stretcher brick (itself a reversal of the typical panel treatment), separates the first-floor openings from those above. Another pent-roof building, a smaller one-story commercial building with an arched central entry, stands next door to the west at 121.

River Point today all but turns its back to the river. Although some streets and houses stand close to the Grand and Red Cedar, steep, thickly wooded banks conceal the water from view. The city has developed the small River Point Park at the actual confluence of the Grand and Red Cedar, but, it seems, more could be done to make the rivers' proximity a community asset.

UPDATING PREVIOUS SURVEYS

Areas may require re-surveying because the existing data has become outdated, a higher level of survey is required (an intensive-level survey will replace an old reconnaissance-level one), or the quality of the old survey is unreliable. Whatever the reason, past survey activity may provide information useful for the present project, including:

- Existing site-specific records (inventory cards, forms, or database records);
- Research that can contribute to the current research effort;
- Recommendations regarding eligibility;
- Districting proposals.

The new survey should build upon the old one. The old thematic narratives should not be used as is, but the new survey should be seen as an opportunity to revise and expand them. The aim of a new survey should be to provide survey materials meeting current standards for all properties in the survey area that have previously been surveyed and that meet the survey criteria developed for the re-survey project. A re-survey project should generally be performed at the intensive level; it usually makes little sense to re-survey previously surveyed properties unless the survey will generate additional information. Old surveys often omitted features of complex properties such as carriage house/stable buildings and agricultural outbuildings that would be included in current intensive-level surveys. The new survey provides an opportunity to obtain complete survey data that should not be missed.

The new survey report should include all of the standard products as well as any newly surveyed properties within the re-survey area.

THEMATIC SURVEYS AND CONTEXT STUDIES

Thematic survey is the survey of properties relating to a specific property type or historic theme. Thematic surveys of industrial and engineering sites, highway bridges, post offices, and state parks have been carried out at the statewide level, and myriad other property types or themes such as vernacular log buildings, outdoor sculpture, designed historic landscapes, and the automobile industry could be the subjects of statewide thematic surveys. Thematic surveys within single counties or larger cities are equally feasible.

A survey project in Grand Rapids included thematic surveys of city parks, public school buildings, and cemeteries. Surveys of public schools, apartment buildings, and banks in the city of Detroit have been completed. The Michigan SHPO has undertaken these context studies as a way to better assist planning efforts in these regions. Thematic surveys could involve important aspects of local history, such as the struggle for Civil Rights in Detroit or Detroit's rich twentieth-century heritage as a center for jazz and other forms of popular music. A survey of sites associated with the history of popular music in Detroit, for example, might seek to identify birthplaces and homes of musicians, recording studios, and clubs, ballrooms, and other places where locally and nationally important performers and groups played. The possibilities for thematic surveys and context studies are endless.

Thematic surveys differ from other survey types by requiring an initial property-specific research phase to identify the specific properties to be surveyed or to locate the areas likely to produce resources that merit survey. Standard sources of information such as published histories, typically used for surveys, may not be as useful in thematic surveys, and research in specialized sources of information appropriate to the project will be needed. A statewide survey of historic railroad bridges might require a search for railroad company records, engineering and railroad journals and bridge company records and catalogs that might provide information on specific structures, and a review of maps to locate likely points for major bridges. Surveys of Civil Rights struggle-related sites or popular music-related sites in Detroit would probably require numerous oral history interviews. A survey of the Finnish farmsteads in the Upper Peninsula would likely require research in old maps and census records to determine where the concentrations of Finnish settlements were located.

Surveyors will need to devise research strategies appropriate for identifying and documenting the resources to be surveyed. Persons with specialized knowledge of the survey's subject matter should be involved in the project at the earliest planning stage. In carrying out a thematic survey, the general instructions for intensive-level survey provided here should be followed. However, a thematic survey must begin with a research phase both to document the theme itself and to identify and document the associated properties. The thematic research will lead to the preparation of a single thematic narrative that includes discussion of associated property types.

Many thematic surveys are done under contract with SHPO. These projects often involve the preparation of inventory forms and a Multiple Resource Documentation Form for the National Park Service. In addition to this form, these surveys must include a separate survey report following the guidelines outlined in this document. Consultants should utilize site forms following the example in Appendix D for the creation of their inventory forms. These items must also be entered in the MiSHPO system as outlined in this document.

SURVEY AND SECTION 106

As a part of their compliance with Section 106 of the National Historic Preservation Act, federal agencies and their designees have the responsibility to identify historic properties that may be affected by an undertaking. An undertaking is a federally assisted or licensed project, such as housing rehabilitation and demolition, streetscape improvements, new road construction and road reconstruction or realignment, airport expansions and renovations, water and sewer projects, new bank branches, railroad line abandonments, and communication towers. Under Section 106, federal funding or licensing agencies (or their designees when permitted under federal regulations) must provide SHPO with data on historic properties that might be affected by their proposed projects along with substantive comments on the eligibility of those properties. The submission of this information is a prerequisite to obtaining comments from SHPO on the effects of the projects on historic above-ground resources. Projects that involve both above-ground and below-ground disturbances should also contact the State Archaeologist to conduct appropriate file reviews of below-ground sites in the project area.

The APE for a project should be defined in consultation with SHPO. **Please note that the area of potential effects (APE) is not simply the project's physical boundaries or right of way.** It is important to understand this. The APE is defined as the geographic area or areas within which an undertaking may directly, or indirectly, cause changes in the character or use of historic properties. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by an undertaking. In defining the APE, you must consider not only physical effects but also visual, auditory, and sociocultural (i.e. land use, traffic patterns, public access) effects.

The potential National Register of Historic Places eligibility of properties that may be affected by a federally assisted or licensed project must be reviewed in the context of the neighborhood or area in which they are located. The agency requesting SHPO's review must provide sufficient information to answer the question, "What are the historic properties either listed in or eligible for listing in the National Register of Historic Places within the area of potential effect (APE) for the project?" This includes determining not only whether affected properties may be individually eligible for the National Register, but also whether they may contribute to the historic character of a larger area or district that as a whole meets the National Register criteria. Competent professionals meeting the federal professional qualifications for historian and architectural historian should perform the work.

WORK PROGRAM

Federal agencies or their federally delegated designees ("Responsible entities" for HUD-funded projects) must perform the following in order to provide the basic information SHPO requires. This information will be used to make informed determinations of eligibility and effect for properties in the APE:

1. A visual inspection of the exterior of each property in the APE and of the surrounding neighborhood to
    a. Evaluate the architectural character and integrity
    b. Determine if properties in the APE may be part of a National Register-eligible district and if so, to define the district's boundaries.
2. Contact SHPO to
    a. Review National Register listings for the community
    b. Determine whether SHPO has previously established firm boundaries for a National Register-eligible district in the area.
3. Research the properties in the APE and document their histories, using standard sources such as
    a. Historic atlases and plat books
    b. Directories and published sources such as county and local histories
    c. Tax records
    d. Interviews with current and past property owners, local historians, and long-term residents

APPENDIX A

HISTORIC ARCHITECTURE SURVEY GLOSSARY OF TERMS

These definitions were obtained from the National Park Service National Register Bulletins 15, 24, and 16a.

ARCHITECTURE CLASSIFICATION – Item on the National Register form calling for the entry of an architectural style or other term by which the property can be identified.

BUILDINGS – A building, such as a house, barn, church, hotel or similar construction is created to shelter any form of human activity. Building may also refer to a historically and functionally related unit, such as a courthouse and jail or a house and barn. Examples include stables, sheds, garages, courthouses, city halls, social halls, commercial buildings, libraries, factories, mills, train depots, stationary mobile homes, theaters, schools, and stores.

DISTRICT – A district possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development. Examples include college campuses, central business districts or other commercial areas, residential areas, industrial complexes, civic centers, rural villages, large farms, ranches or estates, and large landscaped parks.

FORM CLASSIFICATION – the item on the National Register form calling for the architectural form or other term by which the property can be identified.

HISTORIC CONTEXT – An organizing structure for interpreting history that groups information about historic properties that share a common theme, common geographical area, and a common time period. The development of historic context is a foundation for decisions about the planning, identification, evaluation, registration, and treatment of historic properties, based upon comparative historic significance.

HISTORIC INTEGRITY – the unimpaired ability of a property to convey its historical significance.

HISTORIC RESOURCE – a building, site, district, object, or structure evaluated as historically significant.

IDENTIFICATION – the process through which information is gathered about historic properties.

LANDSCAPE – A landscape is a collection of organized features that can range from something as small as a birdbath to large fields or orchards. The U.S. Secretary of the Interior has defined the following six components of a landscape that must be identified and documented if the character of the landscape property is to be understood: spatial organization and land patterns; topography; vegetation; circulation; water features; and structures, site furnishings, and objects.

OBJECT – The term object is used to distinguish from buildings and structures those constructions that are primarily artistic in nature or are relatively small in scale and similarly constructed. Although it may be, by nature or design, movable, an object is associated with a specific setting or environment, such as statuary in a designed landscape. Examples include sculpture and statuary, monuments, fountains, fences and streetlights.

PROPERTY TYPE – a grouping of individual properties characterized by common physical and/or associated attributes.

RESOURCE – any building, structure, site or object that is part of or constitutes a historic property.

RESOURCE TYPE – the general category of property – building, structure, site, district, or object – that may be listed in the National Register.

SETTING – quality of integrity applying to the physical environment of a historic property.

SIGNIFICANCE – Importance of a historic property as defined by the National Register criteria in one or more areas of significance.

SITE – A site is the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historic, cultural, or archaeological value regardless of the value of an existing structure. Examples commonly encountered in above-ground surveys include estate and other grounds, gardens, ruins of historic buildings and structures, cemeteries, parks, and designed landscapes.

STRUCTURE – The term structure is used to distinguish from buildings those functional constructions made usually for purposes other than creating shelter. Examples include bridges, tunnels, dredges, fire towers, canals, dams, power plants, water purification and sewage treatment plants, water towers, corncribs, silos, roadways, windmills, grain elevators, kilns, railroad grades, systems of roadways and paths, boats and ships, railroad locomotives and cars, carousels, bandstands, gazebos, and aircraft.

STYLE – in this case, it is the architectural style that is not on the list of the pre-defined NPS-acceptable terms for the National Register Form. If “other” is selected for the Architectural Classification field, then Style should indicate what the “other” is.

SURVEY – A survey is a systematic search for properties that possess or appear to possess significance to national, state, or local history. Survey is the process of identifying and gathering data on properties that may be historic. It includes field survey, the physical search for and recordation of basic information about historic and potentially historic properties; background research to establish the historic context for the properties within the project area; and historical research on surveyed properties.

THEME – a trend or pattern in history or prehistory relating to a particular aspect of cultural development, such as dairy farming or silver mining.

APPENDIX B

FARMSTEAD AND HISTORIC LANDSCAPE SURVEY STANDARDS

Urban, suburban, and rural survey areas may contain properties and areas that possess significance as historic landscapes. The U.S. Secretary of the Interior has defined the following six components of a landscape that must be identified and documented if the character of the landscape property is to be understood: spatial organization and land patterns; topography; vegetation; circulation; water features; structures; site furnishings; and objects. The degree of importance of any of these features depends on the landscape and its use.

The most likely types of historic landscapes encountered in the field are the Historic Designed Landscape and the Rural Historic Landscape. Before beginning work, surveyors should review *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for the Treatment of Cultural Landscapes*; National Register Bulletin 18, *How to Evaluate and Nominate Designed Historic Landscapes;* and National Register Bulletin 30, *Guidelines for Evaluating and Documenting Rural Historic Landscapes*, for insights into identifying and documenting these important historic resources.

A Historic Designed Landscape is defined in Bulletin 18 as a landscape:

- Significant as a design or work of art
- Consciously designed and laid out either by a master gardener, landscape architect, architect, or horticulturalist to a design principle, or by an owner or other amateur according to a recognized style or tradition, or
- That has a historical association with a significant person, trend, or movement in landscape gardening or architecture, or a significant relationship to the theory or practice of landscape architecture

Historic designed landscapes may include parks, squares and other public spaces, cemeteries, parkway or boulevard systems, small residential grounds, estates, campus or institutional grounds, gardens, golf courses, and planned subdivisions and communities, including mobile-home parks/manufactured housing developments.

A Rural Historic Landscape is defined in Bulletin 30 as:

- A geographic area that historically has been used by people, or shaped or modified by human activity, occupancy, or intervention, and that possesses a significant concentration, linkage, or continuity of areas of land use, vegetation, buildings and structures, roads and waterways, and natural features. Rural landscapes often reflect the day-to-day occupational activities of people engaged in traditional work activities such as mining, fishing, and various types of agriculture. Often, they have developed and evolved in response to both the forces of nature and the pragmatic need to make a living.

Rural historic landscapes often contain large acreage and proportionally small numbers of buildings and structures compared to other types of historic properties. Examples of rural historic landscapes in Michigan include: agricultural districts, industrial districts of a series of mine complexes or remnants, a fishing village or complex, and a district of recreational camps.

SURVEYING HISTORIC LANDSCAPES

Survey forms should be customized in consultation with SHPO for a historic landscape depending on whether the landscape forms a single complex property, such as a park, cemetery, residential grounds, an estate, or a number of complex properties. For single complex property surveys, any feature that appears several times on the landscape such as a fence or wall system, should be recorded on a single form with the quantity included. For cemeteries, records should be created for all public monuments and memorials, such as veteran memorials. Private monuments and memorials should be surveyed when they mark the resting place of historically significant individuals, when they possess special artistic

merit or unique design, or when they are rare examples of a type (e.g. iron cross markers from old Catholic cemeteries).

For multiple complex properties forming a historic landscape, each property should have its own site form. Examples include the following:

- A Rural Historic Landscape that is a rural agricultural district consisting of a group of farms, each of which contains historic features that require survey;
- A Designed Historic Landscape that is a planned residential district in which each individual property contains historic features that require survey.

Survey data for a Rural Historic Landscape should be captured on both a survey form and in the description field as appropriate. Some of the items collected could include:

- Land uses and activities
- Patterns of spatial organization
- Response to the natural environment
- Cultural traditions
- Circulation networks
- Boundary demarcations
- Vegetation related to land use
- Buildings, structures, and objects
- Clusters
- Archaeological sites
- Small-scale elements

Survey data for Designed Historic Landscapes should be captured on both a survey form and in the description field as appropriate. Some of the items collected could include:

- Overall form and plan of the landscape.
- Approximate size of the landscape—Convey the scale of the landscape in terms of acres or square miles, as appropriate.
- Topography—Describe whether the land is flat, rolling, hilly, or varied in relief.
- Natural features—Describe natural features, such as rivers, lakes, hills, or bluffs that help define the landscape.
- Circulation systems of roads, paths, trails, etc.
- Spatial relationships and orientation, such as symmetry, asymmetry, and axial alignment.
- Views and vistas in to and out of the landscape.
- Vegetation—Ideally, describe the common name with caliper for trees and heights for shrubs (and put this information onto maps). At the least, describe the primary types and locations of vegetation. Mention the extent of tree cover, using appropriate terms such as grove, scattered trees, forest, wooded area, and specimen tree. If possible, name the species of trees or describe whether trees are coniferous (evergreen) or deciduous. Include the general maturity of trees. Use a similar approach to describing shrubs and their arrangement on the landscape. Flowers and other low-growing plants should be described in terms of their placement on the landscape: in beds, naturalistic plantings, planters, or specialty gardens.
- Bodies of water such as pools, fountains, lakes, streams, and cascades.

- Number and general character and location of buildings, structures, and objects present.

Photography should include an appropriate number of images to thoroughly document the entire district and individual complexes or features. The views should be taken from different directions and include one or more that illustrate the street frontage.

A single survey map should be prepared for each surveyed complex in accordance with the general survey mapping instructions. The map should include the entire district, not just areas containing the buildings. All surveyed resources should be plotted and labeled. The survey map should also illustrate those important features not surveyed but included on the survey form for the entire property.

SURVEYING FARM PROPERTIES

Farm properties commonly consist of farmstead areas containing houses, barns and other outbuildings plus the remainder of the farm properties, which may include a combination of features such as crop and pasture areas, woodlots, orchards and gardens, lanes, windbreaks, and ponds. Additional buildings such as hay barns and migrant housing clusters may stand outside of the main farmstead area. Small-scale features such as fencing, windmills, wells, and bridges may also be present. These human-built and natural elements plus the overall features of land use and circulation patterns define the character of farm properties.

A survey of farm properties should provide information on the entire property, including a comparison of the current historic patterns of land use and the physical layout as far as it can be determined. It should provide information on all buildings, structures, and other component features.

The surveyor must complete survey forms for the entire property and also individual survey forms for each of the buildings, structures, and objects regardless of age. Survey forms must also be made to cover all examples of any features that appear several times on the landscape such as fencing or wall systems. Historic vegetation associated with human occupation and use—such as windbreaks, tree lines along roads or drives, specimen trees, garden beds, and sugarbushes—should be included on survey forms, when historic information on the origins and uses of these features can be obtained. If information on the origin and use of the features is not found then they should be described and mentioned in the survey form for the larger farmstead.

Photography will include an appropriate number of images to thoroughly document the entire farm and individual features. The views should be taken from different directions and include one or more that illustrate the street frontage.

A single survey map must be prepared for each surveyed farm in accordance with the general survey mapping instructions. The map must include the entire property, not just the area containing the buildings. All surveyed resources must be plotted and labeled. The survey map should also illustrate those important features not surveyed but included on the survey form for the entire farm.

APPENDIX C

CONTRACTING SURVEYS

Survey Sponsors seeking consultants for survey work should develop a Request for Proposal (RFP) for the project. A clear RFP, with work and work products explicitly stated, helps consultants prepare more accurate budgets. If the work program is vague, consultants may have to compensate by pricing for unknown or unclear aspects of the work, and disagreement over the expected products may result at the end of the project. It is a good idea to request that the SHPO Survey Coordinator review the RFP before it is sent out to consultants.

The RFP should define the work program and products as fully as possible. It should clearly and thoroughly define:

- The work the consultant is expected to perform;
- The products—including the number of copies—to provide at the end of the project;
- The boundaries of the survey area, clearly defined in writing and illustrated by a map or series of maps;
- The expectations for the level of property-specific research, including what sources of information the consultant will be expected to use for all properties, and what additional research will be required for a specific number of apparently more significant properties, if that information is available;
- The total number of properties to be surveyed and a breakdown of the numbers by level of research, if possible;
- The time frame within which the project must be completed;
- Services or materials that may be provided to the consultant at the consultant's request; and
- Expectations for meetings the consultant will be expected to attend or presentations the consultant will be expected to make.

The RFP should clearly define the information that consultants must submit in their proposals, including:

- A thorough description of the work to be performed and the final products to indicate whether or not consultants have a clear understanding of what will be required;
- A plan of action for accomplishing the work. This should include a breakdown of the work by components and personnel and a schedule with time frames for each component;
- Educational background and related work experience of the personnel working on the project;
- Writing samples for personnel involved in preparing the report;
- Professional References.

Finally, the RFP should specifically list the criteria against which proposals will be evaluated. The criteria should award points to proposals that demonstrate:

- A solid understanding of the work and products required;
- An adequate program and realistic time frames for successful completion of the project; and
- Personnel with the necessary educational background, work experience, and proven track record of successfully completed projects.

Cost is obviously an important consideration, but no proposal should be considered unless it fully meets the evaluation criteria set forth above.

MISHPO TERMS LIST

Below is a list of some of the acceptable MiSHPO terms.

OWNER TYPE:

- Private
- Public-Local
- Public-State
- Public-Federal

PROPERTY TYPE:

- Apartment building
- Bridge
- Commercial district
- Duplex
- Farm
- Lighthouse
- Railroad depot
- Residential district
- Rowhouse
- Service station
- Ship

FORMS

BUILDING FORMS

- A-frame Building
- Octagon Building
- Polygon Building
- Quonset Building – use for Quonset or other arch-rafter structure with semi-cylindrical roof and non-existent side walls
- Round Building

HOUSE FORMS

- American Foursquare
- Basilica Plan House – use in place of Hen and Chicks
- Bungalow
- Cruciform House
- Cup and Saucer House
- Front-gabled House
- Gabled Ell
- Half Basilica House
- Hall and Parlor House
- Hen and Chicks – use Basilica Plan

- I-House
- New England Large House
- New England 1½ Cottage
- Pyramidal Cottage
- Ranch House
- Upright and Double Wing House
- Upright and Wing
- Basement Barn
- English Barn
- Pennsylvania Barn
- Pole Barn
- Southwestern Michigan Dutch Barn

COMMERCIAL BUILDING FORMS: Use the following terms as appropriate. See Richard Longstreth's *The Buildings of Main Street* (Walnut Creek, CA: AltaMira Press, 2000).

- Arcaded Block
- Enframed Block
- Enframed Window Wall
- One-part Commercial Block
- Stacked Vertical Block
- Temple Front
- Three-part Vertical Block
- Two-part Vertical Block
- Vault (Architecture)

INDUSTRIAL BUILDING FORMS: Use the following terms as appropriate. See Betsy Hunter Bradley's *The Works: The Industrial Architecture of the United States* (NY: Oxford University Press, 1999)

while it is in the possession of the Commission or its staff. After completing its review of the supplemental information, the Commission or its staff will return or destroy it, if the Registrant complies with the procedures outlined in Rule 418 under the Securities Act [17 CFR 230.418].

7. Each exhibit identified in the exhibit index (other than an exhibit filed in eXtensible Business Reporting Language) must include an active link to an exhibit that is filed with the registration statement or, if the exhibit is incorporated by reference, an active hyperlink to the exhibit separately filed on EDGAR. If the registration statement is amended, each amendment must include active hyperlinks to the exhibits required with the amendment."

* * * * *

Note: The text of Form N–3 does not, and these amendments will not, appear in the *Code of Federal Regulations.*

■ 13. Amend Form N–3 (referenced in §§ 239.17a and 274.11b), Cover Page, by adding a new paragraph immediately after the sentence ["t]he Commission also may use the information provided on Form N–3 in its regulatory, disclosure review, inspection, and policy making roles" To read as follows:

* * * * *

A Registrant is required to disclose the information specified by Form N–3, and the Commission will make this information public. A Registrant is not required to respond to the collection of information contained in Form N–3 unless the Form displays a currently valid Office of Management and Budget ("OMB") control number. Please direct comments concerning the accuracy of the information collection burden estimate and any suggestions for reducing the burden to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549. The OMB has reviewed this collection of information under the clearance requirements of 44 U.S.C. 3507.

* * * * *

Note: The text of Form N–CEN does not, and these amendments will not, appear in the *Code of Federal Regulations.*

■ 14. Amend Form N–CEN (referenced in § 274.101) by replacing the Instruction following Item F.3 and replacing Item F.18 to read as follows:

* * * * *

Part F: Additional Questions for Unit Investment Trusts

* * * * *

Item F.3. * * *

Instruction. If the answer to Item F.3 is yes, respond to Item F.12 through Item F.19. If the answer to Item F.3 is no, respond to Item F.4 through Item F.11, and Item F.17 through Item F.19.

* * * * *

Item F. 18. Reliance on rule 12d1–4. Did the Registrant rely on rule 12d1–4 under the Act (17 CFR 270.12d1–4) during the reporting period? [Y/N]

* * * * *

Note: The text of Form N–PX does not, and these amendments will not, appear in the *Code of Federal Regulations.*

■ 15. Amend Form N–PX (referenced in § 274.129), Cover Page by removing "§§ 239.24 and 274.5 of this chapter" and adding, in its place, "17 CFR 239.24 and 274.5".

Note: The text of Form N–MFP does not, and these amendments will not, appear in the *Code of Federal Regulations.*

■ 16. Amend Form N–MFP (referenced in § 274.201), in Item A.14.c. by removing the term "A.14.a–c." and adding, in its place, the term "A.14.a–b."

PART 275—RULES AND REGULATIONS, INVESTMENT ADVISERS ACT OF 1940

■ 17. The authority for part 275 continues to read, in part, as follows:

Authority: 15 U.S.C. 80b–2(a)(11)(G), 80b–2(a)(11)(H), 80b–2(a)(17), 80b–3, 80b–4, 80b–4a, 80b–6(4), 80b–6a, and 80b–11, unless otherwise noted.

* * * * *

Section 275.204–2 is also issued under 15 U.S.C. 80b–6.

* * * * *

Section 275.204–5 is also issued under sec. 913, Public Law 111–203, sec. 124 Stat. 1827–28 (2010).

* * * * *

§ 275.204–2 [Amended]

■ 18. In § 275.204–2 amend paragraph (a)(15)(ii) by removing "." and adding, in its place, "; and".

§ 275.204–3 [Amended]

■ 19. In § 275.204–3 amend paragraph (b) by removing "Subject to paragraph (g), you" and adding, in its place, "You".

§ 275.204–5 [Amended]

■ 20. In § 275.204–5 amend paragraph (e)(1) by removing "§ 275.204–1(b)(3)" and adding, in its place "§ 275.204–1(b)".

§ 275.206(4)–1 [Amended]

■ 21. In § 275.206(4)–1 amend paragraph (b)(2)(i) by removing "," and adding in its place ";".

PART 279—FORMS PRESCRIBED UNDER THE INVESTMENT ADVISERS ACT OF 1940

■ 22. The authority for part 279 continues to read, in part, as follows:

Authority: The Investment Advisers Act of 1940, 15 U.S.C. 80b–1, *et seq.*, Public Law 111–203, 124 Stat. 1376.

Note: The text of Form ADV does not, and these amendments will not, appear in the *Code of Federal Regulations.*

■ 23. Amend Form ADV (referenced in § 279.1) by:

■ a. In General Instruction 4 to Form ADV removing "Section 10 of Schedule R" and adding, in its place, "Section 4 of Schedule R"; and

■ b. In the Instruction to Section 4.B.7 of Schedule R removing "pre-fill Schedule B with the same indirect owners you have provided in Schedule B" and adding, in its place, "pre-fill the chart below with the same indirect owners you have provided in Schedule B for your *filing adviser*".

* * * * *

Curation of Federally Owned or Administered Archeological Collections

AGENCY: National Park Service, Interior.

ACTION: Final rule.

SUMMARY: The National Park Service amends regulations governing the curation of federally owned or administered archeological collections to establish definitions, standards, and procedures to dispose of material remains that have insufficient archeological interest. This rule promotes more efficient and effective curation of archeological collections.

DATES: This rule is effective May 16, 2022.

FOR FURTHER INFORMATION CONTACT: Karen Mudar, Archeology Program, National Park Service, 1849 C Street NW, Washington, DC 20005, 202–354–2103, email: *karen_mudar@nps.gov.* Individuals in the United States who are deaf, deafblind, hard of hearing, or have a speech disability may dial 711 (TTY, TDD, or TeleBraille) to access telecommunications relay services. Individuals outside the United States should use the relay services offered within their country to make international calls to the point-of-contact in the United States.

SUPPLEMENTARY INFORMATION:

Background

Authority To Promulgate Regulations

The Archaeological Resources Protection Act (ARPA; 16 U.S.C. 470aa–mm) authorizes the Secretary of the Interior (the Secretary) to promulgate regulations for the disposition of archeological and other resources recovered under the authority of ARPA, the Reservoir Salvage Act (RSA; 54 U.S.C. 312501–312508), and the Antiquities Act (54 U.S.C. 320301–320303). 36 CFR part 79's disposition process for resources recovered under ARPA, RSA, and the Antiquities Act is authorized thereunder. In addition, the National Historic Preservation Act (NHPA; 54 U.S.C. 302107 and 306131) authorizes the Secretary to promulgate regulations for the proper curation of archeological collections created under ARPA, RSA, and NHPA. 36 CFR part 79's curation requirements for resources recovered under ARPA, RSA, and NHPA are authorized thereunder. The Department of the Interior's Departmental Manual entitled ''Protection of the Cultural Environment'' (519 DM 2.3D) requires the Departmental Consulting Archeologist (DCA), located within the National Park Service (NPS), to develop regulations concerning the preservation of prehistoric and historic material remains of archeological interest under ARPA.

Regulatory History

The regulations at 36 CFR part 79 establish definitions, standards, procedures, and guidelines to be followed by Federal agencies to preserve collections of prehistoric and historic material remains and associated records that generally include those resulting from a prehistoric or historic resource survey, excavation, or other study conducted in connection with a Federal action, assistance, license, or permit.

As currently written, 36 CFR part 79 does not discuss processes for Federal agencies to dispose of particular material remains from archeological collections. It is important for Federal agencies to establish appropriate methods of disposal because prehistoric or historic material remains improperly disposed of could later be rediscovered and misinterpreted by archeologists or others as evidence of activity in the distant past. A proposed rule to establish procedures for discarding particular material remains from Federal collections was published in the **Federal Register** in 1990 (55 FR 37670, September 12, 1990). A final rule was never published. Instead, the DCA focused on the proper curation of federally owned or administered collections and left the subject of disposal of material remains for a future rulemaking.

In recent years, renewed interest from Federal agencies to address the issue of deaccessioning certain material remains has led to the promulgation of this rule. Specifically, Federal agencies such as the Department of Defense asked the DCA to help them find solutions to the growing costs of managing archeological collections. The NPS published a proposed rule in the **Federal Register** on November 18, 2014 (79 FR 68640).

Final Rule

This rule establishes procedures for the disposal of particular material remains of insufficient archeological interest that are held in federally owned or administered archeological collections. The procedures are not intended to apply to entire collections. Material remains refers to artifacts, objects, specimens, and other physical evidence, including human remains, of a historic or prehistoric resource. Federal agencies are responsible for ensuring that disposition of material remains is conducted in accordance with this rule and 36 CFR 79.7 ''Methods to fund curatorial services.'' This rule does not affect any material remains defined as ''cultural items'' by the Native American Graves Protection and Repatriation Act (NAGPRA; 25 U.S.C. 3001 *et seq.*) and subject to that statute. NAGPRA cultural items include Native American human remains, funerary objects, sacred objects, or objects of cultural patrimony.

In addition to providing a mechanism for appropriate and carefully considered disposition, this rule will improve the curation of federally owned or administered archeological collections, such as by promoting more effective space and cost management. This rule addresses many of the comments submitted in 1990 by incorporating independent advice and opinions supplied by numerous experts that were consulted between 2005 and 2013. The NPS stresses that the disposition process laid out in this rule must be employed as part of a comprehensive collection management program that emphasizes collection stewardship and responsible accessioning practices. The best deaccession policy is a good accession policy. This rule provides measures to allow for deaccessioning only as a last resort. The NPS recommends that, in addition to proposing deaccession, agencies implement carefully designed field collection policies and create and implement clear and thoughtful scope of collections statements. Consistent with the Secretary's authority to promulgate regulations for ultimate disposition of certain material remains, this rule uses the term disposition throughout. The NPS acknowledges the museum practice of deaccessioning will be an integral and parallel part of the disposition process described in this rule.

In addition to adding a new Subpart E—Disposition of Particular Material Remains (Sections 79.12–79.18), this rule organizes existing sections 79.1–79.11 into Subparts A (Administrative Provisions), B (Archeological Collections Management), C (Public Access to and Use of Collections), and D (Inspections and Inventories of Collections). This rule also revises sections 79.1–79.4 to update legal citations, removes paragraph designations for defined terms in section 79.4 as recommended by the Office of the Federal Register's Document Drafting Handbook, and adds two defined terms that are used in Subpart E. A section-by-section analysis of the rule can be found in the Background section of the proposed rule.

Summary of Public Comments

The NPS published a proposed rule in the **Federal Register** on November 18, 2014 (79 FR 68640). The NPS accepted comments on the proposed rule through the mail, hand delivery, and through the Federal eRulemaking Portal at *http://www.regulations.gov.* Comments were accepted through February 17, 2015. The NPS received comments from individuals, federally recognized tribes, state and local government agencies, public institutions, and professional organizations. Summaries of the issues raised in the comments and responses from the NPS are provided below.

Disposition Process

1. Comment: Several commenters addressed the notification and consultation requirements in the

proposed rule. Commenters requested more time be given to interested parties to comment on a proposed disposition, and that additional direct notice be given to interested parties during the disposition process. Commenters asked that the Federal Agency Official (FAO) take additional steps to engage with public stakeholders during the disposition process.

NPS Response: The NPS made several changes in the final rule to ensure there is sufficient notice provided to interested parties during the disposition process. The NPS added a requirement that the FAO provide at least 60 days for notified entities to comment on a proposed disposition. The NPS increased the time allowed for objecting to a final determination of disposition from 30 to 60 days. The NPS added to the list of parties who must receive notice of proposed dispositions by including state archeologists, certain private landowners, broader categories of Indian tribes with cultural relationships to material remains in the collections, and organizations and institutions for which the agency has an existing relationship for research, excavation, curation, education, or other partnership in the state and region from which the material remains to be disposed were recovered. The NPS believes these notice requirements will sufficiently involve the relevant stakeholders in the disposition process prior to any determination of disposition published in the **Federal Register**.

2. Comment: Two commenters recommended that the rule limit the amount of time given to the FAO to choose a method of disposition.

NPS Response: The NPS declines to adopt this recommendation because it is important to preserve flexibility in this part of the disposition process, so that the most appropriate method is chosen. Time limits are required in other phases of the process such as during the periods for commenting on and objecting to determinations of disposition. A time limit at this stage would not further the purpose of the rule because agencies could be motivated to forego considered deliberation in order to select a method of disposition merely to meet a time limit.

3. Comment: One commenter argued that judgements other than those of the Indian Claims Court, as well as other types of documentation, should be allowed to determine aboriginal occupancy of land for purposes of whether an Indian tribe may receive deaccessioned materials excavated from lands other than Indian lands. Another commenter argued that culturally affiliated tribes that request deaccessioned material remains should be allowed to receive them.

NPS Response: The NPS has added two methods of disposition in paragraph 79.13(b) to accommodate these requests. Aboriginal occupation of lands where material remains were removed can now be documented by any type of evidence. The final rule allows material remains to be conveyed to federally recognized Indian tribes for the purposes of traditional, cultural, educational, or religious practices.

4. Comment: One commenter asked whether deaccessioned materials could be reused for educational or interpretive purposes (*i.e.,* adaptive reuse).

NPS Response: Deaccessioned materials may be used for educational or interpretive purposes. The methods of disposition in section 79.13 allow for such reuse. The rule is therefore sufficiently flexible to allow adaptive reuse after material remains have been deaccessioned.

5. Comment: One commenter argued that all methods of disposition are unacceptable because disposition is not a preservation activity.

NPS Response: ARPA section 5 (16 U.S.C. 470dd) specifically authorizes the Secretary of the Interior to promulgate regulations providing for the ultimate disposition of archeological resources. A requirement for specific disposition methods to constitute a preservation activity has no basis in the statutory authority.

6. Comment: Two commenters requested that the NPS list the methods of disposition in priority order for material remains excavated from public lands. One commenter requested that the rule provide a clear step-by-step process.

NPS Response: The NPS declines to impose a priority order on the methods of disposition because this would unduly restrict the discretion given to FAOs to dispose of deaccessioned material remains in the manner most appropriate to the situation. With the goal of making the disposition process as clear as possible, the NPS has provided a step-by-step process for an FAO to follow.

Federal Agency Official (FAO)

7. Comment: One commenter asked the NPS to identify the level of government where the FAO is located.

NPS Response: The FAO is defined in section 79.4 to mean ''any officer, employee or agent officially representing the secretary of the department or the head of any other agency or instrumentality of the United States having primary management authority over a collection that is subject to this part.'' In practice, the FAO is typically situated at the departmental, national, headquarters, or equivalent level of the agency, unless the agency has a different policy.

Collections Advisory Committee

8. Comment: Several commenters asked that individuals from outside of the Federal government be invited to participate on the collections advisory committee. One commenter proposed that any disposition should be contingent on a consensus recommendation from the collections advisory committee. Another commenter suggested that the DCA should not be eligible to serve on a collections advisory committee. Several commenters recommended that qualified experts be given more influence on the committee, while one commenter argued that the collections advisory committee should be made up of individuals who are professionally disinterested or distanced from the material remains being considered for disposition.

NPS Response: The NPS has revised the rule to clarify the qualifications necessary to serve on a collections advisory committee. The NPS added a requirement that the committee make consensus recommendations to the FAO about proposed dispositions. The NPS also added a provision stating that the DCA may not participate on the committee, because the DCA may be called upon to make recommendations in the case of a dispute. With the exception of certain Tribal officials specified in paragraph 79.15(e)(3), the NPS declines to delegate the responsibilities of Federal agencies for federally owned or administered property to non-Federal employees through an expansion of the composition of the committee. In order to increase the transparency of the committee, the final rule requires the collections advisory committee to prepare a written report for the FAO that contains, at a minimum, the following:

- The information required for the **Federal Register** notice of determination of disposition identified in paragraphs (i)(1)(i) through (iii) of section 79.15;
- The membership of the committee and their role and expertise pertinent to the deliberations;
- The committee's recommendations, including any conditions of transfer or conveyance; and
- An explanation of why the committee determined other methods of disposition were of lesser public benefit.

9. Comment: Several commenters asked the NPS to include specific procedures in the rule that collections advisory committee members must follow in order to make recommendations to the FAO about proposed dispositions, rather than allowing the committee to determine their own rules. One commenter recommended that the committee have clearly written procedures, including timelines and opportunities for public consultation and input. Another argued that the rule should identify the specific tasks and procedures of the collections advisory committee. One commenter proposed that the regulations establish a single committee to review every proposed disposition.

NPS Response: The rule supports the need for flexibility in the disposition process, including in the formation and operation of collection advisory committees. The NPS believes these committees must address the unique circumstances of each proposed disposition, as well as reflect the unique needs, capacities, and operating environments of the responsible Federal agencies, which a single central committee could not do. However, the rule also establishes some basic requirements about the composition and operation of the committees to enable appropriate recommendations. In order to strike a balance between fostering flexibility and imposing standard requirements, the rule establishes qualifications for committee membership and requires written procedures to be approved by the FAO. The NPS believes this is sufficient to ensure all recommendations are fair, open, timely, and in the best interest of the public. Mandating specific rules of procedure for each committee would be unduly rigid and make the work of the committees more difficult because they would be forced to apply strict rules to the unique situations and capacities of each committee. Although the regulations require that the composition of the committees be tailored to the characteristics of each disposition, nothing in the regulations prevents the same committee from reviewing more than one disposition of a similar nature. Under these circumstances, the Federal agency would not need to form a new committee for each proposed disposition provided the members of the committee meet the requirements in the regulations with respect to the particular collection under review.

Insufficient Archeological Interest

10. Comment: One commenter argued that a determination of insufficient archeological interest should be made on the basis of independent peer review that includes experts outside of the Federal government.

NPS Response: The NPS added a requirement in the final rule that the FAO must consult with qualified museum professionals at non-Federal repositories about the appropriateness of a proposed disposal. The NPS acknowledges that the perspective of qualified museum professionals responsible for the care and curation of the subject materials is necessary for the FAO to make an informed determination. FAOs must use appropriate judgment and base determinations of disposition on appropriate supporting information. Because the rule regulates federally owned or administered collections, however, it remains appropriate that Federal agency staff and officials, with verifiable knowledge of the materials, make decisions regarding the disposition of material remains in those collections.

11. Comment: One commenter argued that a lack of original records should not be sufficient to presume a determination of insufficient archeological interest if provenience can be reconstructed through other means.

NPS Response: The loss or destruction of associated records is one factor in determining whether there is a lack of provenience information. Under section 79.12, a qualified archeological or museum professional must determine that a disposition will not negatively impact the overall value of the collection in order to make a finding of insufficient archeological interest. In doing so, the professional must make a concerted effort to research all records, including museum records, associated with a collection. In addition, the FAO must determine that disposition of the material remains will not negatively impact the overall integrity of the original collection.

12. Comment: One commenter stated that it is unclear who makes the determination of insufficient archeological interest and what that individual's qualifications should be.

NPS Response: At least one qualified archeological or museum professional with verifiable knowledge of and experience in the type of material remains being evaluated makes a determination of insufficient archeological interest. The FAO determines whether the professional is qualified, using the Professional Qualification Standards set by the Secretary of the Interior as a benchmark, and considering the professional's verifiable knowledge of the material remains. The FAO then determines, under section 79.15, whether the material remains are eligible for disposition under this subpart.

13. Comment: Two commenters requested that the rule define the following terms related to insufficient archeological interest: Material remains, physical integrity, irreparable damage, overly abundant, and representative sample.

NPS Response: Existing regulations define material remains as ''artifacts, objects, specimens and other physical evidence that are excavated or removed in connection with efforts to locate, evaluate, document, study, preserve or recover a prehistoric or historic resource.'' This definition goes on to provide illustrative examples of different classes of material remains. The NPS declines to define the other terms requested by the commenters. These terms are commonly used by the archeological community and must be applied in context using the professional judgement of qualified personnel. For example, the amount sampled and sampling method for a representative sample must be determined on a case-by-case basis, using the professional discretion of subject matter experts and best available information. The rule requires subject matter experts to have verifiable knowledge of the material remains to be examined.

14. Comment: One commenter questioned whether material remains could possess increasing archeological interest over time.

NPS Response: For material remains that are overly redundant and not useful for research, the rule requires that a sampling strategy be developed and implemented in order that the retained samples may be subjected to new or improved analytical technologies in the future that could demonstrate those materials remains have greater archeological interest than previously known. The NPS has revised the rule to clarify that samples of material remains determined to be overly redundant and not useful for research must be representative of the population as a whole from which the sample was taken. This will help ensure the integrity and potential future worth of samples that are retained.

15. Comment: One commenter suggested that the criterion ''overly redundant and not useful for research'' be split into two separate criteria, each of which could support a determination of insufficient archeological interest.

NPS Response: The NPS declines to split this criterion into separate criteria because both elements of this criterion are necessary to establish insufficient

archeological interest. Fulfilling only one of these two elements (overly redundant or not useful for research) could not result in a determination of insufficient archeological interest. A redundant set of material remains that is still useful for research could have sufficient archeological interest. For instance, two sets of similar material remains derived from different archeological contexts are likely, by virtue of their spatial disparity, to provide some information about the past, even though those material remains may seem similar or identical in a museum setting. Alternatively, material remains not useful for research but not overly redundant could still have archeological interest because: (1) Their uniqueness may render them inherently informative about the past and (2) they may become useful for research in the future as new technologies are developed. Thus, to meet this test, material remains must be both overly redundant and not useful for research.

16. Comment: One commenter suggested that the NPS establish a hierarchy of levels of archeological interest and provide a range of disposition options for each level.

NPS Response: The rule only addresses the ultimate disposition of certain materials that have insufficient archeological interest. Identifying different degrees or levels of insufficient archeological interest and assigning different disposal options for each level would unnecessarily complicate the process.

Costs

17. Comment: Several commenters addressed the costs for Federal agencies and recipient entities of complying with the disposition process under the rule. Several commenters were concerned that the rule would place financial strain on repositories for retaining materials during the disposition process without addressing a general shortfall of personnel and funding. One commenter expressed concern that several methods of disposition (*e.g.,* conveyance to suitable repositories or institutions) would impose unfair financial burdens on recipients of deaccessioned material remains.

NPS Response: The rule will impose little or no direct cost upon the public. Section 79.7 makes Federal agencies responsible for funding the curation of material remains. This includes costs associated with deaccessioning material remains in federally owned or administered collections, including costs borne by repositories that retain materials during the disposition process. Federal agencies must accession and catalog material remains before deaccessioning, and must follow relevant law and agency policy in ensuring that funding decisions address all aspects of collection stewardship, not just deaccessioning. The rule provides a series of options for disposition and does not require any group or individual to accept material remains that are eligible for disposal. The rule does not impose unfair financial burdens on recipients of deaccessioned material remains because those recipients are under no obligation to accept the material remains. A recipient must independently choose to accept deaccessioned material, thus it will have an opportunity in advance to consider the financial impact of its participation in the disposition process. The NPS believes the disposition process in the rule is financially achievable for Federal agencies.

18. Comment: Two commenters inquired about the costs of deaccessioning material remains of insufficient archeological interest. They were concerned that resources, which could be used to catalog and curate collections, might be diverted to deaccessioning instead.

NPS Response: To limit the possibility that Federal agencies allocate resources to deaccessioning rather than to curating collections, the rule provides controls, under section 79.12, on the disposition process, intended to limit its use only to appropriate circumstances. Deaccessioning is one part of a comprehensive curation methodology. In order to be eligible for disposition, material remains must be part of a Federal collection, and thus have undergone appropriate intake and accessioning procedures, which must be documented in accordance with agency protocols. Agency staff responsible for determining whether particular material remains lack archeological interest must consider the relationship of the material remains to the collection as a whole. Any effort to determine the archeological interest of material remains must include a review of the overall collection, along with associated documentation, from which those material remains are derived. For these reasons, the NPS does not believe that the disposition process will divert funds from curation because deaccessioning is part of a responsible curation program.

19. Comment: One commenter suggested that the disposition process will impose new costs for excavation because allowing for disposition will force archeologists to perform a more thorough analysis of material remains prior to curating them in a repository.

NPS Response: The NPS does not consider this scenario as likely to occur. However, a more thorough analysis of collections during an initial excavation project could be a desirable outcome because it means that the documentation concerning material remains will provide a better understanding of the archeological interest and improve the value of the resulting curated collections to the public. Any increase in the initial cost of analysis would be voluntary.

Compliance

20. Comment: Several commenters discussed ways that implementation of the rule will support and interplay with compliance regimes for laws such as the NHPA and the National Environmental Policy Act (NEPA).

NPS Response: Under section 106 of the NHPA, Federal agencies must consider the effect of an undertaking on any historic property that is included in or eligible for inclusion in the National Register. Museum collections, including archeology collections, are not generally considered historic properties (see National Register Bulletin 15). Further, material remains determined to be of insufficient archeological interest are not likely to be included in or eligible for inclusion in the National Register because, characteristically, they would not be worthy of preservation. NEPA requires Federal agencies to fully consider the impacts of proposals that would affect the human environment prior to deciding to take an action. The disposal of material remains under this rule will generally not constitute a Federal action under NEPA that would have a significant effect on the human environment. Nevertheless, FAOs must consider the context related to each proposed disposal of material remains and comply with all applicable laws, including the NHPA and NEPA, before making a final determination. The FAO must consider the opinions, as appropriate, of the collections advisory committee, Indian Tribes, and other available experts in making disposition decisions to ensure compliance with Federal law. In cases where collections are held under a compliance agreement, such as a Memorandum of Agreement under section 106 of NHPA, the FAO must consider the context and the terms of the agreement to determine whether disposal is appropriate.

Administrative Record

21. Comment: Several commenters focused on the creation and preservation of the administrative record of the disposition process. One commenter asked that the

administrative record be provided to tribes and SHPOs, particularly when they possess additional data about the site or collection. Other commenters asked the NPS to clarify the requirement in paragraph 79.15(i)(2)(i) to prepare a detailed list of material remains to be deaccessioned and better define when photographic documentation would be considered appropriate.

NPS Response: Section 79.18 requires Federal agencies to include in their administrative record specific documentation of the determination of disposition. Consistent with these requirements, Federal agencies should follow their own procedures for preparing, preserving, and distributing administrative records. The FAO should follow existing practices that comply with applicable state and Federal standards for recording material remains in archeological collections when preparing the detailed list of material remains required by paragraph 79.15(i)(2)(i). This paragraph specifies that the list must include a description of each object, or lot of objects if there are multiples of a particular type, and photograph(s) of the objects when appropriate. The FAO should also consider standard practices to determine when photographic documentation is appropriate.

Authority and Applicability of Regulations

22. Comment: Two commenters questioned whether the authorities cited in section 79.2 authorize the NPS to allow the disposition of material remains. Two commenters questioned the applicability of the rule to material remains excavated under the Antiquities Act and the interplay with prior regulations.

NPS Response: Section 5 of ARPA (16 U.S.C. 470dd) gives the Secretary the explicit and sole authority to promulgate regulations providing for ''the ultimate disposition'' of ARPA archeological resources and other resources removed pursuant to the Antiquities Act and the RSA. These authorities are cited in paragraph 79.2(b)(2) which, except for updated citations, is not changed by this rule. The explicit statutory authority to promulgate this rule supersedes any preceding regulatory requirements regarding similar subject matter, in particular, 43 CFR 3.17. This more recent statutory authority thus makes it appropriate to include those resources excavated under the Antiquities Act and eligible for disposal via the process described in the new Subpart E as subject to this rule. For clarity, this rule adds a note to 43 CFR 3.17 stating that resources excavated under the Antiquities Act are eligible for disposal via Subpart E of 36 CFR 79.

23. Comment: Several commenters requested clarification about the term ''practical management authority'' and the meaning of ''indirect'' practical management authority.

NPS Response: Part 79 applies to federally owned or administered collections. Section 79.3(a) uses the term ''practical management authority'' to further explain the circumstances under which collections that are owned by the United States are subject to Part 79. Federal agencies have ownership of collections due to specific laws, activities on Federal lands, or other circumstances, and these collections are managed in a variety of ways. In order for those collections to be subject to Part 79, a Federal agency that owns a collection also must have ''practical management authority'' over that collection, either directly or indirectly. Otherwise, Federal agencies would be responsible for curating collections that they do not control. Direct practical management authority generally includes situations where a Federal agency is directly administering collections at Federal facilities. Indirect practical management authority includes situations in which a Federal agency has legal responsibility and control over collections but a non-Federal entity has responsibility for curating the collection. This is usually documented through the terms of an agreement, contract, permit, or authorized expenditures.

24. Comment: One commenter stated that the rule should only apply to federally owned collections and that there should be no question about who has legal title over material remains that are proposed for disposal.

NPS Response: The FAO should be able to discern the ownership of material remains when determining if those remains are eligible for disposal under paragraph 79.12(a) and when reviewing the provenience information to determine if those remains have insufficient archeological interest under paragraph 79.12(e)(2)(i). Directions from ascertainable owners or questions regarding ownership must inform the FAO's proposed disposition determination. Clear legal ownership by the United States is not a prerequisite for disposal of material remains under Part 79; the rule also applies to material remains that are not owned by the United States but that are managed or controlled by a Federal agency pursuant to the Antiquities Act, NHPA, RSA and ARPA. Other provisions of the rule explicitly ensure that certain owners of federally administered collections, such as Indian individuals or tribes under 79.13(a), have an opportunity to receive them or to object to a proposed disposition. This aspect of the rule is intended to ensure that the government cares for archeological collections in its possession in accordance with applicable laws.

25. Comment: Based on established practices that allow for the re-interment of human remains not subject to NAGPRA, several commenters suggested that this rule should apply to human remains not subject to NAGPRA and identify reburial as a method of disposition. One commenter suggested that the rule establish a disposition process for human remains that are not subject to NAGPRA.

NPS Response: During consultation for the proposed rule, Federal agencies, Tribes, and professional organizations suggested that excluding all human remains from the disposition process for materials of insufficient archeological interest described in this subpart would simplify the rule and avoid confusion with NAGPRA and its implementing regulations. As a result, the proposed rule excluded all human remains from disposition and, in doing so, did not distinguish between human remains subject to NAGPRA and other human remains. The final rule clarifies in paragraph 7.12(b)(1) that Native American cultural items under NAGPRA, which can include human remains, are not eligible for disposition under this rule. Native American human remains are subject to disposition or repatriation under NAGPRA. In paragraph 7.12(b)(2), the final rule also states that other human remains not subject to NAGPRA are ineligible for disposition under Subpart E. The NPS does not intend for this subpart to affect established practices that otherwise allow for the disposition and re-interment of human remains not subject to NAGPRA. The final rule clarifies that human remains not subject to NAGPRA are excluded only from the process described in Subpart E. The NPS is reserving section 79.14 to address this issue in the future if necessary.

Disputes

26. Comment: Several commenters addressed the procedures for objecting to determinations of disposition. One commenter asked that the public have 90 days to dispute a determination of disposition, and that the requirement for submission of documentation be removed. Another commenter recommended that those objecting to a disposition should be responsible for finding a new repository. One

commenter suggested that the DCA should make binding decisions for all objections instead of non-binding recommendations to the FAO. Another commenter requested that the rule require the DCA to thoroughly explain their recommendation to the FAO. Two commenters asked that the rule include a dispute resolution process in section 79.16 to help resolve disagreements over which tribes should receive material remains that have been determined to be eligible for disposal. One commenter specifically recommended adopting the dispute resolution language from NAGPRA.

NPS Response: The NPS made several changes in section 79.16 of the final rule to provide a more effective and inclusive process for objecting to a determination of disposition. The NPS lengthened the timeframe to object to a determination of disposition from 30 to 60 days. The NPS believes this will provide sufficient time for interested parties to file an objection, in part because the list of those notified and consulted with prior to the determination of disposition is comprehensive. It is important that the objecting party document the reasons for the objection so that the DCA and the FAO are able to evaluate the merits of the objection. While objecting parties may suggest a different repository, they are not required to as a condition to filing an objection. The NPS also shortened the timeframe for the FAO to respond to the DCA's non-binding recommendation from 60 to 30 days and added a requirement that the DCA forward a copy of the objection to the FAO within 5 days of receipt of the objection. The final rule also requires the DCA to consult with the objecting party and the FAO with the aim of resolving the objection. This will ensure that the DCA plays a significant role in the resolution of disputes over determinations of disposition. The final rule requires that the DCA explain their recommendation to the FAO.

The NPS declines to make the DCA's decision binding because the DCA's role to other government agencies is advisory in nature. The DCA has no authority to broker binding arbitration with other Federal agencies, nor does the DCA have the authority to make decisions on their behalf. Similarly, the NPS declines to outline a dispute resolution process specifically for tribes because such a process would be duplicative of the appeal process in section 79.16. In addition, the NPS notes that the dispute resolution process in NAGPRA is specifically authorized in 25 U.S.C. 3006(c); no such authorization exists in ARPA or the other applicable authorities for this rule.

Rulemaking Process

27. Comment: Several commenters stated that the rulemaking process was inadequate because of insufficient opportunities for public comment. One commenter asked for an extension of the public comment period.

NPS Response: The NPS consulted widely with Tribes and interest groups before publishing the proposed rule. The proposed rule was open for public comment for 90 days, from November 18, 2014, through February 17, 2015. This is 30 days longer that the standard comment period of 60 days that is identified in Department of the Interior Policy (318 Departmental Manual, section 5.3). The NPS received a substantial number of comments and has worked to address or respond to all issues raised by those comments in this final rule.

Impacts to Federal Collections

28. Comment: Two commenters stated that many collections were made with the understanding that they would be held in perpetuity by the government for future study, and that perpetual curation might be required by agreements entered into for purposes of complying with section 106 of the NHPA.

NPS Response: Legal instruments for the curation of materials, including those created under the section 106 consultation process, such as memoranda of agreement or programmatic agreements, may contain provisions requiring curation of materials beyond what otherwise would be required by this rule. When considering the potential disposal of materials covered by any such agreement, the FAO must review the terms of the agreement to determine whether the agreement and section 79.12 can be reconciled to allow disposal. Legally binding requirements for the perpetual curation of materials that appear in an agreement or other written instrument will not be affected by the disposition process established in this rule.

29. Comment: One commenter argued that deaccessioning would greatly reduce the volume of material remains available for study, which would lead to increased excavation.

NPS Response: The disposition process established in this rule applies narrowly to material remains of insufficient archeological interest. The rule does not compel the wholesale divestment by the government of its collections, but instead allows for small reductions in the size of some collections under specific circumstances. Samples of material remains to be deaccessioned under this rule must be retained when those materials are deemed overly redundant and not useful for research. The cautious approach to disposition required by this rule makes it unlikely that the rule will result in a steep reduction in the amount of materials available for study in Federal collections, and a consequential need for additional excavations.

NAGPRA Consultation

30. Comment: Two commenters sought stronger requirements to consult with Tribes regarding the determination that material remains are not subject to NAGPRA. One commenter asked the NPS to clarify the FAO's responsibilities to consider NAGPRA compliance.

NPS Response: Federal agencies have separate procedural requirements under NAGPRA to ensure that NAGPRA cultural items in their collections are included in inventories and summaries. Extensive consultation is required during the inventory and summary process under 43 CFR 10.8 and 10.9. In general, Federal agencies were required to complete their NAGPRA summaries by November 16, 1993, and their NAGPRA inventories by November 16, 1995, so, in most cases, Federal agencies will have already determined which items in their collections are NAGPRA cultural items. Section 79.12 provides an additional measure to ensure NAGPRA cultural items are handled pursuant to NAGPRA and not subject to disposition under this rule. Prior to making a final determination of disposition, the FAO must determine that the material remains are not NAGPRA cultural items. The rule further states that, when Native American material remains are proposed for disposition, the collections advisory committee must include one or more elected officers (or their designees) of federally recognized Indian Tribes that are regularly consulted by the Federal agency. The rule also contains robust notification requirements that will help ensure that interested Tribes are aware of proposed dispositions. Further, any Tribe may object to determinations of disposition if it believes the materials are NAGPRA cultural items. The NPS believes that these requirements are sufficient to ensure that Native American cultural items subject to NAGPRA will not be disposed of under this rule.

Use of Deaccessioned Material Remains

31. Comment: One commenter argued that enforcing the restrictions on disposition of material remains in the proposed rule would constitute a taking of property under the Fifth Amendment of the Constitution, specifically for material remains excavated and removed from Indian lands and returned to the Indian individual or Indian tribe having rights of ownership over the resources. Commenters sought to ensure that deaccessioned material remains may not be sold in the future. Another commenter questioned the ability of the FAO to enforce prohibitions on government employees receiving deaccessioned material remains.

NPS Response: The NPS has clarified in paragraph 79.13(b) that, as a condition of disposal, the FAO will reasonably ensure that material remains from public lands that are not Indian lands may not be traded, sold, bought, or bartered after disposal is completed. This condition will not apply to material remains from Indian lands. The NPS has removed the prohibition on government employees receiving deaccessioned material remains because it is redundant with government-wide ethics requirements that address the concerns originally underlying this proposed restriction. Indian individuals who are also Federal employees must work with their agency's ethics officials to determine a course of action in the event that they wish to receive deaccessioned material remains.

General Support and Opposition

32. Comment: Some commenters expressed general support for the rule, praising its clear language and stringent and rigorous disposition process. Commenters recognized the need for the rule and its potential to improve the value of collections and reduce careless accession of material remains. Other commenters expressed general opposition to the rule, citing their belief that material remains should not be deaccessioned and that the rule will not provide a complete solution to the curation crisis.

NPS Response: Responsible deaccessioning is a necessary tool for maintaining the scientific value of collections. Several Federal agencies requested this rule, which supports the proper curation of Federal collections. This rule establishes a rigorous and deliberative disposition process that, when properly implemented, will prevent the careless deaccessioning of material remains. Supporting agency stewardship of archeological collections is the foundational goal of 36 CFR 79.

Changes in the Final Rule

After considering the public comments and after additional review, the NPS made the following substantive changes in the final rule. The NPS made other non-substantive, editorial changes for clarity and ease of reading. In many places, the NPS replaced outdated citations to Title 16 of the U.S. Code with correct citations to Title 54. The NPS also removed the paragraph designations in section 79.4 and organized the defined terms alphabetically, as recommended in the Office of the Federal Register's Document Drafting Handbook. In order to make these changes, the entire section 79.4 appears below in the regulatory text even though the only changes to that section are to add definitions of ''Departmental Consulting Archeologist'' and ''provenience information.''

Final rule section or paragraph	Change	Reason for change
79.4	Added definitions of the terms ''Departmental Consulting Archeologist'' and ''provenience information''.	Clarifies the meaning of these terms for non-specialists.
79.12(b)(2)	Specified that the term ''human remains'' refers to human remains that are not ''cultural items'' under NAGPRA.	Clarifies that no human remains may be disposed of under this rule, whether or not they are subject to NAGPRA.
79.12(c)	Clarified that only persons who meet the applicable Professional Qualification Standards set by the Secretary may propose the disposal of material remains.	Helps ensure that only qualified experts may initiate the disposition process. Ensures that disposition is not undertaken casually or as a matter of convenience. The professional standards are available here: *https://www.nps.gov/articles/sec-standards-prof-quals.htm.*
79.12(c)(1)	Added a requirement that Federal agency staff members must have verifiable knowledge of the particular material remains that are proposed for disposal.	Helps ensure that disposition is not undertaken improperly because qualified experts were not involved.
79.12(e)	Added a requirement that archeological or museum professionals must have verifiable knowledge of the particular material remains in order to determine whether those material remains have insufficient archeological interest.	Helps ensure that disposition is not undertaken improperly because qualified experts were not involved.
79.12(e)(2)(i)(C)	Clarified that a lack of provenience information may be established if associated records never existed, have been lost, or have been destroyed.	Addresses a legitimate circumstance where there is no existing provenience information.
79.12(e)(2)(iii)	Clarified that representative samples of material remains that are overly redundant and not useful for research must be representative of the population as a whole from which the sample was taken.	Helps ensure that a statistically valid sample is retained in the event that new analytical techniques are developed that allow the sample to generate useful information about the past.
79.13(a)(2)	Clarified that the FAO must receive written consent and relinquishment of ownership from the Indian individual or tribe having rights of ownership before otherwise disposing of material remains excavated from Indian lands.	Helps ensure that the FAO will not dispose of material remains owned by Indian individuals or tribes without their consent.
79.13(b)(5)	Added the following method of disposal for material remains excavated or removed from public lands: Convey to a federally recognized Indian tribe for the purpose of traditional cultural, educational, or religious practices.	Responds to public comment and improves consistency between the acceptable methods of disposition for materials removed from Indian and public lands.

Final rule section or paragraph	Change	Reason for change
79.15(d)	Added a requirement that the FAO consult with qualified museum professionals located in the repository that provides curatorial services for material remains proposed for disposal when those museum professionals did not propose the disposal.	Helps ensure that appropriate experts are involved in the disposition process.
79.15(e)	Added a requirement that the collections advisory committee make consensus recommendations to the FAO about proposed dispositions.	Responds to public comment and helps ensure that disposition is not undertaken lightly or improperly.
79.15(e)(1)	Added a provision stating that the DCA may not participate on a collections advisory committee.	Helps maintain the impartiality of the DCA, who serves as the arbiter of disputes about proposed dispositions.
79.15(e)(3)	Clarified that the requirement that collections advisory committees include at least one representative of an Indian tribe only applies if there are Native American material remains proposed for disposal.	Ensures the appropriate inclusion of tribal viewpoints in considering a disposition of Native American material remains.
79.15(e)(5)	Added a requirement that the collections advisory committee submit a written report to the FAO about any proposed disposition.	Responds to public comments and improves the administrative record of a disposition.
79.15(g)	Added a requirement that, for material remains excavated from Indian land, the FAO provide a copy of the associated records to the appropriate Tribal Historic Preservation Officer or tribal official.	Responds to public comments and improves accountability to tribal governments.
79.15(h)	Added a minimum duration of 60 days for the public comment period for a proposed disposition. Made the FAO responsible for responding only to relevant, substantive comments.	Responds to public comments to improve timeliness and public accountability. Reduces the administrative burden on the FAO during the comment review period.
79.15(h)(1)	Added a requirement that the FAO must give notice of proposed dispositions to the State Archeologist if there is one.	Improves coordination with state officials and improves the administrative record.
79.15(h)(3)	Added a requirement that the FAO must give notice of proposed dispositions to private landowners from whose lands the objects to be disposed were removed.	Responds to public comments to provide additional information to landowners.
79.15(h)(5)	Removed the requirement that the FAO must give notice to organizations and institutions with an active department of or program in archeology or anthropology pertaining to the archeology of the state or region from which the material remains to be disposed of were recovered. Clarified that the FAO must give notice of proposed dispositions to organizations and institutions for which the agency has an existing relationship pursuant to a written instrument (*e.g.,* permit, agreement) for research, excavation, curation, education, or other partnership in the state and region from which the objects to be disposed were recovered.	Removes ambiguity about which institutions and organizations must receive notice of proposed dispositions. Reduces the burden of compliance for the FAO by requiring only notification of those entities that have a formal relationship. Improves communication about proposed disposition actions with interested researchers.
79.16	Lengthened the timeframe to object to a determination of disposition from 30 to 60 days after publication of the notice of determination of disposition in the **Federal Register**.	Responds to public comments and provides more opportunity for the public to object to a proposed disposition.
79.16(a)	Added a requirement that the DCA forward a copy of objections to the FAO within 5 days of receipt.	Improves accountability from the DCA to the FAO and streamlines the objection process.
79.16(c)	Added a requirement that the DCA consult with the objecting party and the FAO with the aim of resolving the objection.	Responds to public comments to improve the fairness of the objection process by providing another opportunity for discussion between the objecting party and the FAO.
79.16(d)	Added a requirement that the DCA must thoroughly explain their non- binding recommendation to the FAO.	Responds to public comment to provide a more effective and inclusive disputes process.
79.16(e)	Shortened the timeframe for the FAO to respond to the DCA and the objector with a final determination from 60 to 30 days.	Streamlines the objection process and encourages timely resolution to objections.
79.16(f)	Clarified that notice of a decision on an objection is a final agency action under the Administrative Procedure Act.	Responds to public comment to make procedures clear to the public.
79.17	Added a requirement that disposition after an objection will occur no sooner than 30 days after the FAO publishes the notice of decision on the objection and any amendments in the **Federal Register**.	Responds to public comment to make procedures clear to the public.
43 CFR 3.17	Added a note that resources excavated under the Antiquities Act may be eligible for disposal under Subpart E of 36 CFR 79.	Responds to public comments questioning the applicability of the rule to material remains excavated under the Antiquities Act.

Compliance With Other Laws, Executive Orders and Department Policy. Regulatory Planning and Review (Executive Orders 12866 and 13563)

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget will review all significant rules. OIRA has determined that this rule is not significant.

Executive Order 13563 reaffirms the principles of Executive Order 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. Executive Order 13563 directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. Executive Order 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. The NPS has developed this rule in a manner consistent with these requirements.

Regulatory Flexibility Act

This rule will not have a significant economic effect on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). This certification is based on information contained in the economic analyses found in the report entitled ''Cost-Benefit and Regulatory Flexibility Analyses: Proposed Regulations on the Curation of Federally-Owned or Administered Archeological Collections'' that is available online at the following URL: *https://www.nps.gov/orgs/1187/upload/Regulatory_Analyses_36_CFR_Part_79_12.pdf.*

Congressional Review Act (CRA)

This rule is not a major rule under 5 U.S.C. 804(2), the CRA. This rule:

(a) Does not have an annual effect on the economy of $100 million or more.

(b) Will not cause a major increase in costs or prices for consumers, individual industries, Federal, state, or local government agencies, or geographic regions.

(c) Does not have significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises.

The rule relates to internal administrative procedures and management of government function. It does not regulate external entities, impose any costs on them, or eliminate any procedures or functions that would result in a loss of employment or income on the part of the private sector.

Unfunded Mandates Reform Act

This rule does not impose an unfunded mandate on state, local, or tribal governments or the private sector of more than $100 million per year. This rule does not have a significant or unique effect on state, local or tribal governments, or the private sector. A statement containing the information required by the Unfunded Mandates Reform Act (2 U.S.C. 1531 *et seq.*) is not required.

Takings (Executive Order 12630)

This rule does not affect a taking of private property or otherwise have taking implications under Executive Order 12630. A takings implication assessment is not required.

Federalism (Executive Order 13132)

Under the criteria in section 1 of Executive Order 13132, this rule does not have sufficient federalism implications to warrant the preparation of a federalism summary impact statement. This rule does not regulate, change, or otherwise affect the relationship between Federal and state governments. A federalism summary impact statement is not required.

Civil Justice Reform (Executive Order 12988)

This rule complies with the requirements of Executive Order 12988. Specifically, this rule:

(a) Meets the criteria of section 3(a) requiring that all regulations be reviewed to eliminate errors and ambiguity and be written to minimize litigation; and

(b) Meets the criteria of section 3(b)(2) requiring that all regulations be written in clear language and contain clear legal standards.

Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*)

This rule does not contain information collection requirements, and a submission to the Office of Management and Budget under the Paperwork Reduction Act is not required. The NPS may not conduct or sponsor and you are not required to respond to a collection of information unless it displays a currently valid OMB control number.

National Environmental Policy Act

This rule does not constitute a major Federal action significantly affecting the quality of the human environment. A detailed statement under the NEPA is not required because this rule is covered by a categorical exclusion. This rule is excluded from the requirement to prepare a detailed statement because it qualifies as a regulation of an administrative and procedural nature. (For further information see 43 CFR 46.210(i)). This rule does not involve any of the extraordinary circumstances listed in 43 CFR 46.215 that would require further analysis under NEPA.

Federal Advisory Committee Act

Intergovernmental consultation recommended under this rule is exempt from the Federal Advisory Committee Act (FACA). This rule requires that consultation with Indian tribes be conducted between Federal officials and elected tribal officers or their designated employees acting in their official capacities, who meet solely for the purpose of exchanging views, information, or advice related to the management or implementation of this rule. Consultation with Tribes under this rule thus meets the two-part test for an exemption from the FACA set out in the Unfunded Mandates Reform Act of 1995, Public Law 104–4.

Consultation With Indian Tribes (E.O. 13175 and Departmental Policy)

The Department of the Interior strives to strengthen its government-to-government relationship with Indian Tribes through a commitment to consult with Indian Tribes and recognition of their right to self-governance and tribal sovereignty. The NPS has evaluated this rule under the criteria in Executive Order 13175 and under the Department's tribal consultation policy and has determined that tribal consultation is not required because the rule will have no substantial direct effect on federally recognized Indian tribes. Nevertheless, the NPS conducted outreach to tribes and Native Hawaiian Organizations, initiated consultation through two letters to tribal leaders, and conducted face-to-face consultation on this rule upon request. Additional information regarding the identified effects on Indian Tribes and these outreach and consultation efforts is contained in a document entitled ''Consultation with Indian Tribes (E.O. 13175) regarding the proposed 36 CFR 79.12,'' which is available at the following URL: *https://www.nps.gov/orgs/1187/upload/Tribal_Consultation_36_CFR_Part_79_12.pdf.*

Effects on the Energy Supply (E.O. 13211)

This rulemaking is not a significant energy action under the definition in Executive Order 13211; the rule is not likely to have a significant adverse effect on the supply, distribution, or use of energy, and the rule has not otherwise been designated by the Administrator of OIRA as a significant energy action. A Statement of Energy Effects is not required.

Drafting Information

This rule was written with the cooperation and consultation of the following Federal agencies and bureaus: U.S. Bureau of Indian Affairs, U.S. Bureau of Land Management, U.S. Bureau of Reclamation, U.S. Fish and Wildlife Service, U.S. Air Force, U.S. Army Corps of Engineers, U.S. Navy, and U.S. Forest Service. Each agency and bureau provided a specialist in the curation of archeological collections to participate in an informal interagency working group to provide expert advice during the drafting of this rule.

List of Subjects

36 CFR Part 79

Archives and records, Historic preservation, Indians—lands, Museums, Public lands.

43 CFR Part 3

Agriculture Department, Army Department, Historic preservation, Smithsonian Institution.

In consideration of the foregoing, the National Park Service and Department of the Interior amend 36 CFR part 79, and 43 CFR part 2, as set forth below:

PART 79—CURATION OF FEDERALLY OWNED OR ADMINISTERED ARCHEOLOGICAL COLLECTIONS

■ 1. The authority citation for part 79 is revised to read as follows:

Authority: 16 U.S.C. 470aa–mm, 54 U.S.C. 300101 *et seq.*

■ 2. Revise the part heading to read as shown above.

§§ 79.1 through 79.4 [Designated as Subpart A]

■ 3. Designate §§ 79.1 through 79.4 as subpart A and add a heading for subpart A to read as follows:

Subpart A—Administrative Provisions

§ 79.1 [Amended]

■ 4. In § 79.1 amend paragraph (a) by:
■ a. Removing ''(16 U.S.C. 431–433)'' and adding, in its place, ''(54 U.S.C. 320301–320303)'';
■ b. Removing ''(16 U.S.C. 469–469c)'' and adding, in its place, ''(54 U.S.C. 312501–312508)''; and
■ c. Removing ''(16 U.S.C. 470h-2)'' and adding, in its place, ''(54 U.S.C. 306101–306114)''.

■ 5. In § 79.2:
■ a. Revise paragraph (a).
■ b. In paragraph (b)(2), remove ''(16 U.S.C. 431–433)'' and add, in its place, ''(54 U.S.C. 320301–320303)'' and remove ''(16 U.S.C. 469–469c)'' and add, its place, ''(54 U.S.C. 312501–312508)''.

The revision reads as follows:

§ 79.2 Authority

(a) The regulations in this part are promulgated under 54 U.S.C. 302107 which requires that the Secretary of the Interior issue regulations ensuring that significant prehistoric and historic artifacts and associated records are deposited in an institution with adequate long-term curatorial capabilities. This requirement applies to artifacts and associated records subject to the National Historic Preservation Act (54 U.S.C. 300101 *et seq.*), the Reservoir Salvage Act (54 U.S.C. 312501–312508), and the Archaeological Resources Protection Act (16 U.S.C. 470aa–mm).

* * * * *

■ 6. In § 79.3, revise paragraph (a) to read as follows:

§ 79.3 Applicability.

(a) Except as otherwise stated in this section, the regulations in this part apply to collections, as defined in § 79.4 of this part, that are excavated or removed under the authority of the Antiquities Act (54 U.S.C. 320301–320303), the Reservoir Salvage Act (54 U.S.C. 312501–312508), section 110 of the National Historic Preservation Act (54 U.S.C. 306101–306114) or the Archaeological Resources Protection Act (16 U.S.C. 470aa–mm). Such collections generally include those that are the result of a prehistoric or historic resource survey, excavation or other study conducted in connection with a Federal action, assistance, license, or permit. Such collections include those that are owned by the United States and for which a Federal agency has practical management authority, either directly or indirectly, as a result of that ownership; and those collections that are not owned by the United States but that are managed or controlled by a Federal agency pursuant to the laws cited in this paragraph (a).

* * * * *

■ 7. Revise § 79.4 to read as follows:

§ 79.4 Definitions.

As used for purposes of this part:

Associated records means original records (or copies thereof) that are prepared, assembled and document efforts to locate, evaluate, record, study, preserve or recover a prehistoric or historic resource. Some records such as field notes, artifact inventories and oral histories may be originals that are prepared as a result of the field work, analysis, and report preparation. Other records such as deeds, survey plats, historical maps and diaries may be copies of original public or archival documents that are assembled and studied as a result of historical research. Classes of associated records (and illustrative examples) that may be in a collection include, but are not limited to:

(1) Records relating to the identification, evaluation, documentation, study, preservation, or recovery of a resource (such as site forms, field notes, drawings, maps, photographs, slides, negatives, films, video and audio cassette tapes, oral histories, artifact inventories, laboratory reports, computer cards and tapes, computer disks and diskettes, printouts of computerized data, manuscripts, reports, and accession, catalog, and inventory records);

(2) Records relating to the identification of a resource using remote sensing methods and equipment (such as satellite and aerial photography and imagery, side scan sonar, magnetometers, subbottom profilers, radar, and fathometers);

(3) Public records essential to understanding the resource (such as deeds, survey plats, military and census records, birth, marriage and death certificates, immigration and naturalization papers, tax forms and reports);

(4) Archival records essential to understanding the resource (such as historical maps, drawings and photographs, manuscripts, architectural and landscape plans, correspondence, diaries, ledgers, catalogs, and receipts); and

(5) Administrative records relating to the survey, excavation, or other study of the resource (such as scopes of work, requests for proposals, research proposals, contracts, antiquities permits, reports, documents relating to compliance with section 106 of the National Historic Preservation Act (16 U.S.C. 470f), and National Register of Historic Places nomination and determination of eligibility forms).

Collection means material remains that are excavated or removed during a survey, excavation, or other study of a prehistoric or historic resource, and associated records that are prepared or

assembled in connection with the survey, excavation, or other study.

Curatorial services means managing and preserving a collection according to professional museum and archival practices, including, but not limited to:

(1) Inventorying, accessioning, labeling, and cataloging a collection;

(2) Identifying, evaluating, and documenting a collection;

(3) Storing and maintaining a collection using appropriate methods and containers, and under appropriate environmental conditions and physically secure controls;

(4) Periodically inspecting a collection and taking such actions as may be necessary to preserve it;

(5) Providing access and facilities to study a collection; and

(6) Handling, cleaning, stabilizing, and conserving a collection in such a manner to preserve it.

Departmental Consulting Archeologist means the individual serving as the agent of the Secretary of the Interior in overseeing and coordinating the Department's archeological activities.

Federal Agency Official means any officer, employee or agent officially representing the secretary of the department or the head of any other agency or instrumentality of the United States having primary management authority over a collection that is subject to this part.

Indian lands has the same meaning as in § -.3(e) of uniform regulations 43 CFR part 7, 36 CFR part 296, 18 CFR part 1312, and 32 CFR part 229.

Indian tribe has the same meaning as in § -.3(f) of uniform regulations 43 CFR part 7, 36 CFR part 296, 18 CFR part 1312, and 32 CFR part 229.

Material remains means artifacts, objects, specimens, and other physical evidence that are excavated or removed in connection with efforts to locate, evaluate, document, study, preserve or recover a prehistoric or historic resource. Classes of material remains (and illustrative examples) that may be in a collection include, but are not limited to:

(1) Components of structures and features (such as houses, mills, piers, fortifications, raceways, earthworks, and mounds);

(2) Intact or fragmentary artifacts of human manufacture (such as tools, weapons, pottery, basketry, and textiles);

(3) Intact or fragmentary natural objects used by humans (such as rock crystals, feathers, and pigments);

(4) By-products, waste products or debris resulting from the manufacture or use of man-made or natural materials (such as slag, dumps, cores and debitage);

(5) Organic material (such as vegetable and animal remains, and coprolites);

(6) Human remains (such as bone, teeth, mummified flesh, burials, and cremations);

(7) Components of petroglyphs, pictographs, intaglios, or other works of artistic or symbolic representation;

(8) Components of shipwrecks (such as pieces of the ship's hull, rigging, armaments, apparel, tackle, contents, and cargo);

(9) Environmental and chronometric specimens (such as pollen, seeds, wood, shell, bone, charcoal, tree core samples, soil, sediment cores, obsidian, volcanic ash, and baked clay); and

(10) Paleontological specimens that are found in direct physical relationship with a prehistoric or historic resource.

Personal property has the same meaning as in 41 CFR 100–43.001–14. Collections, equipment (*e.g.,* a specimen cabinet or exhibit case), materials and supplies are classes of personal property.

Provenience information means recorded data about the physical location of an object as it was found during a survey, excavation, or other study of a prehistoric or historic resource.

Public lands has the same meaning as in § -.3(d) of uniform regulations 43 CFR part 7, 36 CFR part 296, 18 CFR part 1312, and 32 CFR part 229.

Qualified museum professional means a person who possesses knowledge, experience and demonstrable competence in museum methods and techniques appropriate to the nature and content of the collection under the person's management and care, and commensurate with the person's duties and responsibilities. Standards that may be used, as appropriate, for classifying positions and for evaluating a person's qualifications include, but are not limited to, the following:

(1) The Office of Personnel Management's ''Position Classification Standards for Positions under the General Schedule Classification System'' (U.S. Government Printing Office, stock No. 906—028–00000–0 (1981)) are used by Federal agencies to determine appropriate occupational series and grade levels for positions in the Federal service. Occupational series most commonly associated with museum work are the museum curator series (GS/GM–1015) and the museum technician and specialist series (GS/GM–1016). Other scientific and professional series that may have collateral museum duties include, but are not limited to, the archivist series (GS/GM–1420), the archeologist series (GS/GM–193), the anthropologist series (GS/GM–190), and the historian series (GS/GM–170). In general, grades GS–9 and below are assistants and trainees while grades GS–11 and above are professionals at the full performance level. Grades GS–11 and above are determined according to the level of independent professional responsibility, degree of specialization and scholarship, and the nature, variety, complexity, type, and scope of the work.

(2) The Office of Personnel Management's ''Qualification Standards for Positions under the General Schedule (Handbook X–118)'' (U.S. Government Printing Office, stock No. 906–030–00000–4 (1986)) establish educational, experience and training requirements for employment with the Federal Government under the various occupational series. A graduate degree in museum science or applicable subject matter, or equivalent training and experience, and three years of professional experience are required for museum positions at grades GS–11 and above.

(3) The ''Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation'' (48 FR 44716, Sept. 29, 1983) provide technical advice about archeological and historic preservation activities and methods for use by Federal, State, and local Governments and others. One section presents qualification standards for a number of historic preservation professions. While no standards are presented for collections managers, museum curators or technicians, standards are presented for other professions (*i.e.,* historians, archeologists, architectural historians, architects, and historic architects) that may have collateral museum duties.

(4) Copies of the Office of Personnel Management's standards, including subscriptions for subsequent updates, may be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Copies may be inspected at the Office of Personnel Management's Library, 1900 E Street NW, Washington, DC, at any regional or area office of the Office of Personnel Management, at any Federal Job Information Center, and at any personnel office of any Federal agency. Copies of the ''Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation'' are available at no charge from the Interagency Resources Division, National Park Service, P.O. Box 37127, Washington, DC 20013–7127.

Religious remains means material remains that the Federal Agency Official

has determined are of traditional religious or sacred importance to an Indian tribe or other group because of customary use in religious rituals or spiritual activities. The Federal Agency Official makes this determination in consultation with appropriate Indian tribes or other groups.

Repository means a facility such as a museum, archeological center, laboratory, or storage facility managed by a university, college, museum, other educational or scientific institution, a Federal, State, or local Government agency or Indian tribe that can provide professional, systematic, and accountable curatorial services on a long-term basis.

Repository Official means any officer, employee or agent officially representing the repository that is providing curatorial services for a collection that is subject to this part.

Tribal Official means the chief executive officer or any officer, employee or agent officially representing the Indian tribe.

§§ 79.5 through 79.9 [Designated as Subpart B]

■ 8. Designate §§ 79.5 through 79.9 as subpart B and add a heading for subpart B to read as follows:

Subpart B—Archeological Collections Management

§ 79.10 [Designated as Subpart C]

■ 9. Designate § 79.10 as subpart C and add a heading for subpart C to read as follows:

Subpart C—Public Access to and Use of Collections

§ 79.11 [Designated as Subpart D]

■ 10. Designate § 79.11 as subpart D and add a heading for subpart D to read as follows:

Subpart D—Inspections and Inventories of Collections

■ 11. Add subpart E to read as follows:

Subpart E—Disposition of Particular Material Remains

Sec.

79.12 Determining which particular material remains are eligible for disposal.
79.13 Acceptable methods for disposition of particular material remains.
79.14 [Reserved].
79.15 Final determination of disposition of particular material remains.
79.16 Objecting to a determination of disposition of particular material remains.
79.17 Timing of disposition.
79.18 Administrative record of disposition.

§ 79.12 Determining which particular material remains are eligible for disposal.

(a) *Which material remains are eligible for disposal under this subpart?* In order to be eligible for disposal under this subpart, material remains from collections must be:

(1) Archaeological resources, as defined in the Archaeological Resources Protection Act (16 U.S.C. 470bb(1)), or other resources excavated and removed under the Reservoir Salvage Act (54 U.S.C. 312501–312508) or the Antiquities Act (54 U.S.C. 320301–320303); and

(2) Considered to be of insufficient archeological interest under the criteria in paragraph (e) of this section, based on the definition of ''of archaeological interest'' in 43 CFR 7.3(a)(1).

(b) *Which material remains are not eligible for disposal under this subpart?* The following material remains from collections are not eligible for disposal under this subpart:

(1) Native American ''cultural items'' as defined in the Native American Graves Protection and Repatriation Act of 1990 (25 U.S.C. 3001(3)), because disposition is governed by that Act and its implementing regulations (43 CFR part 10);

(2) Other human remains not subject to the Native American Graves Protection and Repatriation Act of 1990;

(3) Material remains excavated and removed from Indian lands on or before the enactment of the Archaeological Resources Protection Act (16 U.S.C. 470aa–mm) on October 31, 1979; and

(4) Material remains excavated and removed from Indian lands under the Antiquities Act (54 U.S.C. 320301–320303).

(c) *Who may propose the disposal of particular material remains?* The following individuals who meet the applicable Professional Qualification Standards set by the Secretary of the Interior may propose the disposal of particular material remains from a collection:

(1) Federal agency staff members with verifiable knowledge of the particular material remains, including archeologists, curators, and conservators; and

(2) Qualified museum professionals located in a repository that provides curatorial services for a collection held in that repository.

(d) *Who is responsible for the disposal of particular material remains?* The Federal Agency Official is responsible for ensuring that particular material remains are disposed of according to the requirements of this subpart.

(e) *When are particular material remains considered to be of insufficient archeological interest?* Particular material remains are considered to be of insufficient archeological interest when, on a case-by-case basis, at least one qualified archeological or museum professional who meets the Professional Qualification Standards set by the Secretary of the Interior and possesses verifiable knowledge of and experience in the type of material remains being evaluated makes a determination. The determination must follow the process established in § 79.15 and document that:

(1) Disposition of the material remains will not negatively impact the overall integrity of the original collection recovered during the survey, excavation, or other study of a prehistoric or historic resource; and

(2) At least one of the following three requirements—lack of provenience information; lack of physical integrity; or overly redundant and not useful for research—are met:

(i) *Lack of provenience information.* Lack of provenience information may be established after a concerted effort to recover the information in the related associated records is performed and documented and by one or more of the following circumstances:

(A) The labels on the material remains or the labels on the containers that hold the material remains do not provide adequate information to reliably establish meaningful archeological context for the material remains;

(B) The labels on the material remains or the labels on the containers that hold the material remains have been lost or destroyed over time and cannot be reconstructed through the associated records; or

(C) The associated records of the material remains never existed, have been lost, or have been destroyed.

(ii) *Lack of physical integrity.* Material remains lack physical integrity when, subsequent to recovery during the survey, excavation, or other study of a prehistoric or historic resource, the material remains were irreparably damaged through decay, decomposition, or inadvertent loss. Examples may include human-caused incidents, exposure to elements, or natural disaster.

(iii) *Overly redundant and not useful for research.* Material remains are overly redundant and not useful for research in light of the collection's archeological context, research questions, and research potential. These considerations may vary based on geography, time and culture period, scientific or cultural significance, prior analysis, and other factors. Because it is difficult to predict if future analytical methods will yield

useful information about the material remains proposed for disposal, a sample of the material remains deemed to be overly redundant and not useful for research must be retained for curation, as required by § 79.15(f).

§ 79.13 Acceptable methods for disposition of particular material remains.

(a) *Indian lands.* This paragraph applies to material remains that are determined to be of insufficient archeological interest under § 79.12(e) and that were excavated or removed from Indian lands after October 31, 1979. Under the Archaeological Resources Protection Act (16 U.S.C. 470aa–mm), these material remains are the property of the Indian individual or Indian tribe having rights of ownership over the resources. Under the authority of 16 U.S.C. 470dd, disposition of these material remains is subject to the consent of the Indian individual or Indian tribe. The Federal Agency Official must use the following methods of disposal for these material remains in the following order:

(1) Return them to the Indian individual or Indian tribe having rights of ownership under the Archaeological Resources Protection Act's custody regulations, 43 CFR 7.13(b), 36 CFR 296.13(b), 32 CFR 229.13(b), and 18 CFR 1312.13(b).

(2) If the Indian individual or Indian tribe having rights of ownership does not wish to accept and take physical custody of the material remains, the Federal Agency Official may otherwise dispose of the material remains using the disposition methods in paragraph (b) of this section after receiving written consent and relinquishment of ownership from the Indian individual or Indian tribe having rights of ownership.

(b) *Public lands.* This paragraph applies to material remains that are determined to be of insufficient archeological interest under § 79.12(e) and that were excavated or removed from public lands that are not Indian lands. As a condition of disposal, the Federal Agency Official will reasonably ensure that material remains from such lands may not be traded, sold, bought, or bartered after disposal. The Federal Agency Official must consider the following methods for disposal of the material remains:

(1) Transfer to another Federal agency.

(2) Convey to a suitable public or tribal scientific or professional repository as defined in § 79.4(k) of this part.

(3) Convey to a federally recognized Indian tribe if the material remains were excavated or removed from lands of religious or cultural importance to that tribe and were identified and documented by a Federal land manager under 43 CFR 7.7(b)(1), 36 CFR 296.7(b)(1), 32 CFR 229.7(b)(1), or 18 CFR 1312.7(b)(1).

(4) Convey to a federally recognized Indian tribe from whose aboriginal lands the material remains were removed. Aboriginal occupation may be documented by evidence including, but not limited to, a final judgment of the Indian Claims Commission or the United States Court of Claims, or a treaty, Act of Congress, or Executive Order.

(5) Convey to a federally recognized Indian tribe for the purpose of traditional cultural, educational, or religious practices.

(6) Transfer within the Federal agency for the purpose of education or interpretation, or convey to a suitable institution to be used for public benefit and education including, but not limited to, local historical societies, museums, university or college departments, and schools.

(7) If the Federal Agency Official considers each of these prior methods carefully and is still unable to find an acceptable method of disposition, then the material remains may be destroyed. The Federal Agency Official or their designee must witness and document the destruction, including through photography or video as practicable.

§ 79.14 [Reserved]

§ 79.15 Final determination of disposition of particular material remains.

The Federal Agency Official is responsible for ensuring that the agency disposes of material remains according to the requirements of this subpart. A determination made under this subpart in no way affects a Federal land manager's obligations under other applicable laws or regulations. The Federal Agency Official must take all the following actions before making a final determination that it is appropriate to dispose of material remains.

(a) The Federal Agency Official must determine that the material remains are eligible for disposal under the criteria in § 79.12(a).

(b) The Federal Agency Official must verify in writing that none of the material remains proposed for disposal meet the criteria in § 79.12(b).

(c) The Federal Agency Official must verify that the material remains proposed for disposal are appropriately documented through a professional procedure approved by the Federal agency that is consistent with curatorial services, including accessioning and cataloging, as defined in § 79.4(b).

(d) The Federal Agency Official must consult with qualified museum professionals located in the repository that provides curatorial services for the material remains proposed for disposal if those museum professionals did not propose the disposal under § 79.12(c)(2). This consultation with the qualified museum professionals must address the appropriateness of the proposed disposal.

(e) The Federal Agency Official must establish a collections advisory committee of at least five members to review proposed dispositions of material remains. The committee must make a consensus recommendation to the Federal Agency Official about each proposed disposition based on the adequacy of the documentation addressing the requirements in paragraphs (a) and (b) of this section and the appropriateness of the proposed disposition based on the criteria in § 79.12(e).

(1) The collections advisory committee must consist of qualified employees from Federal agencies who meet appropriate Professional Qualification Standards set by the Secretary of the Interior, and must include the curator and the principal archeologist of the Federal agency that owns or administers the material remains if either or both of these two positions exist. The Departmental Consulting Archeologist may not participate on the collections advisory committee. If the Departmental Consulting Archeologist is the principal archeologist, then the Federal Agency Official must designate another qualified archeologist at the agency instead.

(2) Collections advisory committee members must include Federal employees with subject matter or technical expertise in the object types, cultural period, and culture area of the proposed disposition. These employees may include archeologists, anthropologists, curators, and conservators with expertise in historic, prehistoric, or underwater material remains.

(3) If the material remains being proposed for disposal are Native American, then collections advisory committee members must also include at least one or more individuals who are Tribal Officials acting in their official capacities representing their respective federally recognized Indian tribes that are regularly consulted by the Federal agency regarding the collection containing the material remains being proposed for disposal.

(4) The collections advisory committee must have written

procedures and governing rules, including terms of member appointments and the duration of the committee, approved by the Federal Agency Official, to ensure all recommendations about the appropriateness of disposal are fair, open, timely, and in the best interests of the public.

(5) The collections advisory committee must submit a written report to the Federal Agency Official for each proposed disposition that, at a minimum, documents the information required for the **Federal Register** notice identified in paragraphs (i)(1)(i) through (iii) of this section; membership of the committee and each member's role and expertise pertinent to the proposed disposition; a summary of any comments received on the proposed disposition under paragraph (h) of this section; the recommendations for disposition, including any conditions of transfer or conveyance; and the reasons why other methods of disposal would be of lesser public benefit.

(6) Federal employees or qualified members of federally recognized Indian tribes may be temporarily added to the committee if its existing members determine that specific expertise, including archeological knowledge of the cultural period and cultural area, is needed on a case-by-case basis.

(7) Collections advisory committee members, whether permanent or temporary, and their family members may not benefit financially or in any other way from a disposition of material remains, except to the extent that members of a federally recognized Indian Tribe, when that Indian Tribe is being considered as a potential recipient of material remains, may participate in the collections advisory committee as described in § 79.15(e)(3).

(f) The Federal Agency Official must retain in the curated collection a sample of those material remains determined to be overly redundant and not useful for research that is representative of the population as a whole from which the sample was taken.

(1) The size of the representative sample must be large enough to permit future analysis for research purposes.

(2) The method for establishing a representative sample, including sample size and typology, must be determined by a qualified museum or archeological professional with expertise in the type of prehistoric or historic material remains being sampled.

(3) The sampling method must be documented and consistent with professional prehistoric or historic archeological practice.

(g) The Federal Agency Official must retain all associated records in the archeological collection as defined in § 79.4(a)(2). A copy of the original associated records must be given to the recipient of any transferred or conveyed items subject to the restrictions stipulated in the Archaeological Resources Protection Act (16 U.S.C. 470hh(a)). For material remains excavated and removed from Indian land, a copy of the original associated records must be given to the Tribal Historic Preservation Officer (or other designated tribal representative) from the tribal land where the material remains were recovered.

(h) The Federal Agency Official must notify the entities listed in this paragraph of the proposed disposition and solicit comments on the proposal. Notifications must be made in writing, and must include a deadline for submitting comments that is at least 60 days after notice is issued, in accordance with procedures established by the Federal agency. All written comments must be reviewed by the Federal Agency Official and the collections advisory committee. The Federal Agency Official will respond to all relevant, substantive comments received. Notice must be given to the following:

(1) The State Historic Preservation Officer and, where established, the State Archeologist, from the state(s) where the material remains to be disposed of were recovered.

(2) The Tribal Historic Preservation Officer (or other designated tribal representative) from the Indian land(s) where the material remains to be disposed of were recovered.

(3) Federal, state, tribal, or local agencies that were involved in the recovery of the material remains to be disposed of.

(4) Private landowners from whose lands the material remains to be disposed of were removed, but only in such cases where the Federal agency obtained practical management authority over the material remains as the result of activities conducted in connection with a Federal action, assistance, license, or permit, on those private lands.

(5) Universities, museums, scientific institutions, and educational institutions with which the agency has an existing relationship pursuant to a written instrument (*e.g.,* permit, agreement) for research, excavation, curation, education, or other partnership in the state and region from which the material remains to be disposed of were recovered.

(6) Indian tribes that consider the land to have religious or cultural importance, if the material remains are from a site on public lands that has religious or cultural importance to Indian tribes under 43 CFR 7.7(b)(1).

(7) Indian tribes from whose aboriginal lands the material remains were removed, if aboriginal occupation has been documented by a final judgment of the Indian Claims Commission or the United States Court of Claims, treaty, Act of Congress, or Executive Order.

(i) The Federal Agency Official must, after the comment period described in paragraph (h) of this section has expired and the Federal Agency Official has responded to all relevant, substantive comments received, publish a notice of determination of disposition in the **Federal Register**.

(1) The notice published in the **Federal Register** must include the following:

(i) A general description of the material remains to be disposed.

(ii) The criteria used to determine that the material remains are of insufficient archeological interest under § 79.12(e).

(iii) The method of disposal.

(iv) The name of the Federal Agency Official or their designee as a point of contact.

(v) An explanation of a person's right to object to the determination of disposition under § 79.16 and the name, email, and physical address of the Departmental Consulting Archeologist.

(2) The Federal Agency Official must also prepare a determination of disposition that includes the following:

(i) A detailed list of the material remains to be disposed, including a description of each object, or lot of objects if there are multiples of a particular type, and photograph(s) of the objects when appropriate.

(ii) The report of the collections advisory committee as stipulated in paragraph (e)(5) of this section.

(iii) Documentation that all of the procedures in § 79.15 have been met.

(iv) The name of the recipient entity or method of disposal, as appropriate.

(v) Justification of the method to be used to dispose of the material remains under § 79.13.

(vi) The name of the Federal Agency Official or their designee as a point of contact.

(vii) Other conditions of transfer or conveyance, as appropriate.

(viii) A statement that the determination is a final agency action under the Administrative Procedure Act (5 U.S.C. 704) unless an objection is filed in accordance with § 79.16.

§ 79.16 Objecting to a determination of disposition of particular material remains.

Anyone may object to and request in writing that the Departmental Consulting Archeologist review a Federal Agency Official's determination to dispose of material remains within 60 days of publication of the notice of determination of disposition in the **Federal Register**. The objection must document why the objector disagrees with the Federal Agency Official's decision regarding the disposal. The procedure for objecting to a determination of disposition is as follows:

(a) The objection must be sent to the Departmental Consulting Archeologist. The Departmental Consulting Archeologist must forward a copy of the objection within 5 days of receipt to the Federal Agency Official who made the determination under objection. The Federal Agency Official must halt the planned disposition until the Departmental Consulting Archeologist completes the requested review.

(b) The Departmental Consulting Archeologist must review the objection, and the Federal Agency Official's determination of disposition in § 79.15(i)(2).

(c) The Departmental Consulting Archeologist must consult with the objecting party or parties and the Federal Agency Official with the aim of resolving the objection.

(d) Within 60 days of receipt of the objection, whether or not a formal resolution has been agreed upon, the Departmental Consulting Archeologist must transmit to the Federal Agency Official a non-binding recommendation, including a thorough explanation, for further consideration.

(e) The Federal Agency Official must consider the recommendation of the Departmental Consulting Archeologist prior to making a decision on the objection. Within 30 days of receipt of the recommendation, the Federal Agency Official must respond to the Departmental Consulting Archeologist and the objector with a decision on the objection and a justification for that decision. The decision document must include any information about administrative appeal rights required by internal agency appeal procedures or a statement that the decision document is a final agency action under the Administrative Procedure Act, as appropriate.

(f) The Federal Agency Official must publish notice of the decision on the objection and any amendments made to the determination of disposition in the **Federal Register**. This may only be done after the objector exhausts any internal appeal procedures identified in the decision document sent to the objector under § 79.16(e). Publication of the notice of the decision on the objection constitutes a final agency action under the Administrative Procedure Act (5 U.S.C. 704).

§ 79.17 Timing of disposition.

Disposition will occur no sooner than 60 days after the notice of determination of disposition is published in the **Federal Register** under § 79.15(i). If the Federal agency receives an objection under § 79.16, then disposition will occur no sooner than 30 days after the notice of decision on the objection and any amendments are published in the **Federal Register** under § 79.16(f).

§ 79.18 Administrative record of disposition.

(a) After the Federal Agency Official has made a determination of disposition, he or she must document the determination and retain the administrative record as part of the associated records as defined in § 79.4(a)(2), which must include:

(1) The professional evaluation of the material remains conducted under §§ 79.12(e) and 79.15(b).

(2) The report of the collections advisory committee provided under § 79.15(e)(5).

(3) Notifications of the proposed disposition under § 79.15(h); consent of Indian individuals or tribes, if applicable, under § 79.13(a)(2); and comments received from the parties notified under § 79.15(h).

(4) Objections received by the Departmental Consulting Archeologist, the non-binding recommendation of the Departmental Consulting Archeologist, and the decision on the objection and any amendments made to the determination of disposition, if applicable, under § 79.16.

(5) The disposition action with specific information, including a description and evaluation of objects; the method of disposition and the reason for the method chosen; names and titles of persons initiating and approving the disposition; date of disposition; relevant accession and catalog numbers; evidence of the receipt for the return, transfer, or conveyance of the material remains by the recipient tribe, agency, repository, or institution, including the title to the received material remains, as appropriate; photographic documentation, as appropriate; and the name and location of the recipient institution or entity, as appropriate.

(6) A detailed inventory of the representative sample of material remains retained, when the larger proportion is disposed of because it is overly redundant and not useful for research.

(7) Other activities and decisions pertaining to the disposition of the material remains, such as conditions of use after the disposition is completed, as appropriate.

(b) The administrative record must be made available to the public upon request, unless the information or a portion of it must be withheld under the terms of the Freedom of Information Act (5 U.S.C. 552) or the Archaeological Resources Protection Act (16 U.S.C. 470hh). The latter restricts the government's ability to make sensitive information, such as archeological site location data, available to the public.

(c) After disposition, the accession and catalog records must be reviewed and amended through a procedure established by the Federal agency. The amendments must identify the material remains that were deaccessioned and disposed of, the date of disposition, and the manner in which they were disposed. The documentation prepared under § 79.15, § 79.16, and paragraph (a) of this section must be retained in accordance with Federal agency policy.

TITLE 43: PUBLIC LANDS: INTERIOR

SUBTITLE A—OFFICE OF THE SECRETARY OF THE INTERIOR

PART 3—PRESERVATION OF AMERICAN ANTIQUITIES

■ 12. The authority citation for part 3 is revised to read as follows:

Authority: 54 U.S.C. 320302–320303.

■ 13. Amend § 3.17 by adding a note at the end of the section to read as follows:

§ 3.17 Preservation of Collection

* * * * *

Note to § 3.17: Regulations concerning curation of federally owned or administered archeological collections are found in 36 CFR part 79. Objects excavated under the Antiquities Act may be eligible for disposal under subpart E of 36 CFR part 79.

Shannon A. Estenoz,

Assistant Secretary for Fish and Wildlife and Parks.

[FR Doc. 2022–07471 Filed 4–14–22; 8:45 am]

BILLING CODE 4312–52–P

INTRODUCTION

The following appendix describes the Inadvertent Discovery Plan for Cultural Resources or Human Remains for the "*Removal of Four Beautification (Low-Head) Dams in the Grand River, Grand Rapids, Kent County, Michigan, a component of the Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project*." The procedure outlined below conforms to MI-NRCS general Procedure for Construction Discovery but in this instance covers only items of cultural resource not attributable to the architecture of the low-head dams. Any discovered human remains are subject to this Inadvertent Discovery Plan.

RECOGNIZING CULTURAL RESOURCES

A cultural resource discovery is an item of presumed human manufacture and likely to be greater than 50 years of age. Examples include but are not limited to:

- Stone tools or debitage (i.e., arrow head or chipped stone waste flakes),
- Clusters of tin cans, ceramics, bottles, logging implements, agricultural equipment etc., that appears older than 50 years

UPON DISCOVERING CULTURAL RESOURCES

In the event that any NRCS staff, consultant, local agency representative, contractor, landowner, etc. discover a cultural resource during removal of the low-head dams, they must immediately notify the construction manager, who will, in response: 1. cease operations in that location and 2. notify the NRCS Cultural Resources Specialist.

If the action affecting the resource is not halted, continuing to affect the resource may result in withdrawal of NRCS assistance. Pursuant to Section 110(k) of the National Historic Preservation Act and the NRCS National Cultural Resources Procedures Handbook, Subpart C, Section 601.27, the NRCS must ensure that Federal assistance is NOT used to cause or further an adverse impact to a cultural resource.

UPON DISCOVERING HUMAN REMAINS

The following steps will be implemented if human remains and/or materials subject to NAGPRA are inadvertently discovered during this Project. This largely follows the steps set forward in Michigan Attorney General Opinion No. 6585 of 1989, *Cemeteries and Dead Bodies*, those recommended by the State Historic Preservation Office, and those recommended by the Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians (Gun Lake Tribe) who reviewed and commented on this permit application.

If the action affecting the remains is not halted, continuing to affect the remains may result in withdrawal of NRCS assistance.

Human Remains and Associated Materials

1. Upon the discovery of human remains and any associated materials, excavation in the immediate vicinity is halted. Cover and secure the area and do not handle finds. All Project personnel shall treat any discovery as confidential.

2. The local police authority is immediately notified so that they may evaluate the site.

3. Immediately notify the NRCS, who will then notify the Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians THPO, SHPO archaeologists and any additional tribes who requested consultation with NRCS.

4. If the police determine that human remains represent evidence of a crime or missing person, they will complete their investigation.

5. If the police determine that human remains do not represent evidence of a crime or missing person, the burial will be adequately documented and preserved in place or relocated as determined through appropriate consultation. It is preferred that burial sites be preserved and maintained in place. If this is not possible, the remains and any associated materials would need to be moved for their protection.

The following sequence of steps will be employed if it is not possible to preserve and maintain an inadvertently discovered burial in place:

1. Excavations shall be respectful and conducted out of public view, to the extent possible.

2. A qualified archaeologist experienced in human remains recovery shall recover the remains and any related materials that may be present. Archaeological expertise is important in documenting the discovery context and evaluating whether the remains are isolated or if additional remains may be immediately present. Archaeological recovery may be done under the auspices of law enforcement. If law enforcement chooses not to be involved, a permit for disinterment must be obtained from the local Department of Public Health, or through a court order.

3. As soon as possible, the remains shall be examined by a physical anthropologist using standard non-invasive methods and procedures to create a basic biological profile and estimate ethnicity.

4. Draft and final archaeological reports, with related physical anthropological reports and law enforcement case documentation appended, will be submitted to the NRCS, Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians THPO, and SHPO archaeologists.

Discoveries of Native American Ancestors and/or Other Materials Subject to NAGPRA

1. If it can be determined immediately that a discovery is, or has the potential to be, a Native American Ancestor and/or other materials subject to NAGPRA (i.e., associated or unassociated funerary objects, sacred objects, and objects of cultural patrimony), the Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians (and any other consulting Tribes) will be notified within 72 hours of discovery and potential identification. Tribal notification and consultation will be coordinated by the NRCS and SHPO archaeologists. After notification and initial consultation, consulting Tribes may request that all federally recognized Tribes likely to be culturally affiliated with the discovery be notified in writing by mail or email and further consultation initiated regarding the cultural affiliation, care, handling, excavation (if necessary), and/or disposition per NAGPRA.

2. Known or suspected Native American Ancestors or other materials subject to NAGPRA will not be moved, touched, or further disturbed after discovery until completion of Tribal consultation or emergent circumstances arise.

3. Accommodations will be made for traditional or ceremonial practices in association with discoveries.

4. Photographs shall not be taken, except when necessary for identification and documentation. Tribes may request that any photographs of Native American Ancestors or other materials subject to NAGPRA be destroyed or repatriated at the end of the Project.

5. Pending consultations, documentation of the discovery will include a written description, mapping and sketching, and precise GPS coordinates. This documentation will be curated with other Project records and not be published or made publicly available in any way.

6. To ensure the protection, preservation, and proper respectful treatment of any discovered materials, pursuant to applicable law, the nature and location of any discovery shall remain confidential as best as reasonably possible given the circumstances and location. Only those persons and entities identified in this plan shall be notified of the discovery or given information about the discovery. The Permittee, NRCS, SHPO, and related contractors will ensure all staff and consulting personnel are appropriately trained for their respective roles in implementing this plan.

7. Consulting Tribes will be afforded opportunities to employ proper traditional cultural practices and treatments during periods of non-Tribal holding of discoveries.

8. The permanent care of Native American Ancestors and materials subject to NAGPRA will be determined by the appropriate Tribe or Tribes in consultation with the SHPO.

9. Draft and final archaeological reports, with related physical anthropological reports and law enforcement case documentation appended, will be submitted to the appropriate Tribes for review and comment.

Additional Notes
The Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians (Gun Lake Tribe) has notified the NRCS and SHPO that they wish to consult if Native American Ancestors or cultural materials are found. This Tribe will be consulted in addition to those who requested consultation with the NRCS.

Appendix G – *Glossary of Terms*

ACHP – Advisory Council on Historic Preservation is an independent federal agency created solely to address historic preservation issues. It promotes the preservation, enhancement, and sustainable use of our nation's historic resources. The ACHP advises and guides federal agencies and participants through the Section 106 review process.

City – The City of Grand Rapids, Michigan is the sponsoring local organization, EGLE permit applicant and responsible for establishing contracts for demolition work. The City is an invited signatory.

GRPM – Grand Rapids Public Museum, a concurring party.

GRWW – Grand Rapids Whitewater, Inc. is leading the design and engineering of the Project and will closely coordinate with the City and other partners to accomplish the intent of the design. GRWW is an invited signatory.

GVMC – Grand Valley Metropolitan Council is the applicant for federal assistance through the RCPP and is responsible for ensuring habitat restoration work and requirements of the RCPP agreement are met. GVMC is an invited signatory.

MOA – Memorandum of Agreement. This MOA serves to document steps that will be taken to mitigate the adverse effects caused by the removal of the four low-head dams in the Grand River in downtown Grand Rapids as part of the Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project.

MSF – Michigan Strategic Fund, a signatory.

NHPA – National Historic Preservation Act

NRCS – Natural Resources Conservation Service, a federal agency of the U.S. Department of Agriculture. NRCS is the lead federal agency for this MOA and is a signatory.

SHPO – State Historic Preservation Office, a signatory.

Signatory Status – Parties who may sign a MOA fall into 1 of 3 categories:
(from: https://www.achp.gov/executing_agreement_documents)

1. **Signatory** – In accordance with 36 CFR Part 800.6(c)(1), a signatory has the sole authority to execute, amend, or terminate the agreement. The federal agency and the SHPO/THPO are signatories. The ACHP is a signatory when it chooses to participate. A THPO or tribal representative is a required signatory when the undertaking occurs on or affects historic properties on tribal lands.

2. **Invited Signatory** - In accordance with 36 CFR Part 800.6(c)(2), an invited signatory, upon signing, has the authority to amend and terminate the agreement. The federal agency official may invite additional parties to sign the agreement such

as an Indian tribe who attaches religious and cultural significance to historic properties affected by the undertaking (off tribal lands), or any party that assumes a responsibility under the agreement.

3. **Concurring Party** – In accordance with 36 CFR Part 800.6(c)(3), a concurring party is a consulting party invited to concur in the agreement document but who does not have the authority to amend or terminate the agreement. A concurring signature is essentially an endorsement of the agreement.

Consulting Party – Consulting Party status entitles the person or group to share their views, receive and review pertinent information, offer ideas, and consider possible solutions together with the federal agency and other consulting parties. Each party can decide how active a role they wish to play in consultation.

RE: ER20-876 Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, (USDA/NRCS)

Dear Mr. Quates:

We have reviewed the additional information provided on November 2, 2020 for the Lower Grand River Watershed Habitat Restoration Project in Grand Rapids, Michigan that was submitted in order to address the Michigan SHPO's comments dated June 29, 2020. Federal agencies have a responsibility to identify and assess the eligibility of historic resources within the area of potential effect, SHPO's role is concur with the recommendations of eligibility and effect when appropriate. As it stands presently, we do not have enough information regarding eligibility.

After review of the information presented in the report, we require additional information specifically addressing the National Register of Historic Places Eligibility of the low head dams proposed for removal. While the information provides general history of dams in the Grand River watershed, there does not appear to have been any analysis of these dams to address their potential eligibility. There is also no information on the current condition of the dams. At a minimum, a federally qualified architectural historian should be retained to examine the known history as well as survey, photograph and map the current dams. This information should be presented in a clear manner to facilitate review of the materials.

Please note that the Section 106 review process cannot proceed until we are able to consider the information requested above. This letter does not clear the project. If you have any questions, please contact Brian Grennell, Cultural Resource Management Coordinator, at 517-335-2721 or by email at GrennellB@michigan.gov. If you have any question about architectural survey efforts, please contact Katie Kolokithas, Survey Coordinator, at (517) 241-6062 or by email at kolokithask1@michigan.gov. **Please reference our project number in all communication with this office regarding this undertaking.** Thank you for this opportunity to review and comment, and for your

Sincerely,

Brian G. Grennell
Cultural Resource Management Coordinator

for Martha MacFarlane-Faes
Deputy State Historic Preservation Officer

Subject: Update to December 20, 2018, Submittal Regarding Initial Consultation and Scoping Field View, Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, MI, ER19-325.

Dear Mr. Grennell

On December 20, 2018, Environmental Resources Management (ERM), under the direction of the Natural Resource Conservation Service (NRCS), submitted a request for initial consultation regarding the Lower Grand River Watershed Habitat Restoration Project. Please refer to ER No. 19-325. NRCS would like to take this opportunity to provide this update describing the current proposed project design and associated evaluation and recommendations regarding cultural resources, and to invite you to concur with our findings.

Project Overview

To refresh you on the background for the proposed Project, a Regional Conservation Partnership Program (RCPP) grant was awarded to the Grand Valley Metropolitan Council in 2017 to improve aquatic habitat in the Lower Grand River (which runs from Portland, at the confluence of the Looking Glass River, to Grand Haven, at the mouth of the river). This grant provides $8 million in funding for the Lower Grand River Habitat Restoration and Farmland Conservation Project. Of that amount, about $4.1 million was allocated to support instream habitat restoration of the Grand River where it flows through the City of Grand Rapids in Kent County under the U.S. Department of Agriculture NRCS Watershed Protection and Flood Prevention Act, PL 83-566 program. Specifically, the $4.1 million would be used for revitalizing the rapids in downtown Grand Rapids from 130 feet upstream of Bridge Street to Fulton Street (the proposed Project). The proposed Project would include the following activities:

Demolition of four low-head dams;

Restructuring the channel through excavation, grading, and importing boulders, cobble and gravel substrate;

Installing additional scour protection on existing bridge structures; and

Installing four diversified hydraulic features.

USDA is an equal opportunity provider and employer.

Areas of Potential Effect

The proposed Project includes the following:

A Construction Area—the area within the wetted channel of the Grand River from approximately 130 feet upstream of the Bridge Street Bridge to the upstream edge of the Fulton Street Bridge (see Figure 1); and

The Project Area—the areas where proposed Project activities would occur:

- Portions of the land on both sides of the Grand River from the 6th Street Dam to Fulton Street (where construction access or staging areas would occur as shown on Figure 1)
- The wetted channel of the river from 130 feet upstream of the Bridge Street Bridge to the upstream face of the Fulton Street Bridge (the Construction Area); and
- Three recipient sites in the river for the placement of relocated unionid mussels. The three recipient sites are mussel beds near Ada, Michigan; at Riverside Park just upstream of Grand Rapids; and between Plaster Creek and the M-11 (28th Street) Bridge.

The proposed Project's Area of Potential Effect (APE) is defined for direct effects as the Construction Area and Project Area, and for indirect effects as areas immediately adjacent to the Construction Area. Indirect effects, primarily visual, will only be considered for properties from which the channel modifications will be visible. Potential impacts may result from demolition of four low-head dams; restructuring the channel through excavation, grading, and importing boulders, cobble, and gravel substrate; development and use of staging areas; and installing additional scour protection on existing bridge structures. Proposed earth disturbance is not planned beyond the confines of the active river channel except for construction access points and temporary staging areas on the banks. Temporary access ramps leading from the bank into the river are anticipated to be placed on the existing land surface. There will be little to no alteration or grading and the sites of the temporary ramps will be restored to original state upon completion; therefore, no impacts to historic properties from these temporary ramps are expected. The staging area located south of Bridge Street will have lighting fixtures and 6 to 8 inches of topsoil temporarily removed and stored. Geotextile blanket and stone will be placed to provide temporary driving and storage surfaces. Upon completion of the proposed Project, the stone and geotechnical blanket will be removed, and the lighting fixtures and soil replaced. The staging area located northeast of I-196 will be utilized with limited alteration.

Research Results

As reported in the December 2018 request for consultation, the early phases of Section 106 activities included a background search for previous cultural resources surveys and reported cultural resources. This search, conducted on February 21, 2018, included a 1-mile buffer for archaeological resources and a 2,000-foot buffer for historic and architectural resources. Results of this research have been revised based on the updated APE (see Tables 1 and 2 and Figures 2 and 3). Background research is based on information provided by the Michigan State Historic Preservation Office (SHPO), including the Archaeological Site Index files.

[redacted] prior archaeological surveys and [redacted] previously recorded archaeological sites were identified within the 1-mile buffer. One site, an [redacted], is partially within the updated direct APE; however, the mapped location is based on historical reports, has not been field verified, and ground disturbance activities are not expected to occur in this area. [redacted] The site includes [redacted] In the December 20, 2018 submittal, fencing [redacted] was recommended. Under the current project design, [redacted]

is not immediately adjacent to the direct APE, and no ground disturbance is planned anywhere near the site; therefore, protective fencing is no longer recommended. The NRHP eligibility of the other sites noted below has not been determined.

The potential for isolated human burials and undocumented cemeteries was also considered. According to the Archaeological Site Index [redacted] one of these sites are located in the direct APE.

[redacted]

Seven architectural reconnaissance surveys and nine intensive architectural surveys have been completed near the proposed Project. A total of 39 architectural resources that are listed in the NRHP, recommended as eligible for listing, or have achieved status as a locally designated landmark with national significance are within the indirect APE and/or the 2,000-foot buffer, including six historic districts or extensions of the districts (see Table 2 and Figure 3).

Table 2: Known Architectural Resource Summary of Resources Listed on the NRHP, Recommended for Listing on the NRHP, and Locally Designated Landmarks within 2,000-Foot Buffer

Resource#	Resource Name/Description	Address	Location Relative to APE	NRHP Status
P394	Old Federal Building, United States Post Office and Federal Building	148 Ionia Ave NW	In 2,000-foot buffer	Local National Designated Landmark
P4348	Turner, Eliphalet H., House	731 Front Ave NW	In 2,000-foot buffer	Listed
P4354	German-English School Association	327 Front Ave NW	In 2,000-foot buffer	Local National Designated Landmark
P4356	Ledyard Block Historic District	123-145 Ottaway Ave NW, 104-124 Monroe Center NW	In 2,000-foot buffer	Listed
P4384	Heartside Historic District	Division, Commerce, and Ionia Avenues; Fulton, Weston, Oakes, and Cherry Streets	In 2,000-foot buffer	Listed, National Park Service Certified Local District
P4395	Aldrich Building	98 Monroe Center NW	In 2,000-foot buffer	Listed
P4411	Sixth Street Bridge	Over the Grand River connecting Newberry Street NW and Sixth Street NW	In 2,000-foot buffer	Listed
P5549	8 Ionia SW in Heartside Historic District	8 Ionia Ave SW	In 2,000-foot buffer	Certified Historic Structure
P5555	Lemon and Wheeler Building in Heartside Historic District	25 Ionia Ave SW	In 2,000-foot buffer	Certified Historic Structure
P23718	Fine Arts Building	220 Lyon Street NW	Indirect APE	Listed
P23721	Goodspeed Brothers Building	188 Monroe Ave NW	In 2,000-foot buffer	Listed
P23722	Grand Rapids City Hall	35 Lyon Street NW	In 2,000-foot buffer	Delisted NRHP (Previously Listed on the NRHP)
P23724	Grand Rapids Savings Bank Building	60 Monroe Center NW	In 2,000-foot buffer	Listed
P23731	Michigan Trust Company Building	40 Pearl Street NW	In 2,000-foot buffer	Listed
P23735	Rood Building	139 Pearl Street NW	In 2,000-foot buffer	Listed
P28623	Peck Block	34-50 Monroe Center NW, 209 Division S	In 2,000-foot buffer	Listed
P28714	Aldrich, Godfrey and White Block	89-99 Monroe Center NW	In 2,000-foot buffer	Listed

Resource#	Resource Name/Description	Address	Location Relative to APE	NRHP Status
P29454	Weirich Building	400-402 Bridge Street NW	In 2,000-foot buffer	Eligible
P29456	Oroiquis Building, Iroquois Building in John Ball Park Historic District	404-406 Bridge Street NW	In 2,000-foot buffer	Eligible
P35106	United States Post Office	155 N Division Ave, 135-137 Ionia Ave NW	In 2,000-foot buffer	Listed
P35321	Star Transfer Company Building	134 Grandville Ave SW	In 2,000-foot buffer	Eligible
P38818	Heartside Historic District (Second Proposed Local District Expansion)	Roughly bounded by Cherry Street to the north, Division Street to the east, US 131 to the west and Wealthy Street to the south	In 2,000-foot buffer	Eligible
P38930	Berkey and Gay Furniture Company	940 Monroe Ave NW	In 2,000-foot buffer	Listed
P47552	Grand Rapids Cycle Company Factory	514 Butterworth Street SW	In 2,000-foot buffer	Listed
P47572	Vandenberg Center	300 Monroe Ave NW	In 2,000-foot buffer	Eligible
P47667	P. Steketee & Sons Complex	86 Monroe Ave NW	In 2,000-foot buffer	Eligible
P48253	Fourth Street / Stocking NW Commercial Historic District	Stocking NW, Fourth Street NW	In 2,000-foot buffer	Eligible
P48426	Ionia Avenue Mission Hall	737 Ionia Ave NW	In 2,000-foot buffer	Eligible
P48427	Belknap Lookout Historic District	Bounded by Leonard, College, Michigan, and Division	In 2,000-foot buffer	SHPO recommended district
P48647	John Ball Park Historic District	Roughly bounded by Bridge, Mt. Vernon, Seward, RR Tracks, Butterworth St., Indiana Ave., and Douglas St.	In 2,000-foot buffer	SHPO recommended district
P48654	Downtown Grand Rapids Historic District	Roughly bounded by Fulton, Monroe, Pearl, the Grand River, Lyon, Ramson	In 2,000-foot buffer	Eligible
P48820	Fox Building	83-85 Monroe Center NW	In 2,000-foot buffer	Eligible
P51124	Grand Rapids and Indiana Railroad Grand River Bridge	Over Grand River 300 feet south of Pearl Street	Indirect APE	Eligible
P51170	McKay Tower	146 Monroe Center NW	In 2,000-foot buffer	Eligible
P51324	Lexington School in John Ball Park Historic District	45 Lexington Ave NW	In 2,000-foot buffer	Listed
P57261	Grand Rapids / Kent	56 N Division Ave NE	In 2,000-foot buffer	Eligible
P57471	Keeler Building	56 N Division Ave	In 2,000-foot buffer	Listed

Resource#	Resource Name/Description	Address	Location Relative to APE	NRHP Status
	Civil War Memorial statue	2 Division Ave NW	In 2,000-foot buffer	Local National Designated Landmark
	Slater's Indian Mission	Ah-Nab-Awen Park	In 2,000-foot buffer	Local National Designated Landmark

Scoping Field View

On November 6, 2018, Eric Scuoteguazza (ERM archaeologist) and Danielle McKissic (ERM architectural historian) accompanied Duane Quates (MI NRCS Archaeologist) on a scoping field view of the Project Area to gain an understanding of the proposed Project's potential to impact significant cultural resources, including known resources.

Results of this field view are summarized in the attached "Initial Consultation" letter (dated December 20, 2018). The NRCS field view noted that numerous known cultural resources are located within the indirect APE, including structures and districts that are potentially eligible for listing on the NRHP. Based on the nature of the proposed Project, relatively little viewshed change is expected as a result of the undertaking. For these reasons, the visual APE includes only properties immediately adjacent to and abutting the proposed Project. Both previously recorded and as yet unrecorded resources that met the age threshold (50 years or older) within this potential visual impact area during survey were considered. During the field view, the 19 properties below were considered to fall within the parameters described above (see Figure 4 and Table 3).

Table 3: Previously and Newly Recorded Historic Resources in the Indirect APE

Survey Number/ Field Number	Previously Recorded	Approximate Year	Description	NRHP Recommendation
DM 1	N	ca. 1960	U.S. Post Office Building	Ineligible
DM 2	N	ca. 1910	Commercial Building	Ineligible
DM 3	N	1932	Civic Auditorium	Ineligible
DM 4	N	ca. 1910	Commercial Building	Ineligible
P23733/DM 5	Y	1913	Pantlind Hotel (Amway Grand Plaza Hotel)	Eligible
P23718/DM 6	Y	1923	Fine Arts Building	Listed
DM 7	N	ca. 1915	Commercial Building	Ineligible
DM 8	N	1903	Old Town Riverfront Building	Ineligible
DM 9	N	1915	Gillette Bridge	Ineligible
P51124/DM 10	Y	1892	Grand Rapids and Indiana Railroad Grand River Bridge (Blue Bridge)	Eligible
DM 11	N	ca. 1903	Bridge Street Bridge	Eligible
DM 12	N	1900	Pearl Street Bridge	Eligible
DM 13	N	1927	Fulton Street Bridge	Ineligible
DM 14	N	Undetermined	Garritt's Piling; historic resource in Grand River	Ineligible
DM 15	N	ca. 1980	Grand Rapids Historic Riverwalk	Ineligible (possibly not of age)

DM 16	N	Undetermined	Dam 1	Undetermined
DM 17	N	Undetermined	Dam 2	Undetermined
DM 18	N	Undetermined	Dam 3	Undetermined
DM 19	N	Undetermined	Dam 4	Undetermined

The November 2018 field view included an aboveground reconnaissance-level architectural resource survey. Within properties adjacent to the proposed Project, the field view team attempted to locate and photograph all previously recorded historic properties and validate the reported location and condition, as well as determine whether the Construction Area was visible. The aboveground survey also included documentation of newly identified aboveground resources. For the resources recommended as eligible or ineligible in Table 3, evaluation of eligibility is based on field survey observations. For resources requiring research beyond the field survey observations, NRHP recommendations are as of yet undetermined, pending further research.

Three previously recorded resources were identified within the indirect APE prior to the field survey. The three previously identified resources (P23718, P23733, and P51124) were relocated, documented, and evaluated. The previously recorded resources consist of one commercial building (P23718), one hotel (P23733), and one bridge (P51124). Of these resources, P23718 is listed on the NRHP. Resource P23733 is recommended eligible for listing on the NRHP. Field observations support that P51124 is eligible for listing on the NRHP, as per SHPO staff recommendation.

Of the newly recorded resources, a preliminary NRHP recommendation was provided based on Criterion C findings for all the resources with the exception of the low-head dams (DM 16 through DM 19). Additional research will be needed to evaluate the dams and consideration for inclusion on the NRHP. Furthermore, SHPO consultation and research into other newly recorded resources could alter the NRHP eligibility recommendations provided in Table 3, under Criteria A or B.

Evaluations and Recommendations

While a number of archaeological resources are known to exist within the Project Area and vicinity, earth disturbance is not planned beyond the confines of the active river channel except for construction access points and staging areas. The NRCS field view supported the fact that the Project Area has been heavily urbanized and occurs within a portion of the Grand River that has been historically channelized for flood control purposes. Given the extensive existing land disturbance, and the fact that the majority of the planned activities are limited to the stream channel and some upland areas (for temporary staging and access), the Proposed Action is unlikely to result in impact to stratigraphically intact portions of the soil profile or, therefore, significant archaeological sites or potential culture-bearing soil horizons.

However, if the proposed Project design would change to include grading or significant earth disturbance in upland areas, further archaeological evaluation and possibly testing may be required prior to construction to avoid areas possibly maintaining deeply buried pre-contact or historic archaeological remains. SHPO would be consulted if plans change to include such earthmoving or grading, and a qualified archaeological monitor may be recommended. With the planned avoidance of Site [redacted] and no planned ground disturbance occurring in its vicinity, a finding of no adverse effects to archaeological historic properties is recommended.

Architectural resource assessment and survey identified both previously recorded resources as well as new resources. Three previously recorded resources, P23718, P23733, and P51124, were found to be significant under NRHP criteria. While these resources are adjacent to the proposed Project, a finding of no adverse effects to these resources is recommended due to a lack of visual change as well as a lack of physical changes that could impact resource integrity.

In addition to the three previously recorded resources, 16 new resources were identified during the field survey effort (Table 3). These resources consisted of six buildings (DM 1, DM 2, DM 3, DM 4, DM 7, DM 8), four bridges (DM 9, DM 11, DM 12, DM 13), one historic resource associated with the Grand River (DM 14), one riverwalk (DM 15), and four low-head dams (DM 16, DM 17, DM 18, DM 19). Of these resources, ten are considered to be ineligible for listing on the NRHP. Resources DM 11 and DM 12 are recommended eligible for inclusion on the NRHP; however, due to lack of visual change from the Proposed Action, a finding of no adverse effects to these two resources is recommended. Any visual effects of the proposed Project are planned to be limited to the Grand River channel and properties adjacent to the Project area.

As part of the Proposed Action, the four low-head dams would be demolished. NRHP eligibility for the four low-head dams has not been determined. Resources subject to direct effects (limited to the four low-head dams) may require additional study to determine NRHP significance, potential effect, and the potential need for mitigation of adverse effects to these structures.

The proposed Project would have no effect on the remaining previously recorded and newly recorded architectural resources adjacent to the Project Area. Given that the proposed Project would include the demolition of low-profile dams whose structures are not currently visible above the water surface, and the restoration of rapids that are historic to the natural landscape of the area, there would be no adverse change in the historic viewshed of the identified resources. Additionally, any proposed staging areas for the proposed Project would not directly impact the resources identified within the viewshed, nor would they cause permanent impact on the immediate surroundings that may tie into the significance of that resource. However, should earthmoving, tree-clearing, or terracing activities be proposed as Project planning and design progresses, such viewshed changes may need to be re-evaluated in consultation with SHPO.

We appreciate your participation in our Section 106 consultation process. Please address any comments, questions, and/or additional information requests to me. I can be contacted at my office number (517) 324-5261, my cell number (517) 980-0707, and by email at Edward.Quates@usda.gov. I look forward to discussing this project with you and the MI SHPO staff.

Yours sincerely,

E.W. Duane Quates, Ph.D.
State Cultural Resources Specialist / Archaeologist

Brimley, Michigan 49715

RE: Tribal Consultation for the Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, Michigan

Dear Officer Carrick:

The U.S. Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS) is hereby initiating consultation with the Bay Mills Indian Community regarding the proposed Lower Grand River Watershed Habitat Restoration Project, located in Grand Rapids, Kent County, Michigan (Attachment 1). This effort is being sponsored by the City of Grand Rapids and undertaken by Grand Rapids Whitewater (GRWW), which is a non-profit funding applicant (the Applicant).

Specifically, the project is within the wetted channel of the Grand River and stretches for 0.7 miles from the I-196 Bridge to the Fulton Street Bridge. This project does not include removal of the 6th Street dam or other related work upstream of the I-196 Bridge; that work will be planned and constructed as a separate and independent Section 106 undertaking under the authority of the Great Lakes Fishery Commission with the United States Army Corps of Engineers providing technical support and assistance.

The purpose of the Lower Grand River Watershed Habitat Restoration Project is to revitalize, enhance, and maintain the rapids in downtown Grand Rapids. The project will facilitate the restoration of the ecological, cultural, and recreational functions of the historic rapids by:

- Restoring aquatic habitat diversity and suitability for threatened, endangered, and special concern native Great Lakes fish and mussel species;
- Reducing or eliminating public safety hazards generated by the existing hydraulics;
- Diversifying in-stream features that will improve habitat and create/enhance recreational activities in the river.

This project is funded, in part, by the USDA/NRCS Regional Conservation Partnership Program (RCPP), per the Watershed Protection and Flood Prevention Act, PL-566 program. As such, it is subject to the requirements of the National Environmental Policy Act of 1969, as well as the National Historic Preservation Act of 1966. Therefore, an Environmental Assessment (EA) is being completed to identify and address potential environmental impacts which may result from proposed activities. Accordingly, considerations of potential impacts to archaeological, historic and architectural resources (collectively referred to as *cultural resources*) are being taken into account, and consultation with Michigan's State Historic Preservation Office (SHPO) is in progress with the assistance of NRCS' third-party contractor, Environmental Resources Management (ERM).

USDA is an equal opportunity provider and employer.

While a number of cultural resources are known to exist within the project vicinity, earth disturbance is not planned beyond the confines of the active river channel, and staging areas on its banks are anticipated to be placed on the existing land surface with little to no alteration or grading.

As mentioned above, this project serves to facilitate the restoration of the ecological, cultural, and recreational functions of the historic rapids and **should not be confused with** other efforts that oppose this goal and propose to dredge the grand river for power boat access to and through Ottawa County.

The USDA/NRCS invites your comments and/or guidance regarding the Lower Grand River Watershed Habitat Restoration Project, including information about potential impacts to archaeological sites, burials, and traditional cultural properties. We also welcome your interest in being involved in the project's development, up to and including your being listed as a "consulting party," should you so choose.

If you choose to be included as a consulting party, please notify us in writing within thirty calendar days of receipt of this invitation. We will instruct the Applicant to provide you with forthcoming draft documents for your review and comment, and you will be kept apprised of project progress, including agency consultation. If you are aware of a stakeholder group that is interested in consulting on this planned undertaking, please respond with the appropriate contact information.

Formal responses to this invitation as well as any questions or requests for additional information should be directed to the Cultural Resources Coordinator on my staff:

RE: Tribal Consultation for the Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, Michigan

Dear Officer Carrick:

The U.S. Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS) is hereby initiating consultation with the Bay Mills Indian Community regarding the proposed Lower Grand River Watershed Habitat Restoration Project, located in Grand Rapids, Kent County, Michigan (Attachment 1). This effort is being sponsored by the City of Grand Rapids and undertaken by Grand Rapids Whitewater (GRWW), which is a non-profit funding applicant (the Applicant).

Specifically, the project is within the wetted channel of the Grand River and stretches for 0.7 miles from the I-196 Bridge to the Fulton Street Bridge. This project does not include removal of the 6th Street dam or other related work upstream of the I-196 Bridge; that work will be planned and constructed as a separate and independent Section 106 undertaking under the authority of the Great Lakes Fishery Commission with the United States Army Corps of Engineers providing technical support and assistance.

The purpose of the Lower Grand River Watershed Habitat Restoration Project is to revitalize, enhance, and maintain the rapids in downtown Grand Rapids. The project will facilitate the restoration of the ecological, cultural, and recreational functions of the historic rapids by:

- Restoring aquatic habitat diversity and suitability for threatened, endangered, and special concern native Great Lakes fish and mussel species;
- Reducing or eliminating public safety hazards generated by the existing hydraulics;
- Diversifying in-stream features that will improve habitat and create/enhance recreational activities in the river.

This project is funded, in part, by the USDA/NRCS Regional Conservation Partnership Program (RCPP), per the Watershed Protection and Flood Prevention Act, PL-566 program. As such, it is subject to the requirements of the National Environmental Policy Act of 1969, as well as the National Historic Preservation Act of 1966. Therefore, an Environmental Assessment (EA) is being completed to identify and address potential environmental impacts which may result from proposed activities. Accordingly, considerations of potential impacts to archaeological, historic and architectural resources (collectively referred to as *cultural resources*) are being taken into account, and consultation with Michigan's State Historic Preservation Office (SHPO) is in progress with the assistance of NRCS' third-party contractor, Environmental Resources Management (ERM).

USDA is an equal opportunity provider and employer.

While a number of cultural resources are known to exist within the project vicinity, earth disturbance is not planned beyond the confines of the active river channel, and staging areas on its banks are anticipated to be placed on the existing land surface with little to no alteration or grading.

As mentioned above, this project serves to facilitate the restoration of the ecological, cultural, and recreational functions of the historic rapids and **should not be confused with** other efforts that oppose this goal and propose to dredge the grand river for power boat access to and through Ottawa County.

The USDA/NRCS invites your comments and/or guidance regarding the Lower Grand River Watershed Habitat Restoration Project, including information about potential impacts to archaeological sites, burials, and traditional cultural properties. We also welcome your interest in being involved in the project's development, up to and including your being listed as a "consulting party," should you so choose.

If you choose to be included as a consulting party, please notify us in writing within thirty calendar days of receipt of this invitation. We will instruct the Applicant to provide you with forthcoming draft documents for your review and comment, and you will be kept apprised of project progress, including agency consultation. If you are aware of a stakeholder group that is interested in consulting on this planned undertaking, please respond with the appropriate contact information.

Formal responses to this invitation as well as any questions or requests for additional information should be directed to the Cultural Resources Coordinator on my staff:

Ref: *Lower Grand River Watershed Habitat Restoration and Farmland Conservation Project*
Grand Rapids, Kent County, Michigan
ACHP Project Number: 17025

Dear Mr. Quates:

On June 11, 2021, the Advisory Council on Historic Preservation (ACHP) received a notification and supporting documentation regarding the potential adverse effects of the referenced undertaking on a property or properties listed or eligible for listing in the National Register of Historic Places. Based upon the information provided, we have concluded that Appendix A, *Criteria for Council Involvement in Reviewing Individual Section 106 Cases*, of our regulations, "Protection of Historic Properties" (36 CFR Part 800) implementing Section 106 of the National Historic Preservation Act, does not apply to this undertaking. Accordingly, we do not believe our participation in the consultation to resolve adverse effects is needed.

However, if we receive a request for participation from the State Historic Preservation Officer, Tribal Historic Preservation Officer, affected Indian tribe, a consulting party, or other party, we may reconsider this decision. Should the undertaking's circumstances change, consulting parties cannot come to consensus, or you need further advisory assistance to conclude the consultation process, please contact us.

Pursuant to Section 800.6(b)(1)(iv), you will need to file the final Section 106 agreement document (Agreement), developed in consultation with the Michigan State Historic Preservation Office and any other consulting parties, and related documentation with the ACHP at the conclusion of the consultation process. The filing of the Agreement and supporting documentation with the ACHP is required in order to complete the requirements of Section 106 of the National Historic Preservation Act.

Thank you for providing us with your notification of adverse effect If you have questions or require our further assistance, please contact Ms. Alexis Clark at (202) 517-0208 or by e-mail at aclark@achp.gov and reference the ACHP Project Number above.

Sincerely,

LaShavio Johnson

RE: ER20-876 Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County (USDA/NRCS)

Dear Ms. Gutierrez:

Under the authority of Section 106 of the National Historic Preservation Act of 1966, as amended, we have reviewed the proposed undertaking at the above-noted location. We have recently reviewed the report entitled NRHP Evaluation of Four Beautification Dams in the Grand River, Grand Rapids, Michigan submitted to fulfill the U.S. Department of Agriculture's Natural Resource Conservation Service's (NRCS) cultural resource management obligations under Sections 106 and 110 of the National Historic Preservation Act of 1966, as amended.

After review of the eligibility information presented in the report, we concur with the recommendations for the four beautification dams as eligible under Criterion A as series of structures that conveys the long history of the City of Grand Rapids with the Grand River and for their role in the emergence of city planning and the development of the riverfront as a focal point of downtown Grand Rapids. The dams may be individually eligible for listing in the National Register, or as a contributing of a larger historic district associated with the total design of Harland Bartholomew, depending on the extent of the implementation of Bartholomew's design and whether any larger, potential district possesses historic integrity. The lack of a larger historic district or loss of integrity of the larger district does not diminish the individual significance, and thus eligibility, of the dams.

We do not concur that the dams are eligible under Criterion B for their association with city planner Harland Bartholomew. Though Bartholomew may be a significant historical figure, National Register Bulletin 15 states, "architects, artisans, artists, and engineers are often represented by their works, which are eligible under Criterion C." Bulletin 15 further guides that rather than the works of architects, artisans, artists, and engineers, the "homes and studios... can be eligible for consideration under Criterion B, because these usually are the properties with which they are most personally associated" (emphasis added). For these reasons, the structures are not eligible under Criterion B.

Likewise, we do not concur with the recommendation of not eligible under Criterion C. Given these are works of architecture and engineering, they should be more thoroughly examined under Criterion C. We believe these dams embody the distinctive characteristics of a type, period or method of construction and are therefore eligible under Criterion C.

While there are some differences between the SHPO's opinion of eligibility above in terms of the applicable Criterion, it appears that SHPO and NRCS agree that the dams are resources eligible for inclusion in the National Register and requesting additional changes to the report now would be inappropriate. The only additional information that SHPO requires for the NRHP Evaluation report at this time is the acreage of the area surveyed as part of this effort for reporting purposes. Please be sure to include that in all future survey efforts as well.

Therefore, based on the information provided for our review, the State Historic Preservation Officer (SHPO) concurs with the determination of USDA/NRCS that the proposed undertaking will have an **adverse effect** on the Grand Rapids, Grand River Beautification Dams, which appear to meet the criteria for listing in the National Register of Historic Places.

This undertaking meets the criteria of adverse effect because: *the undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association,* 36 CFR § 800.5(a)(1). Specifically, the undertaking will result in physical destruction of or damage to all or part of the property.

Federal agencies are required to avoid, minimize, or mitigate adverse effects. Please note that if the federal agency and the SHPO concur that the adverse effect cannot be avoided, the Section 106 process will not conclude until the consultation process is complete, an MOA is developed, executed, and implemented, and, if applicable, the formal comments of the Advisory Council have been received, 36 CFR § 800.6. For more information on your responsibilities and obligations for projects that will have an adverse effect on historic properties under 36 CFR § 800.6, please review the enclosed materials.

We remind you that federal agency officials or their delegated authorities are required to involve the public in a manner that reflects the nature and complexity of the undertaking and its effects on historic properties per 36 CFR § 800.2(d). The National Historic Preservation Act also requires that federal agencies consult with any Indian tribe and/or Tribal Historic Preservation Officer (THPO) that attach religious and cultural significance to historic properties that may be affected by the agency's undertakings per 36 CFR § 800.2(c)(2)(ii).

The opinion of the SHPO is based on the materials provided for our review. If you believe that there is material that we should consider that might affect our finding, or if you have questions, please contact Brian Grennell, Cultural Resource Management Coordinatoe, at (517) 335-2721 or by email at GrennellB@michigan.gov. **Please reference our project number in all communication with this office regarding this undertaking.**

Finally, the State Historic Preservation Office is not the office of record for this undertaking. You are therefore asked to maintain a copy of this letter with your environmental review record for this undertaking. Thank you for this opportunity to review and comment, and for your cooperation.

Sincerely,

Martha MacFarlane-Faes

RE: ER20-876 Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, (USDA-NRCS)

Dear Dr. Quates:

We have reviewed the information regarding the hydraulic modeling results for the Lower Grand River Watershed Habitat Restoration Project, Grand Rapids, Kent County, submitted to our office on December 14, 2023. Based on the information provided in "Table 1: Comparison of hydraulic modeling results downstream of project", it appears that there is no elevated risk of downstream erosion associated with this project. Based on this information, the State Historic Preservation Officer (SHPO) concurs with the determination of USDA-NRCS that **no *archaeological* properties are affected** within the area of potential effects of this undertaking.

The revised project information does not change our earlier concurrence (March 21, 2021) of **adverse effect** on the Grand Rapids, Grand River Beautification Dams, which appear to meet the criteria of listing in the National Register of Historic Places. We will continue to consult with the NRCS on implementation of the stipulations outlined in the Memorandum of Agreement among the NRCS, SHPO, the Michigan Strategic Fund, the City of Grand Rapids, Michigan, Grand Rapids Whitewater, Inc., and the Grand Valley Metropolitan Council that was executed on September 30, 2022.

We remind you that federal agency officials or their delegated authorities are required to involve the public in a manner that reflects the nature and complexity of the undertaking and its effects on historic properties per 36 CFR § 800.2(d). The National Historic Preservation Act also requires that federal agencies consult with any Indian tribe and/or Tribal Historic Preservation Officer (THPO) that attach religious and cultural significance to historic properties that may be affected by the agency's undertakings per 36 CFR § 800.2(c)(2)(ii).

The opinion of the SHPO is based on the materials provided for our review. If you believe that there is material that we should consider that might affect our finding, or if you have questions, please contact If you have any questions, please contact Scott Slagor, Cultural Resource Protection Manager, at 517-285-5120 or by email at slagors2@michigan.gov. For questions regarding archaeological resources, please contact Dr. Sarah Surface-Evans, Senior Archaeologist at 517-282-7959 or by email at frederickk1@michigan.gov.**Please reference our project number in all communication with this office regarding this undertaking**.

CALL 811 FOR MISS DIG

FOR PROTECTION OF UNDERGROUND UTILITIES AND IN CONFORMANCE WITH PUBLIC ACT 53, 1974, THE CONTRACTOR SHALL CALL 811 A MINIMUM OF THREE (3) FULL WORKING DAYS (EXCLUDING SATURDAYS, SUNDAYS AND HOLIDAYS) PRIOR TO EXCAVATING IN THE VICINITY OF UTILITY LINES. ALL "MISS DIG" PARTICIPATING MEMBERS WILL THUS BE ROUTINELY NOTIFIED. THIS DOES NOT RELIEVE THE CONTRACTOR OF THE RESPONSIBILITY OF NOTIFYING UTILITY OWNERS WHO MAY NOT BE A PART OF THE "MISS DIG" ALERT SYSTEM.

GENERAL NOTES

1. MATERIALS AND WORKMANSHIP SHALL BE IN ACCORDANCE WITH THE 1993 EDITION OF THE CITY OF GRAND RAPIDS STANDARD CONSTRUCTION SPECIFICATIONS, EXCEPT AS OTHERWISE INDICATED ON THESE PLANS OR IN THE SUPPLEMENTAL SPECIAL SPECIFICATIONS.
2. IF A WATER SERVICE (COPPER, LEAD OR OTHERWISE) IS DISTURBED, DAMAGED, RELOCATED OR REPLACED FROM THE WATER MAIN TO THE CURB STOP, WHETHER PLANNED OR UNINTENTIONAL, THE CONTRACTOR IS TO HAVE THE SERVICE MATERIAL VERIFIED FROM THE MAIN TO THE METER. IF ANY PORTION IS FOUND TO BE LEAD, THEN THE CONTRACTOR MUST HAVE THE LEAD REPLACED WITH A COPPER WATER SERVICE. ALL WATER SERVICE REPLACEMENTS MUST BE COMPLETED BY A REGISTERED UNDERGROUND CONTRACTOR. IF THE REPLACEMENT INVOLVES WORK ON PRIVATE PROPERTY, THE CONTRACTOR IS TO CONTACT THE ENGINEER IMMEDIATELY TO OBTAIN PERMISSIONS FOR THE SERVICE TO BE REPLACED BY CITY OF GRAND RAPIDS UNDERGROUND CONTRACTORS ON TERM CONTRACT FOR LEAD SERVICE REPLACEMENT. THE CONTRACTOR WILL REIMBURSE THE CITY FOR THIS COST.

GPF No. 5315

Sheet No. 5 of 34 G04

MICHIGAN UNIFIED KEYING SYSTEM SOIL EROSION & SEDIMENTATION CONTROL MEASURES

✳ INDICATES APPLICABILITY OF A SPECIFIC CONTROL MEASURE TO ONE OR MORE OF THE SEVEN PROBLEM AREAS

KEY	DETAIL	CHARACTERISTICS	SLOPES A	STREAMS AND WATERWAYS B	SURFACE DRAINAGEWAYS C	ENCLOSED DRAINAGE (Inlet & Outlet Control) D	LARGE FLAT SURFACE AREAS E	BORROW AND STOCKPILE AREAS F	ADJACENT PROPERTIES G
1	Dust Control – No Detail –	DUST CONTROL APPLICATIONS CAN INCLUDE WATERING, CHEMICAL DUST SUPPRESSION, GRAVEL OR ASPHALT SURFACING, TEMPORARY AGGREGATE COVER AND HAUL TRUCK COVERS	✳				✳	✳	
2	Selective Grading & Shaping	WATER CAN BE DIVERTED TO MINIMIZE EROSION FLATTER SLOPES EASE EROSION PROBLEMS	✳				✳	✳	✳
3	Grubbing Omitted	SAVES COST OF GRUBBING, PROVIDES NEW SPROUTS RETAINS EXISTING ROOT MAT SYSTEM, REDUCES WIND FALL AT NEW FOREST EDGE. DISCOURAGES EQUIPMENT ENTRANCE	✳				✳		✳
4	Vegetative Stabilization	MAY UTILIZE A VARIETY OF PLANT MATERIAL STABILIZES SOIL SLOWS RUNOFF VELOCITY FILTERS SEDIMENT FROM RUNOFF	✳	✳	✳		✳	✳	✳
5	AVAILABLE DETAIL								
6	Sodding with Wire Staked and/or Netting	FACILITATES ESTABLISHMENT OF VEGETATIVE COVER EFFECTIVE FOR DRAINAGEWAYS WITH LOW VELOCITY EASILY PLACED IN SMALL QUANTITIES BY INEXPERIENCED PERSONNEL SHOULD INCLUDE PREPARED TOPSOIL BED	✳		✳			✳	✳
7	AVAILABLE DETAIL								
8	Sodding	PROVIDES IMMEDIATE PROTECTION CAN BE USED ON STEEP SLOPES WHERE SEED MAY BE DIFFICULT TO ESTABLISH. EASY TO PLACE, MAY BE REPAIRED IF DAMAGED SHOULD INCLUDE PREPARED TOPSOIL BED	✳		✳		✳	✳	✳
9	Vegetative Buffer Strip	SLOWS RUNOFF VELOCITY FILTERS SEDIMENT FROM RUNOFF REDUCES VOLUME OF RUNOFF ON SLOPES	✳	✳					✳
10	Mulching	USED ALONE TO PROTECT EXPOSED AREAS FOR SHORT PERIODS PROTECTS SOIL FROM IMPACT OF FALLING RAIN PRESERVES SOIL MOISTURE AND PROTECTS GERMINATING SEED FROM TEMPERATURE EXTREMES	✳				✳	✳	
11	Roughened Surface	REDUCES VELOCITY AND INCREASES INFILTRATION RATES COLLECTS SEDIMENT HOLDS WATER, SAND AND MULCH BETTER THAN SMOOTH SURFACES	✳				✳		
12	AVAILABLE DETAIL								
13	Riprap, Rubble, Gabions	USED WHERE VEGETATION IS NOT EASILY ESTABLISHED EFFECTIVE FOR HIGH VELOCITIES OR IRON CONCENTRATIONS PERMITS RUNOFF TO INFILTRATE SOIL DISSIPATES ENERGY FLOW AT SYSTEM OUTLETS	✳	✳	✳				
14	AVAILABLE DETAIL								
15	AVAILABLE DETAIL								
16	AVAILABLE DETAIL								
17	Benches	REDUCES RUNOFF VELOCITY BY REDUCING EFFECTIVE SLOPE LENGTH COLLECTS SEDIMENT. PROVIDES ACCESS TO SLOPES FOR SEEDING, MULCHING AND MAINTENANCE	✳					✳	
18	Earth Diversion Berm	DIVERTS WATER FROM VULNERABLE AREAS COLLECTS AND DIRECTS WATER TO PREPARED DRAINAGEWAYS MAY BE PLACED AS PART OF NORMAL CONSTRUCTION OPERATION	✳					✳	✳
18A	Earth Diversion Berm With Stone Outlet at Inlet	DIVERTS WATER FROM VULNERABLE AREAS COLLECTS AND DIRECTS WATER TO PREPARED DRAINAGEWAYS MAY BE PLACED AS PART OF NORMAL CONSTRUCTION OPERATION	✳					✳	✳
19	Diversion Ditch	COLLECTS AND DIVERTS WATER TO REDUCE EROSION POTENTIAL MAY BE INCORPORATED IN PERMANENT PROJECT DRAINAGE SYSTEMS	✳					✳	✳
20	Diversion Berm & Ditch	DIVERTS WATER TO A PREPARED DRAINAGEWAY MAY BE USED AT INTERVALS ACROSS SLOPE FACE TO REDUCE EFFECTIVE SLOPE LENGTH	✳					✳	✳
21	Stone Filter Berm	CONSTRUCTED OF GRAVEL OR STONE INTERCEPTS AND DIVERTS RUNOFF TO STABILIZED AREAS OR PREPARED DRAINAGE SYSTEMS SLOWS RUNOFF AND COLLECTS SEDIMENT	✳	✳					✳
21A	Stone Filter Berm with Silt Fence	CONSTRUCTED OF GRAVEL OR STONE INTERCEPTS AND DIVERTS RUNOFF TO STABILIZED AREAS OR PREPARED DRAINAGE SYSTEMS SLOWS RUNOFF AND COLLECTS SEDIMENT – SILT FENCE PREVENTS EROSION AROUND SPILLWAY	✳	✳					✳
22	AVAILABLE DETAIL								
23	AVAILABLE DETAIL								
24	Grassed Waterway	MUCH MORE STABLE FORM OF DRAINAGEWAY THAN BARE CHANNEL GRASS TENDS TO SLOW RUNOFF AND FILTER OUT SEDIMENT USED WHERE BARE CHANNEL WOULD BE ERODED			✳				
25	Slope Drain (Surface Pipe)	PREVENTS EROSION ON SLOPES WHEN RUNOFF CANNOT BE DIVERTED TO EDGES OF SLOPE AREA. USUALLY TEMPORARY CAN BE CONSTRUCTED OR EXTENDED AS GRADING PROGRESSES	✳						
26	Slope Drain – Paved Chute/Flume	PREVENTS EROSION ON SLOPES WHEN RUNOFF CANNOT BE DIVERTED TO EDGE OF SLOPE AREA. USUALLY PERMANENT CAN BE CONSTRUCTED OR EXTENDED AS GRADING PROGRESSES	✳						
27	Slope Drain (Subsurface Pipe)	PREVENTS EROSION ON SLOPES WHEN RUNOFF CANNOT BE DIVERTED TO EDGE OF SLOPE AREA. USUALLY PERMANENT CAN BE CONSTRUCTED AS GRADING PROGRESSES	✳						
28	Drop Spillway	SLOWS VELOCITY OF FLOW, REDUCING EROSIVE CAPACITY		✳	✳				
29	Pipe Drop	REDUCES RUNOFF VELOCITY REMOVES SEDIMENT AND TURBIDITY CAN BE DESIGNED TO HANDLE LARGE VOLUMES OF FLOW			✳				
30	Pipe Spillway	REMOVES SEDIMENT AND TURBIDITY FROM RUNOFF MAY BE PART OF PERMANENT EROSION CONTROL PLAN			✳				
31	Energy Dissipator	SLOWS RUNOFF VELOCITY TO NON-EROSIVE LEVEL PERMITS SEDIMENT COLLECTION FROM RUNOFF	✳		✳	✳			
32	Level Spreader	CONVERTS COLLECTED CHANNEL OR PIPE FLOW BACK TO SHEET FLOW AVOIDS CHANNEL EASEMENTS AND CONSTRUCTION OFF PROJECT SITE SIMPLE TO CONSTRUCT			✳				
33	Sediment Trap	MAY BE CONSTRUCTED OF A VARIETY OF MATERIALS TRAPS SEDIMENT AND REDUCES VELOCITY OF FLOW CAN BE CLEANED AND EXPANDED AS NEEDED			✳				
34	Sediment Basin	TRAPS SEDIMENT RELEASES RUNOFF AT NON-EROSIVE RATES CONTROLS RUNOFF AT SYSTEM OUTLETS CAN BE VISUAL AMENITIES			✳	✳			
35	AVAILABLE DETAIL								
36	Catch Basin Inlet Protection	COLLECTS HIGH VELOCITY CONCENTRATED RUNOFF MAY USE FILTER CLOTH OVER INLET					✳		✳

✳ INDICATES APPLICABILITY OF A SPECIFIC CONTROL MEASURE TO ONE OR MORE OF THE SEVEN PROBLEM AREAS

KEY	DETAIL	CHARACTERISTICS	SLOPES A	STREAMS AND WATERWAYS B	SURFACE DRAINAGEWAYS C	ENCLOSED DRAINAGE (Inlet & Outlet Control) D	LARGE FLAT SURFACE AREAS E	BORROW AND STOCKPILE AREAS F	ADJACENT PROPERTIES G
37	Sod Filter	INEXPENSIVE AND EASY TO CONSTRUCT PROVIDES IMMEDIATE PROTECTION PROTECTS AREAS AROUND INLETS FROM EROSION				✳			
38	AVAILABLE DETAIL								
39	Fabric Filter Curb Inlet Protection	CAN UTILIZE MATERIAL FOUND ON SITE EASY TO CONSTRUCT FILTERS SEDIMENT FROM RUNOFF				✳			✳
40	Inlet Sediment Trap	EASY TO SHAPE COLLECTS SEDIMENT MAY BE CLEANED AND EXPANDED AS NEEDED				✳			
41	Stone and Rock Ford Crossing	MAY BE ROCK OR CLEAN RUBBLE MINIMIZES STREAM TURBIDITY INEXPENSIVE MAY ALSO SERVE AS DITCH CHECK OR SEDIMENT TRAP		✳					
42	Temporary Culvert	ELIMINATES STREAM TURBULENCE AND TURBIDITY PROVIDES UNOBSTRUCTED PASSAGE FOR FISH AND OTHER WATER LIFE CAPACITY FOR NORMAL FLOW CAN BE PROVIDED WITH STORM WATER FLOWING OVER ROADWAY		✳					
43	Culvert Sediment Trap	EASY TO INSTALL AT INLET KEEPS CULVERT CLEAN AND FREE FLOWING MAY BE CONSTRUCTED OF LUMBER OR LOGS		✳					✳
44	AVAILABLE DETAIL								
45	Temporary Stream Channel Change	NEW CHANNEL KEEPS NORMAL FLOWS AWAY FROM CONSTRUCTION REQUIRES STATE PERMIT		✳					
46	AVAILABLE DETAIL								
47	Cofferdam	WORK CAN BE CONTINUED DURING MOST ANTICIPATED STREAM CONDITIONS CLEAR WATER CAN BE PUMPED DIRECTLY BACK INTO STREAM		✳					
48	AVAILABLE DETAIL								
49	Check Dam	REDUCES FLOW VELOCITY CATCHES SEDIMENT CAN BE CONSTRUCTED OF LOGS, STRAW, HAY, ROCK, LUMBER, MASONRY, OR SAND BAGS		✳	✳				
50	AVAILABLE DETAIL								
51	Retaining Wall	REDUCES GRADIENT WHERE SLOPES ARE EXTREMELY STEEP PERMITS RETENTION OF EXISTING VEGETATION, KEEPING SOIL STABLE IN CRITICAL AREAS, MINIMIZES MAINTENANCE	✳						✳
52	AVAILABLE DETAIL								
53	Windbreak	MINIMIZES WIND EROSION MAY BE SNOW FENCE					✳		
54	Silt Fence	USES GEOTEXTILE FABRIC AND POSTS OR POLES EASY TO CONSTRUCT AND LOCATE AS NECESSARY	✳		✳		✳		✳
55	Stone Filter–Before Paving	STONE FILTER TO PROVIDE INEXPENSIVE AND EASILY CONSTRUCTED SEDIMENT CONTROL PRIOR TO PAVING SEE DETAIL AT LEFT			✳	✳			
55A	Stone Filter–After Paving	STONE FILTER TO PROVIDE INEXPENSIVE AND EASILY CONSTRUCTED SEDIMENT CONTROL AFTER PAVING SEE DETAIL AT LEFT			✳	✳			
55B	Catch Basin, Filter Bag	MANUFACTURED FILTER BAG INSERTED UNDER CASTING. COLLECTS SEDIMENT AT CATCH BASIN INLET SEE DETAIL AT LEFT			✳	✳			
56	Turbidity Curtain	A TURBIDITY CURTAIN IS USED WHEN SLACK WATER AREA IS NECESSARY TO ISOLATE CONSTRUCTION ACTIVITIES FROM THE WATERCOURSE. THE STILL WATER AREA CONTAINS THE SEDIMENT WITHIN THE CONSTRUCTION LIMITS		✳					
57	Stream – Liner	MAY BE 6A TYPE STONE, SMALL ROCKS OR SIMILAR–SIZED CLEAN CONCRETE–MASONRY RUBBLE, MINIMIZES STREAM TURBIDITY RELATIVELY INEXPENSIVE MAY BE USED AS DITCH CHECK OR SEDIMENT TRAP			✳				
58	Sediment Sump	CONTROLS SEDIMENTATION IN LARGE STREAMS, CONSIST OF OVER EXCAVATING THE DRAIN BY ONE TO TWO FEET, THE SUMP WILL BE AT LEAST 200 FEET LONG, SEDIMENTS ACCUMULATED DURING CONSTRUCTION WILL BE REMOVED UPON PROJECT COMPLETION			✳				
59	AVAILABLE DETAIL								
60	Temporary Construction Entrance	ASSISTS IN REMOVING SOIL FROM THE TIRES OF CONSTRUCTION VEHICLES AND VEHICLES WHEN EXITING THE CONSTRUCTION SITE. ALSO REDUCES TRACKING EXCESSIVE SEDIMENT/SOIL ONTO THE ADJACENT ROAD							✳

SOIL EROSION & SEDIMENTATION CONTROL NOTES

1. CONTRACTOR SHALL PLACE ALL SOIL EROSION & SEDIMENTATION CONTROL MEASURES AS SHOWN IN THE PLANS, OR AS DIRECTED BY THE ENGINEER IN ACCORDANCE WITH THE MICHIGAN UNIFIED KEYING SYSTEM.
2. CONSTRUCTION OPERATIONS SHALL BE SCHEDULED AND PERFORMED SO THAT PREVENTATIVE EROSION CONTROL MEASURES ARE IN PLACE PRIOR TO EXCAVATION; TEMPORARY STABILIZATION MEASURES ARE IN PLACE IMMEDIATELY FOLLOWING BACK FILLING AND/OR GRADING OPERATIONS.
3. SPECIAL PRECAUTIONS WILL BE TAKEN IN THE USE OF CONSTRUCTION EQUIPMENT TO PREVENT SITUATIONS THAT PROMOTE EROSION.
4. CLEANUP WILL BE DONE IN A MANNER TO ENSURE THAT EROSION CONTROL MEASURES ARE NOT DISTURBED.
5. THE PROJECT WILL BE INSPECTED DAILY FOR SOIL EROSION AND SEDIMENTATION CONTROL COMPLIANCE BY CERTIFIED STORM WATER OPERATOR PROVIDED BY CONTRACTOR. DEFICIENCIES WILL BE CORRECTED BY THE CONTRACTOR WITHIN 24 HOURS.
6. TEMPORARY EROSION CONTROL MEASURES SHALL BE COMPLETELY REMOVED BY THE CONTRACTOR UPON ESTABLISHMENT OF PERMANENT CONTROL MEASURES, WITH PRIOR APPROVAL OF OWNER, ENGINEER, AND/OR AGENCY HAVING JURISDICTION.
7. CONSTRUCTION WILL DISTURB LESS THAN 5 ACRES, THUS AN NPDES STORM WATER DISCHARGE PERMIT WILL NOT BE REQUIRED. CONTRACTOR SHALL MEET THE PERMIT–BY–RULE (RULE 323.2190) HOWEVER FOR AREAS BETWEEN 1 ACRE AND 5 ACRES.
8. ALL ROADS WITHIN THE INFLUENCE OF THE PROJECT MUST REMAIN CLEAN AT ALL TIMES. CONTRACTOR SHALL SWEEP ROADS AS DIRECTED BY THE ENGINEER.
9. BEST MANAGEMENT PRACTICES FOR SOIL EROSION AND SEDIMENTATION CONTROL MEASURES SHALL BE USED ON THIS PROJECT AS SHOWN ON THE PLANS AND AS DEFINED BY THE ENGINEER.
10. ALL EROSION CONTROL MEASURES SHALL BE CONSTRUCTED AND MAINTAINED IN ACCORDANCE WITH THE CITY OF GRAND RAPIDS AND THE OFFICE OF THE KENT COUNTY DRAIN COMMISSIONER REQUIREMENTS AND PROJECT SPECIFICATIONS
11. ANY EROSION OR SEDIMENT FROM WORK ON THIS SITE SHALL BE CONTAINED ON THE SITE AND NOT ALLOW3ED TO COLLECT ON ANY OFF SITE AREAS OR IN WATERWAYS: WATERWAYS INCLUDE BOTH NATURAL AND MAN–MADE OPEN DITCHES, STREAMS, STORM DRAINS, LAKES AND PONDS.
12. WORK TO BE PERFORMED WITHIN THE GRAND RIVER FOR 2,756 FEET BETWEEN I–196 AND FULTON STREET AND ALONG THE GRAND RIVER FOR 900 FEET IN AH–NAB–AWEN PARK. STAGING AREAS 0 FEET AWAY FROM RIVER AT AH–NAB–AWEN PARK AND 25 FEET AWAY AT MONROE LOT.
13. THE SOIL TYPE WITHIN THE PROJECT IS IDENTIFIED AS URBAN LAND BY THE UNITED STATES DEPARTMENT OF AGRICULTURE NATURAL RESOURCES CONSERVATION SERVICE
14. PROVIDE TRAFFIC CONTROL BARRICADES, SIGNS, LIGHTS, ETC. IN ACCORDANCE WITH THE LATEST EDITION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES AS NECESSARY FOR THE PROTECTION AND SAFETY OF THE PUBLIC. MAINTAIN THESE DEVICES AT ALL TIMES DURING CONSTRUCTION.
15. PROTECT TREES NOT SHOWN FOR REMOVAL FROM DAMAGE DURING CONSTRUCTION IN ACCORDANCE WITH THE CONTRACT DOCUMENTS.
16. ALL REMOVED MATERIALS ARE THE PROPERTY OF THE CONTRACTOR. CLEANUP AND DISPOSE OF ALL EXCESS MATERIALS OFF SITE AT A LOCATION DESIGNATED FOR THIS USE AND IN ACCORDANCE WITH LOCAL REGULATIONS OR AT N ON SITE LOCATION DESIGNATED BY THE OWNER, UNLESS OTHERWISE NOTED.
17. USE (2) TWO BENCH MARKS FOR VERIFICATION OF ALL CONSTRUCTION ELEVATIONS. SET ADDITIONAL BENCH MARKS TO COMPLY WITH THIS REQUIREMENT.
18. RESTORE ALL STREET SURFACES, DRIVEWAYS, CULVERTS, ROADSIDE DRAINAGE DITCHES, AND OTHER PUBLIC OR PRIVATE STRUCTURES THAT ARE DISTURBED OR DAMAGED AS A RESULT OF CONSTRUCTION ACTIVITIES TO A CONDITIONS EQUAL TO OR BETTER THAN EXISTING CONDITIONS AND TO THE SATISFACTION OF THOSE HAVING JURISDICTION, UNLESS NOTED OTHERWISE IN THE PLANS.

CONSTRUCTION SEQUENCE

1. IMPLEMENTATION OF TEMPORARY EROSION CONTROL MEASURES; SELECTIVE GRADING, DIVERSIONS AS REQUIRED IN FIELD, PROTECTION OF STORM SEWER FACILITIES
2. EXCAVATION AND STOCKPILING OF SOIL.
3. PERIODIC MAINTENANCE OF AFFECTED EROSION CONTROL MEASURES.
4. PERMANENT MEASURES; FINAL GRADING, SEEDING AND MULCHING.

SEE UNIFIED KEYING SYSTEM FOR EROSION CONTROL KEY NUMBERS

EGLE STREAM CROSSING NOTES

1. CONSTRUCTION OF STREAM CROSSING SHALL BE SUBJECT TO THE SPECIFICATIONS FOR PROTECTION OF NATURAL RESOURCES AT UTILITY CROSSING AS GIVEN IN THE ADMINISTRATIVE RULES PART NO. 301 OF PUBLIC ACT 451, AS AMENDED, 1994.
2. A SILTATION BARRIER SHALL BE CONSTRUCTED IMMEDIATELY DOWNSTREAM OF THE CONSTRUCTION SITE PRIOR TO THE COMMENCEMENT OF ANY CONSTRUCTION ACTIVITIES. (SEE MICHIGAN UNIFIED KEYING SYSTEM FOR SPECIFIED BARRIER) THE SILTATION BARRIER SHALL BE MAINTAINED IN GOOD WORKING ORDER THROUGHOUT THE DURATION OF THE PROJECT.
3. BACKFILL SHALL CONSIST OF INERT MATERIALS WHICH WILL NOT CAUSE SILTATION NOR CONTAIN SOLUBLE CHEMICALS OR ORGANIC MATTER WHICH IS BIODEGRADABLE. ALL FILL SHALL BE CONTAINED IN SUCH MANNER SO AS NOT TO ERODE INTO ANY WATERCOURSE.
4. ALL RAW BANKS SHALL BE STABILIZED WITH RIPRAP TO THREE FEET ABOVE ORDINARY HIGH WATER MARK, THEN SEEDED, FERTILIZED AND MULCHED, OR SODDED TO PREVENT EROSION
5. UPON PROJECT COMPLETION THE EXCESS SPOILS SHALL BE REMOVED AND DISPOSED IN AN APPROPRIATE UPLAND SITE.
6. SILTATION BARRIER MAY BE REMOVED UPON PLACEMENT OF PERMANENT EROSION CONTROL BARRIERS.

GENERAL NOTES:

1. THE CONSTRUCTION STAGING PLAN SHOWN HERE IS FOR PERMITTING AND COST ESTIMATION PURPOSES ONLY. THIS CARE OF WATER PLAN IS BASED ON CORRESPONDENCE WITH THE CITY OF GRAND RAPIDS AND THE CONSTRUCTION MANAGER ADVISOR. THE CONTRACTOR WILL ULTIMATELY BE RESPONSIBLE FOR DEVELOPING AND MAINTAINING A CONSTRUCTION STAGING PLAN TO MEET PERMITTING CONDITIONS AND CONSTRUCTION NEEDS.
2. PROTECT IN PLACE WETLANDS AND MATURE TREES NOT SPECIFICALLY DESIGNATED FOR REMOVAL.
3. CONTRACTOR SHALL MAINTAIN AND MONITOR ALL EXISTING UTILITY OUTFALLS TO FUNCTION OR DRAIN PROPERLY THROUGHOUT CONSTRUCTION; INCLUDING BOTH MARKED AND UNMARKED UTILITIES.
4. THE CONTRACTOR SHALL CONDUCT OPERATIONS IN COMPLIANCE WITH DIVISION 1 OF THE 2021 CITY OF GRAND RAPIDS STANDARD CONSTRUCTION SPECIFICATIONS AND THE PROVISIONS OF SECTIONS 107.15 "DUST CONTROL" AND 812 "TEMPORARY TRAFFIC CONTROL FOR CONSTRUCTION ZONE OPERATIONS" OF THE MDOT STANDARD CONSTRUCTION SPECIFICATIONS.
5. NO MATERIAL OR EQUIPMENT SHALL BE PLACED, STORED, OR OPERATED OUTSIDE THE STAGING AREA LIMITS SHOWN ON PLANS.
6. TEMPORARY EARTHWORK NECESSARY TO ESTABLISH STAGING AND ACCESS FACILITIES SHALL HAVE A MAXIMUM TOPSOIL REMOVAL DEPTH OF 1 FOOT.
7. THE CONTRACTOR IS RESPONSIBLE TO DEVELOP AND MAINTAIN A TRAFFIC CONTROL PLAN THROUGHOUT CONSTRUCTION.

TEMP. CONSTRUCTION ACCESS & CARE OF WATER - AH-NAB-AWEN PARK STAGING

THE UNDERGROUND LOCATIONS SHOWN FOR BEDROCK, NATURAL GAS (GAS), TELEPHONE (TEL), ELECTRICAL POWER (PWR), CABLE TV (CTV) AND FIBER OPTIC LINES (FIBER) ARE APPROXIMATE. THE CITY OF GRAND RAPIDS ASSUMES NO RESPONSIBILITY FOR THEIR ACCURATE REPRESENTATION IN THIS DRAWING. MISS DIG MUST BE CONTACTED PRIOR TO CONSTRUCTION TO LOCATE THESE UTILITIES.

- OHW — ORDINARY HIGH WATER MARK
- 100-YR FLOOD PROTECTION

0 60' 120'

SCALE: 1" = 60'

GENERAL NOTES:

1. THE CARE OF WATER PLAN AND TEMPORARY STRUCTURES SHOWN HERE ARE FOR PERMITTING AND COST ESTIMATION PURPOSES ONLY. THIS CARE OF WATER PLAN IS BASED ON CORRESPONDENCE WITH THE CITY OF GRAND RAPIDS AND THE CONSTRUCTION MANAGER ADVISOR. THE CONTRACTOR WILL ULTIMATELY BE RESPONSIBLE FOR DEVELOPING AND MAINTAINING A CARE OF WATER PLAN TO MEET PERMITTING CONDITIONS AND CONSTRUCTION NEEDS.
2. BRIDGE LOW CHORDS REPRESENT LOW CHORD OF BRIDGE DECKS. GILLETT AND PEARL STREET BRIDGES HAVE ARCHED BAYS; LOW CHORDS SHOWN REPRESENT APPROXIMATE HIGH POINT OF ARCHES. CONTRACTOR IS RESPONSIBLE TO VERIFY LOW-CHORD ELEVATIONS AND CLEARANCE HEIGHTS.
3. ALL IN WATER WORK REQUIRES USE OF APPROVED BMP'S TO PREVENT IMPACTS TO WATER QUALITY.
4. PROTECT IN PLACE WETLANDS AND MATURE TREES NOT SPECIFICALLY DESIGNATED FOR REMOVAL OR IMPACT.
5. BE PREPARED TO UN-ISOLATE WORK AREA AND ALLOW FLOW ON BOTH SIDES OF CHANNEL UPON SHORT NOTICE IF OWNER'S REPRESENTATIVE DETERMINES BED SCOUR NEAR BRIDGE PIERS, FLOODWALLS, OR OTHER INFRASTRUCTURE SHOULD BE INSPECTED.
6. CONTRACTOR SHALL MAINTAIN AND MONITOR ALL EXISTING UTILITY OUTFALLS TO FUNCTION OR DRAIN PROPERLY THROUGHOUT CONSTRUCTION; INCLUDING BOTH MARKED AND UNMARKED UTILITIES.
7. ACCESS CAUSEWAYS, WORK ISOLATION MEASURES, AND TEMPORARY GRADE CONTROLS SHALL BE INSTALLED IN THE FLOWING RIVER. REFER TO THE TECHNICAL SPECIFICATIONS FOR FLOW RATE AND DEPTH INFORMATION. CONTRACTOR SHALL SUBMIT PLAN TO PERFORM WORK IN THE FLOWING RIVER WITH MAXIMUM DEPTHS TO PERFORM WORK.
8. SURFACES FOR ALL TEMPORARY CAUSEWAYS AND COFFERDAMS CAN BE PROVIDED TO CONTRACTOR

CONSTRUCTION SEQUECNING NOTES:

1) CAUSEWAYS MUST BE INSTALLED BEFORE REMOVAL OF DAMS OR CONSTRUCTION OF PROPOSED IMPROVEMENTS CAN BEGIN AT ANY GIVEN LOCATION.
2) PROPOSED IMPROVEMENTS AT DAM 3 SHALL BE HELD UNTIL AFTER COFFERDAM AT DAM 2 HAS BEEN REMOVED.
3) PROPOSED IMPROVEMENTS AT DAM 4 SHALL BE HELD UNTIL AFTER COMPLETION OF PROPOSED IMPROVEMENTS AT DAM 2.

MUSSEL RELOCATION NOTES:

1) MUSSEL RELOCATION IS ANTICIPATED TO OCCUR BY OTHERS, PRIOR TO IN-CHANNEL CONSTRUCTION ACTIVITIES BEGINNING WITH THE EXCEPTION OF NOTE 3 BELOW.
2) LOCATIONS UNABLE TO BE ACCESSED FOR MUSSEL RELOCATION WOULD BE RELOCATED DURING CONSTRUCTION, IF FLOW CONDITIONS ALLOW AND RELOCATION IS ABLE TO BE COMPLETED AHEAD OF CONSTRUCTION ACTIVITIES.
3) THE AREA WITHIN THE WORK ISOLATION AT DAM 2 WOULD BE RELOCATED PRIOR TO WORK COMMENCING IN THAT AREA. RELOCATION ACTIVITIES HERE WOULD HAVE UP TO 10 DAYS TO CLEAR THE AREA.

THE UNDERGROUND LOCATIONS SHOWN FOR BEDROCK, NATURAL GAS (GAS), TELEPHONE (TEL), ELECTRICAL POWER (PWR), CABLE TV (CTV) AND FIBER OPTIC LINES (FIBER) ARE APPROXIMATE. THE CITY OF GRAND RAPIDS ASSUMES NO RESPONSIBILITY FOR THEIR ACCURATE REPRESENTATION IN THIS DRAWING. MISS DIG MUST BE CONTACTED PRIOR TO CONSTRUCTION TO LOCATE THESE UTILITIES.

T07

NOTES:

1. ESTABLISH STABILIZED CONSTRUCTION ENTRANCE PRIOR TO THE INITIATION OF SITE CONSTRUCTION ACTIVITIES IN LOCATON SHOWN ON THE PLANS OR AS DIRECTED BY THE ENGINEER.
2. REMOVE ALL VEGETATION, TOPSOIL, AND OTHER OBJECTIONABLE MATERIAL FROM THE FOUNDATION AREA.
3. GRADE FOUNDATION AND CROWN FOR POSITIVE DRAINAGE AWAY FROM PUBLIC ROAD IF POSSIBLE. IF THE SLOPE OF THE CONSTRUCTION ENTRANCE IS TOWARD A PUBLIC ROAD AND EXCEEDS TWO PERCENT, CONSTRUCT AN EIGHT INCH HIGH DIVERSION RIDGE WITH A RATIO OF 3–TO–1 SIDE SLOPES ACROSS THE FOUNDATION AREA ABOUT 15 FEET FROM THE ENTRANCE TO DIVERT RUNOFF AWAY FROM THE ROAD.
4. INSTALL A CULVERT PIPE UNDER THE PAD IF NEEDED TO MAINTAIN PROPER PUBLIC ROAD DRAINAGE.
5. PLACE AGGREGATE TO THE DIMENSIONS AND GRADE SHOWN IN THE CONSTRUCTION PLANS, LEAVING THE SURFACE SMOOTH AND SLOPED FOR DRAINAGE.
6. DIVERT ALL STORM WATER RUNOFF AND DRAINAGE FROM THE INGRESS,/EGRESS PAD TO A SEDIMENT TRAP OR BASIN.
7. INSPECT DAILY.
8. RESHAPE PAD AS NEEDED FOR DRAINAGE AND RUNOFF CONTROL.
9. TOP DRESS WITH CLEAN AGGREGATE AS NEEDED.
10. IMMEDIATELY REMOVE MUD AND SEDIMENT TRACKED OR WASHED ONTO PUBLIC ROADS.
11. FLUSHING SHOULD ONLY BE USED IF THE WATER CAN BE CONVEYED INTO A SEDIMENT TRAP OR BASIN.

TEMP. CONSTRUCTION ACCESS & CARE OF WATER - CONSTRUCTION ENTRANCE AND TRACKING PAD DETAIL

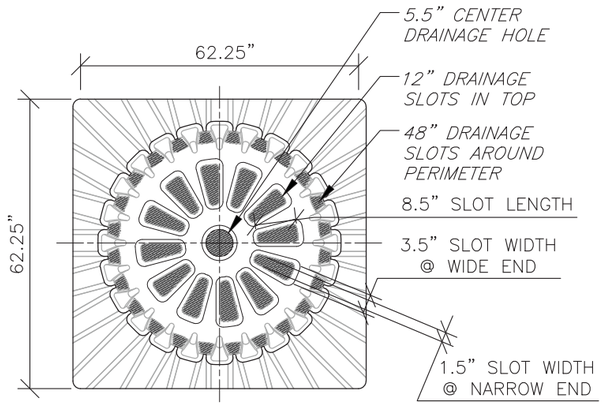
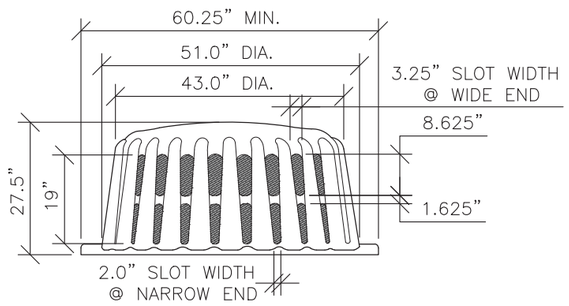
ISOMETRIC VIEW

SHOWN WITH ROADWAY PROJECTS FILTER HAT



PLAN VIEW



ELEVATION VIEW

Model #S–200A
REPLACEMENT FILTERS: MODEL #S–240

55 SQUARE FRAME & FILTER ASSEMBLY
NO SCALE

1
T08

FILTER OPTIONS

FILTER HAT IS AVAILABLE IN THREE OPTIONS:
1) ALL HIGH–FLOW MATERIAL
2) ALL HIGH–EFFICIENCY MATERIAL
3) HIGH–FLOW MATERIAL ON TOP HALF OF HAT, HIGH–EFFICIENCY MATERIAL ON BOTTOM HALF (THIS FILTER COVER IS RECOMMENDED FOR ALL ROADWAY PROJECTS.)

IT IS THE PURCHASERS RESPONSIBILITY TO PURCHASE APPROPRIATE FILTER HAT. PURCHASER SHALL PROVIDE ROCK FOR FILTER POCKETS.

FILTER HAT INSTALLATION

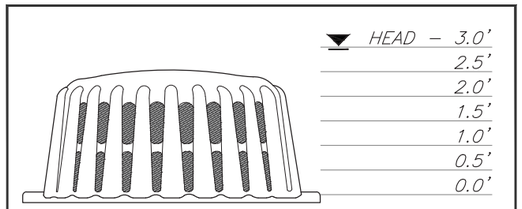
FILTER HAT SLIDES DIRECTLY OVER FILTER FRAME. TO KEEP FILTER FRAME IN PLACE OVER STORM STRUCTURE, ROCK POCKETS ARE SEWN DIRECTLY INTO FILTER HAT MATERIAL. EVERY FILTER HAT COMES IN ONE PIECE FOR EASY INSTALLATION.

MAINTENANCE

ALL TEMPORARY EROSION, SEDIMENTATION, & POLLUTION CONTROL PRACTICES SHOULD BE INSPECTED DAILY. CONTRACTOR SHALL REMOVE SEDIMENT AND DISPOSE OF IN A PROPER MANNER. INSPECT S–200A DAILY FOR CUTS, ABRASIONS, AND PROPER INSTALLATION. REPLACE OR REPOSITION AS NECESSARY.

SPECIFICATIONS

FILTER FABRIC SILT–SAVER HAT SHALL BE BASED ON DESIGN PROFESSIONAL'S SPECIFICATIONS.



FRAME & FILTER DISCHARGE ANALYSIS

HEAD (FT)	EQUATION USED	OPENING AREA (SF)	FRAME FLOW (CFS)	FILTER AREA (SF)	FILTERED FLOW (CFS)
0.5	O	2.1	7	6	2
1.0	O	3.9	19	12	3
1.5	O	7.0	41	18	5
2.0	O	8.0	54	24	7
2.5	O	9.2	70	30	9
3.0	O	9.2	77	—	77

DUE TO NARROW SLOT, A TRANSITION WILL OCCUR BETWEEN WEIR AND ORIFICE CONDITIONS. ORIFICE FLOW WILL PROVIDE A MORE CONSERVATIVE ESTIMATE OF FLOW, THEREFORE THE LESSER OF THE ORIFICE AND WEIR FLOWS WILL BE USED FOR EACH STAGE CALCULATION.

FILTER MATERIAL ALLOWS 129 gpm/SF OR 0.29cfs/SF
ORIFICE EQUATION (O) = Q=0.6A(2gh)^0.5
P = FEET PERIMETER
h = HEAD IN FEET
Q = CAPACITY IN cfs
A = FREE OPEN AREA OF FRAME
g = 32.2 FEET-PER-SECOND/SECOND

FRAME MATERIAL: BLACK 0.25" HMWPE

FILTER FABRIC MATERIAL: REFER TO SPEC

SCALE: NOT TO SCALE

× DENOTES STAKE LOCATION
(APPROXIMATELY 0.7 STAPLES PER SY)

FIGURE D: STAKE SPACING PLAN VIEW – NTS

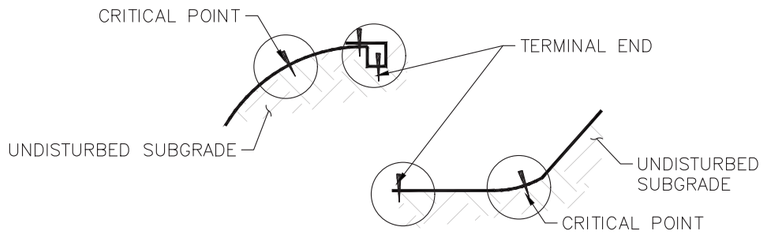

FIGURE E: CRITICAL POINT SECURING – NTS

ECB INSTALLATION NOTES:

1. CONTRACTOR SHALL USE ALL NATURAL 100% BIODEGRADABLE COIR NAG 700BN EROSION CONTROL BLANKETS (ECBs) OR APPROVED EQUIVALENT. STAKES SHALL ALSO BE 100% BIODEGRADABLE. SEE SPECIFICATIONS AND MANUFACTURER'S INSTALLATION GUIDELINES FOR ADDITIONAL INFORMATION.
2. PLACE ECB BEHIND BOULDER TOE TO A DEPTH OF 18" BELOW FINISHED GRADE AND SECURE IN PLACE PER STAKING PLAN (FIGURE D). ECB MUST BE PLACED LOOSELY OVER GROUND SURFACE. DO NOT STRETCH.
3. EDGES OF PARALLEL ECBs MUST BE STAKED WITH AN APPROXIMATE 6" OVERLAP (FIGURE B). UPSTREAM ROLL MUST BE ON TOP OF DOWNSTREAM ROLL. IF NEEDED, CONSECUTIVE ECBs SPLICED DOWNSLOPE MUST BE OVERLAPPED END–OVER–END (SHINGLED) WITH AN APPROXIMATE 3" OVERLAP.
4. IN THE FOLLOWING ORDER, APPLY TOPSOIL, SEED MIX, BONDED FIBER MATRIX, THEN WRAP ECB AT THE TOE TOWARDS THE TOP OF BANK.
5. EXCAVATE A 1.0' WIDE BY 1.0' DEEP TRENCH 5' BEHIND THE TOP OF THE SLOPE. THE TRENCH SHALL RUN ALONG THE LENGTH OF THE INSTALLATION. STAKE ECB ALONG BOTTOM OF TRENCH, FILL WITH COMPACTED SOIL, OVERLAP ECB TOWARDS TOE OF SLOPE, AND SECURE WITH 6" STAKES EVERY 1.0' (FIGURES A&C).

CALL 811 FOR MISS DIG

FOR PROTECTION OF UNDERGROUND UTILITIES AND IN CONFORMANCE WITH PUBLIC ACT 53, 1974, THE CONTRACTOR SHALL CALL 811 A MINIMUM OF THREE (3) FULL WORKING DAYS (EXCLUDING SATURDAYS, SUNDAYS AND HOLIDAYS) PRIOR TO EXCAVATING IN THE VICINITY OF UTILITY LINES. ALL "MISS DIG" PARTICIPATING MEMBERS WILL THUS BE ROUTINELY NOTIFIED. THIS DOES NOT RELIEVE THE CONTRACTOR OF THE RESPONSIBILITY OF NOTIFYING UTILITY OWNERS WHO MAY NOT BE A PART OF THE "MISS DIG" ALERT SYSTEM.

GENERAL NOTES

1. MATERIALS AND WORKMANSHIP SHALL BE IN ACCORDANCE WITH THE 1993 EDITION OF THE CITY OF GRAND RAPIDS STANDARD CONSTRUCTION SPECIFICATIONS, EXCEPT AS OTHERWISE INDICATED ON THESE PLANS OR IN THE SUPPLEMENTAL SPECIAL SPECIFICATIONS.
2. IF A WATER SERVICE (COPPER, LEAD OR OTHERWISE) IS DISTURBED, DAMAGED, RELOCATED OR REPLACED FROM THE WATER MAIN TO THE CURB STOP, WHETHER PLANNED OR UNINTENTIONAL, THE CONTRACTOR IS TO HAVE THE SERVICE MATERIAL VERIFIED FROM THE MAIN TO THE METER. IF ANY PORTION IS FOUND TO BE LEAD, THEN THE CONTRACTOR MUST HAVE THE LEAD REPLACED WITH A COPPER WATER SERVICE. ALL WATER SERVICE REPLACEMENTS MUST BE COMPLETED BY A REGISTERED UNDERGROUND CONTRACTOR. IF THE REPLACEMENT INVOLVES WORK ON PRIVATE PROPERTY, THE CONTRACTOR IS TO CONTACT THE ENGINEER IMMEDIATELY TO OBTAIN PERMISSIONS FOR THE SERVICE TO BE REPLACED BY CITY OF GRAND RAPIDS UNDERGROUND CONTRACTORS ON TERM CONTRACT FOR LEAD SERVICE REPLACEMENT. THE CONTRACTOR WILL REIMBURSE THE CITY FOR THIS COST.

REMOVAL - SOUTH

REMOVAL LEGEND

- X — REMOVE ITEM AS NOTED
- SAWCUT AND REMOVE CONCRETE PAVEMENT
- REMOVE EXISTING VEGETATION, INCLUDING ROOT SYSTEMS
- REMOVE EXISTING TREE, INCLUDING ROOT SYSTEMS
- WORK LIMIT LINE

REMOVAL GENERAL NOTES

1. PAVEMENT REMOVAL LIMITS WILL BE DETERMINED BY ENGINEER. (DIMENSIONS ARE APPROXIMATE.)
2. FOR ALL ABANDONED UTILITIES THAT ARE REMOVED AS PART OF CONSTRUCTION OF A NEW UTILITY SUCH REMOVAL OF THE ABANDONED UTILITY TO LAY THE NEW UTILITY SHALL BE CONSIDERED TO BE INCLUDED IN THE ITEM FOR LAYING OF THE NEW UTILITY AND WILL NOT BE PAID FOR SEPARATELY. THIS IS ALSO THE CASE FOR THOSE UTILITIES THAT ARE DESIGNATED TO BE ABANDONED ON THE PLANS BUT END UP BEING REMOVED IN ORDER TO LAY A NEW UTILITY.
3. ALL CONSTRUCTION TO BE IN ACCORDANCE WITH THE CITY OF GRAND RAPIDS STANDARD CONSTRUCTION SPECIFICATIONS, LATEST EDITION.
4. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VISITING THE SITE AND BECOMING FAMILIAR WITH THE DEMOLITION AND CLEARING REQUIREMENTS.
5. NO REMOVAL, DEMOLITION, CLEARING OR TOPSOIL REMOVAL SHALL OCCUR ON SITE UNTIL THE SESC AND STORMWATER PERMITS HAVE BEEN ISSUED AND THE CONTRACTOR HAS VERIFIED AND STAKED THE LIMITS OF REMOVAL IN THE FIELD. NOTIFY SITE CONSULTANT OF THE START OF CONSTRUCTION AND DATE WHEN THE LIMITS LINE WILL BE ESTABLISHED FOR REVIEW AND APPROVAL.
6. ALL MATERIALS NOTED TO BE SALVAGED SHALL BE TURNED OVER TO THE OWNER OR REINSTALLED ON SITE AS NOTED.
7. NO BURNING OR BURYING OF CLEARED OR DEMOLITION MATERIAL SHALL BE ALLOWED ON SITE.
8. REMOVE ALL STRUCTURES, FOUNDATIONS, BITUMINOUS PAVEMENT, CONCRETE SIDEWALK STEPS AND OTHER EXISTING SITE FEATURES AS INDICATED ON THE DRAWINGS. ALSO, REMOVE ALL DEBRIS FROM WITHIN CONSTRUCTION LIMITS ON SITE. ALL DEMOLITION MATERIALS SHALL BE REMOVED FROM THE SITE AND, UNLESS OTHERWISE NOTED, DISPOSED OF IN A MANNER ACCEPTABLE TO LOCAL JURISDICTION HAVING AUTHORITY.
9. THE CONTRACTOR SHALL BE LICENSED BY THE CITY OF GRAND RAPIDS AND THE STATE OF MICHIGAN FOR DEMOLITION REMOVAL AND HAULING OF MATERIALS.
10. THE CONTRACTOR IS RESPONSIBLE TO OBTAIN ALL PERMITS. AND FEES FOR THIS WORK.
11. THE CONTRACTOR WILL BE RESPONSIBLE FOR VERIFYING EXISTING UTILITY LOCATIONS PRIOR TO THE START OF CONSTRUCTION. THE CONTRACTOR SHALL PROTECT AND MAINTAIN EXISTING UTILITY SERVICES AT ALL TIMES.
12. ALL EXCESS OR UNSUITABLE TOPSOIL OR SUBSOIL TO BECOME THE PROPERTY OF THE CONTRACTOR AND REMOVED OFFSITE. DEPOSIT OF ANY SURPLUS SOIL WITHIN THE CITY OF GRAND RAPIDS MAY REQUIRE A SEPARATE SOIL EROSION PERMIT FOR THAT SITE.
13. PROTECT EXISTING TREES UNLESS OTHERWISE NOTED. NO PARKING OR STORAGE OF MATERIALS WITHIN TREE ROOT ZONE. PLACE TREE PROTECTION FENCE WHERE SHOWN ON PLAN.
14. TREE PROTECTION FENCE PER DETAIL 1/19 – INSTALL PRIOR TO ANY CONSTRUCTION ACTIVITY AND MAINTAIN DURING ENTIRE CONSTRUCTION PERIOD.
15. CONTRACTOR TO CALL 811 AT LEAST 3 WORKING DAYS PRIOR TO CONSTRUCTION, TO CONFIRM LOCATION OF EXISTING UTILITIES.
16. CONTRACTOR MUST RESTORE AND REPAIR ANY EXISTING CONDITIONS DISTURBED BY CONSTRUCTION.
17. ANY AREA DISTURBED BY CONSTRUCTION TO BE RESTORED TO CONDITION EQUAL TO OR BETTER THAN BEFORE CONSTRUCTION BEGAN. PATCH PAVEMENT IN-KIND IF REQUIRED.
18. SAWCUT FULL DEPTH ALL EDGES OF PAVEMENT TO BE REMOVED.

THE UNDERGROUND LOCATIONS SHOWN FOR NATURAL GAS (GAS), STEAM, TELEPHONE (TEL), ELECTRICAL POWER (PWR), CABLE TV (CTV) AND FIBER OPTIC LINES (FIBER) ARE APPROXIMATE. THE CITY OF GRAND RAPIDS ASSUMES NO RESPONSIBILITY FOR THEIR ACCURATE REPRESENTATION IN THIS DRAWING. MISS DIG MUST BE CONTACTED PRIOR TO CONSTRUCTION TO LOCATE THESE UTILITIES.

HP = HIGH POINT
LP = LOW POINT

— · — · — LIMITS OF EARTH CHANGE

GRADING GENERAL NOTES

1. PLACE EROSION CONTROL BLANKET ON ALL DISTURBED SLOPES.
2. SIDEWALK CROSS SLOPES TO BE 2% MAX. LONGITUDINAL SLOPES TO BE 5% MAX.
3. FOR WORK AT OR ABOVE SUBGRADE ELEVATION, IT IS THE CONTRACTOR'S RESPONSIBILITY TO VERIFY THE REQUIRED EARTHWORK VOLUMES BASED ON THE GRADING PLAN. IF FILL IS REQUIRED, THE CONTRACTOR SHALL INCLUDE THE REQUIRED VOLUME OF IMPORTED CLASS II FILL. IF EXCESS SOILS NEED TO BE SPOILED, THE CONTRACTOR SHALL INCLUDE HAULING AND SPOILING SOILS OFF-SITE IN THE BID. NO CONTRACT COST ADJUSTMENTS WILL BE CONSIDERED FOR EARTHWORK REQUIRED TO ACHIEVE THE FINISH GRADES SHOWN.

MICHIGAN DEPARTMENT OF MANAGEMENT AND BUDGET S-E-S-C KEYING SYSTEM

KEY	BEST MANAGEMENT PRACTICES	SYMBOL	WHERE USED
EROSION CONTROLS			
E8	PERMANENT SEEDING		Stabilization method utilized on sites where earth change has been completed (final grading attained).
E9	MULCH BLANKETS		On exposed slopes, newly seeded areas, new ditch bottoms, or areas subject to erosion.
S51	SILT FENCE		Use adjacent to critical areas, to prevent sediment laden sheet flow from entering these areas.
S53	STABILIZED CONSTRUCTION ACCESS		Used at every point where construction traffic enters or leaves a construction site.
S58	INLET PROTECTION FABRIC DROP		Use at stormwater inlets, especially at construction sites.

SESC SCHEDULE & SEQUENCE

	APRIL '23	MAY	JUNE	JULY	AUGUST	SEPTEMBER	OCTOBER	NOVEMBER	DECEMBER	JANUARY '24	FEBRUARY	MARCH	APRIL	MAY	JUNE
INSTALL AND MAINTAIN TEMPORARY EROSION CONTROLS	■	■	■	■	■	■	■	■	■	■	■	■	■	■	
TOPSOIL STRIPPING & STOCKPILING		■	■	■

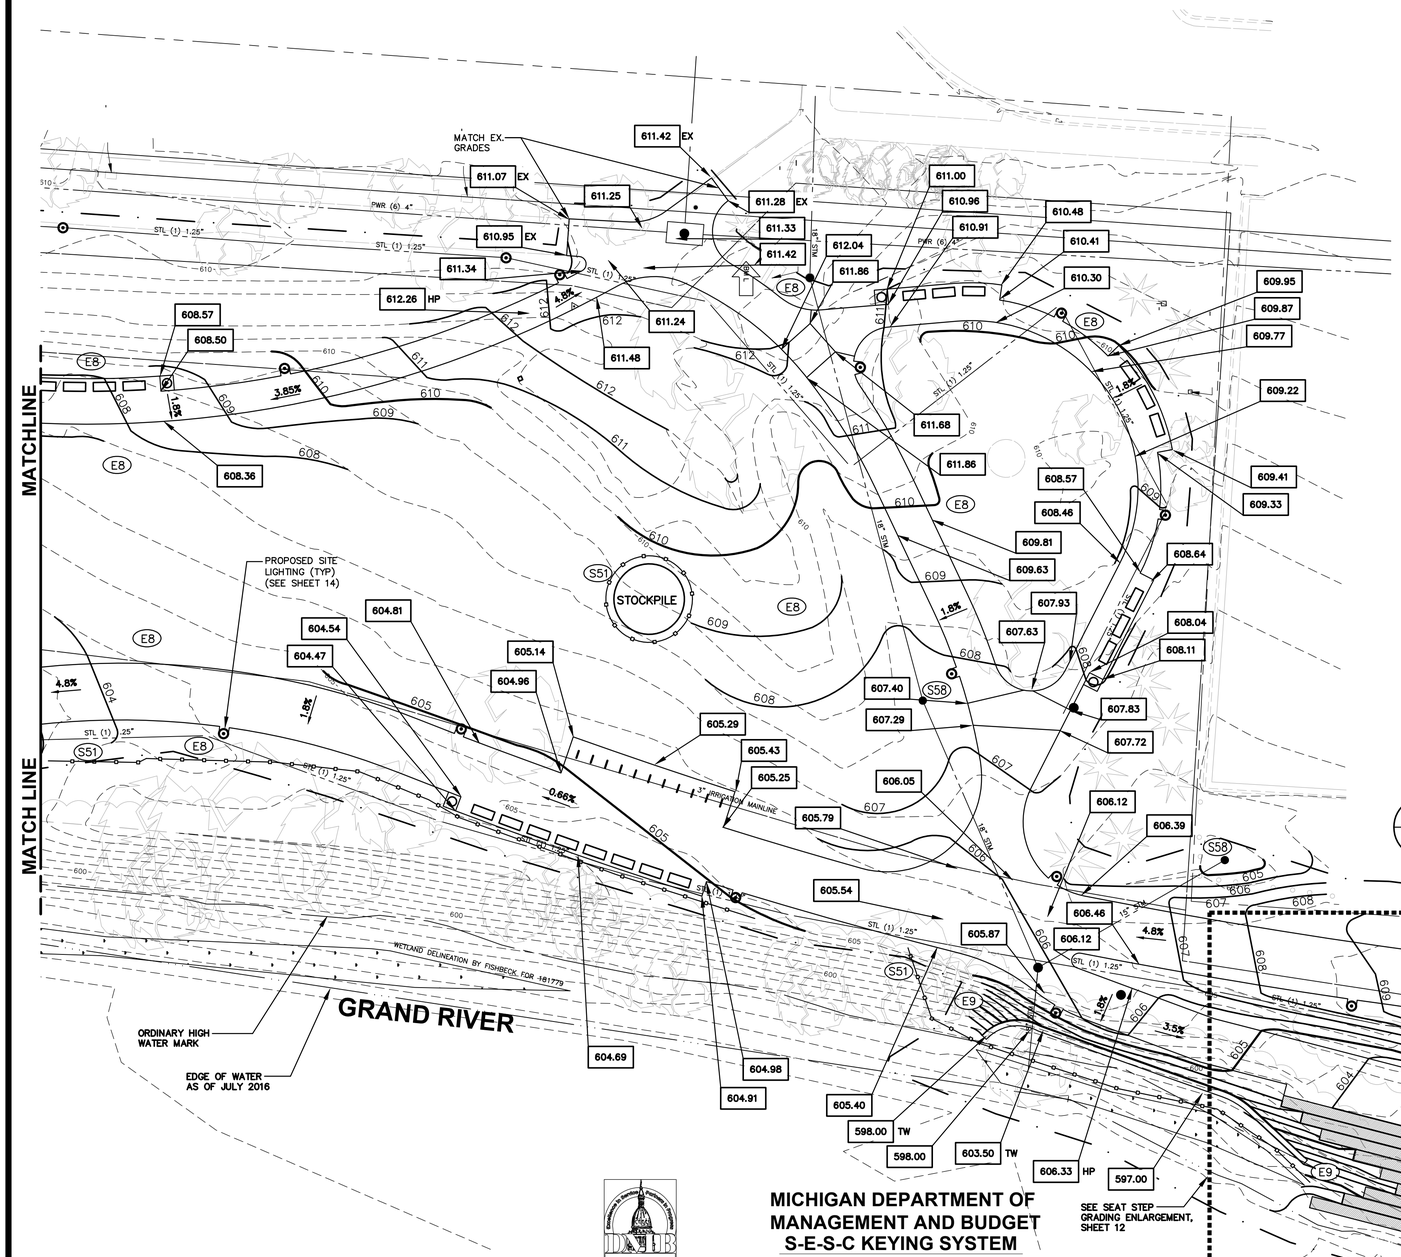
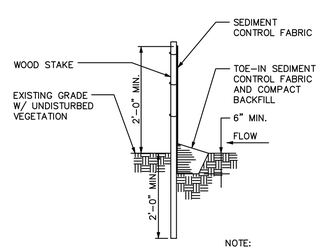
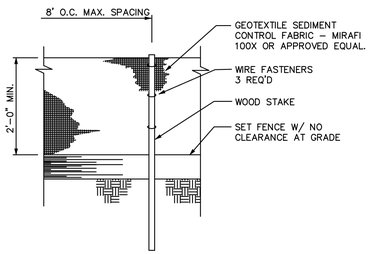
Sheet No. 9 of 21



MICHIGAN DEPARTMENT OF MANAGEMENT AND BUDGET S-E-S-C KEYING SYSTEM

KEY	BEST MANAGEMENT PRACTICES	SYMBOL	WHERE USED
EROSION CONTROLS			
E8	PERMANENT SEEDING		Stabilization method utilized on sites where earth change has been completed (final grading attained).
E9	MULCH BLANKETS		On exposed slopes, newly seeded areas, new ditch bottoms, or areas subject to erosion.
S51	SILT FENCE		Use adjacent to critical areas, to prevent sediment laden sheet flow from entering these areas.
S53	STABILIZED CONSTRUCTION ACCESS		Used at every point where construction traffic enters or leaves a construction site.
S58	INLET PROTECTION FABRIC DROP		Use at stormwater inlets, especially at construction sites.





NOTE:
FACTORY PREASSEMBLED SILT FENCE SYSTEMS MAY BE INSTALLED IN PLACE OF THE FIELD ASSEMBLED SILT FENCE DETAILED AFTER APPROVAL BY ENGINEER.

S51 SILT FENCE DETAIL
NO SCALE

NOTES:
1. ESTABLISH STABILIZED CONSTRUCTION ENTRANCE PRIOR TO THE INITIATION OF SITE CONSTRUCTION ACTIVITIES.
2. CARE SHOULD BE TAKEN TO PREVENT MATERIAL MOVEMENT INTO ADJACENT WETLANDS/WATERBODIES.
3. CARE SHOULD BE TAKEN TO MAINTAIN EXISTING ROADSIDE DRAINAGE VIA CULVERT INSTALLATION, WITH SEDIMENT SUMP PLACED DOWNFLOW OF CULVERT.

TW = TOP OF WALL
EX = EXISTING SPOT ELEV. (APPROX.)
RIM = RIM ELEVATION
HP = HIGH POINT
LP = LOW POINT

— · — · — LIMITS OF EARTH CHANGE

GRADING GENERAL NOTES

1. PLACE EROSION CONTROL BLANKET ON ALL DISTURBED SLOPES.
2. SIDEWALK CROSS SLOPES TO BE 2% MAX. LONGITUDINAL SLOPES TO BE 5% MAX.
3. FOR WORK AT OR ABOVE SUBGRADE ELEVATION, IT IS THE CONTRACTOR'S RESPONSIBILITY TO VERIFY THE REQUIRED EARTHWORK VOLUMES BASED ON THE GRADING PLAN. IF FILL IS REQUIRED, THE CONTRACTOR SHALL INCLUDE THE REQUIRED VOLUME OF IMPORTED CLASS II FILL. IF EXCESS SOILS NEED TO BE SPOILED, THE CONTRACTOR SHALL INCLUDE HAULING AND SPOILING SOILS OFF-SITE IN THE BID. NO CONTRACT COST ADJUSTMENTS WILL BE CONSIDERED FOR EARTHWORK REQUIRED TO ACHIEVE THE FINISH GRADES SHOWN.

THE UNDERGROUND LOCATIONS SHOWN FOR NATURAL GAS (GAS), STEAM, TELEPHONE (TEL), ELECTRICAL POWER (PWR), CABLE TV (CTV) AND FIBER OPTIC LINES (FIBER) ARE APPROXIMATE. THE CITY OF GRAND RAPIDS ASSUMES NO RESPONSIBILITY FOR THEIR ACCURATE REPRESENTATION IN THIS DRAWING. MISS DIG MUST BE CONTACTED PRIOR TO CONSTRUCTION TO LOCATE THESE UTILITIES.

GPF No. .

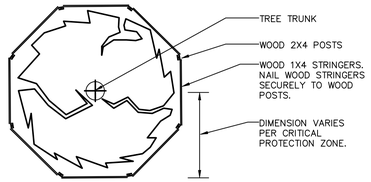
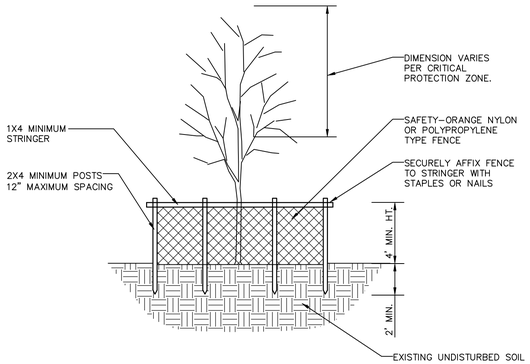
Sheet No. 18 of 21



NOTE: FOR GROUPS OF TREES, PLACE BARRICADES BETWEEN TREES AND CONSTRUCTION ACTIVITY.



NOTES:
1. FOR GROUPS OF TREES: PLACE THE BARRICADES AT THE DRIPLINE AROUND THE GROUP'S PERIMETER.
2. INSTALLATION OF TREE PROTECTION BARRICADES SHALL BE PERFORMED BEFORE ANY SITE DEVELOPMENT ACTIVITY TAKES PLACE.
3. THE TREE PROTECTION BARRICADES SHALL REMAIN IN PLACE THROUGHOUT THE CONSTRUCTION PHASE AND UNTIL ALL SITE DEVELOPMENT ACTIVITIES ARE FULLY COMPLETE.
4. ANY DAMAGE THAT MAY OCCUR TO THE BARRICADES SHALL REPAIRED OR REPLACED TO THE ORIGINAL SPECIFICATIONS, WITHIN 24 HOURS OF THE DAMAGE OCCURRING.
5. THE AREA WITHIN THE TREE PROTECTION BARRICADES SHALL NOT BE USED FOR THE STORAGE OF ANY MATERIALS, SUPPLIES OR DEBRIS OR THE DISPOSAL OF ANY SOLID, LIQUID OR GASEOUS MATERIALS THAT COULD CAUSE HARM TO THE TREES.
6. ANY TREE SCHEDULED TO REMAIN IF DAMAGED DURING CONSTRUCTION SHALL BE REPLACED WITH MATERIAL AS APPROVED BY OWNER'S REPRESENTATIVE.
7. MONETARY TREE VALUE SHALL BE DETERMINED BY USING THE GUIDE FOR PLANT APPRAISAL PUBLISHED BY THE INTERNATIONAL SOCIETY OF ABORICULTURE OR OTHER SOURCES AS DETERMINED BY THE CITY FORESTER.
8. BARRICADES SHALL PROTECT ALL TREES SCHEDULED TO REMAIN, BEFORE AND DURING ALL CONSTRUCTION ACITIVITIES.
9. A PERFORMANCE BOND WILL BE REQUIRED FROM THE CONTRACTOR BY THE CITY FOR TREE PROTECTION TO INSURE TIMELY REPAIRS OR REPLACEMENT OF DAMAGED BARRICADES AND/OR RECEIPT OF MONETARY VALUE FOR ANY DAMAGED TREES.
10. THE AMOUNT OF SAID BOND SHALL BE BASED ON THE EQUIVALENT VALUE OF THE TREES SPECIFICALLY COVERED. THE BOND AMOUNT REQUIRED FOR PROTECTED TREES SHALL BE FOUR (4) TIMES THE EQUIVALENT VALUE OF THOSE TREES.
11. ANY PROPOSED UNDERGROUND UTILITIES SHALL BE ROUTED AROUND PROTECTED TREES TO THE OUTSIDE OF THE TREE'S DRIPLINE. IF THIS IS NOT FEASIBLE AS DETERMINED BY THE CITY, A SLEEVE MAY BE USED UNDER THE TREE PROVIDED THAT ALL ACCEPTABLE HORTICULTURAL/ABORICULTURAL PRACTICES ARE ADHERED TO.

*TREE PROTECTION BARRICADES SHALL BE LOCATED TO PROTECT A MINIMUM OF 75% OF THE CRITICAL PROTECTION ZONE.

APPENDIX C

Supporting Maps, Figures, Photos and Tables

Tables

Table 3-1. Summary of Informal Scoping Issues Identified

Item / Concern	Relevant to the Proposed Action?		Rationale for Relevancy and Inclusion in Plan-EA
	Yes	No	
Aesthetics/Scenic beauty	X		Bankside clearing for river access associated with construction of cofferdam and instream work would reduce aesthetic value temporarily.
Air quality and noise	X		Direct impacts to air quality and noise from machinery emissions, noise, and airborne dust may slightly increase ambient noise levels and degrade air quality during construction activity. Indirect impacts on ambient noise are expected to be small, to be somewhat concentrated around the Project Area, and to occur over a relatively long period of time. Indirect impacts on air quality are expected to be less than measurable, to be spread across the greater Grand Rapids metropolitan area, and to occur over a relatively long period of time.
Ecologically critical areas		X	NA. There are none present in the Project Area.
Threatened and endangered species (TES)	X		TES are present within the Project Area and therefore, analysis of effects is required by ESA.
Health and human safety	X		Dam hydraulics are safety risk.
Fishery habitat	X		In-stream work would affect habitat.
Shellfish bed habitat	X		In-stream work would affect habitat.
Water quality	X		Increased sedimentation, turbidity, and other water quality impacts are possible.
Invasive species	X		Sea lamprey are present and could potentially breach in-place barrier and access upstream portions of the watershed.
River flow	X		Removal of dams and installation of substrate enhancement materials would change hydraulics.
Fish Passage	X		In-stream work and change in hydraulics could potentially affect fish passage.
Recreational access for boaters, anglers and the public		X	Future projects are planned to provide improved public access to the river. Not included in current project scope.
Land use, recreation, and visual resources	X		Dam removal and rapids restoration would alter recreation access and safety.
Wetlands	X		Wetland delineation survey confirms there are wetlands present within the Project Area.
Water and Riverine Resources	X		Sediment transport and flood control are potential concerns.
Soils & Geology	X		Soil erosion is a potential issue.
Terrestrial Vegetation and Wildlife	X		Proposed Project activities would potentially generate impacts to terrestrial vegetation and wildlife resources

Table 3-1. Summary of Informal Scoping Issues Identified

Item / Concern	Relevant to the Proposed Action?		Rationale for Relevancy and Inclusion in Plan-EA
Socioeconomics	X		Consideration of Project impact on overall economic benefits factor into decision making.
Cultural resources	X		SHPO and tribal consultation is being conducted as required by the National Historic Preservation Act (NHPA). Analysis of effects to cultural resources reflects the importance of local culture and national context.
Flood control and Protection	X		Dam removal and substrate enhancement would change river hydraulics. Ability of existing flood protection barriers currently protecting development along the riverbanks must not be negatively impacted.
Coral reefs		X	Not relevant to the proposed Project.
Civil rights	X		Consideration of Project impact on civil rights issues factor into decision making.
Essential fish habitat	X		In-stream habitat restoration work will increase fish habitat.
Fish and wildlife (including coordination requirements)	X		Project coordination with state and federal agencies led to the development of the Biological Assessment and issuance by USFWS of the Biological Opinion.
Forest resources		X	No proposed impact to forest resources.
Migratory birds		X	The proposed Project does not anticipate affecting migratory bird populations or habits.
National Economic Development (NED) P&G	X		As a non-water resource project, a NED is not required.
Natural areas	X		The in-stream habitat restoration will result in an increase in natural areas.
Other concerns identified by SLOs, agencies, and the public		X	No additional concerns identified.
Parklands		X	No upland parkland improvements are included under the proposed Project.
Prime and unique farmland, and farmland of statewide significance		X	No farmland work included with the PL 83-566 funding.
Regional water resource plans (including coastal zone plans)		X	Not included under the proposed Project scope.
Riparian areas	X		Access to the river will be required to perform in-stream work and restored following implementation.
Scientific resources		X	Not included under the proposed Project scope.
Sole source aquifers		X	Not included under the proposed Project scope.
Waters of the United States, including special aquatic sites	X		In-stream project is not a special aquatic site, and permitting authority is under State of Michigan
Wild and scenic rivers	X		In-stream improvements take place within the Lower Grand River.

Table 3-2. Past, Present, and Reasonably Foreseeable Future Activities

Project or Activity Name	Location	Description	Time/Status	Resources Potentially Affected
BMP implementation in the Indian Mill Creek and Rogue River watersheds	Terrestrial and riparian areas within the watersheds of Indian Mill Creek and Rogue River, which are tributaries of the Project Area	BMPs regarding agricultural conservation practices will be implemented to address excess sediment loading in both watersheds.	Present and reasonably foreseeable: federal EQIP funds contributed by the RCPP award that would fund the Proposed Action also fund this action	Water and Riverine Resources; Aquatic Species and Habitat
Ongoing City of Grand Rapids forestry practices	Terrestrial areas within City limits	Annual tree pruning, removal, and planting activities would affect terrestrial vegetation within the analysis area but are not expected to affect the Grand River	Present and reasonably foreseeable: current patterns are expected to continue	Terrestrial Vegetation and Wildlife
Residential and commercial development	Terrestrial areas in the Grand Rapids metropolitan area	Residential and commercial development in the analysis area is expected to continue to expand, especially outside of the Project Area	Present and reasonably foreseeable: current patterns are expected to continue	Terrestrial Vegetation and Wildlife; Land Use, Recreation, and Visual Resources
Mill Creek restoration	The Mill Creek Watershed, upstream of the Project Area	Stream restoration and water quality improvements projects, removing concrete walls to reconnect stream to floodplain	Present and reasonably foreseeable: Kent County Parks is undertaking a stream restoration project funded through EGLE, and other nonpoint source reduction projects are recommended	Water and Riverine Resources; Aquatic Species and Habitat
MDOT westbound I-196 project	In and upstream of the Project Area, in the Grand River and along both banks in the immediate vicinity of the I-196 bridge	The project extended bridge piers in the Grand River and then built a new lane of westbound I-196. Cofferdams to facilitate construction extended into the river channel, increasing Dam tailwater levels and altering hydraulics. Construction lasted approximately two years. The fill has been removed from the river and the staging area is being restored.	Recent past: 2017–2019	Water and Riverine Resources; Wetlands; Aquatic Species and Habitat

Table 3-2. Past, Present, and Reasonably Foreseeable Future Activities

Project or Activity Name	Location	Description	Time/Status	Resources Potentially Affected
MDOT eastbound I-196 project	In and upstream of the Project Area, outside the LDB in the immediate vicinity of the I-196 bridge	Repair of existing bridge structures and ramps. Work on the bridge substructure will be performed from anchored barges. No alteration of the river channel will occur.	Reasonably foreseeable: scheduled for 2021	Air Quality and Noise; Terrestrial Vegetation and Wildlife; Aquatic Species and Habitat; Land Use, Recreation, and Visual Resources; Public Health and Safety; Urban Dynamics
Upstream sediment sampling project	In and just upstream of the Project Area, in the Grand River from Ann Street to the low-head dam upstream of Bridge Street	Boat anchoring, sediment sampling, and sediment coring to characterize contaminants of concern and particle size distribution	Recent past: spring and summer 2020	Water and Riverine Resources; Aquatic Species and Habitat
Ann Street to Bridge Street Grand River Project	In and just upstream of the Project Area, in the Grand River and terrestrial areas from Ann Street to the low-head dam upstream of Bridge Street	Removal of the 6th Street Dam and installation of a new solution for a lamprey barrier, perhaps including an adjustable hydraulic structure	Reasonably foreseeable: design, development of alternatives, and NEPA processes are underway	Air Quality and Noise; Water and Riverine Resources; Wetlands; Terrestrial Vegetation and Wildlife; Aquatic Species and Habitat; Floodplain Management; Land Use, Recreation, and Visual Resources; Socioeconomics; Cultural Resources; Public Health and Safety; Urban Dynamics
River for All: Leonard to Ann Street Trail Connection	Terrestrial areas near the Grand River from Leonard Street to Ann Street	A paved non-motorized trail connection along the Grand River	Reasonably foreseeable: concept planned by City of Grand Rapids	Floodplain Management; Land Use, Recreation, and Visual Resources
River for All: The Water Department Storage Yard park	LDB of the Grand River and terrestrial areas approximately 0.3 miles upstream of Leonard Street	Ground-level and elevated trails, a small boat portage way, and other park facilities	Reasonably foreseeable: concept planned by City of Grand Rapids	Water and Riverine Resources; Aquatic Species and Habitat; Floodplain Management; Land Use, Recreation, and Visual Resources; Public Health and Safety
River for All: Coldbrook Site park and creek restoration sites	LDB of the Grand River and terrestrial areas just downstream of Leonard Street, upstream of Project Area within the Coldbrook Creek Watershed	Stepped river access, surfacing/daylighting a portion of Coldbrook Creek, stormwater treatment, and an emergency boat access ramp	Present and reasonably foreseeable: concept planned by City of Grand Rapids and activities ongoing and planned by Coldbrook Creek Watershed Group	Water and Riverine Resources; Aquatic Species and Habitat; Floodplain Management; Land Use, Recreation, and Visual Resources; Public Health and Safety

Table 3-2. Past, Present, and Reasonably Foreseeable Future Activities

Project or Activity Name	Location	Description	Time/Status	Resources Potentially Affected
River for All: Monroe North Site park	LDB of the Grand River and terrestrial areas just upstream of I-196	Stepped seating terraces, a public boat ramp, a stormwater treatment marsh	Reasonably foreseeable: concept planned by City of Grand Rapids	Air Quality and Noise; Water and Riverine Resources; Wetlands; Terrestrial Vegetation and Wildlife; Aquatic Species and Habitat; Floodplain Management; Land Use, Recreation, and Visual Resources; Public Health and Safety
River for All: Grand Rapids Public Museum Site park	RDB of the Grand River and terrestrial areas between Pearl Street and the Blue Bridge	Multiple gathering spaces and park facilities	Reasonably foreseeable: concept planned by City of Grand Rapids	Air Quality and Noise; Soils and Geology; Terrestrial Vegetation and Wildlife; Floodplain Management; Land Use, Recreation, and Visual Resources; Cultural Resources
River for All: Fish Ladder Park Site park	RDB of the Grand River and terrestrial areas just upstream of I-196	Stepped river access, new trees, trails, and an emergency boat access ramp	Reasonably foreseeable: concept planned by City of Grand Rapids	Air Quality and Noise; Water and Riverine Resources; Wetlands; Terrestrial Vegetation and Wildlife; Aquatic Species and Habitat; Floodplain Management; Land Use, Recreation, and Visual Resources; Public Health and Safety
Sidewalk repair within the Project Area	LDB bank of the Grand River from Louis Street to the Blue Bridge	Repair of the sidewalk may require some work in the wet and flowing river within 30 feet of the bank.	Reasonably foreseeable: concept planned by City of Grand Rapids	Air Quality and Noise; Soils and Geology; Water and Riverine Resources; Wetlands; Aquatic Species and Habitat; Floodplain Management; Land Use, Recreation, and Visual Resources; Cultural Resources; Public Health and Safety; Urban Dynamics
Ah-Nab-Awen Park redevelopment	Land areas of Ah-Nab-Awen Park and the RDB of the Grand River within said park	Stepped river access, universally accessible ramp, widening of existing River Walk path, new trees, viewing terrace, and elements from Native American culture	Reasonably foreseeable: concept planned by City of Grand Rapids	Air Quality and Noise; Soils and Geology; Water and Riverine Resources; Wetlands; Aquatic Species and Habitat; Floodplain Management; Land Use, Recreation, and Visual Resources; Cultural Resources; Public Health and Safety; Urban Dynamics

Table 4-1. Background Air Quality Concentrations for the Grand Rapids-Monroe Street Monitoring Station (No. 260810020)

Air Pollutant	Period	Concentration [a]	USEPA NAAQS [b]
Ozone, O_3 (8-hour)	2022	0.071 ppm[c]	0.070 ppm
Particulate matter with diameter of less than 2.5 micrometer, $PM_{2.5}$ (annual, 3-year average)	2022	9.2 µg/m^3	12.0 µg/m^3
Particulate matter with diameter of less than 2.5 micrometer, $PM_{2.5}$ (24-hour, 3-year average)	2022	23 µg/m^3	35 µg/m^3
Particulate matter with diameter less than 10 micrometer, PM_{10} (24-hour)	N/A	No data	150 µg/m^3
Lead, Pb (highest 3-month average per year)	2019	0.01	0.15 µg/m^3
Nitrogen dioxide, NO_2 (annual)[d]	2022	12.58 ppb	53 ppb
Nitrogen dioxide, NO_2 (daily maximum 1-hour, 3-year average)	N/A	No data	100 ppb
Sulfur dioxide, SO_2 (1-hour, 3-year average)	2022	4 ppb	75 ppb
Carbon monoxide, CO (2nd highest 8-hour average not exceeded more than once per year)	2022	1.2 ppm	9 ppm
Carbon monoxide, CO (2nd highest 1-hour average not exceeded more than once per year)	2022	1.5 ppm	35 ppm

N/A = not applicable, ppm = parts per million, µg/m^3 = micrograms per cubic meter, ppb = parts per billion
Values in red exceed USEPA NAAQS

[c] 3-year average calculated using the Max. Allowable values, which are the maximum 4th-highest value that can occur in each year without violation of the standard
[d] The monitoring station measures reactive oxides of nitrogen (NO_y) and is not used for NAAQS determinations

Table 4-2. Typical Noise Levels and Possible Human Effects

Common Noises	Noise Level (dBA)	Effect
Rocket launching pad (no ear protection)	180	Irreversible hearing loss
Carrier deck jet operation	140	Painfully loud
Air raid siren		
Thunderclap	130	Painfully loud
Jet takeoff (200 feet)	120	Maximum vocal effort
Auto horn (3 feet)		
Pile driver	110	Extremely loud
Loud concert		
Garbage truck	100	Very loud
Firecrackers		
Heavy truck (50 feet)	90	Very Annoying
City traffic		Hearing damage (8 hours of exposure)
Alarm clock (2 feet)	80	Annoying
Hair dryer		
Noisy restaurant	70	Telephone use difficult
Freeway traffic		
Business office		
Air conditioning unit	60	Intrusive
Conversational speech		
Light auto traffic (100 feet)	50	Quiet
Living room	40	Quiet
Bedroom		
Quiet office		
Library/soft whisper (15 feet)	30	Very quiet
Broadcasting studio	20	Very quiet
Pin dropping	10	Just audible
Threshold of hearing	0	Hearing begins

Table 4-3. Listed Unionid Mussels Species Potentially Occurring in the Analysis Area

Scientific Name	Common Name	Federal Status	State of Michigan Status	Preferred Habitat	Reported Host Fish Known in the Analysis Area
Epioblasma triquetra	Snuffbox	E		Cobble, gravel, and sand substrate with moderately high current velocity	Logperch, Blackside Darter, Rainbow Darter, Largemouth Bass
Alasmidonta marginata	Elktoe		SC	Large creeks to medium rivers in mixed sand, gravel, and/or cobble with swift currents	White Sucker, Northern Hogsucker, Shorthead Redhorse, Rock Bass
Alasmidonta viridis	Slippershell		T	Generally found in small creeks and headwater streams with variable sand and gravel substrate, often behind large boulders. Considered intolerant to impoundment.	Mottled Sculpin, Johnny Darter
Cyclonaias tuberculata	Purple wartyback		T	Large creeks and rivers with coarse sand or gravel substrate with moderate to swift current	Yellow Bullhead, Channel Catfish, Flathead Catfish
Lasmigona compressa	Creek heelsplitter		SC	Variable sized streams, but typically in creeks and headwaters in pools above and below riffles with compact sand and gravel, or mud patches near shore	Carp and true minnows, gar, suckers, catfish, Bluegill, darters and Yellow Perch
Lasmigona costata	Fluted shell		SC	Small to medium-sized rivers in variable substrate	Variable; many species
Ligumia recta	Black sandshell		E	Sandy mud to coarse sand and gravel substrate with a moderately high current	Rosyface Shiner, sucker species, Yellow Perch, Walleye
Pleurobema sintoxia	Round pigtoe		SC	Medium to large rivers with mixed mud, sand, and gravel in moderate to swift current	Carp and true minnows, sunfish, Spotfin Shiner, Bluegill
Potamilus alatus	Pink heelsplitter		SC	Medium to large rivers and impoundments in silty sand and mud with slow moving current	Freshwater Drum
Toxolasma parvum	Lilliput		E	Soft substrate such as mud, sand and fine gravel with slow-moving water	Sucker species and Johnny Darter
Truncilla truncata	Deertoe		SC	Small, medium and large rivers, and lakes with various substrate including sand, gravel, and mud	Freshwater Drum
Utterbackia imbecillis	Paper pondshell		SC	Slow moving pools of rivers, streams, and impoundments with soft sand and mud substrates	Sunfishes, carp and true minnows, non-fish species including tiger salamander and bullfrog
Venustaconcha ellipsiformis	Ellipse		SC	Small to medium streams in sand and gravel substrates	Darters, Logperch
Villosa iris	Rainbow		SC	Large creeks to medium rivers with substrates of mixed sand, gravel, and/or cobble with swift current	White Sucker, Northern Hogsucker, Shorthead Redhorse, Rock Bass

Table 6-3. Hydraulic Characteristics of the River between the 6th Street Dam and Fulton Street

	No Action (Existing Conditions)	After the Proposed Action
Velocity at 3,900 cfs		
Range (ft/s)	0 to 12	0 to 7.5
Average (ft/s)	2.7	2.7
Coefficient of Variation	38%	42%
Depth at 3,900 cfs		
Range (ft)	0 to 8.3	0 to 8.3
Average (ft)	2.9	3.0
Coefficient of Variation	38%	38%
Wetted Area at 890 cfs (ft^2)	1,793,267 (41.2 acres)	1,801,609.51 (41.4 acres)

Table 6-4. Potential Impacts and Benefits to Aquatic Species and Habitat

Construction Activity	Potential Temporary Impacts	Long-term Benefits of Restored River Conditions
Installation of temporary construction access	Slight impacts from increased sedimentation and turbidity if erosion control is inadequate.	No impact or benefit; temporary access removed at end of construction.
Establishment of isolation areas	Noticeable impacts from crushing of unionid mussels and increased turbidity caused by machinery working in the wet. Many fish would flee the Construction Area. Slight to nonexistent impacts from increased shear stress on LDB of river that could stress unionid mussels. Increased physiological stress from relocation activities.	Isolation areas removed at end of construction; no impact or benefit other than the minimization of impacts from other construction activities.
Mussel relocation	Mussel population reduced in Construction Area and increased in recipient sites. Increased physiological stress from relocation activity.	Eventual recolonization of Construction Area from nearby mussel beds.
Demolition of four low-head dams	Direct impacts from crushing of unionid mussels and increased turbidity caused by machinery working in the wet.	Improved access to unionid mussel habitat. Improved upstream fish passage for desirable, non-jumping fish species and mussel host species (e.g., catfish, Lake Sturgeon, River Redhorse, Walleye, Smallmouth Bass, Logperch and other small-bodied species) due to improved hydraulic diversity. Improved mussel diversity upstream of existing low head dams, due to increased host fish species passage.
Excavation and grading of river channel to form runs, riffles, glides, pools, rapids, and eddies	Noticeable impacts from crushing of unionid mussels by machinery working in the wet.	Increased diversity of habitats would benefit of aquatic species. Improved hydraulic diversity.
Installation of diversified hydraulic features	Noticeable impacts from crushing of unionid mussels by machinery working in the wet.	May increase available pool and run habitat for some fish species. Improved hydraulic diversity.
Installation of boulder, cobble, gravel substrate	Noticeable impacts from crushing of unionid mussels by machinery working in the wet.	Improved unionid mussel and fish habitat. Increased refuge areas and eddies for various fish species. Improved hydraulic diversity.
Augmentation of scour protection on existing bridges, if needed	Noticeable impacts from crushing of unionid mussels by machinery working in the wet.	Slight reduction in mussel habitat. Slight to nonexistent effect from increased resistance to scouring and subsequent loss of integrity.

Table 6-5. EGLE Flood Flow Rates

Recurrence Interval	Flow (cfs)
100-year	50,000
50-year	44,000
25-year	38,000
10-year	31,000
5-year	26,000
2-year	18,000
Bankfull	13,000

Table 6-6. Potential Unavoidable Adverse Impacts of the Proposed Action

Resource Area	Potential Unavoidable Adverse Impact of the Proposed Action
Air Quality and Noise	•Temporary increases in dust, combustion/exhaust pollutants, and noise during construction
Soils and Geology	•Temporary shallow soil disturbance by construction equipment and activities in staging areas and at the river banks
Water and Riverine Resources	•Temporary increase in bed mobility and downstream turbidity and sediment transport during construction
Wetlands	•Potential minor adverse impact on wetland communities from increased foot traffic and littering on wetlands adjacent to the river during the operational phase
Terrestrial Vegetation and Wildlife	•Temporary impacts on terrestrial wildlife from noise and vibration during construction •Damage to vegetation and wildlife through the planned removal of several trees during construction
Aquatic Species and Habitat	•Temporary impacts on both listed and other unionid mussel species during construction resulting from mussels being physically crushed as a result of machinery use and placement of substrates, and to a lesser extent from increased turbidity, shear stress or water velocity •Temporary impacts on fish species during construction as a result of physically crushing fish that are not able to easily escape during construction, temporary habitat loss, increased turbidity, and temporary loss of spawning areas
Floodplain Management	•Slight increases in water surface elevation for 2-year to 50-year flood events, but contained within the existing flood protection system
Land Use, Recreational and Visual Resources	•Temporary restrictions on river access for recreational use during construction •Temporary impairment of visual quality during construction
Socioeconomics	•Temporary hindrances to river-oriented activities could result in slightly fewer customers for businesses near the river during construction
Cultural Resources	•Removal of the low-head dams considered eligible for listing on the National Register of Historic Places (NRHP)--to be mitigated •No other impacts as currently proposed, but if the Project design changes to include grading in areas (and to depths) that may contain culture-bearing soil horizons, potential impacts could be mitigated through further testing, avoidance, and presence of a qualified archaeological monitor during construction activity
Public Health and Safety	•New hydraulic features would present different safety risks and new safety hazards
Urban Dynamics	•Increased congestion due to improved safety

Table 6-7. Irreversible and Irretrievable Commitment of Resources by Resource Area

Resource Area	Irreversible Impacts	Irretrievable Impacts	Explanation
Air Quality and Noise	No	No	Impacts would be limited to slight, temporary construction-related dust and emissions.
Soils and Geology	No	No	Soils would be impacted by temporary access and staging areas during construction. All areas to be disturbed are classified as being previously disturbed and lack the characteristics of their natural state. Disturbed areas would be restored to the extent practicable after construction.
Water and Riverine Resources	No	No	Temporary disturbance during construction would be minimized through best management practices and monitoring. Impacts would be further minimized by conducting the construction in stages, with activities occurring within isolation areas. Following construction, impacts on water and riverine resources would be beneficial.
Wetlands	No	No	No wetlands would be filled or converted to other uses.
Terrestrial Vegetation and Wildlife	No	No	Vegetation communities, including trees, would be removed during construction. Loss of vegetation would be temporary and replacement plantings would be provided.
Aquatic Species and Habitat	No	Yes	Potential reproductive failure during construction would be an irretrievable loss of production. Long-term impacts on aquatic species and habitat would be beneficial. Unionid mussels would experience population decline during construction, but the populations are anticipated to recover after several years following completion.
Floodplain Management	No	No	Floodplain management impacts would be slight and reversible.
Land Use, Recreation and Visual Resources	No	No	No impacts on land uses are anticipated. Construction-related impacts on recreational and visual resources would be temporary and reversible. Upon completion, potential beneficial impacts on recreation and visual resources are anticipated.
Socioeconomics	No	No	Beneficial impacts on socioeconomics are anticipated.
Cultural Resources	Yes	No	The Proposed Action would remove four low-dams constructed in the early 1900s, determined to be NRHP eligible. A mitigation plan has been developed and implemented in an MOA to address impacts to the dams.
Public Health and Safety	No	No	Consequences for public health and safety would be slight and/or beneficial.
Urban Dynamics	No	Yes	The Construction Area, both in the River and on land, would not be available for public events during the construction period.

Table 6-8. Cumulative Effects

Ann Street to Bridge Street Grand River Project	This potential future project, dependent on availability of funds, would include removal of the 6th Street Dam and installation of a new solution for a lamprey barrier. The barrier would be installed first and would curtail migration of Sea Lamprey, which is one of the existing functions of the 6th Street Dam. This project would have the potential for direct impacts on unionid mussels and fish from the equipment used for the implementa on of this project and could indirectly impact any downstream mussels or fish if turbidity is not locally controlled during construction. Other indirect impacts could include the migration of Sea Lamprey to upstream reaches of the Grand River if the barrier does not function adequately, and fish (including unionid fish host species) could be negatively impacted. The potential impacts from this project will be assessed in a separate NEPA process, and impacts related to ESA-listed species will also be addressed in a separate consultation process. If mussel relocation, fish passage practices, and conservation and mitigation measures are used during construction similar to those of the Proposed Action, the impacts would be minimized. By improving habitat adjacent to the Project Area and by allowing upstream fish passage to river reaches upstream of the current 6th Street Dam, the two projects would likely result in benefits to aquatic species and populations that would be greater than the sum of each project on its own.
Upstream Sediment Sampling Project	Another action associated with the Ann Street to Bridge Street Grand River Project is a recently completed upstream sediment sampling project that occurred in and just upstream of the Project Area, in the Grand River from Ann Street to the low-head dam upstream of Bridge Street. This project was estimated to directly harm up to 226 individual mussels, 10 of which would have been of federally or state listed species. Temporary impacts from this project will have recovered before the proposed Project begins construction.
River of All Opportunity Sites	The *River for All* plan is dependent on future funding and includes the design and creation of six opportunity sites along and adjacent to the Grand River shoreline. Where possible, the City of Grand Rapids is exploring opportunities to naturalize flood walls and improve the community's connection and access to the Grand River in these locations. The six opportunity sites include: • A Leonard Street to Ann Street non-motorized trail connection along the Grand River; • The Water Department Storage Yard park, which may include a small boat portage way; • The Coldbrook Site park and creek restoration, which may include stepped river access, surfacing/daylighting a portion of Coldbrook Creek, stormwater treatment, and an emergency boat access ramp; • The North Monroe Site Plan, which may include a public boat ramp and a stormwater treatment marsh; • Fish Ladder Park Site Plan, which may include stepped river access and an emergency boat access ramp; and Any in-water work for these future projects would have the potential to directly impact unionid mussels, fish species, and habitats if equipment must work within the wetted channel or if increased river-wading foot traffic disturbs fish or unionid habitat. Additionally, indirect impacts could result from increased turbidity or sedimentation if erosion or turbidity control devices are not adequately utilized during construction. Additional fish and/or unionid mussel educa on incorporated during these Projects would also help minimize the potential effects of increased river access. If adequate conservation and mitigation measures are used during these opportunity projects, there likely would be negligible additive impacts to those of the Proposed Project.
Sidewalk Repairs	The sidewalk along the LDB from Louis Street to Blue Bridge is currently in need of repair. If the City of Grand Rapids initiates the repair of this sidewalk, the construction activity may require some work in the wet and flowing river within 30 feet of the bank. Repairs are expected to coincide with construction of this Project but would be permitted separately.

Table 6-8. Cumulative Effects

	Temporary impacts to fish and unionid mussels could occur if work in the wet and flowing river increases turbidity and/or harms individual fish and/or mussels. Use of construction best management practices and translocating mussels could minimize the potential impacts, especially if this project were coordinated with the Proposed Action.
Mill Creek Restoration	Upstream of the Construction Area and downstream of the Ada mussel recipient site, Kent County Parks plans to undertake stream restoration and water quality improvement projects, including removing concrete walls to reconnect Mill Creek to its floodplain. Increased turbidity during construction could flow into the Construction Area and contribute to temporary cumulative impacts, although this is expected to have only a slight contribution.
Ah-Nab-Awen Park redevelopment	Along the RDB of the Grand River within Ah-Nab-Awen Park, stepped river access, universally accessible ramp, widening of existing River Walk path, new trees, viewing terrace, and elements from Native American culture will be constructed. Temporary impacts to fish and unionid mussels could occur if work in the wet and flowing river increases turbidity and/or harms individual fish and/or mussels. Use of construction best management practices and translocating mussels could minimize the potential impacts, especially if this project were coordinated with the Proposed Action.
Canal Park	On the LDB upstream from the project areas Canal Park will be improved through enhanced flood protection and ecological resiliency, trail enhancements, renovated playground, improved access to the Grand River and flexible programming spaces. Temporary impacts to fish and unionid mussels could occur if work in the wet and flowing river increases turbidity and/or harms individual fish and/or mussels. Use of construction best management practices and translocating mussels could minimize the potential impacts, especially if this project were coordinated with the Proposed Action.
Acrisure Amphitheater	A new 12,000-seat outdoor riverfront amphitheater at 201 Market Ave. SW including public green space, plaza, and outdoor dining area. Temporary impacts to fish and unionid mussels could occur if work in the wet and flowing river increases turbidity and/or harms individual fish and/or mussels. Use of construction best management practices and translocating mussels could minimize the potential impacts, especially if this project were coordinated with the Proposed Action.
Grand River Edges Trail, Fulton To Wealthy	Fulton St. to Wealthy Street, on the LDB downstream of the project area, an existing trail segment will be rehabilitated of from Wealthy St (west of river) into the Black Hills neighborhood at Oxford St., with proposed extension to Hall St and connections to Kent Trails and Millennium Park. Temporary impacts to fish and unionid mussels could occur if work in the wet and flowing river increases turbidity and/or harms individual fish and/or mussels. Use of construction best management practices and translocating mussels could minimize the potential impacts, especially if this project were coordinated with the Proposed Action
Oxford Trail	Rehabilitation of the existing trail segment from Wealthy St (west of river) into the Black Hills neighborhood at Oxford St., with proposed extension to Hall St and connections to Kent Trails and Millennium Park. Temporary impacts to fish and unionid mussels could occur if work in the wet and flowing river increases turbidity and/or harms individual fish and/or mussels. Use of construction best management practices and translocating mussels could minimize the potential impacts, especially if this project were coordinated with the Proposed Action

1.0 Introduction

1.1 The State of the Resource

Grand River is the longest river in Michigan; travelling from Jackson to its outlet into Lake Michigan at Grand Haven, this river stretches 260 miles through primarily agricultural areas, draining numerous smaller rural watersheds, but also through some of Michigan's largest urban areas. In days past, there were rapids that ran through what is now the heart of Grand Rapids. Historically, the river has played a central role in the life of the city, serving as a thoroughfare for lumber that fed the burgeoning furniture industry. To meet the needs of this growing and industrious city, in the late 1800s and early 1900s the river was extensively modified, especially between Ann Street and Fulton Street, altering the bedform and even installing "beautification dams" to alleviate odors associated with the city's combined sewer system. Despite the historical alterations, some physical characteristics of the river that made the area so unique remain. The river bed still drops 18.5 feet over the distance between Ann Street and Fulton Street, and some of the original bedrock outcroppings that served as surgeon habitat are still present.

Between Lake Michigan and the city of Ada, a distance of approximately 60 river miles, the river gradient sufficient to restore rapid habitat only exists at the project reach. The geographical extent of the project was identified to maximize rapid potential and encompasses areas between Fulton Street and Ann Street in the main channel of the Grand River (Figure 1-1). The project envisions extensive in-stream habitat restoration activities over an area of approximately 36 acres of river bed that will restore the historic rapids and help recreate some of the lost ecosystem functions that were once provided by the river.

The existing dams alter sediment transport, flow velocity, block fish passage, and are a public safety hazard. As a tributary of Lake Michigan, removal of the four low-head beautification dams would allow fish passage and connectivity of the watershed, access to historical spawning grounds, and previously isolated fish populations. It would also reduce or eliminate the existing public safety hazards created by dam hydraulics. Proposed substrate enhancements would serve to improve habitat diversity and quality, benefitting fish and invertebrates, including the federally-listed endangered snuffbox mussel (*Epioblasma triquetra*), Michigan-listed threatened lake sturgeon (*Acipenser fulvescens*) and river redhorse (*Moxostoma carinatum*), and potentially improving their productivity, which is not as robust as it should be (Figure 1-2).

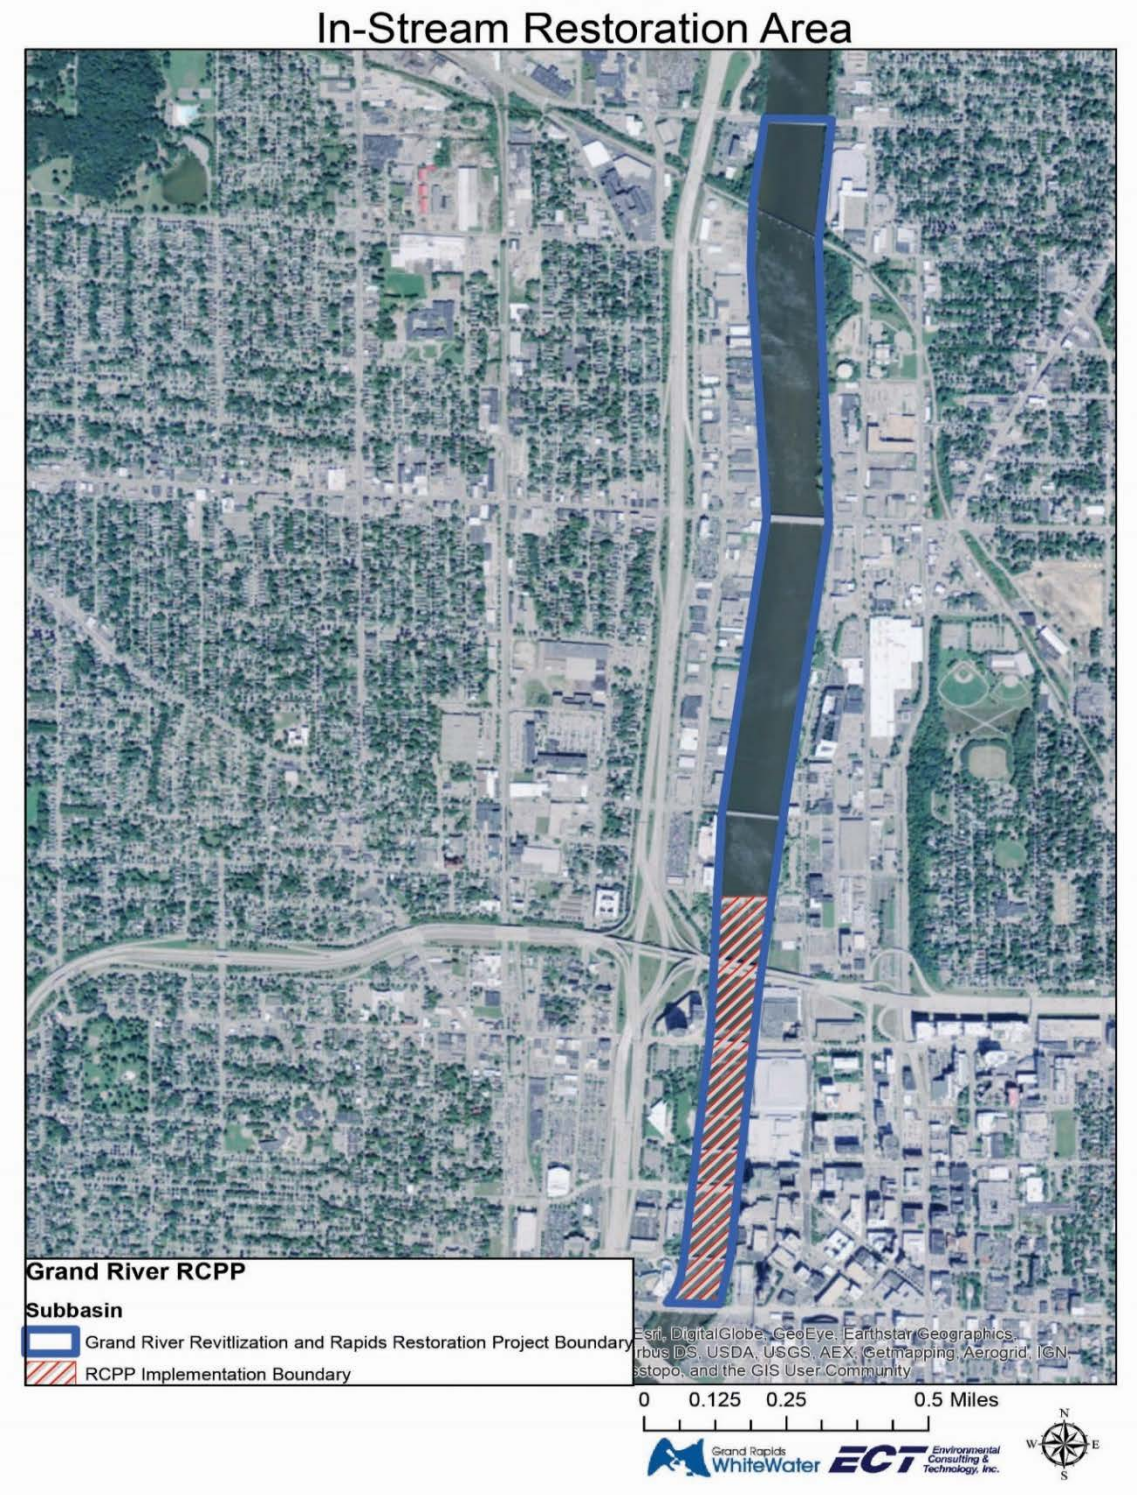

Figure 1-1. Project Area Boundary

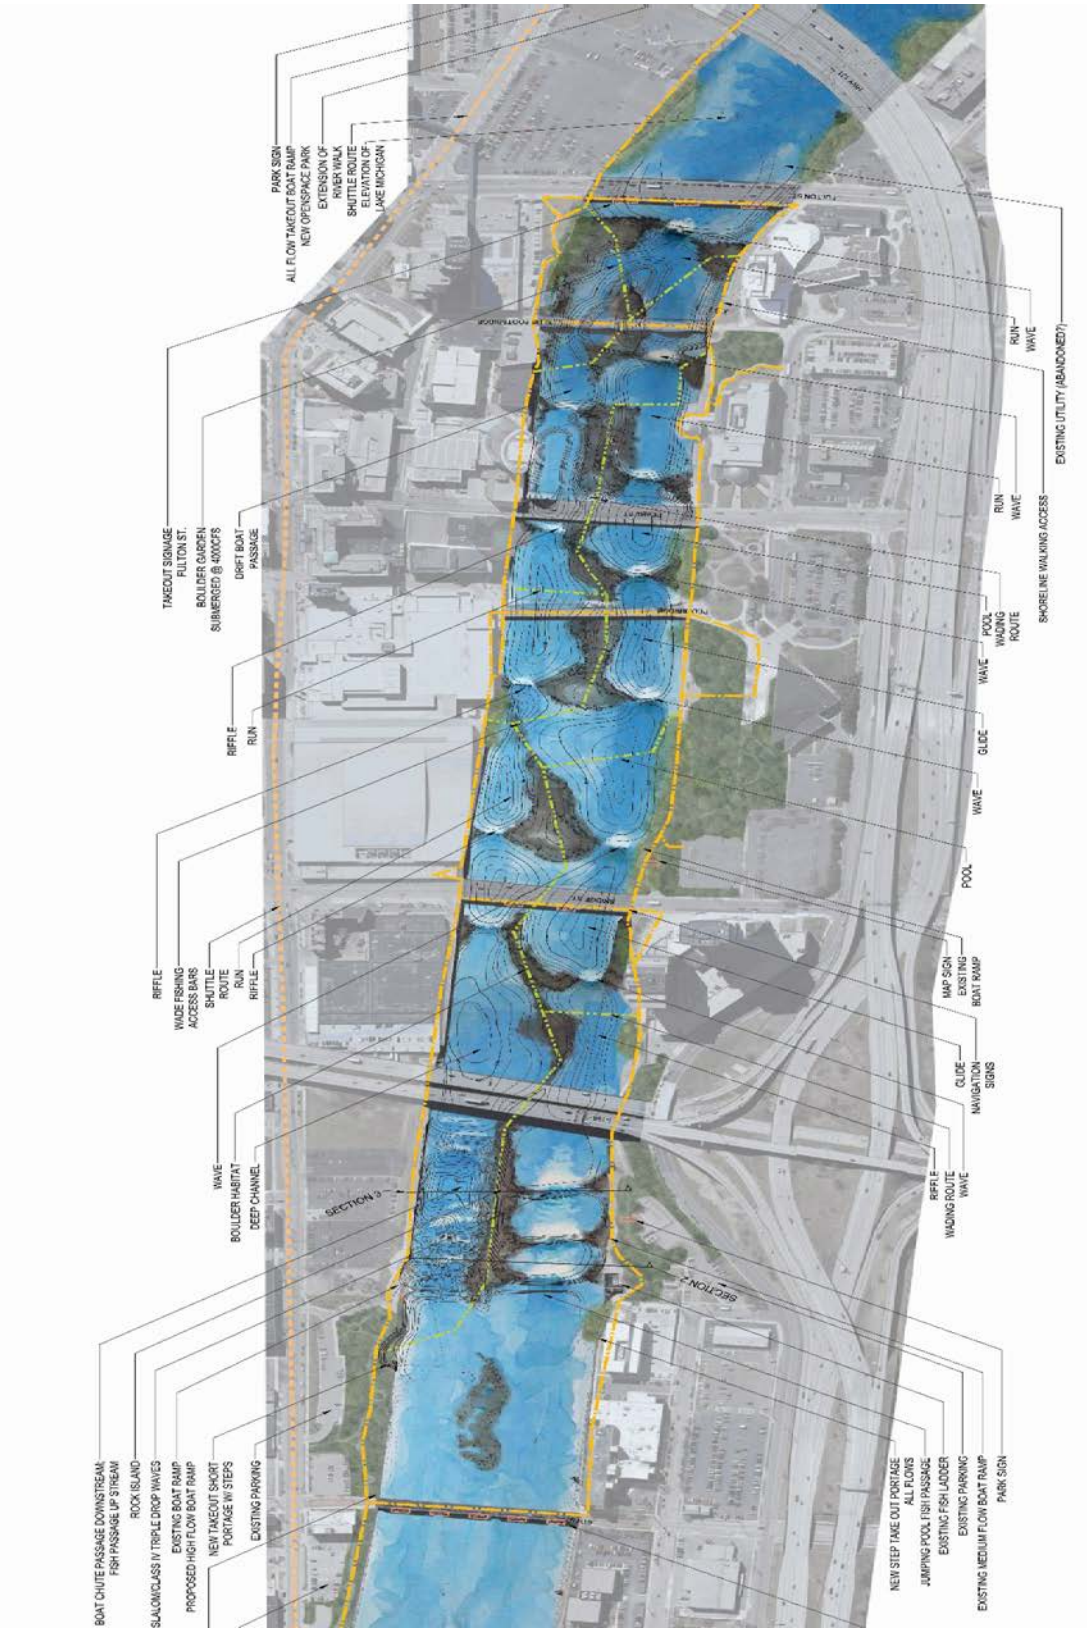

Figure 1-2. Conceptual Image of Proposed Project Enhancements

1.2 Restoring the Resource

Rapids restoration between Ann Street and Fulton Street would serve to oxygenate the water, another benefit to aquatic life, and create new recreational opportunities for the public, such as whitewater boating and fly fishing. Figure 1-1 depicts the current project area.

The project is expected to have an overall long-term beneficial effect on water resources, fish and aquatic species, including threatened and endangered species, and the local economy. An economic impact analysis prepared in 2014 indicated the local economy would benefit from increased access and use of the river by citizens and visitors. An updated economic impact analysis is in process to better gauge the current value of those benefits.

In addition to the in-stream work taking place under the watershed project plan (WPP), farmland conservation practices will be implemented in areas of the upper watershed to reduce soil erosion and improve water quality.

Future projects in the Grand River include the removal of the 6th Street dam and installation of an adjustable hydraulic structure to provide a barrier to migrating sea lamprey. These additional activities will help the WPP project achieve its full potential.

1.3 Compliance with Natural Resources Conservation Service Requirements

The components required by the Natural Resources Conservation Service (NRCS) are addressed within this document and have been checked for completeness against NRCS-CPA-52 form. Appendix B contains an evaluation checklist, including the criteria addressed.

To meet the requirements outlined in NRCS-CPA-52, the following criteria were addressed:

- Objectives (purpose)
- Need for action
- Resource concerns and existing/benchmark conditions, including economic considerations and public health and safety
- Special environmental concerns (e.g., endangered species)

- Alternatives (including the no-action alternative, effects of alternatives, and the preferred alternative)
- Impacts to special environmental concerns
- Mitigation

1.4 Proposed Alternatives

Along the reach of the river that courses through downtown Grand Rapids, the Grand River drops an impressive 18.5 feet, representing the steepest grade anywhere along its entire length. Only 1 percent of the river habitat in the lower peninsula of Michigan is comprised of rapid-type habitat, which is important to the life cycle of many aquatic species. Rapid-type habitat is defined as a river system with a steep energy gradient, coarse bed substrates, and nonuniform distribution of instream velocities.

Three project alternatives are being evaluated to support the project:

1. No action
2. Removal of four, low-head beautification dams without substrate improvements
3. Removal of four, low-head beautification dams with substrate improvements

1.5 The Recommended Alternative

The preferred alternative to meet the needs of this project is Item 3, removal of four, low-head beautification dams in the Grand River from 20 meters (65 feet) upstream of Interstate 196 to Fulton Street (the Project Area) and improving substrates over 1 kilometer (3,300 feet) of the Grand River. This will create substrate diversity in more than 36 acres of river bottom and will facilitate revitalization of the ecological, cultural, and recreational functions of the historical rapids. Through implementation of this preferred alternative, project opportunities that will be realized include:

- Protection of threatened, endangered, and special concern (TES) species of fish and mussels, including lake sturgeon, river redhorse, and snuffbox mussel.
- Enhancement of recreational activities with safe public access in an urbanized Great Lakes river corridor.
- Improved habitat diversity and suitability in more than 36 acres of the Grand River, resulting in increased Great Lakes native fish and mussel diversity and productivity.

2.0 Purpose and Need for Action

2.1 Purpose and Need

The purposes of the Lower Grand River Watershed Habitat Restoration – Farmland Conservation Project are to revitalize, enhance, and maintain the rapids in downtown Grand Rapids. The project will facilitate restoration of the ecological, cultural, and recreational functions of the historic rapids by:

- Restoring aquatic habitat diversity and suitability for threatened, endangered, and special concern (TES) native Great Lakes fish and mussel species.
- Reducing or eliminating public safety hazards generated by existing hydraulics.
- Diversifying in-stream features that will improve habitat and create/enhance recreational activities in the river.

The project's need for federal action is due to the degraded natural resource of the river and several recognized safety problems. Historical physical changes to the Grand River as it flows through downtown Grand Rapids, including construction of four, low-head beautification dams and removal of substrate, have impacted native and TES species of fish and mussels, limited public recreational activities, and altered habitat. Studies have determined TES species of fish and mussel community diversity and productivity are currently much lower than possible. According to the *Lake Sturgeon Habitat* report completed by River Restoration in 2013, "The Grand River is one of only four rivers on the eastern shoreline of Lake Michigan where a known remnant population of lake sturgeon (*Acipenser fulvescens*) successfully reproduces (Smith, MDNR unpublished data). The availability of spawning and staging habitats in rivers is considered a major factor limiting the recovery of lake sturgeon in Lake Michigan (Daugherty *et al.*, 2009; Auer, 1999). Furthermore, remnant sturgeon populations throughout the Great Lakes Basin have been found to be genetically unique, with the Grand River population likely included, and protection of each population is a priority of federal, state and tribal agencies (Welsh *et al.*, 2010; Holey *et al.*, 2000). Recently numerous sturgeon restoration projects have begun (Holtgren *et al.*, 2007); however, very few have focused on increasing spawning and staging habitat in Michigan."

Four, low-head beautification dams alter flow velocity and create public safety hazards. From 2005 to 2016, the Grand Rapids Fire Department has rescued 72 people from water-related incidents in this reach of the river, resulting in 40 civilian injuries as well as 5 civilian deaths from 2005 to 2016.

Habitat diversity has been significantly reduced. Along the reach of the river that courses through downtown Grand Rapids, the Grand River drops an impressive 18.5 feet, representing the steepest grade anywhere along its entire length. Only 1 percent of the river habitat in the lower peninsula of Michigan is comprised of rapid-type habitat, which is important to the life cycle of many aquatic species. Rapid-type habitat is defined as a river system with a steep energy gradient, coarse bed substrates, and nonuniform distribution of instream velocities.

Three project alternatives are being evaluated to support the project:

1. No action
2. Removal of four, low-head beautification dams without substrate improvements
3. Removal of four, low-head beautification dams with substrate improvements

The preferred alternative to meet the needs of this project is Item 3, removal of four, low-head beautification dams in the Grand River from 20 meters (65 feet) upstream of Interstate 196 to Fulton Street (the Project Area) and improving substrates over 1 kilometer (3,300 feet) of the Grand River. This will create substrate diversity in more than 36 acres of the river bottom and will facilitate revitalization of the ecological, cultural, and recreational functions of the historical rapids. Through implementation of this preferred alternative, project opportunities that will be realized include:

- Protection of TES fish and mussel species, including lake sturgeon, river redhorse, and snuffbox mussel.
- Enhancement of recreational activities with safe public access in an urbanized Great Lakes river corridor.
- Improved habitat diversity and suitability in more than 36 acres of the Grand River, resulting in increased Great Lakes native fish and mussel diversity and productivity.

In addition, project implementation will align with the goals and objectives of the following regional planning documents:

- Lake Sturgeon Recovery – *Lake Sturgeon Rehabilitation Strategy Draft*. Hayes, Dr. D.B., and Dr. D.C. Caroffino. December 2011. Michigan Department of Natural Resources.
- Restoration of habitats, fishery improvements and encouragement of outdoor recreation – *Lower Grand River Watershed Management Plan*. Lower Grand River Organization of Watersheds. 2011.
- Rapid restoration effect on the local fisheries in the river, productivity and diversity of Lake Michigan, productivity and diversity of Grand River native fish and mussel populations, and river accessibility recreational opportunities – *Grand River Fisheries Assessment*. Hanshue, S.K., and A.H. Harrington. 2017. Michigan Department of Natural Resources Fisheries Report 20, Lansing.

In tandem with these in-stream restoration activities, the region is engaging in multiple actions directed at creating better water quality within the Grand River. Regional Conservation Partnership Program funding has been obtained for best management practices in two upper watersheds: the Rogue River and Indian Mill Creek. The City of Grand Rapids has invested more than $400 million dollars to separate its sewer system, eliminating combined sewer overflows to the Grand River. The City of Grand Rapids and many surrounding communities draining to the Grand River are proactively managing stormwater. Concerted efforts between communities and conservation organizations in the Grand River are planning and implementing efforts to improve water quality. Such previous, ongoing, and future efforts will help ensure the restored rapids habitat between Interstate 196 and Fulton Street will be productive and sustainable.

2.2 Watershed Problems and Resource Concerns

2.2.1 Habitat Conditions

The habitat of the Grand River through Grand Rapids is severely degraded, but it offers a unique opportunity for Michigan and the Great Lakes.

The ecosystem processes of the Grand River have been degraded from loss of the rapids, channelization, dredging, and urban development. Only 1 percent of the river habitat in the lower peninsula of Michigan is comprised of rapid-type habitat, which is important to the life cycle of many aquatic species. Rapid-type habitat is defined as a river area with a steep energy

gradient, coarse bed substrates, and nonuniform distribution of instream velocities. Prior to dam installation and subsequent dredging and channelization, the Grand River rapids ran through Grand Rapids.

The historical modifications were made to support development of the region, but those industries and practices have long lost their relevance. Five dams have been constructed within Grand Rapids, including the 6th Street Dam and four smaller, low-head beautification dams. The 6th Street Dam was constructed more than 100 years ago to facilitate the floating of logs over the bedrock outcrop upstream of Leonard Street. Four smaller, low-head beautification dams were subsequently constructed downstream of the 6th Street Dam to maintain channel width during low flow to prevent the concentration of raw sewage that was discharged into the river. Dredging and mining of large substrate has occurred in the channel where it runs through the city. In addition, the river is constrained between more than a mile of flood protection walls on both sides of the channel. These modifications have together created a straight, uniform channel with little diversity in flow depth, substrate, or velocity, limiting natural aquatic ecosystem processes and constraining the physical, chemical, and biological processes of the river ecosystem.

Despite drastic modifications to the river system, the habitat supports important species. Snuffbox mussel (federally listed as endangered), lake sturgeon, and river redhorse (state listed as threatened) are species known to inhabit the project area, along with many host fish species. Section 7.7, Fish and Aquatic Species, discusses this further.

2.2.2 Supporting the Important Species of the Region

The removal of four, low-head beautification dams, followed by diversification of in-stream features through creation of riffles, runs, glides, drops, and pools with variable depths and flow velocity throughout the project area reach, will serve to improve habitat quality for the threatened and endangered species and their hosts. This project would:

- Diversify river conditions, providing variability in flow velocity and depth.
- Improve quality of habitat for threatened and endangered species and host fish along 3,300 feet by 476 feet (36 acres) of Grand River.
- Reduce barriers of access for native and regional species, potentially increasing genetic diversity through reconnection with formerly segregated fish populations.
- Initiate Phase 1 of a multiphase project to reconnect access for lake sturgeon to historical spawning grounds just above the 6th Street Dam.

2.2.3 Risks to Human Health and Safety

The historical modification made to the Grand River have created a public safety concern. Four of the city's five low head dams are located within the project area outlined in this project plan. While the data is not specific to only the dams, the hydraulics created by the dams are a safety risk to boaters and swimmers alike and have contributed to multiple rescue and recovery operations over the years.

According to Grand Rapids Fire Department (GRFD) data, from 2005 to 2016 there were 40 civilian injuries and 5 civilian deaths. Within the same time period, the Grand Rapids Fire Department rescued 72 people from water-related incidents. On average, the Grand Rapids Fire Department averages 10 water rescue incidents per year (GRFD, 2016)

2.2.4 Economic and Social Considerations

Use of the river is expected to increase after project completion. More people are expected to spend time in and around the river using the scenic waterway and enjoying easy access to greater recreational opportunities. As a result, Grand Rapids can expect to attract new businesses that want to capitalize on the improvements made to the river.

Anderson Economic Group (AEG) authored a 2014 economic impact analysis report. In it, the restored river and riverfront were projected to generate between 232,434 and 538,313 new visitor days for Grand Rapids each year. For a breakdown of net new visitor days, AEG estimated an additional 13,090 to 15,400 for whitewater boating users, 42,500 to 50,000 for non-whitewater boating users, 66,844 to 80,213 for fishing users, and between 110,000 to 392,700 for shore-based users. The low-end estimate is a conservative scenario based on data and observations of smaller-scale river restoration projects. The higher estimate is a potential scenario reflecting possible increased draws given the project's location, broad scope, potential to attract several major events, and overall community and statewide interest. The economic impact under these scenarios is $15.9 million to $19.1 million in net new activity every year, respectively. This is driven by direct net new spending of $12.9 million to $15.5 million, which stimulates an additional $3.0 million to $3.6 million in indirect economic impacts within Grand Rapids. This economic impact includes 80 to 96 new jobs and $2 million to $2.3 million in new earnings for the Grand Rapids' workforce.

AEG is updating their 2014 analysis to address additional impacts such as impacts of construction, installation, and maintenance of the project. They are also performing a cost-benefit analysis for the WPP.

3.0 Public Participation Plan

The intent of the public participation plan is to provide the public with information about the Restore the Rapids Project and encourage their engagement within the planning process. Appendix A contains a copy of the public participation plan that outlines outreach methods and activities that have been or will be employed to reach the broader community of Grand Rapids.

3.1 Sponsors, Local Partners, Agencies, and Tribal Participation

The Sponsor for the project is the City of Grand Rapids, Michigan.

Project sponsors must have the legal authority and resources to carry out, operate, and maintain works of improvement (Public Law 83-566 Section 2).

For the purpose of the project, Partners are the agencies involved in scheduling, facilitating communication, and project design and development. Local partners for the project include:

- Grand Valley Metropolitan Council (GVMC) – Lead Partner.
- Grand Rapids Whitewater (GRWW) – Supporting Partner.

Consultants were procured to provide environmental and economic assessments. The consulting team supporting the effort include:

- AEG.
- EcoAnalysts, Inc.
- Environmental Consulting & Technology, Inc. (ECT).
- Environmental Resources Management (ERM).
- Fishbeck, Thompson, Carr & Huber, Inc. (FTCH).

Agencies involved with the project include state and federal resource agencies such as:

- NRCS.
- U.S. Fish and Wildlife Service (USFWS).
- Michigan Department of Natural Resources (MDNR).
- Michigan Department of Environmental Quality (MDEQ).

- U.S. Army Corps of Engineers (USACE).
- U.S. Environmental Protection Agency (EPA).

Tribes that have been contacted and invited to participate in the project include:

- Little River Band of Ottawa Indians (federally recognized).
- Grand River Band of Ottawa Indians (federal recognition pending).
- Nottawaseppi Huron Band of the Potawatomi, Anishinaabe community (federally recognized).
- Gun Lake Tribe (federally recognized).
- United Tribes of Michigan (representatives from 12 federally recognized tribes)

Other stakeholders for this project that have contributed time and effort include:

- Downtown Grand Rapids, Inc.
- Grand Rapids Public Museum.
- Kent County Drain Commissioner.
- Lower Grand River Organization of Watersheds.
- Michigan League of Conservation Voters.
- Private foundations and businesses.

3.2 Permits and Compliance

The project will comply with applicable state and federal regulations.

This project will be funded in part using NRCS federal dollars. A prerequisite for funding is a WPP environmental assessment (EA). This process requires compliance with relevant federal and state regulations, including PL 83-566, Section 7, of the Endangered Species Act; Section 106 of the National Historic Preservation Act; and relevant parts of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended by the State of Michigan, as required by the joint permit being submitted (with MDEQ).

3.3 Mitigation

Mitigation measures will be necessary during implementation of the habitat restoration process because of anticipated detriment to some of the fish and aquatic life within the project area.

Threatened and endangered species unionid mussels within the project area could be harmed during project construction; therefore, a mussel relocation and monitoring plan will be put in place to reduce the number of mussels affected. After the construction area is isolated and the water level lowered, but before dam removal and substrate enhancement activities begin, a team of malacologists/biologists will search and collect unionid mussels for tagging and translocation, with an 80-percent recovery goal. Translocated mussels will be monitored 1 year following each translocation, and an annual report summarizing translocation and monitoring results will be produced.

To mitigate the loss of mussels crushed or otherwise not successfully recovered and translocated, a donor-advised fund will be established to fund research, monitoring, and other conservation measures within the Grand River basin. Wetlands are not known to be present within project area boundaries; however, a delineation survey will be performed for confirmation. Mitigation activity would be incorporated into the project should construction activity negatively impact wetlands found to be within or adjacent to the project area.

4.0 Environmental Evaluation

As part of the preliminary investigation process, the components required by NRCS are addressed within this document and have been checked for completeness against NRCS-CPA-52 form. Appendix B contains an evaluation checklist, including the criteria addressed.

To meet the requirements outlined in NRCS-CPA-52, the following criteria were addressed:

- Objectives (purpose)
- Need for action
- Resource concerns and existing/benchmark conditions, including economic considerations and public health and safety
- Special environmental concerns (e.g., endangered species)
- Alternatives (including no-action alternative, effects of alternatives, and the preferred alternative)
- Impacts to special environmental concerns
- Mitigation

5.0 Studies Completed

Several studies are under review/revision or are being conducted by consultants concurrently with the preliminary investigation and will be used to inform and develop the WPP. These studies include a biological assessment prepared by EcoAnalysts, Inc. (formerly Ecological Specialists, Inc.), that is currently under review, and an updated economic impact analyses being prepared by AEG.

Other existing local studies and sources of information are noted in Section 13.0, References.

6.0 Scope of the WPP

The NRCS-compliant watershed project plan under PL 83-566 will use analyses of current conditions and expected impacts of the proposed project and will leverage existing studies and reports providing relevant data collected within the watershed. The WPP will:

- Meet the requirements of Public Law 83-566, NRCS policy, congressional criteria, executive orders, the National Environmental Policy Act (NEPA), USACE Principles and Guidelines (as applicable), and other applicable laws and regulations.
- Utilize commissioned economic and environmental analyses that evaluate the potential alternatives, including the no-action alternative.
- Include consultation with the State Historic Preservation Office as part of the EA.

The WPP will follow the outline presented in the National Watershed Planning Manual. GVMC and other project Partners will engage all concerned parties in the planning process, including conducting public outreach to obtain input from the local communities.

Project Partners will work together to identify issues and concerns, incorporating them into the final WPP. This project is a non-water resources project, and, as such, the alternatives analysis will not include a national economic development alternative. The development of alternatives will follow the federal "*Principles and Guidelines for Water and Related Land Resources Implementation Studies.*"

6.1 Scoping and Public Participation

The WPP and EA planning processes include scoping and public participation to identify environmental, natural resource, economic, and social concerns associated with this watershed project.

Coordination will take place between GVMC, its project Partners, stakeholders, NRCS, and other NEPA agencies involved to determine the format and schedule for the scoping meeting(s) in compliance with Part 501, Subpart C, Section 501.24 of Title 390, National Watershed Program Manual (NWPM).

6.2 Alternatives

The WPP will include all reasonable alternatives that meet the purpose and need for action. They will be studied and analyzed in the EA plan. Because the WPP and EAs are being produced concurrently by two separate contractors, coordination will be necessary during identification and selection of project alternatives. This coordination will allow WPP development to continue concurrently with the EA development. The coordination meetings will be used to identify project alternatives that meet the following NRCS requirements (Part 501, Subpart B, Section 501.12[A], Title 390 NWPM):

- Inclusion of all reasonable alternatives meeting the purpose and need for action
- Inclusion of the future-without-project condition or no-action alternative
- Rationale provided for excluding alternatives from study
- Discussion of environmental and natural resource concerns raised during WPP scoping

6.3 WPP Development

The WPP will be prepared as required to meet funding approval under Public Law 83-566 as a final comprehensive report containing the EA and the content listed. The WPP will be developed using existing available information and the results of studies conducted by GVMC, GRWW, and other project Partners. Cost estimates and a cost-benefit analysis, focusing specifically on how the project alternatives meet the purpose and need for action, will be included.

The WPP will include the EA in accordance with NRCS requirements. The WPP will also contain information and analyses pertaining to the following required content pursuant to Part 501, Subpart D, Title 390 NWPM.

- Abstract
- Summary
- Purpose and need for action
- EA scope
- Affected environment
- Alternatives
- Environmental consequences
- Documentation of consultation, coordination, and public involvement
- Preferred alternative
- References
- List of preparers
- Distribution list
- Index

7.0 Affected Resources – Existing Conditions

7.1 Project Setting

The project is in the urbanized section of Grand River as it traverses through the core of Grand Rapids. Surrounded by urban development, the project area runs from just north of the Interstate 196 Bridge to the Fulton Street Bridge, passing right through Grand Rapids. The banks in some areas are channelized with concrete flood protection walls. In some cases, these walls are foundational walls to buildings that act as part of the flood protection system. The river banks are also developed with public parks, multi-use buildings, and parking lots. Bridges and highways cross the river.

Between Lake Michigan and the city of Ada, a distance of approximately 60 river miles, the river gradient sufficient to restore rapid habitat only exists at the project reach. The geographical extent of the project was identified to maximize rapid potential and encompasses areas between Fulton Street and Ann Street in the main channel of Grand River.

7.2 Current Infrastructure

Current infrastructure within the project reach includes a concrete flood protection system, four low-head beautification dams, a fish ladder, and bridge support columns.

7.3 Topography

The topography of the Lower Grand River Watershed is heavily influenced by the region's glacial origins. Proglacial lakes around the state drained through the land that would become the Grand River creating the incised and confined channel that exists to this day. The valley is broad, with a relatively uniform width of 1 mile, which includes incised gullies and relic flood terraces. The river itself has some significant topographical variability along its length. In the 2-mile stretch of Grand River that winds its way through downtown Grand Rapids, the riverbed elevation drops 18.5 feet and contains some of the most dynamic topography in the region (Churches, 2013).

7.4 Climate

Local climate is heavily influenced by latitude, variation of land surface altitude, and proximity to Lake Michigan. Mean precipitation within the Grand River watershed is approximately 31 inches, whereas annual snowfall can range from as low as 30 inches to more than 100 inches, depending on proximity to the lake (Hanshue and Harrington, 2017). Records from 1981 to 2010 show the mean annual total precipitation within Grand Rapids was 38.1 inches, and mean annual temperature was 48.5 degrees Fahrenheit (°F), with a mean of 129 days per year that fall below 32°F (GLISA. 2016).

The area has short, mild springs and falls, warm and humid summers, and cold, snowy winters. Without the lake's moderating influence on regional temperature, the area would have a much more continental climate; because the seasonal temperature variation is moderated by the presence of a nearby water body, the Grand Rapids area can support diverse agricultural products such as peaches, apples, corn, and soybeans.

7.5 Geology and Soils

7.5.1 Geology

"Surficial geology is varied and ranges from coarse-textured end moraine and ice contact topography to glacial lake plains. In some portions of the watershed glacial tills and deposits are several hundred feet thick while other areas are characterized by exposed bedrock" (Hanshue and Harrington, 2017).

7.5.2 Soils

"Soil groups in the Grand River watershed are widely distributed and are largely characterized as having moderately low runoff potential. Soil types with low runoff potential comprise 18 percent of the watershed, whereas soils with high runoff potential comprise 14 percent. Presettlement land cover in the watershed was primarily beech-maple, mixed oak, and coniferous forests. Forested wetlands, shrub-swamp/emergent wetland, wet prairie and open water accounted for approximately 18 percent of the presettlement land cover. Contemporary land use is dominated by agriculture (57 percent); forested land cover has been reduced to 25 percent and wetlands reduced by over 50 percent. Urban land use accounts for 9 percent of the current landscape" (Hanshue and Harrington, 2017).

The primeval state of the soils in the project area is sandy and reflects the character of the glacial outwash that once coursed through the Grand River Valley. Today the soils in the immediate vicinity of the project area are heavily urbanized, and few retain the hydrologic qualities of their natural state. Most of these areas retain little to no ability to infiltrate water and are heavily dependent on local infrastructure for drainage. In the upper reaches of the project area, the soils drain better and retain many more of the characteristics of the original glacial outwash material (Soil Survey Staff, 2015).

7.6 Water Resources

7.6.1 Surface Water Quality

Water quality in the Grand River basin is influenced by many human activities, including agriculture, industry, and urban development. Waters of the State are protected for designated uses of warmwater or coldwater fisheries, indigenous aquatic life and other wildlife, agriculture, industrial and municipal water supply, navigation, and recreation. Waters of the State that are designated as trout streams or are principal migratory routes for potamodromous salmonids have more stringent dissolved oxygen and temperature standards set to protect coldwater fish. The Grand River main stem from Lake Michigan to the Moores Park Dam is identified as a principal migratory route for salmon and steelhead and therefore receives this additional protection (Hanshue and Harrington, 2017).

Water quality within the project area has been consistently improving and was given a huge boost in 2017 when the city completed the total separation of their combined sewer system. The city of Grand Rapids has monitored water quality within the downtown reach of Grand River going back to 1985. The City of Grand Rapids Environmental Services Department maintains data on dissolved oxygen, fecal coliforms, pH, biological oxygen demand, temperature change, total phosphate, nitrates, total suspended solids, and chlorides. Water quality records specifically pertaining to the project reach will be obtained from the City of Grand Rapids Environmental Services Department and MDEQ.

The Grand River basin historically suffered from poor water quality because of unregulated discharges from municipal and industrial point source discharges. Water quality in the basin is steadily improving, and virtually all point source discharges are now regulated through the National Pollutant Discharge Elimination System permitting program administered by the MDEQ Water Resources Division.

Nonpoint source pollution remains the greatest factor degrading water quality. This type of pollution enters the water from atmospheric deposition and surface runoff and generally consists of sediment, nutrients, bacteria, organic chemicals, and inorganic chemicals from agricultural fields, livestock feedlots, construction sites, parking lots, urban streets, septic seepage, and open dumps. Implementing best management practices with farmland, construction sites, and urban development designs can significantly reduce runoff, erosion, and influxes of sediment, nutrients, and other chemicals into lakes and streams.

7.6.2 Ground Water

The Grand Rapids area sits on top of thick glacial drift before reaching the Marshall Sandstone formation at approximately 550 feet above sea level. The city does not depend on subterranean aquifers to supply water to its citizens but pipes the water in from Lake Michigan instead (NARA, 2015). While the glacial drift is too thin to support a viable aquifer, many agricultural operations and residential properties in the area around Grand Rapids tap the aquifer supported by the Marshall Sandstone.

7.6.3 Water Rights

As a traditionally navigable waterway, the Grand River from its outlet at Lake Michigan upstream to Fulton Street is under USACE and MDEQ jurisdiction. Waters in Michigan are not divided into water-right owners as in western states; however, permits for water withdrawals are required (MDEQ and MLARA, 2018).

7.7 Fish and Aquatic Species

According to the MDNR Grand River Fisheries Assessment, the Grand River watershed supports 107 species of fish. This fish community includes several species of conservation interest within the project area and/or the larger watershed, including lake sturgeon and river redhorse, which are state-listed as threatened.

The watershed rates highly for Catostomid diversity (11 of 15 species present), sunfish and minnow communities (9 of 16 species present), as well as channel catfish, flathead catfish, largemouth bass, smallmouth bass, walleye, black buffalo, black redhorse, golden redhorse, spotted sucker, river chub, striped shiner, and grass pickerel. These species may not be present

within the project area but are present within the surrounding watershed. These species are species of great conservation concern within the state of Michigan.

Lake Michigan's proximity to Grand River causes significant seasonal influence, with many potadroumous species like lake whitefish and salmon migrating up the river during the spring and summer, changing the species composition. The major impediment for many of these species is the 6th Street Dam north of the proposed in-stream habitat construction area. This dam blocks all species except steelhead and salmon, which can make use of the fish ladder attached to the 6th Street Dam (Hanshue and Harrington, 2017).

Grand River is known to support numerous unionid mussels, including the federally listed endangered snuffbox mussel (discussed further in Subsection 7.10). Unionid habitat preferences include sand and gravel substrates in small to medium-sized rivers, which is limited under existing conditions. Table 7-1 identifies unionid mussels known to exist within the project area, as well as their host fish.

Table 7–1. Unionid and Host Species Known to Reside in the Project Area

Unionid Mussels		Host fish
Epioblasma triquetra	Snuffbox	Percidae (perches)
Alasmidonta viridis	Slippershell	Percidae (perches)
Cyclonaias tuberculata	Purple wartyback	Ictaluridae (catfish)
Ligumia recta	Black sandshell	Centrarchidae (sunfish and bass), Percidae (perches), *Aplodinotus grunniens* (freshwater drum)
Toxolasma parvum	Lilliput	Centrarchidae (sunfish and bass), Percidae (perches)
Pleurobema sintoxia	Round pigtoe	Cyprinidae (minnows), Centrarchidae (sunfish and bass)
Potamilus alatus	Pink heelsplitter	*Aplodinotus grunniens* (freshwater drum)
Truncilla truncata	Deertoe	*Aplodinotus grunniens* (freshwater drum)
Venustaconcha ellipsiformis	Ellipse	Percidae (perches)
Villosa iris	Rainbow	
Alasmidonta Marginata	Elktoe	Catastomidae (suckers), Centrarchidae (sunfish and bass)
Lasmigona Compressa	Creek heelsplitter	
Lasmigona Costata	Fluted shell	Cyprinidae (minnows), Catastomidae (suckers), Ictaluridae (catfish), Centrarchidae (sunfish and bass), Percidae (perches), *Aplodinotus grunniens* (freshwater drum)
Utterbackia Imbecillis	Paper pondshell	Ictaluridae (catfish), Centrarchidae (sunfish and bass), Percidae (perches)

Source: EcoAnalysts, Inc. 2018.

The Great Lakes have been invaded many times by species from outside the basin, and controlling their spread and impact is of upmost concern to the people who live in the basin. Many species, such as common carp, round goby, zebra mussel, curly leaf pondweed, and Eurasian water milfoil, are present in Grand River, but for this particular project the greatest threat comes from sea lamprey.

Lamprey are a parasitic species that was introduced to the Great Lakes accidentally when the Welland Canal was constructed. Lamprey lack bones and a jaw and instead have a large sucking disk that they use to cut into the sides of healthy animals. The species is now present throughout the Great Lakes, and its migration to upstream Grand River tributaries is believed to be stopped by the 6th Street dam. However, there is some evidence to suggest lamprey may be able to bypass the dam at certain flow rates (LGRWMP, 2011) (GLFC, 2018).

“Floodplain forests and nearshore environments within the watershed have been significantly altered as a result of the introduction of terrestrial exotics such as the emerald ash borer, Dutch elm disease, garlic mustard, phragmites and purple loosestrife. These changes are transferred to the aquatic ecosystem in the form of reduced productivity and altered habitat” (Hanshue and Harrington, 2017).

7.8 Wildlife

Wildlife as it pertains to land animals will be minimally impacted by the project, as the project area is solely within the river. Wildlife such as mink have been observed in the surrounding area. Species that could occur in the project surrounding area include the federally listed endangered northern long-eared bat (*Myotis septentrionalis*), Indiana bat (*Myotis sodalis*), Karner blue butterfly (*Lycaeides melissa samuelis*), and eastern Massasauga rattlesnake (*Sistrurus catenatus*), a Michigan state-listed species of special concern; however, they are highly unlikely to be present because of the lack of existing suitable habitat and/or they have never been reported in Kent County (MNFI, 2018).

7.9 Vegetation

“The Grand River catchment contains several unique and rare plant communities ranging from dry mesic southern forest to southern floodplain forest to interdunal wetlands. These plant communities represent remnants of the pre-settlement landscape and are rich in biodiversity. These communities provide critical habitats for numerous vertebrate and invertebrate species of

conservation interest including several that are identified as endangered, threatened, or of special concern" (Hanshue and Harrington, 2017).

7.10 Threatened and Endangered Species

Any modification of habitat must consider species of local and national concern that are present in the project area. Because the project work is either confined to within the river or in the urbanized areas that border it, aquatic species or species that depend on aquatic environments are assumed to be of particular interest. The Lower Grand River Watershed includes many species that meet these criteria along its length; however, relatively few of these species are present in the vicinity of the WPP area.

Species that are present include:

- Snuffbox Mussels—Protected both at the federal and state level and located in and around the project area. The mussels are medium-sized reaching approximately 2 inches and with a roughly triangular shape. Generally, the mussel's habitat is sandy, gravelly substrates in swift-flowing small streams (MNFI, 2018).
- River Redhorse—Fish species in the genus Catostomidae, or suckers, that reaches the northern limit of its range in Michigan. This sucker is the largest in the family and is emblematic of good water quality and good habitat quality (ODNR, 2012). While the species is rare, records kept by the Michigan Natural Features indicate some of the most recent sightings (2007) occurred in Kent County (MNFI, 2018).
- Lake Sturgeon—Grand River supports a remnant but stable population of lake sturgeon, though their habits are somewhat mysterious. The fish is a long-lived species that only reaches sexual maturity at 17 to 20 years; creating sustainable breeding populations within the state is vital. The species is threatened in Michigan, and there are limitations on how much the population can be boosted with enhanced breeding techniques, since sturgeon populations are genetically linked to their home river (Hanshue and Harrington, 2017) (MNFI, 2018).

7.11 Wetlands

Historically, 42 percent of the wetlands in the Lower Grand River Watershed were drained and converted to agriculture (LGRWMP, 2011). In the more densely populated areas, such as that surrounding the project area, the watershed has been highly urbanized. A wetland delineation survey will be conducted to identify wetlands within and adjacent to the project boundaries.

7.12 Land Use, Zoning, and Ownership

The project area is located within Grand River as it runs through Grand Rapids. Land uses bordering the project area are a combination of open space, public walkways, and commercial/ mixed-use properties. Zoning surrounding the river is presumed to be mixed-use and commercial, and shoreline property is owned by the City and private investors. Under Michigan law adjacent riverfront property owners own the river bottom to the thalwag, i.e., the lowest elevation within the water course (City of Grand Rapids, 2017).

7.13 Cultural and Historical Properties

The cultural and historical properties assessment has yet to be completed. An archaeologist will be consulted to assess the presence of and potential impact on any significant sites of cultural and historical importance. Investigation of any existing tribal water rights and treaty boundaries that fall within the project area, or that would be affected by the project, will be conducted. Any findings of significance will be factored into the final WPP.

7.14 Recreation

The Grand River supports a variety of game fish, and recreational use by anglers is high throughout the middle and lower reaches of its main stem. The areas near the fish ladder and dams where hydraulics have created deeper pools in which fish congregate are popular locations where the public can be seen fishing. There are numerous coldwater tributaries in the lower segment of the Grand River, both above and below the project area, that support popular fisheries for brown trout, brook trout, and steelhead. “Diverse warm water fisheries for walleye, smallmouth and largemouth bass, northern pike, panfish, and channel and flathead catfish are found on the main stem, tributaries and inland lakes” (Hanshue and Harrington, 2017). Coho and Chinook salmon migrate from Lake Michigan upstream through the project area and fish ladder to access upper reaches of the river.

Recreational boating is also enjoyed within the project area and all along the river, although connection of the upper reach to the lower reach is impeded by the dams. Hydraulic conditions created by these dams cause a public safety hazard when boaters get caught up in the hydraulics and capsize. Pathways and parks adjacent to the proposed project area are enjoyed by the public for numerous activities, including walking, running, picnicking, biking etc., and are conveniently

accessed from numerous access points along the waterfront by those who visit and/or work in downtown Grand Rapids.

7.15 Socioeconomics

7.15.1 Population

The human population in the project area is increasing at a higher rate than both the state of Michigan as a whole and the region of West Michigan.

The project is located within the second largest city in the state of Michigan. The city is characterized by a population of just under 200,000 residents and is central to the Grand Rapids-Wyoming Metropolitan Statistical Area, with a population of nearly one million people. Grand Rapids has been growing at an accelerated rate relative to West Michigan as a whole, with the population increasing an average 4.2 percent annually over the last 5 years, compared to just 0.7 percent of West Michigan. This compares to a population growth rate of 0.8 percent in Michigan, overall. The percentage of the Grand Rapids population represented by people of color within the metropolitan region is 32.4 percent, whereas the West Michigan proportion is 13.7 percent.

Grand Rapids, much like the entire country, is undergoing massive demographics shifts. In the last 30 years, the percent of the population who identify as people of color has risen from 20 to 42 percent as of 2014 (Table 7-2). This trend, toward a more diverse population, is also reflected in the divide between a more diverse younger population and a more homogenous older population. The trend is expected to continue, with Kent County expected to have a majority of people of color by 2050.

Table 7–2. Selected Regional Population Demographics

Population	1980 (percent)	2014 (percent)
People of color	20	42
White	80	58

Source: PolicyLink and PERE, 2017

7.15.2 Area Employment, Income, and Agriculture

Grand Rapids currently has a per capita income of $27,549 in 2016 dollars, which is comparable to all of Kent County where the per capita income is $28,070 in 2016 dollars. The biggest employers by number of jobs in the metropolitan region are manufacturing, followed by health care and social assistance, and administrative and support and waste management and remediation services.

On a larger scale, the Grand Rapids-Wyoming Metropolitan Statistical Area (MSA) encompasses four counties in West Michigan: Montcalm, Kent, Ottawa, and Barry. It is one of the most robust, economic regions within the state of Michigan as evidenced by the demographics data displayed in Table 7-3.

Table 7–3. Selected Regional Demographics

Demographic	Grand Rapids Wyoming MSA	State of Michigan
Population	1,050,000	9,900,000
Number of households	384,790	3,880,000
Median household income	$60,212	$52,492
Median home value	$164,500	$147,100
Percentage minority residents	20.9%	24.7%
Percentage age 65 and over	13.6%	16.2%
Median age	36	39.7
Percentage in poverty	11%	15
Percentage involved in amusement and recreation activities	1.86%	1.23%
Percentage involved in natural resource occupations (farming, fishing, forestry)	2%	0.07%
Top three industries by number of positions	• Manufacturing • Healthcare and social assistance • Retail trade	• Motor vehicles and motor vehicle equipment manufacturing • Restaurants and food services • Hospitals

Source: PolicyLink and PERE, 2017

The median household income within the MSA is roughly 15 percent higher than in the state of Michigan as a whole. The median home value in the Grand Rapids-Wyoming MSA is also approximately 12 percent higher than the state of Michigan as a whole (PolicyLink and PERE, 2017).

8.0 Estimated Project Implementation Costs

Interstate 196 to Fulton Street (Base Project)

Line No.	60 Percent Design Cost Opinion August 2017	Quantity	Unit Issue	Unit Cost	□artner	A□□□tant	□e□□e□t	Total ($)

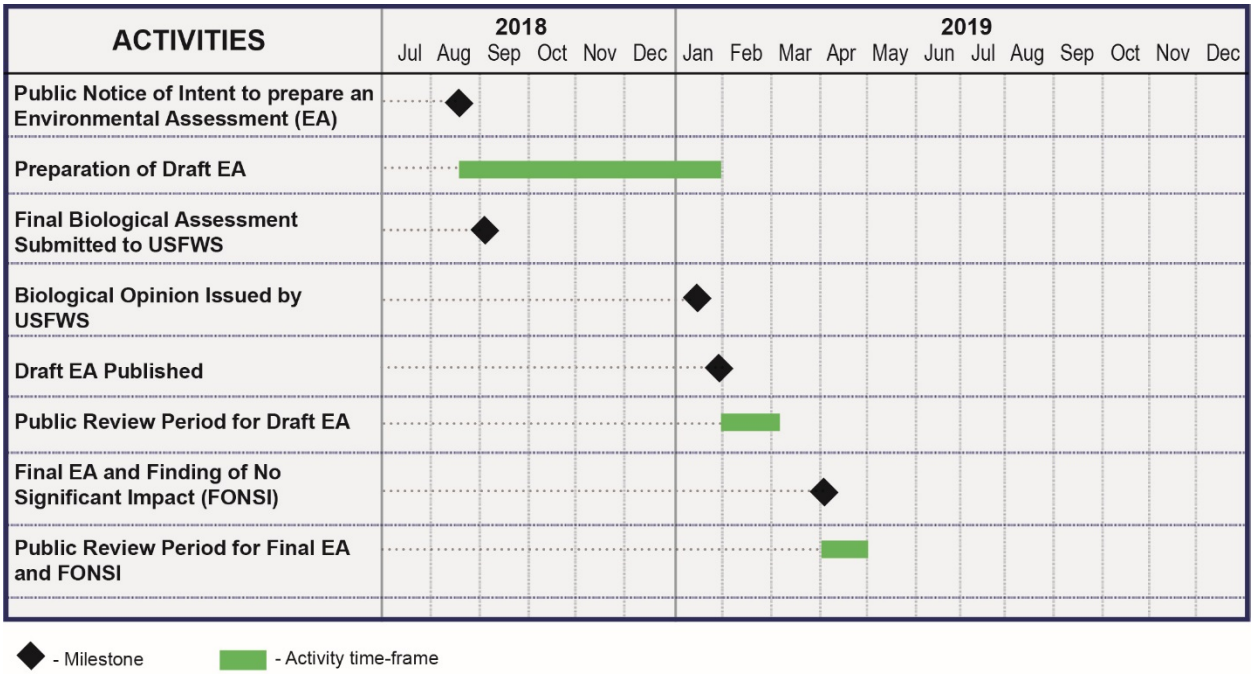
9.0 Schedule for Plan – EA Completion

The EA is being conducted by ERM and is currently in progress. The anticipated schedule is as follows:



10.0 Additional Studies Needed

The following studies are being performed on behalf of this project:

- Biological assessment prepared by EcoAnalysts, Inc. (formerly Ecological Specialists, Inc.)
- Economic impact analyses being prepared by AEG
- Cost benefit analysis being prepared by AEG
- EA being prepared by ERM
- Sediment transport study prepared by River Restoration
- Flood modeling prepared by River Restoration

11.0 Interdisciplinary Technical Procedures

Generation of the necessary technical documents, as identified in Section 10.0, include interdisciplinary efforts performed by stakeholders. The technical procedures required for each of these documents is driven by regulatory agencies, including:

- NEPA.
- MDEQ.
- NRCS.
- USFWS.
- U.S. Department of Agriculture.
- Security and Exchange Commission.
- Bureau of Consumer Financial Protection.

12.0 Alternatives

12.1 Formulation Process

To determine the most viable alternatives to meet the project's purpose and need, the City of Grand Rapids, lead partner GVMC, and supporting partner GRWW considered the goals for conservation and restoration, needs of recreational users (anglers, boaters, general public), the current status of the existing infrastructure, and resources and funding available for project implementation. Alternatives considered during project development but proposed for elimination from detailed study due to lack of feasibility or lack of consistency with the project's purpose and need is discussed in Section 12.2. The preferred Proposed Action Alternative is described in Section 12.3.1 and the No-Action Alternative is described in Section 12.3.2.

12.2 Alternatives Proposed for Elimination from Detailed Study

Alternative 2, removal of four low-head beautification dams without substrate enhancements, will likely be eliminated from detailed study, because it fails to meet all the needs identified in the purpose and needs statement.

Alternative 2 involves removal of the four aged low-head beautification dams between the Interstate 196 Bridge and Fulton Street Bridge without subsequent substrate enhancement. Removal of the low-head dams would improve connectivity for fish migration up-stream and remove the dangerous hydraulic conditions that create a public safety hazard that has caused drownings and numerous rescues over the years. Without substrate enhancement, however, the quality of the habitat will not be improved, and expanded recreational opportunities will not be realized.

12.3 Description of Alternatives Considered

12.3.1 Preferred Proposed Action

Alternative 3 (preferred alternative) entails removal of the four aged low-head beautification dams and enhancement of substrate to improve habitat and expand recreational opportunities. These actions would fulfill the purpose and needs of the project. Removal of the low-head dams would improve connectivity for fish migration up-stream and remove the dangerous hydraulic

conditions that create a public safety hazard that has caused drownings and numerous rescues over the years. Substrate enhancement will improve the quality of habitat for threatened and endangered species, in addition to other local and regional aquatic species, and create river features that provide additional recreational opportunities that currently do not exist, such as whitewater boating and fly-fishing.

12.3.2 No-action Alternative

The no-action alternative (Alternative 1) would leave the current conditions as they are. The low-head beautification dams would be left in place, and the related public safety issues would continue to be present. There would be no substrate enhancement; therefore, habitat quality would not be improved. The existing limited recreational activities would not be affected.

12.4 Economics

In accordance with Title 390, NWPM, Part 501, Subpart B, Section 501.11B(1), a national economic development analysis is not required because this project is not a water resources project. However, an economic impact analysis for a larger area (of which this project is a portion) was conducted by AEG in 2014 and is now being updated (by AEG) to specifically assess the impacts of this specific project. AEG is also generating an economic impact cost-benefit analyses report for the project. The alternative that achieves the agreed-on level of resource protection while maximizing the net economic benefit will be the preferred alternative. All costs, including operation, maintenance, and replacement, expected to be incurred over the period of analysis will be included.

Appendix A

Public Participation Plan

Appendix A
Public Participation Plan

The public participation plan (PPP) is an integral part of the project development process and is designed to encourage collaboration between stakeholders, including partners, agencies, tribes, and the public. This preliminary investigative report was prepared to provide information to assist in evaluation of further planning, objectives, and goals, and aid in the securing of funding for the Lower Grand River Watershed Habitat Restoration – Farmland Conservation Project. During development of this report, the project Sponsor, lead Partner, and supporting Partner conducted initial consultation with natural resource agencies and stakeholders. The project Sponsor and its Partners will conduct further comprehensive public scoping prior to preparation of the WPP as described in Section 6.0, Scope of the WPP.

The purpose of the PPP is to outline methods for encouraging involvement of citizens, organizations, and other interested parties in the development of the WPP. The objective of the PPP is to:

- Create awareness among the public regarding the Lower Grand River Habitat Restoration -Farmland Conservation Project and alternatives considered.
- Educate the public about the purpose and need for the draft Grand River WPP goals and objectives.
- Establish a process that encourages members of the public and other interested parties to participate in development of the WPP.
- Make sure interested stakeholders can review and comment on the draft WPP.

Public Participation Events

Public participation events will be hosted in three locations within the project area to provide opportunities for the public to obtain information, ask questions, and express concerns they may have regarding the proposed project. These events may include community/business forums, public meetings, or other scheduled community events such as farmer's markets. Concerns brought forth through this process will be noted in the WPP and addressed as necessary.

Advertisement of PPP Events

The public and other interested parties will be notified of the WPP and PPP events using one or more of the following tools:

- Printed Information—Printed flyers about the WPP and PPP event dates will be prepared and distributed.
- Web Sites—Information about the WPP and PPP event dates will be made available for existing websites and online calendars.
- Social Media—Information about the WPP and PPP event dates will be made available for use on Twitter, Facebook, Instagram, or other social media outlets.
- Press and Media—Information about the WPP and PPP event dates will be provided to local press and media for print, radio, or online dissemination.

These tools will be used for distribution of notices through Partner and stakeholder agencies and organizations including, but not limited to:

- Grand Valley Metro Council.
- City of Grand Rapids.
- West Michigan Environmental Action Council.
- West Michigan Sustainable Business Forum.
- Grand Rapids Public Library.
- West Grand Neighborhood Association.
- Lower Grand River Organization of Watersheds.
- Grand Rapids Press.
- The Grand Rapids Times.
- MLive.com.
- Radio (stations WBLU, WYCE, WGRD, WFGR).

PPP Event Engagement Tools

An open house format will be used to introduce the purpose and need for the WPP, introduce the Grand River Revitalization project, and offer opportunities to ask questions and express concerns. Content will be focused around the four aspects of the project: physical, biological, economical, and social. Additionally, outreach participants and the public will be invited to

provide input through a survey using Survey Monkey, an online survey development cloud-based software. This will allow the community to engage when time allows.

PPP Outcomes

Questions and concerns received through public participation events will be documented for WPP planning efforts. Additional information documented for each public participation event will include the date, type, and purpose of the activity, as well as the names of the participating organizations and the public. Questions and concerns received at the events will be used to focus the scope of the WPP, and specific concerns will be addressed in the WPP.

Cumulative Effects Narrative (Describe the cumulative impacts considered, including past, present and known future actions regardless of who performed the actions)			
L. Mitigation (Record actions to avoid, minimize, and compensate)			
M. Preferred Alternative √ preferred alternative	☐	☐	☐
Supporting reason			

N. Context (Record context of alternatives analysis)

The significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests, and the locality.

O. Determination of Significance or Extraordinary Circumstances

Intensity: Refers to the severity of impact. Impacts may be both beneficial and adverse. A significant effect may exist even if the Federal agency believes that on balance the effect will be beneficial. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts.

If you answer ANY of the below questions "yes" then contact the State Environmental Liaison as there may be extraordinary circumstances and significance issues to consider and a site specific NEPA analysis may be required.

Yes	No	
☐	☐	• Is the preferred alternative expected to cause significant effects on public health or safety?
☐	☐	• Is the preferred alternative expected to significantly affect unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, or ecologically critical areas?
☐	☐	• Are the effects of the preferred alternative on the quality of the human environment likely to be highly controversial?
☐	☐	• Does the preferred alternative have highly uncertain effects or involve unique or unknown risks on the human environment?
☐	☐	• Does the preferred alternative establish a precedent for future actions with significant impacts or represent a decision in principle about a future consideration?
☐	☐	• Is the preferred alternative known or reasonably expected to have potentially significant environment impacts to the quality of the human environment either individually or cumulatively over time?
☐	☐	• Will the preferred alternative likely have a significant adverse effect on ANY of the special environmental concerns? Use the Evaluation Procedure Guide Sheets to assist in this determination. This includes, but is not limited to, concerns such as cultural or historical resources, endangered and threatened species, ~~environmental justice,~~ wetlands, floodplains, coastal zones, coral reefs, essential fish habitat, wild and scenic rivers, clean air, riparian areas, natural areas, and invasive species.
☐	☐	• Will the preferred alternative threaten a violation of Federal, State, or local law or requirements for the protection of the environment?

P. To the best of my knowledge, the data shown on this form is accurate and complete:

In the case where a non-NRCS person (e.g. a TSP) assists with planning they are to sign the first signature block and then NRCS is to sign the second block to verify the information's accuracy.

Signature (TSP if applicable)	**Title**	**Date**
Signature (NRCS)	**Title**	**Date**

If preferred alternative is not a federal action where NRCS has control or responsibility and this NRCS-CPA-52 is shared with someone other than the client then indicate to whom this is being provided.

The following sections are to be completed by the Responsible Federal Official (RFO)

NRCS is the RFO if the action is subject to NRCS control and responsibility (e.g., actions financed, funded, assisted, conducted, regulated, or approved by NRCS). These actions do not include situations in which NRCS is only providing technical assistance because NRCS cannot control what the client ultimately does with that assistance and situations where NRCS is making a technical determination (such as Farm Bill HEL or wetland determinations) not associated with the planning process.

Q. NEPA Compliance Finding (check one)

The preferred alternative:		**Action required**
☐	1) is **not a federal action** where the agency has control or responsibility.	Document in "R.1" below. No additional analysis is required
☐	2) is a federal action **ALL** of which is **categorically excluded** from further environmental analysis **AND** there are **no extraordinary circumstances as identified in Section "O".**	Document in "R.2" below. No additional analysis is required
☐	3) is a federal action that has been **sufficiently analyzed** in an existing Agency state, regional, or national NEPA document **and** there are no predicted significant adverse environmental effects or extraordinary circumstances.	Document in "R.1" below. No additional analysis is required.
☐	4) is a federal action that has been sufficiently analyzed in another Federal agency's NEPA document (EA or EIS) that addresses the proposed NRCS action and its' effects **and has been formally adopted by NRCS**. NRCS is required to prepare and publish its own Finding of No Significant Impact for an EA or Record of Decision for an EIS when adopting another agency's EA or EIS document. (**Note: This box is not applicable to FSA)**	Contact the State Environmental Liaison for list of NEPA documents formally adopted and available for tiering. Document in "R.1" below. No additional analysis is required
☐	5) is a federal action that has **NOT** been sufficiently analyzed or may involve predicted significant adverse environmental effects or extraordinary circumstances and may require an EA or EIS.	Contact the State Environmental Liaison. Further NEPA analysis required.

R. Rationale Supporting the Finding

R.1 Findings Documentation	
R.2 Applicable Categorical Exclusion(s) **(more than one may apply)**	
7 CFR Part 650 *Compliance With NEPA*, subpart 650.6 *Categorical Exclusions* states prior to determining that a proposed action is categorically excluded under paragraph (d) of this section, the proposed action must meet six sideboard criteria. See NECH 610.116.	

I have considered the effects of the alternatives on the Resource Concerns, Economic and Social Considerations, Special Environmental Concerns, and Extraordinary Circumstances as defined by Agency regulation and policy and based on that made the finding indicated above.

Investigation and Analyses Report

Investigation and Analysis Report for the Watershed Project Plan
Grand River Habitat Restoration and Farmland Conservation Project

Appendix D

Grand Valley Metro Council City of Grand Rapids, Michigan

The purpose of the Investigation and Analyses Report is to present information that supports the formulation, evaluation and conclusions of the Draft Watershed Project Plan and Environmental Assessment for Grand River Habitat Restoration and Farmland Conservation Project (Draft Plan-EA). The report is required and must be included as an appendix to the Final Plan-EA.

The procedures, techniques, assumptions, and the scope and intensity of the investigations for each subject is described in sufficient detail so that a reader not familiar with the watershed or its problems can form an opinion on the adequacy of the Draft Plan-EA. This report supplements information contained in the Draft Plan-EA and is not intended to replace or duplicate information contained therein.

INTRODUCTION

The planning studies presented in this Investigation and Analysis Report (I&A Report) are based on standard methods, procedures, and computer programs used and approved for use by the United States Department of Agriculture Natural Resources Conservation Service (NRCS). The following information gives a summary of the investigation and analysis for the key planning studies in the preparation of the Watershed Project Plan (Plan) - Environmental Assessment (EA) for the Lower Grand River Habitat Restoration project (proposed Project). Additional information relevant to each of the sections provided in this report is available upon request as part of the administrative record for the project. Requests for additional information can be submitted to the following address:

USDA-NRCS
3001 Coolidge Road, Suite 250
East Lansing, Michigan 48823

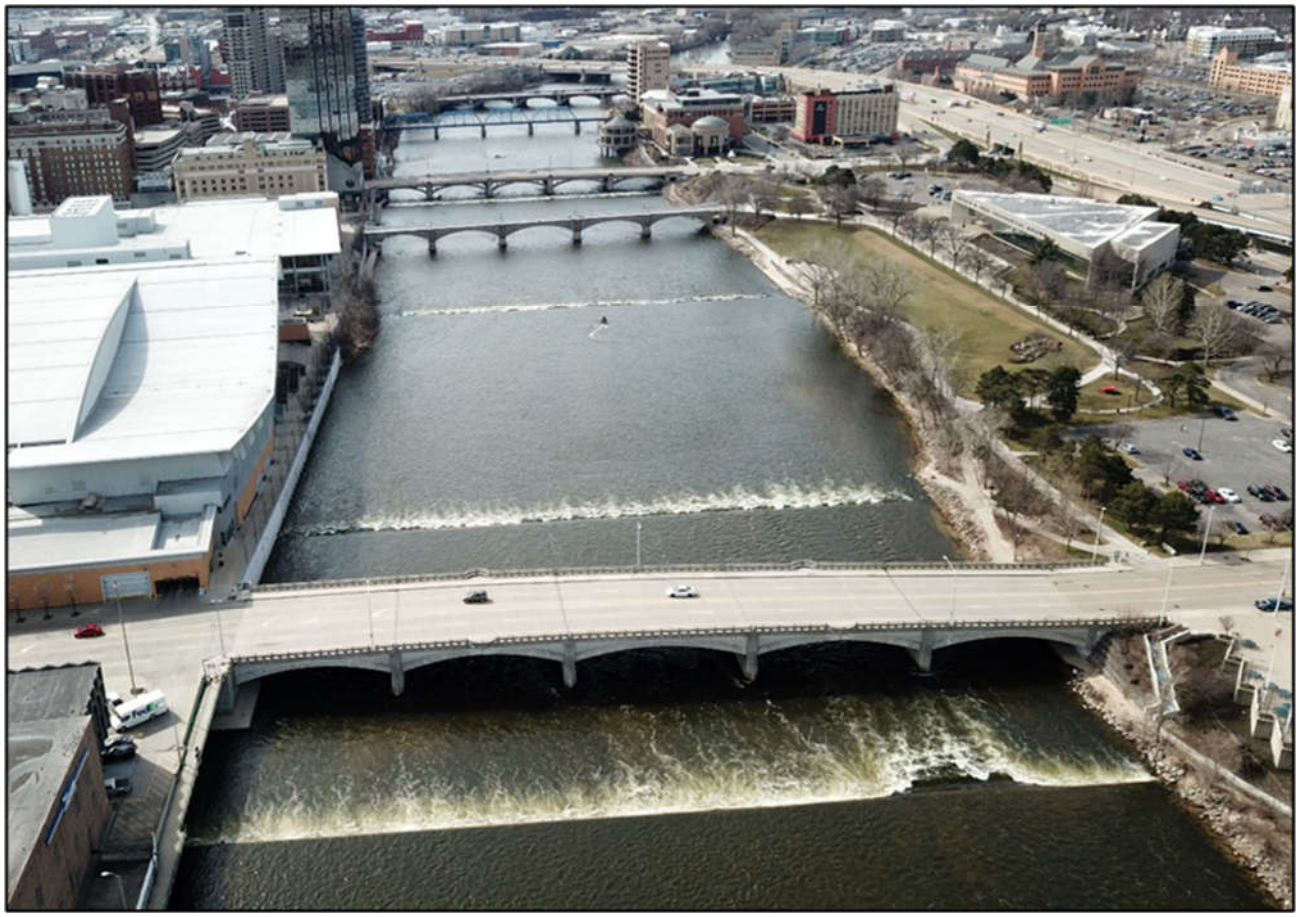

Figure 1. Image of the Grand River, City of Grand Rapids – Proposed Project Reach (looking downstream)

The proposed Project is located within the Lower Grand River, as it flows within the City of Grand Rapids. As the second-largest city in the state of Michigan, Grand Rapids is located in central-western Kent County on the Grand River, within the Lower Grand River Watershed (LGRW). Located on the west side of the state, Grand Rapids site approximately 30 miles east of Lake Michigan, 137 miles south of Traverse City and 60 miles northwest of the state capital Lansing. The Grand River Watershed is the second largest in the State of Michigan with an overall drainage area of 5,572 square miles. The grand River is the longest river in Michigan, about 252 miles, and has an elevation change of about 680 feet over its length. Figure 2 illustrates the four Hydrologic Unit Codes (HUC-14) within the larger Grand River Watershed that are the focus of the Watershed Project Plan-Environmental Assessment.

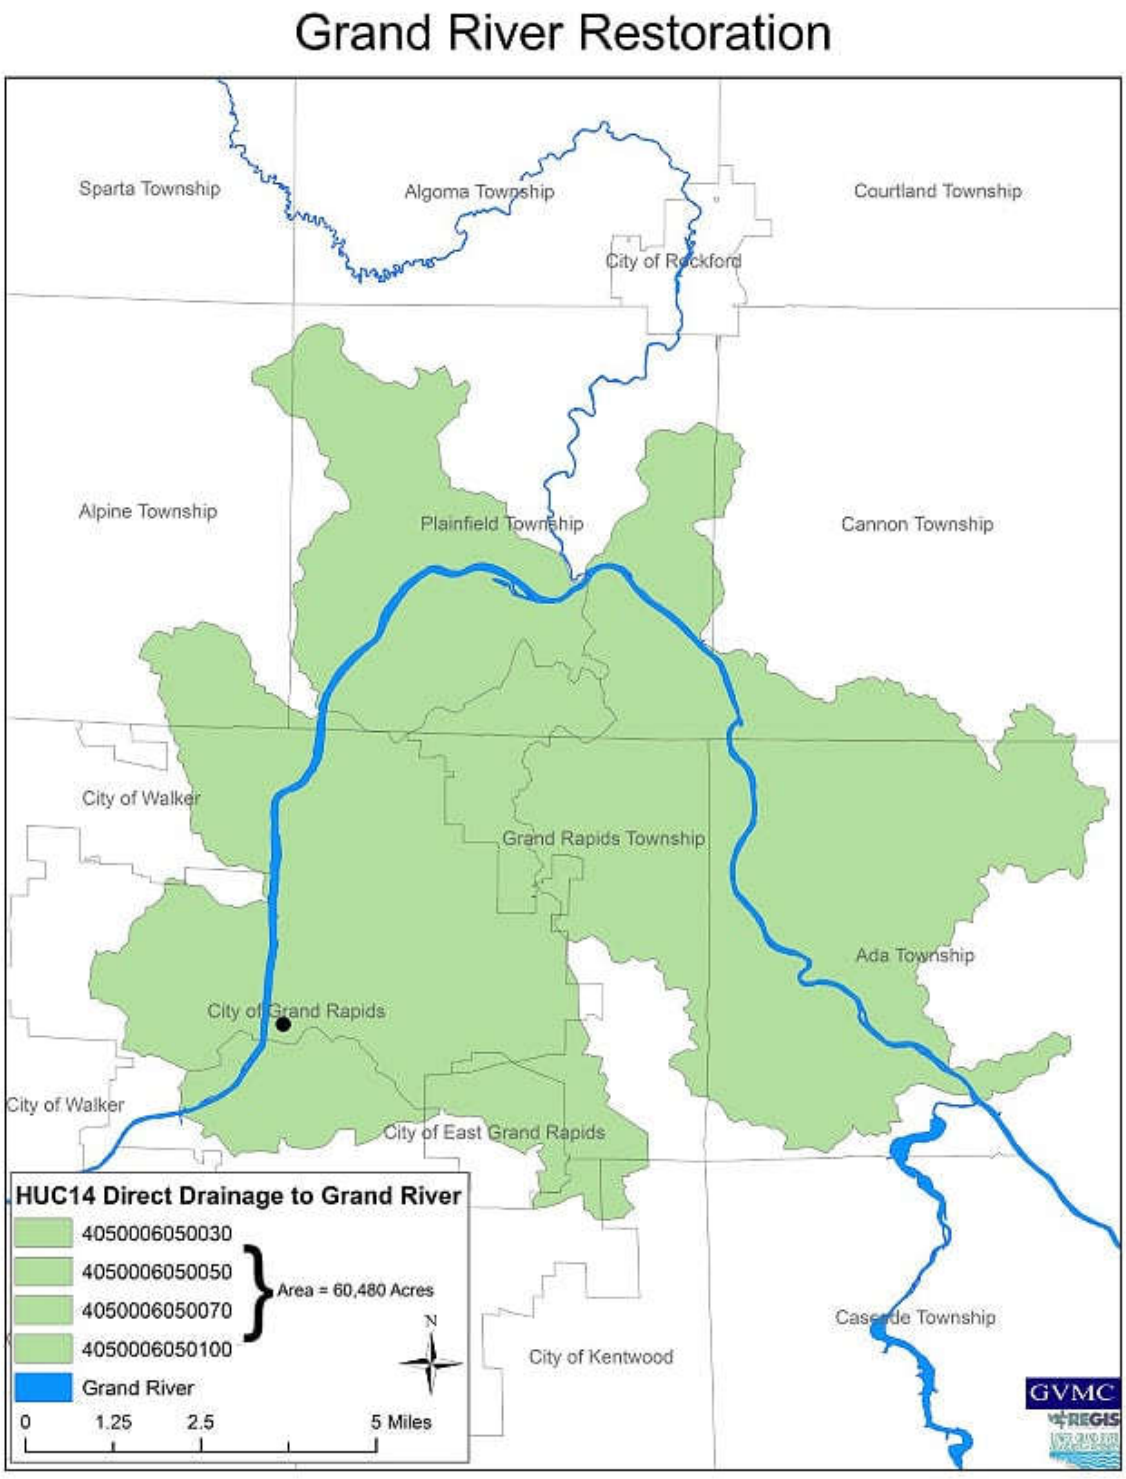

Figure 2. HUC14 Map - Direct Drainage to Grand River

The location of the proposed Project is the approximately two-mile reach through downtown Grand Rapids, approximately 40 river miles upstream of Lake Michigan. The 2.2 mile stretch of the Grand River running directly through the city once featured large boulders, rock islands, and natural reefs. Industrialization in the nineteenth century impacted the river greatly through the downtown stretch as it was greatly abused by water-powered, river-dependent industries; large increases in population; stripping of the forests; and discharges of chemical and sewage wastes. The Great Flood of 1904 inspired city leaders to invest in many improvements along the river, including flood walls and earthen embankments. The resulting floodwalls still dictate much of the Grand River's banks through downtown Grand Rapids. By the early 1900s, so much water had been diverted from the river to power downtown industries that the Grand River was dirty and nearly dry at times. Numerous rustic dams made of wood, stone and debris had been installed in the river by the mid-1800's for purposes of power. "Beautification" efforts in the 1920s added five low-head dams to the river in an attempt to keep the water levels higher in the summer, reducing unsightly odors and improving aesthetics. (see Figure 1 above)

The City of Grand Rapids proposes to make improvements in and along the Grand River within City boundaries to improve aquatic habitat/diversity and enhance access to the river and increase recreational opportunities. The Grand River through the proposed Project reach has been heavily modified, including dredging and channelization. The proposed Project action includes the demolition of the four low-head dams, excavation of areas of the existing channel, and placement of natural materials including boulders, cobble, and gravel to create riffles, pools, runs, glides, and wave features through a portion of the downtown reach. The need arises from the degraded condition of the river, which is an important natural resource for Grand Rapids and the State of Michigan, and several recognized safety problems associated with that degraded condition. The purpose of the proposed project is to reduce public safety hazards generated by low-head dams and create diverse riffle, run, wave, and pool features to restore aquatic riverine habitat and diversity and create/enhance recreational opportunities such as whitewater activities and angling in the Grand River in downtown Grand Rapids.

SEDIMENTATION AND GEOTECHNICAL ANALYSIS

The debris deposited by the glaciers forms the parent material for the soils throughout the LGRW. The almost infinite variety of combinations of mineral materials located in many conditions of topography and climate have resulted in a great number of soil types of varying fertility. Sandy and loamy soils are common throughout the basin.

It is suspected that much of the rapids within the Grand River was flowing upon or very near the top of bedrock surface of the Bayport Limestone Formation. Within these historic rapids, it is expected that numerous boulders and cobbles were present in the region of the rapids as glacial outwash flows would have deposited such erratics. Although several feet of variation is noted, the top of bedrock at Leonard Street is approximately elevation 600 ft, while it is approximately elevation 590 ft at Bridge Street. Floodwalls, bridges and the 6th Street Dam throughout this area are largely founded on bedrock.

The gravity sections of boulder floodwalls north and south of Pearl Street are believed to have been constructed with primarily granite boulders pulled from the river and are founded at the river bottom with very little embedment or scour protection.

Sediment sampling within the proposed Project reach was conducted by Material Testing Consultants. They completed sampling at 12 locations between 6th Street dam and Fulton Street bridge, see Figure 3 below. The samples were collected using a petite Ponar Grab sample. Supplementary probing was

performed along the sides the boat in a repeatable pattern to subjective evaluate the consistency of the river bottom based on the presence of cobble and boulder greater than or equal to 6-inches or the presence of sand, gravel, or cobble smaller than 6-inches. This information was used for the sediment transport analysis.

The sediment transport analysis was performed by the engineers at River Restoration. The analysis found that long-term aggradation or degradation through the project reach is not anticipated to occur due to the transport limited supply reach, the relative increased energy throughout the project, and proposed stable gradation of imported/placed substrate. The project would function as a threshold reach, conveying the inflowing sand sediment loads to the downstream reach over a typical annual hydrograph. No long-term changes to inflowing or outflowing sediment are proposed.

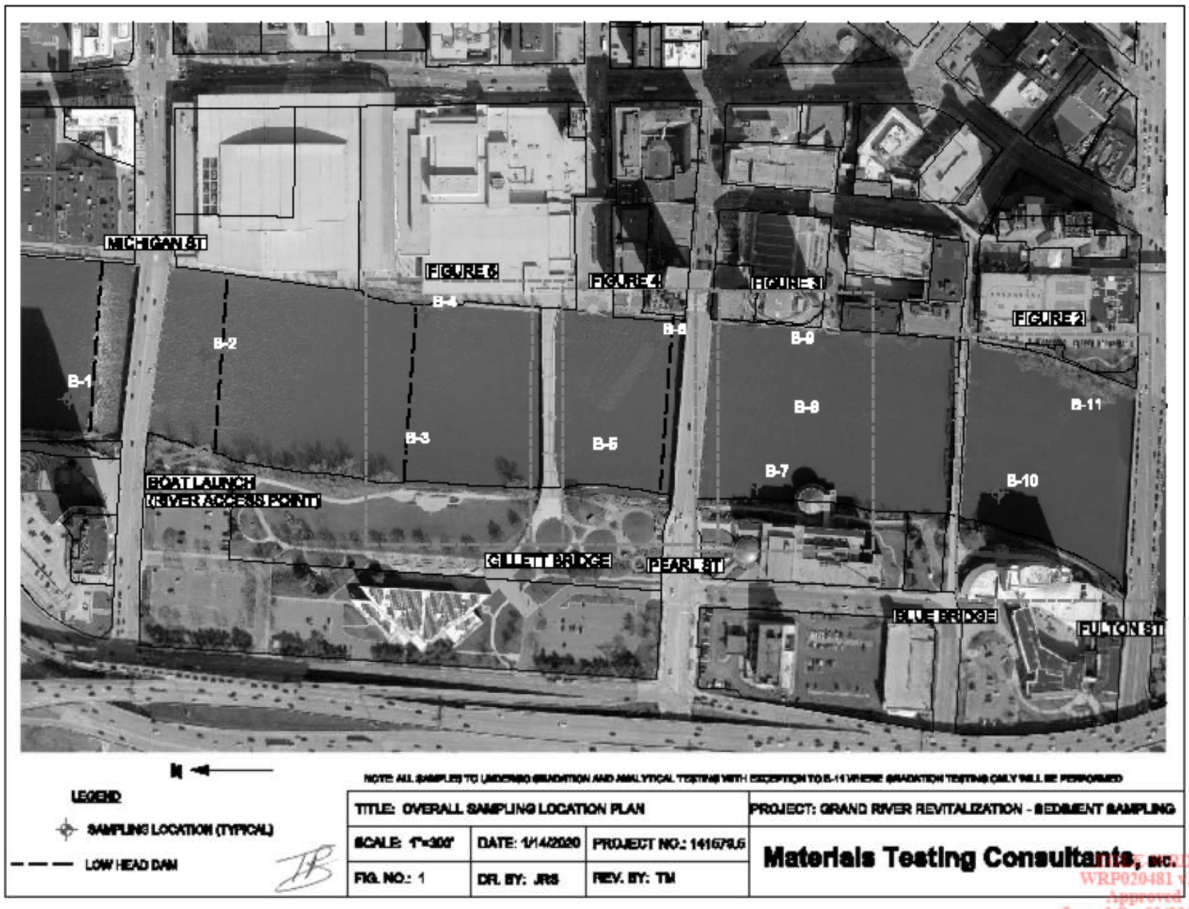

Figure 3. Sediment Sampling Location Map

FLOODING AND RISK ANALYSIS

The City of Grand Rapids built major floodwalls before World War I and obtained Works Progress Administration (WPA) funds to work on flood protection and river beautification during the 1930s. In addition, significant sections of the Grand River bed and adjacent floodplain have been filled within the City of Grand Rapids. Based on the study completed by the MDNRE (Fongers, 2008) on the flashiness

index of the LGR and its tributaries, it appears that the flashiness index for the LGR is increasing over time due to development and climate change indicators.

Understanding the above existing condition challenges, the proposed project goals, and subsequent constraints, were identified through continued agency coordination. Constraints due to flood conveyance, scour potential and integrity of existing infrastructure was further evaluated by the design team, including the means by which each would be evaluated were determined and several project design approaches, concepts, and possible iterations were presented, considered, and reviewed by the project partners. The design process and evaluation of goals and constraints for the project has benefited from ongoing coordination with the regulatory agencies, including MDNR, EGLE, USFWS, and GLFC. Consultation with these agencies was initiated in early 2015 and has continued through the completion of the Basis of Design report.

The project designs evaluated in this section represent different channel configurations that result in varying degrees of restoration potential of the historic rapids and aquatic habitat. The project location places constraints on the complete restoration of the rapids to pre-development conditions due to existing infrastructure (e.g., bridges and flood walls) and public uses. The pre-developed channel was significantly wider with multiple side channels and islands and likely covered a much broader area during periods of flooding. The existing encroachments of infrastructure on the river include floodwalls, bridges, properties, and other facilities, which make restoration to pre-development conditions infeasible. Therefore, all design alternatives were evaluated to determine the relative benefits and detriments of enhancing the rapid habitat and function within the existing planform.

The design alternatives have all been evaluated against the project goals and constraints that were identified by stakeholder. The designs are also compared in regard to activities below the ordinary high-water mark, impacts to wetlands, and activities in the floodplain as is shown in the comparison of design alternatives. Modeling results have verified that hydraulic conditions; including velocity, depth, and shear stress, would allow for feasible construction work windows. The site will be stabilized and inundated at the end of each construction season. The isolated construction area has been modeled to be inundated during flow rates greater than 10,000 cfs. This flowrate was a good compromise between available work window and flood conveyance. If a large flood event is forecasted, the contractor will coordinate with the City and take necessary action to ensure that harmful interference from flooding is avoided and the integrity of existing and temporary structures is maintained. The proposed project preferred alternative is the result of this thoughtful modeling effort and thorough technical review process.

The City of Grand Rapids prepared a final revised levee certification for the Grand River Flood Protection System in response to the *FEMA Completeness Check and Comments for 44 CFR 65.10 Submission* dated February 12, 2018. The City of Grand Rapids, in partnership with neighbor City of Walker, prepared a Freeboard Analysis Report, Closure Evaluation Report, Embankment Protection Analysis Report, Levee/Floodwall Stability and Settlement Report, Interior Drainage Analysis, Operation, Maintenance, and Inspection Manual, and As-Built Drawings to FEMA for their review. The City of Grand Rapids asked for FEMA to designate the Reach E-5 at the Water Resource Recovery Facility of the levee system as an accredited Sound Reach and FEMA designation of the remainder of the Grand River Flood Protection System, including the portion that extends into the City of Walker as Freeboard Deficient. The certification request and its associated documents are currently under review by FEMA.

GEOLOGY AND TOPOGRAPHY

The LGRW encompasses 2,909 square miles, with the Lower Grand River originating below the Looking

Glass River confluence, near the City of Portland, flowing northwest to its convergence with Lake Michigan. The main branch of the Lower Grand River is 51 miles long, and the major tributaries flow for a total of 209 miles (see Figure 4 below). The bedrock formations of the Watershed consist primarily of shale, sandstone, limestone, and gypsum. These formations formed from sediments that were deposited from 345 to 370 million years ago, in seas which occupied a depression known as the Michigan basin. The Pleistocene epoch began about 1 million years ago. At least four major glaciers advanced and retreated over Michigan during the Pleistocene epoch. As the last glacier retreated, the load of earthen materials incorporated in the ice was deposited, forming several types of glacial features (till plains, moraines, outwash, lake plains, and spillways). The thickness of the glacial drift overlying bedrock varies from 0 to 500 feet within the river basin.

The topography within the LGRW is influenced by glacial deposition of sediment and the effect of water deposition and drainage over time. The elevations in the Watershed range from 780 feet, at the most eastern edge of the Watershed, to 571 feet at its confluence with Lake Michigan at the City of Grand Haven. Within the 2.2 mile stretch of river in downtown, there exists over 18 vertical feet of drop in the riverbed, making the proposed Project area within this reach a rare and unique restoration opportunity. The LGRW ranges from fairly rugged topography in the entrenched mainstream of the Grand River (in the Grand Rapids area) to a low, flat plains area along the lower reaches of the river toward Grand Haven. Many of the tributary streams in this area flow through steep, walled valleys where they join the entrenched valley of the Grand River.

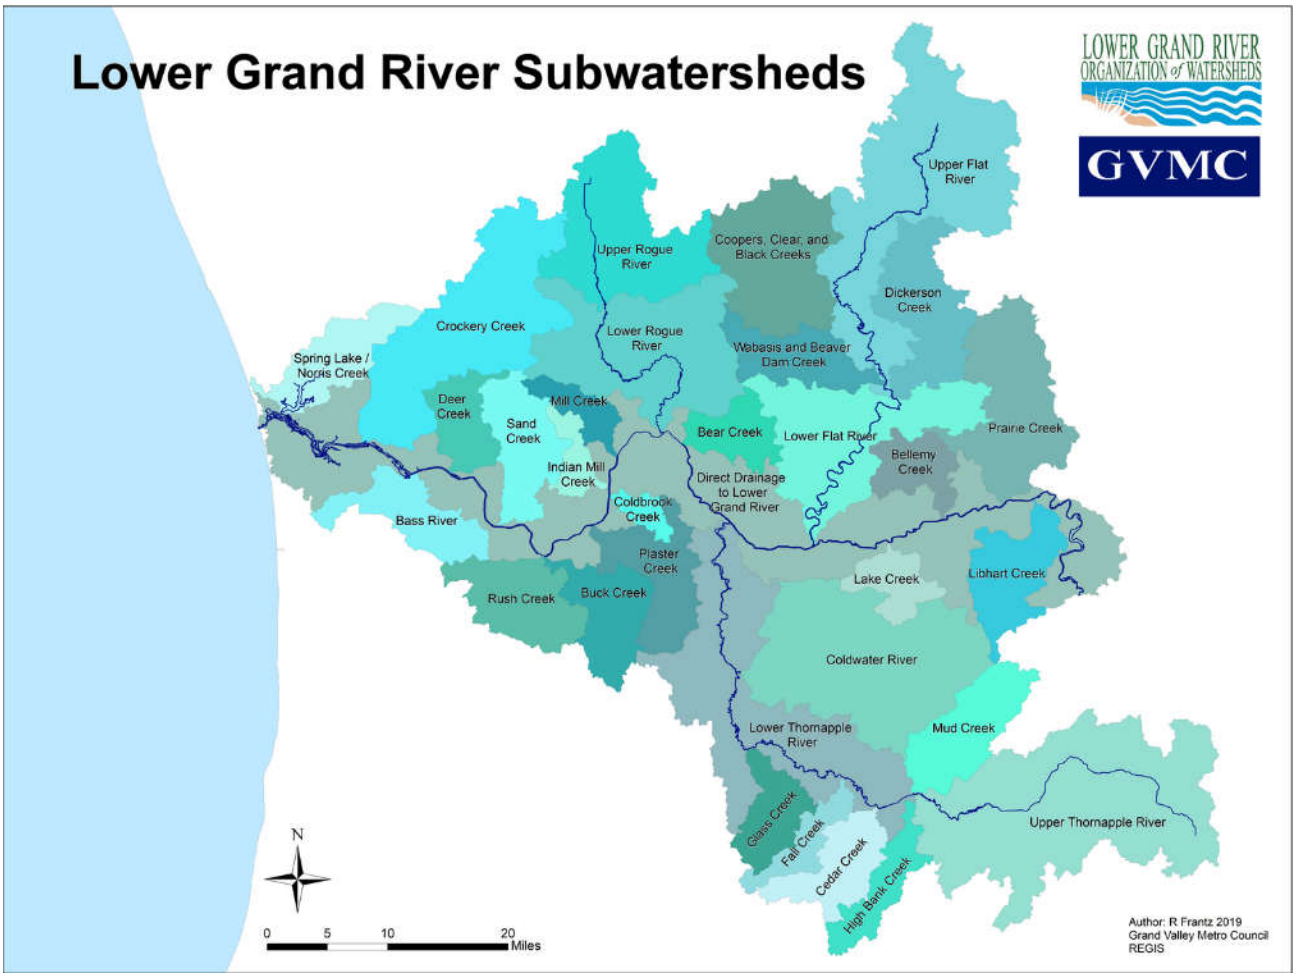

Figure 4. Lower Grand River Watershed and Subwatershed Map

WATER QUALITY

Industrialization in the nineteenth century impacted water quality the Grand River greatly by water-powered, river-dependent industries; large increases in population; stripping of the forests; and discharges of chemical and sewage wastes. In the mid-1960's, the Clean Water Act provided funding for efforts to improve wastewater technologies and sparked environmental efforts to restore aquatic resources within the river. By the end of the 1960s, water quality had improved to the point that recreationists were once again looking to the Grand River for waterskiing, boating, fishing, and swimming opportunities.

The lingering effects of human use within the LGR can be seen to this day. In 2010, the Journal of Great Lakes Research classified 38.6 percent of river miles in the Grand watershed as "impaired" based on fish and invertebrate communities. The City of Grand Rapids has monitored water quality since 1985 using a Modified Water Quality Index. This index does not provide for direct comparison to other rivers, but measurements taken upstream and downstream of the city show a trend of improving water quality over time. The index also shows only a slight decrease in water quality downstream of Grand Rapids, with all values in recent years indicating "Good" water quality and very few limits to recreational use.
As such, seven impairments have been identified as having an impact on designated uses of the Watershed including the following:

Impacts of Sediment on Designated Uses
Impacts of Nutrients on Designated Uses
Impacts of Unstable Hydrology on Designated Uses
Impacts of Thermal Pollution on Designated Uses
Impacts of Chemicals on Designated Uses
Impacts of Habitat Fragmentation on Designated Uses
Impacts of Pathogens/Bacteria on Designated Uses

Within the Project reach, e. Coli has been identified as an impairment, however projects are being implemented throughout the watershed to address these impairments.

NATURAL RESOURCES

Wetlands
Wetland Delineation Reports were performed by Golder Associates in 2015 and Fishbeck (FTCH) in 2019. The 2019 delineation was performed to add to the Golder report because the wetland delineations are only considered valid to the State of Michigan for 3 years after they are performed. FTCH identified 5 delineated wetlands within the RCPP project reach totaling 0.276 acres.

Fish and Wildlife
A diversity of aquatic and terrestrial habitat types is found throughout the LGRW that harbors various amphibian, reptile, avian, mammal, and fish species. Many of these species are important from a recreational and economical perspective. Well-organized conservation and outdoor sporting groups exist throughout the Watershed, such as Ducks Unlimited, Pheasants Forever, Trout Unlimited, and Michigan United Conservation Clubs, to protect and enhance habitat for animals such as whitetail deer, wild turkeys, pheasants, grouse and many species of fish. Many nontarget species are also likely to benefit from these efforts.

Protected, Endangered and Invasive Species

The proposed Project Area includes numerous considerations for protected, endangered and invasive species. Most notably the federally-endangered snuffbox mussel and invasive Sea Lamprey. As such, the preferred alternative provides a specific balance of channel alteration and associated impacts. Through ongoing correspondence with MDNR fisheries division, Michigan Department of Environment, Great Lakes and Energy (EGLE), United States Fish and Wildlife Service (USFWS), and other stakeholders, the preferred configuration was developed that met the project goals of restoring aquatic habitat and enhancing recreational opportunities, and also minimized impacts to endangered snuffbox mussels and existing wetlands. The preferred alternative demonstrates fish passage that considers the range of fish species and life stages in the Grand River as well as preventing the spread of invasive species.

HYDROLOGY

The LGR flows for 51 miles and drains 2,909 square miles. The Watershed is characterized by poor natural drainage, resulting in numerous lakes, swamps, and artificial drains. The LGRW includes three major tributaries that flow into the Grand River: the Thornapple River, the Flat River, and the Rogue River (see Figure 3). Significant alterations have been made to the Grand River and its tributaries since the mid-1800s including a series of low-head dams within the downtown area, see Figure 5 below.

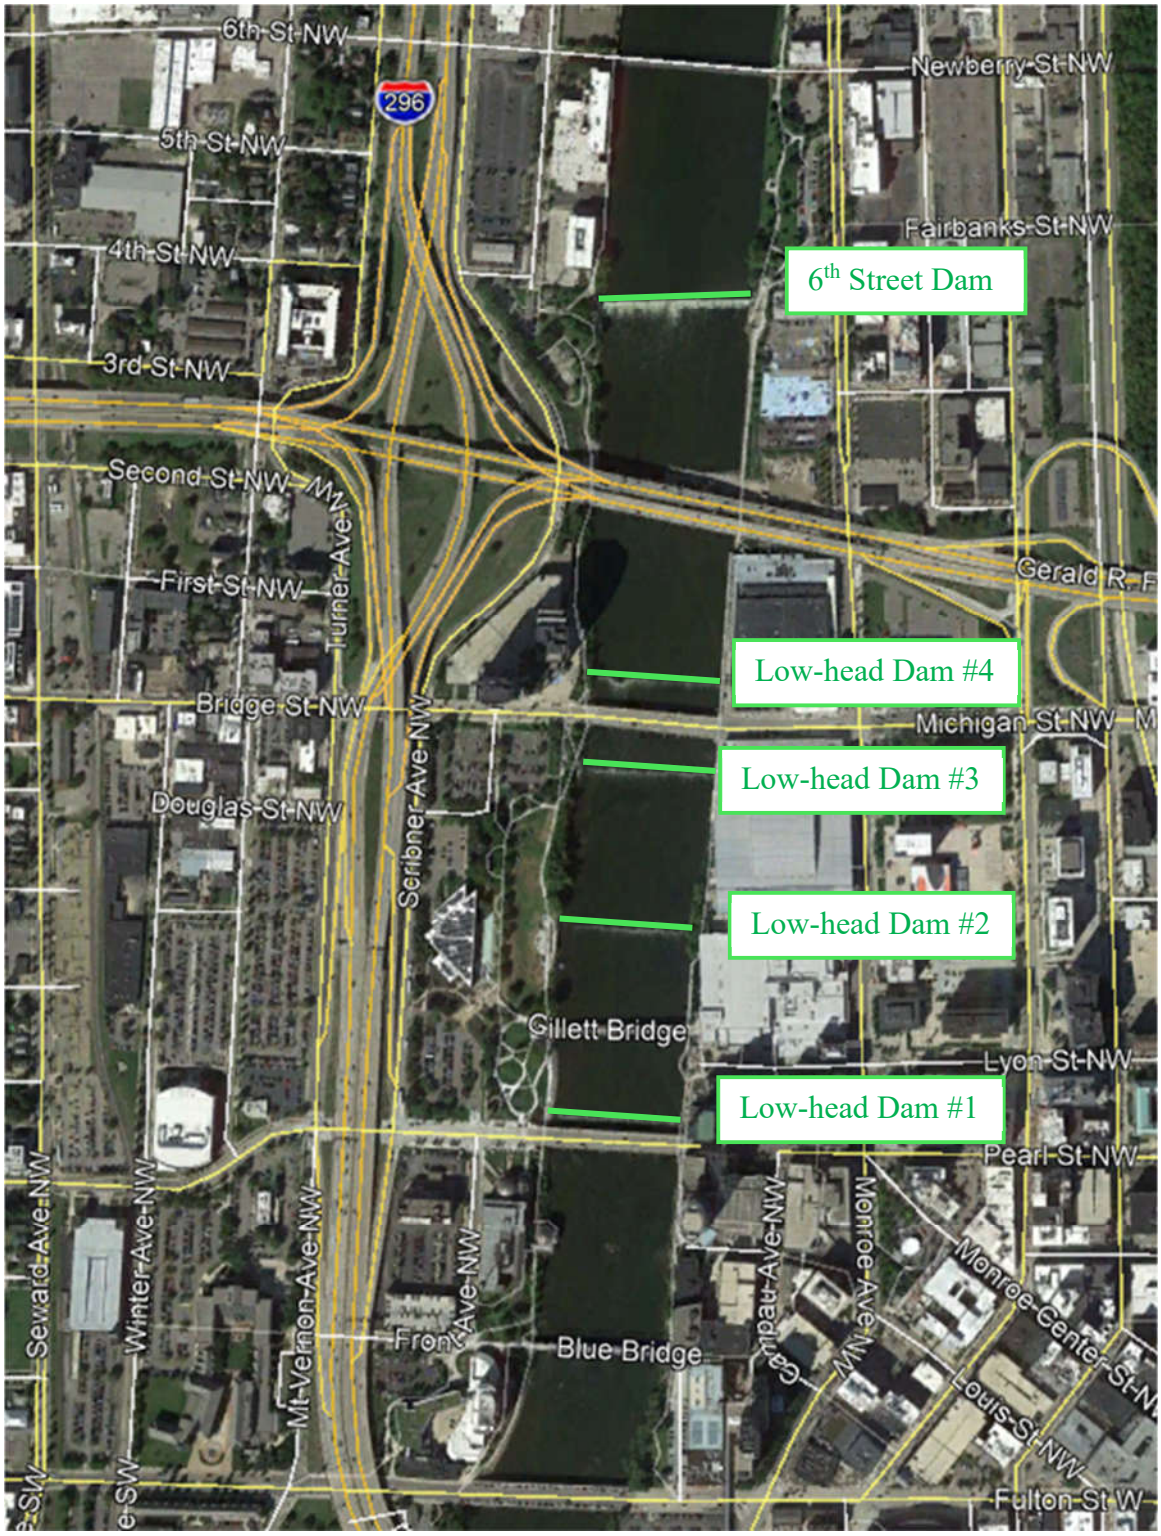

Figure 5. Low-Head Dam Location Map

These low-head dams have drastically affected the ecological and physical conditions of riverine system. Normal high and low water conditions within the riverine system are altered by the low-head dams, resulting in changes in stream channel, fisheries, and other aquatic habitats. In addition, the dams limit the normal movement of fish and other aquatic organisms along the river's length. As such, the proposed Project will demolish the 4 low-head dams and restore the substrate within the proposed Project reach.

Per EGLE guidance, harmful interference and flood risk were evaluated based on the flowrates shown in Table 1 (below). These flow rates were determined through correspondence with EGLE through use of the online 'Request a Flood or Low Flow Discharge Form' as authorized by PA 451 of 1994. This information was used in all model runs. The proposed Project does not change the hydrology of the Grand River through the reach.

Table 1. Lower Grand River Flood Flow Rates

Recurrence Interval	Flow (cfs)
100-yr	55,000
50-yr	48,000
25-yr	42,000
10-yr	33,000
5-yr	27,000
2-yr	18,000

More regular flows which occur throughout a typical summer and fall were used to for evaluating suitable aquatic habitat, fish passage, substrate stability, and recreational hydraulics.

HYDRAULIC ANALYSIS

The most prominent and widespread anthropomorphic hydraulic controls acting on the Grand River systems are constructed dams, such as the four low-head dams within the proposed Project reach. These dams dramatically alter the rivers response to baselevel change. The baselevel lowering occurring within this dam-controlled river system only affects the downstream portion of the river. The upstream portion experiences a "slack-water" effect, causing sediment infilling upstream as the channel adjusts to the decrease in slope. The opposite effect occurs downstream of dams. The downstream reaches have generally become incised due to a sediment deficit below the dam. These low-head dams are the only major anthropomorphic hydraulic controls active in the Lower Grand River. The proposed Project aims to restore the natural rapids (for which the city is named) that once occupied the channel downstream of these controls.

The hydraulic influence of the proposed Project terminates upstream at the 6th Street Dam hydraulic control and downstream immediately above Fulton Street. The four-concrete low-head dams cross the river through the project reach, varying in height from 1.5 feet to 4 feet. A Hydraulics Report (Appendix E) was prepared by the engineers at River Restoration. The hydraulic report analyzes the modeling results for the proposed Project. The hydraulic design of the project targets more regular flows which occur throughout a typical summer and fall. Flowrates used to evaluate these design elements ranged from the 7Q10 low flow (the lowest 7-day average flow that occurs every 10 years) of 890 cfs up to the bankfull flowrate of 13,000 cfs. The HEC-RAS model demonstrates there are no increases to the 100-year water surface elevations, within the project reach or downstream or upstream, as compared to existing conditions. Increases in water surface elevations are present for the 2- through 50-year flood events, but the increases are contained within the City of Grand Rapids' flood projection system and do not result in

Harmful Interference as defined by EGLE.

DESIGN CRITERIA

The design criteria have been established as the preferred alternative for the proposed Project utilizing national, state and local regulatory guidance documents and industry standards. This alternative has been designed and evaluated to a higher level of detail through ongoing coordination with EGLE and MDNR.

The alternatives evaluated represent different channel configurations that result in varying degrees of restoration potential enhancement of the historic rapids and aquatic habitat while minimizing potential environmental impacts. The Project location places constraints on the complete restoration of the rapids to pre-development conditions due to existing infrastructure (e.g., bridges and flood walls) and public uses. The pre-developed channel was significantly wider with multiple side channels and islands and likely covered a much broader area during periods of flooding. The existing encroachments of infrastructure on the river include floodwalls, bridges, properties, and other facilities, which make restoration to pre-development conditions infeasible. Therefore, all alternatives were evaluated to determine the relative benefits and detriments of enhancing the rapid habitat and function within the existing planform

The distribution of water surface gradient and stable grade control provided by the low-head dams will be replaced with four in-channel features. The proposed grading of each of the four in-channel features is unique to the site constraints and existing grade at each location; however, each feature generally follows a typical design. The wave features would be installed on the west side of the channel, constructed from boulder with a gradually sloping boulder wing structure tying into the existing bank.

The dimensions and location of the proposed design has been determined through iterative coordination between the design team and EGLE, MDNR, and other stakeholders to find an optimal balance of achieving project goals and satisfying constraints. The way in which each constraint has generally influenced the locations, elevations, dimensions, and slopes of the grading is described below.

Table 2. Design Criteria

Design Constraint	Design Influence
Flood conveyance	Limited volume and elevations of proposed in-river fill
Public Safety	Location of grading and proximity to existing infrastructure, more gentling sloping areas of proposed grading
Integrity of Existing Infrastructure	Location of grading and proximity to existing infrastructure, avoidance of directing flow into existing piers or floodwalls
Fish Passage	gentling sloped grading of riffles and near-shore grading
Sea Lamprey escapement at the 6th Street Dam	Elevations of features set to avoid decreasing the effectiveness of the 6th Street Dam as a barrier to Sea Lamprey

AGENCY COORDINATION

The Project is being funded by the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) under the watershed Protection and Flood Prevention Act (PL-566) and Regional Conservation Partnership Program (RCPP) in combination with private and public funding obtained through project fundraising efforts. The Grand Valley Metropolitan Council (GVMC), in partnership with the City of Grand Rapids (the Sponsoring Local Organization (SLO)), has prepared a Plan-EA pursuant to NRCS PL-566 requirements. In addition, a Biological Assessment was prepared in consultation with the USFWS and Michigan Department of Natural Resources (MDNR); the USFWS subsequently issued a Biological Opinion (BO) (issued October 22, 2020) covering multiple state and federal threatened and endangered species, including freshwater mussels. The BO is included in Appendix E.

During the preliminary scoping period for the project, scoping questions, comments, and concerns were requested from government agencies, both orally at public meetings and via written submittal of comments. A scoping notice was prepared and mailed to interested parties. The scoping comment period was open for 30 days and several comments were received.

A public notice of availability of the Draft Plan-EA will be mailed to interested parties, published in the local newspaper or included in a utility mailer and posted to the NRCS project website. The Draft Plan-EA will be released for public review and comment and a public meeting will be held

Agency coordination and consultation is summarized and documented in the Plan-EA.

ALTERNATIVES EVALUATION

The alternatives evaluated represent different channel configurations that result in varying degrees of restoration potential enhancement of the historic rapids and aquatic habitat while minimizing potential environmental impacts. The proposed Project location places constraints on the complete restoration of the rapids to pre-development conditions due to existing infrastructure (e.g., bridges and flood walls) and public uses. The pre-developed channel was significantly wider with multiple side channels and islands and likely covered a much broader area during periods of flooding. The existing encroachments of infrastructure on the river include floodwalls, bridges, properties, and other facilities, which make restoration to pre-development conditions infeasible. Therefore, all alternatives were evaluated to determine the relative benefits and detriments of enhancing the rapid habitat and function within the existing planform.

Alternatives were considered for the design of dam removals, substrate enhancements, and wave features. The design was generated to avoid and minimize environmental impacts associated with initial construction and long-term repair and rehabilitation to the extent possible while still achieving the project purpose. The Plan-EA evaluates environmental impacts associated with five alternatives. However, three explicit alternatives were considered for this feasible and prudent alternatives analysis. In addition to the no action alternative, two action alternatives have been developed and evaluated against project goals and constraints. The action alternatives range from relatively high degree of alterations and substrate enhancement, with a relatively large area of impact to the riverbed, to removing the low-head dams without substrate enhancement, with relatively less direct impact to the riverbed.

Each action alternative provides a specific balance of channel alteration and associated impacts.

Through ongoing correspondence with MDNR fisheries division, EGLE, USFWS, and other stakeholders, a preferred configuration was developed that met the project goals of restoring aquatic habitat and enhancing recreational opportunities, and also minimized impacts to endangered snuffbox mussels and existing wetlands, demonstrated fish passage that considered the range of fish species and life stages in the Grand River, avoided increased flood risk with conservative modeling parameters, prevented tailwater increases that could allow invasive Sea Lamprey escapement, and minimized public safety concerns. The project purpose is to revitalize a river with a relatively steep gradient where dams and impairments exist in the Grand River in downtown Grand Rapids. Restoring a different river or somewhere else in the Grand River would not address those targeted impairments and would not have sufficient gradient provide functional in-channel hydraulic features. There are no feasible and prudent alternatives based on locations at another location in another river or the Grand River.

The preferred configuration includes the demolition the four low-head dams downstream of 6th Street Dam and construction of a series of proposed in-channel hydraulic features to replace grade control. Three configurations of the preferred alternative were explored, including design, modeling, and agency correspondence, to determine a preferred configuration between Bridge Street and Fulton Street and contains four wave features and four riffle features.

ECONOMICS

The NRCS National Watershed Manual was used as a reference for the economic analysis of the proposed Project. To inform portions of the Plan-EA for the proposed Project, Anderson Economic Group (AEG) was retained to perform a cost-benefit and economic impact analysis of the alternatives proposed RCPP reach. The purpose of the AEG economics reporting was to:

Document the proposed alternatives in terms of their impact on the environment, ecosystem, and recreation;
Catalogue, measure, and categorize costs and benefits for each alternative from the national perspective;
Monetize the estimated costs and benefits, where possible; and
Calculate the net effect of each of the alternatives as compared to the No Action alternative.

The proposed Project is a non-water resource project, meaning that the project is not primarily for flood damage reduction, water supply, water-based recreation, water quality management, nor large scale irrigation or drainage. As such, in comparing alternatives, the Plan-EA is required to identify the “least costly socially and environmentally acceptable method of achieving the agreed-upon level of resource protection.”

AEG followed Principles and Guidelines procedures to identify and quantify the costs and benefits of the project: all costs, including operation, maintenance, and replacement, expected to be incurred over the period of analysis are included in the economic reports. We met and exceeded the expectations outlined by the National Watershed Program Manual by quantifying not only the costs for each alternative, but also added benefits not required for non-water resource plans.

The estimated project costs, totaling $14,485,608 over three years, include a 15% contingency and cover the demolition of the four low-dams and enhancement of the substrate in the Project Area. The costs of future OMRRR maintenance are likely to be negligible.

Overall, AEG findings indicate the net benefit of removing the low-head dams and enhancing the underlying substrate is significant; demolition of the low-head dams with substrate enhancement, yields a

net present value of $17.6 to $22.4 million in net benefits over 25 years on dimensions that we are able to monetize, see Table 3 below. This includes a significant value to the city and surrounding community over the no-action alternative.

Table 3. Net Economic Impact of Construction for the Grand River Restoration and Net Annual Economic Impact of Increased Recreational Activity in Grand Rapids, Earnings and Employment

	Earnings (millions)	Average Annual Employment
Construction Spending	$1.1 to $1.2	5 to 6
Increased Recreational Activity	$6.2 to $8.3	273 to 367

Pearl St.
Blue Bridge
Fulton St.
RCPP Design May 2019
Wave and Riffle Grading Removed
No changes
Feature lowered and wave returned to west side
Upper feature lowered, wave moved further from bank, west side converted to riffle. Lower riffles removed.
Boulder garden reduced, center grading reduced
Design with July 2019 modifications

RE: Endangered Species Act Section 7 Consultation for the City of Grand Rapids Watershed Flood Prevention Act grant and associated mussel relocation project. Project #2024-0036384

Dear Ms. Shaffer, Mr. Staal, and Mr. Chapman:

Enclosed is the U.S. Fish and Wildlife Service' (USFWS) Biological Opinion (BO) for the U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS) Watershed Flood Prevention Act (WFPA) grant and the associated City of Grand Rapids and Grand Rapids White Water (City/GRWW) freshwater mussel relocation project in partnership with the USFWS. The BO evaluated the project's effects on the endangered snuffbox mussel (*Epioblasma triquetra*) in accordance with Section 7(a)(2) of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq*.).

The NRCS and the USFWS determined that the proposed project was "likely to adversely affect" Snuffbox mussel as well as negatively impact State listed freshwater mussels and fish. The NRCS's request for formal consultation was received on April 23, 2024, with the Biological Assessment (BA) 2024: Impacts to federal and state threatened and endangered species from rehabilitation of the Grand River between Bridge and Fulton Streets in Grand Rapids, Kent County, Michigan Revision 1. The City/GRWW submitted a BA amendment June 20, 2024, with new information on the proposed action, impact areas, and effects of the action on state and federally listed mussels.

This BO is based on information provided in the April 2024 BA, June 2024 BA Amendment, project meetings, conference calls, site visits, survey data, and other sources of information. A

complete administrative record of this consultation is on file at the USFWS Michigan Ecological Services Field Office.

Your BA also contains an analysis of adverse effects on freshwater mussels listed as special concern, threatened, or endangered by the State of Michigan including: Black Sandshell (*Ligumia recta*), Lilliput (*Toxolasma parvum*), Purple Wartyback (*Cyclonaias tuberculata*), Slippershell (*Alasmidonta viridis*), Round Pigtoe (*Pleurobema sintoxia*), Pink Heelsplitter (*Potamilus alatus*), Deertoe (*Truncilla truncata*), Ellipse (*Venustaconcha ellipsiformis*), Elktoe (*Alasmidonta marginata*), Creek Heelsplitter (*Lasmigona compressa*), Fluted Shell (*Lasmigona costata*) and Paper Pondshell (*Utterbackia imbecillis*) mussels. The BA also contains an analysis of effects to state threatened Lake Sturgeon (*Acipenser fulvescens*) and River Redhorse (*Moxostoma carinatum*). Therefore, effects to state listed freshwater mussels and fish are also included in this Opinion.

Additionally, the NRCS used the Michigan All Species Determination Key in the USFWS Information for Planning and Consultation System and received no effect determinations for the following federally listed species: northern long eared bat (*Myotis septentrionalis*); Indiana Bat (*Myotis sodalis*); tricolored bat (*Perimyotis subflavus*); monarch butterfly (*Danaus plexippus*); eastern massasauga rattlesnake (*Sistrurus catenatus*), and Karner blue butterfly (*Lycaeides melissa samuelis*).

Snuffbox

After reviewing the current status of the Snuffbox, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is our biological opinion that these actions, as proposed, are not likely to jeopardize the continued existence of the species.

With respect to the ESA's compliance, all aspects of the project description are binding. The Reasonable and Prudent Measures and the accompanying Terms and Conditions provided within the enclosed biological opinion are nondiscretionary and are designed to minimize incidental take of listed species.

We appreciate the opportunity to cooperate with the NRCS, the City of Grand Rapids, and Grand Rapids Whitewater in conserving endangered species. If you have any questions regarding these comments, please contact Jessica Pruden, of this office, at 517-351-8245, or jessica_pruden@fws.gov.

Sincerely,

SCOTT HICKS

INTRODUCTION

The City of Grand Rapids (City) is pursuing proposed Watershed and Flood Prevention Act PL83-566 grant funding (WFPA) with the United States Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS) (NRCS WFPA Project) to improve aquatic habitat in the Lower Grand River where it flows through downtown Grand Rapids, Kent County, Michigan (GVMC, 2011). The funding would be used for revitalizing the rapids in the NRCS WFPA Project Area (downstream face of the 6th Street Dam to upstream face of Fulton St. Bridge). To reduce the impacts on freshwater mussels resulting from the NRCS WFPA Project, the City and Grand Rapids Whitewater (GRWW) plan to relocate as many freshwater mussels as practicable from direct impact areas (City/GRWW Project). Although NRCS does not anticipate funding the mussel relocation, absent the funding for the revitalization of the rapids the mussel relocation would not be necessary and therefore the relocation is a consequence or effect of the action for the purposes of Section 7 evaluation (50 CFR 402.02). In addition, the U.S. Fish and Wildlife Service (USFWS) has engaged in the planning for this project since Grand Rapids was first selected by the U.S. Environmental Protection Agency (USEPA) to be part of the Urban Waters Federal Partnership (UWFP) in 2013. USFWS plans to assist the City and GRWW during the mussel relocation portion of the action (City/GRWW Project).

This document transmits the USFWS' Biological Opinion (BO) based on our review of the Proposed Actions including NRCS WFPA Project and the associated City/GRWW Project in partnership with the USFWS under the UWFP and these Projects effects on the Snuffbox mussel (*Epioblasma triquetra*) in accordance with Section 7(a)(2) of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq.*). The NRCS and the USFWS determined that the proposed project was "likely to adversely affect" Snuffbox mussel as well as negatively impact State listed freshwater mussels and fish. The NRCS's request for formal consultation was received on April 23, 2024, with *the Biological Assessment 2024: Impacts to federal and state threatened and endangered species from rehabilitation of the Grand River between Bridge and Fulton Streets in Grand Rapids, Kent County, Michigan Revision 1.* An amendment to this Biological Assessment (BA) was submitted June 20, 2024, with new information on the proposed action, impact areas, and effects of the action on state and federally listed mussels.

This Opinion is based on information provided in the April 2024 BA, June 2024 BA Amendment, project meetings, conference calls, site visits, survey data, and other sources of information. A complete administrative record of this consultation is on file at the USFWS Michigan Ecological Services Field Office.

Consultation History

The Grand Rapids Revitalization Project was initially funded with private funds, prompting the development of a Habitat Conservation Plan (HCP) pursuant to section 10(a)(1)(B) of the ESA in January 2015. Meetings were held each year between 2015 and present to discuss the development of the Project and compliance with various state and federal regulations. In 2017, the USDA NRCS awarded a Regional Conservation Partnership Program (RCPP) grant pursuant to the Watershed Protection and Flood Prevention Act, PL-566 program, to the Grand Valley Metro Council (GVMC) located in Grand Rapids, Michigan.

The GVMC is an alliance of governmental units in the West Michigan area appointed to plan for the growth and development, improve the quality of the community's life, and coordinate governmental services. The City is a member of the GVMC. The GVMC worked with GRWW to implement the RCPP grant. The RCPP grant provided $8 million in funding for the "Lower

Grand River Watershed Habitat Restoration-Farmland Conservation Project." Of the $8 million, $4.1 million was to be used for revitalizing the rapids in Grand Rapids downstream of the face of 6th Street Dam to the upstream face of Fulton Street Bridge. Funding under the RCPP created a federal nexus for the RCPP Project, which transitioned ESA compliance for adverse effects to Snuffbox mussel from Section 10(a)(1)(B) to Section 7 of the ESA. Initially formal consultation pursuant to Section 7 was requested by NRCS on July 3, 2018, accompanied by a BA. The USFWS and Michigan Department of Natural Resources (MDNR) had significant comments on the 2018 BA, which were subsequently addressed by NRCS. A revised draft BA was submitted to the USFWS on November 2, 2018. USFWS and MDNR comments on the draft were received November 29, 2018. These comments were addressed in the revised BA that was submitted to the USFWS in December 2018. Due to concerns with increased tailwater elevation, which could decrease the effectiveness of the 6th Street Dam as a barrier to sea lamprey (*Petromyzon marinus*) migration, significant changes were made to the project design. Most significantly, the upstream construction limit was moved downstream to Bridge Street on April 15, 2019, which reduced the amount of material placement in the river, alleviated the tailwater increase post-construction, and maintained tailwater elevations during construction. A revised BA reflecting changes made to project design was submitted to the USFWS in May 2019. After review of the May 2019 BA, the USFWS and MDNR continued to have concerns with hydraulic modeling, sea lamprey escapement, and fish passage. The project was redesigned and a revised BA was submitted to the USFWS in February 2020. After additional concerns on the February BA were addressed, a final BA was submitted in June 2020 and was submitted along with a request by NRCS to initiate formal consultation. In a letter dated July 9, 2020, formal consultation was initiated with NRCS on June 9, 2020, and the USFWS completed formal consultation through issuance of a BO on October 22, 2020.

The City continued to pursue their permit application to the Michigan Department of Environment Great Lakes and Energy under the Clean Water Act state assumed program for work within the Grand River. During this process the RCPP grant funding was extended, though ultimately they were unable to obtain necessary permits in time to secure the grant funding. The City is now pursing the PL83-566 WFPA funding.

As a result, the USFWS and NRCS are now consulting on the proposed WFPA Project and the City/GRWW Project (mussel relocation project) in partnership with the USFWS.

BIOLOGICAL OPINION

DESCRIPTION OF THE PROPOSED ACTION

As defined in the ESA Section 7 regulations (50 CFR 402.02), "action" means "all activities or programs of any kind authorized, funded, or carried out, in whole or in part, by Federal agencies in the United States or upon the high seas." The "action area" is defined as "all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action."

Proposed Action

NRCS proposes to remove four low head dams, construct riffles and boulder arches, bank vane structures, and create emergent habitat boulder fields within a portion of the Grand River between the 6th Street Dam and Fulton Street in downtown Grand Rapids, Kent County, Michigan. The NRCS, the City, and GRWW stated intent of the proposed design is to: 1) restore the rapids; 2)

improve public safety; 3) restore aquatic habitat diversity and suitability for native Great lakes fish and mussel species; and 4) enhance river access and use.

The area that would be affected by project construction includes the area from 91 m (300 ft) upstream of Bridge Street to the upstream face of Fulton Street, an area of 127,600 m2 (31.5 acres). Of the 127,600 m2 (31.5 acres), 47,415 m2 (11.7 acres) would be directly impacted during dam removal, temporary scour protection placement, causeway construction, feature creation, and tracking in the river to construct features (i.e., emergent habitat boulder fields, diversified boulder arches, and rock pile vanes downstream of Pearl Street) (direct impact area). The areas between direct impact areas would be indirectly impacted by temporary increases in turbidity and changes in flow patterns associated with causeways and features constructed in the river. Increased scour potential outside of direct impact areas will be avoided and minimized during construction. Upstream indirect impacts during construction (38,420 m2; 9.5 acres) would be limited to slight changes in depth and velocity depending on what construction and project features are in the river. The area of indirect impact within the construction area is approximately 80,185 m2 (19.8 acres).

The area permanently impacted includes a sum of the habitat area occupied by all structures on the riverbed where that habitat would not be available to freshwater mussels post-construction. This includes areas where boulders and rock are placed to construct riffles, diversified boulder arches, emergent habitat boulder fields, rock vanes, and transient sand. Scour protection would be removed when the Dam 2 construction area is no longer isolated. This area is not considered a permanent impact area.

Prior to construction of the NRCS WFPA Project, the City/GRWW Project will be implemented and consists of collecting as many mussels as possible from the NRCS WFPA Project area in partnership with the USFWS and translocating them to three recipient sites.

A survey was conducted in 2015 to identify suitable recipient sites for mussels that would be translocated from the NRCS WFPA Project impact areas (ESI, 2016). Five potential sites were identified: Ionia, Saranac, Chief Hazy Cloud, Ada, and Site 7.

Collection and translocation of mussels would occur when water temperature is above 10° C (50° F) and air temperature is between 10 and 32° C (50 and 90° F) unless permission is obtained from USFWS and MDNR to salvage and relocate outside of these temperature windows.

As many unionids as practicable would be translocated from direct impact areas before construction in 2024 to minimize these impacts. However, unsafe diving/collection conditions may prevent some unionids from being removed. Unionids not relocated from direct impact areas could be crushed by construction activities. The river bottom would not be physically modified in approximately 80,185 m2 (19.8 acres) of the NRCS WFPA Project Area, but could be affected by turbidity and changes in local hydraulic conditions. Staging and access areas would primarily be from Ah-Nab-Awen Park.

The following is a list of the major components of the proposed project in the Action Areas:

- Between Blue Bridge and Fulton Street
    - Augmented boulder vane structure with a reduced footprint and surrounding scattered boulders.
- Between Pearl and Blue Bridge
    - Placement of emergent habitat boulder field and a series of bank vane structures to provide slack water near designated access points on the bank.

- Between Gillett and Pearl Street (Location of Dam 1)
    - Installation of a single constructed riffle with emergent habitat boulders.
- Between Bridge and Gillett Street (Location of Dam 2)
    - Installation of a hydraulic feature that combines constructed riffles on either side of a series of boulder arches located near the center of the channel. The new hydraulic feature has a reduced footprint.
    - Small scour pools are included directly downstream of the boulder arches with .
- Between Bridge Street and Gillet (Location of Dam 3)
    - Re-grading of the channel upstream of Dam 3.
    - Emergent habitat boulders are proposed to be placed within the dam removal footprint.
- Upstream of Bridge Street (Location of Dam 4)
    - The dam removal limits include re-grading of the channel upstream of Dam 4.

Equipment staging would be primarily within Ah-Nab-Awen Park. Some equipment may be staged on the east bank between I-196 and the 6th Street Dam, but the river would only be accessed from Ah-Nab-Awen Park. Erosion and sediment control measures would be used in accordance with the Michigan Unified Keying System and approved by the City's Stormwater (Michigan Natural Resources and Environmental Protect Act Part 91) reviewers.

General construction best management practices (BMPs) to be implemented for the NRCS WFPA Proposed Action are outlined below.

- Vegetation removal will only occur within the staging areas and will be minimized as much as practicable to provide access and limit any safety concerns.
- Vegetation removal in staging areas will be limited to smaller shrubs and urban trees.
- Construction staging and stockpile areas will be established.
- Areas for storage of spare oil booms, designated oiling, and petroleum handling areas, will be established outside of the riparian zone and will be isolated from the river using silt-fences, straw wattles, and berms.
- The contractor will establish and post protocols for potential oil spill cleanup and emergency response.
- Construction equipment such as excavators, loaders, cranes, and haul trucks, will be maintained and stored in areas in accordance with guidelines prescribed by EGLE.
- Runoff from equipment maintenance and storage areas will be directed to stabilized outlets designed to adequately convey the volume discharged.
- Heavy equipment would be well maintained to prevent leaks.
- Vehicles or other equipment will not be washed at locations where the runoff could flow directly into a watercourse or separate storm sewer.
- Construction materials, including topsoil and chemicals, will be stored, covered, or isolated to prevent runoff of pollutants and contamination of groundwater.
- Empty canisters, cans, or other chemical containers (e.g., hydraulic fluids, etc.), scrap wood, scrap metal, and all other waste materials would be disposed of daily or kept in sealed waste containers until they can be properly disposed of off-site, such as in a landfill.

- Waste materials will not be buried on-site.
- Prior to entering the watercourse, all equipment will be washed under high-pressure water with a nonharmful and biodegradable degreaser.
- Equipment in the watercourse will be inspected frequently and maintained properly to ensure no grease, oils, or chemicals are entering the watercourse.
- If equipment is leaking such fluids, it will be removed from the water course and repaired prior to reentering.
- Equipment regularly traversing in and out of the watercourse will be cleaned under high pressure water (i.e., wheel washing station) at a minimum once per week.
- Biodegradable hydraulic fluid fuel will be used in any equipment entering the water.
- Oil booms may be placed downstream of any equipment working in the wet as necessary.
- All in-river construction work is expected to be conducted with river conditions approximately ≤3,900 CFS. However, the construction crew on site would ultimately decide on conditions they can safely work under.
- Construction in the wet would be restricted to lower flow rated with suitable flow depths for tracking in the river .
- Causeways of imported clean coarse aggregate will be installed along the west bank to access the Dam 1, 3, and 4 construction areas, as well as the bank vane structures and the emergent habitat boulder fields downstream of Pearl Street.
- The Dam 2 construction area would be accessed directly from the staging area. Temporary scour protection at the Gillett Bridge piers would be accessed by tracking on the river bottom.
- The contractor will be required to have construction equipment equipped with Global Positioning Systems (GPS) to ensure all construction and in river tracking is within the direct impact areas outlined in this BA.
- Wetlands that are within direct impact areas would be covered with timber mats before any causeway construction or tracking on the river occurs.

To maintain flow conditions for in-river work and avoid and minimize potential temporary increases in tailwater elevations at 6th Street Dam, the following construction sequencing has been developed.

Causeways would be installed before removal of dams or construction of proposed improvements. Construction of proposed improvements could then occur at any location downstream of Dam 3 as the first construction activities, with the Dam 2 feature being prioritized first (if construction begins in spring/early summer). Installation of the access causeway and construction of proposed improvements to Dam 3, including the removal of the dam, would not occur until the cofferdam within the Dam 2 construction area is removed and the contractor is confident the Dam 2 feature will be completed within the same construction season. The installation of the access causeway and the removal of Dam 4 would not occur until the Dam 2 feature has been fully constructed.

Flow velocity may increase when the Dam 2 cofferdam is in place, potentially increasing scour around the Gillett Bridge piers. Therefore, temporary scour protection has been included at the

eastern three bridge piers. Access to these piers would extend from the causeway along the west bank. Scour protection would extend around the three eastern most piers to twice the pier width (4.4 m; 14.4 ft). Scour protection would be installed before the Dam 2 area is isolated in July/August (after sea lamprey (*Petromyzon marinus*) spawning season). The temporary causeway and scour protection would be removed before the end of the construction season at the latest (not left in over winter). The additional material in the river has been modeled to have minor (0.01 ft) impact on tailwater elevation at 6th Street Dam and would not be in the river during sea lamprey spawning season.

Isolation measures at Dam 2 would be installed when the water temperature is > or = to 20°C and no earlier than July 1st, which corresponds to when the sea lamprey migration season ends. The NRCS, the City, and GRWW, will coordinate installation activities with the USFWS Sea Lamprey Control Program. Isolation measures would be removed immediately following the completion of the work on the west side of Dam 2. Construction within the isolation measures is anticipated to require approximately three weeks. The isolation measures would not be left in the river overwinter. The modeled impacts to tailwater at 6th Street Dam were evaluated and considered at length during the development of the construction sequencing and modeled increases in tailwater have been avoided and minimized to the greatest extent practicable. The Dam 2 construction area would be accessed from the Ah-Nab-Awen Park staging area via an access ramp. Temporary causeways of clean imported aggregate would be constructed around the outside of the area to be isolated for construction of the diversified boulder arches, and around the construction area for the east side riffle feature. A cofferdam constructed of aggregate bags filled with clean imported material would be installed inside the causeways. The causeways cannot be used to isolate the area, as the rock used for the causeway is too permeable. Aggregate bags cannot be used for the causeway, as they are not designed to hold construction equipment.

Fish would likely move out of this area during construction of the causeway. However, once the area is isolated, it will be electrofished and/or seined to remove as many fish that remain as practicable. Unionid mussels would be collected and translocated (the City/GRWW Project). Water would then be pumped out. A screen would be placed around the pump and a net around the pump area to limit entrainment of fish. During pumping, if fish remain in the area, a crew would be on site to collect and remove fish from the isolated area. Because the lack of flow and potentially increased water temperature may stress unionid mussels inhabiting the isolated area, sufficient personnel would be on site to limit the unionid collection time to less than 10 days.

Once mussels are removed from the isolated area, Dam 2 would be removed, and a diversified hydraulic structure would be constructed at its location. The proposed structure would include constructed riffles with emergent habitat boulders on either side of a series of boulder arches and scour holes. Once the west side is complete, the cofferdams would be removed and the proposed improvements on the east side would be constructed, using previously installed causeways to access.

On the east side of the river, Dam 2 would be demolished and removed, and the proposed riffle structure would be constructed. The riffle would be constructed of stable imported alluvium and stabilized with imported riprap with a D50 of 30 cm (12 in), with large emergent habitat boulders placed throughout. Riffle slope would be 50:1. The isolation measure and causeways would be removed following the completion of Dam 2 feature construction. Temporary causeways would be removed following construction.

Causeways to, and along, Dams 3 and 4 would be installed and the dams demolished and removed. The channel upstream of the dams would be regraded after dam removal. Emergent

habitat boulders would also be placed within the Dam 3 removal and regraded area. Dam 3 would be accessed from the north end of Ah-Nab-Awen Park, and Dam 4 would be accessed from a temporary causeway extending from the park to Dam 4. Temporary causeways would be removed following construction.

Dam 1 would be demolished and removed and replaced with a riffle. The Dam 1 construction area would be accessed via a causeway that would run from Ah-Nab-Awen Park along the west bank to the Dam 1 construction area. Temporary causeways would be constructed on the upstream and downstream sides of the proposed riffle feature. The low-head dam would be demolished and removed. The riffle would be constructed with stable imported alluvium, and stabilized with imported riprap (D50, 30 cm [12 in]), and have a slope of 50:1. Emergent habitat boulders would be placed throughout the riffle. Temporary causeways would be removed following construction.

Two emergent habitat boulder fields would be constructed between Pearl and Fulton Streets. Both areas would be accessed from a causeway extending from Ah-Nab-Awen Park to the construction areas. Emergent habitat boulders on the west side would be placed from the causeway, while boulders on the east half of the river would be placed while tracking in the river. Boulder vanes would be constructed upstream and downstream of Grand Rapids Public Museum Carousel and on the east bank to create slack water for public access to the river.

Between Blue and Fulton Street, diversified boulder arches would be created on the west side of the river and emergent habitat boulder field on the east side. Access would be provided by extending the causeway along the west bank downstream of Blue Bridge. The emergent habitat boulder field would be constructed by tracking in the river.

Once features are in place, some changes in depth and flow would result. Depths upstream of Bridge Street would be faster and shallower than existing conditions. Tailwater elevations at 6th Street Dam are expected to be lowered, maintaining the existing sea lamprey barrier effectiveness (June 2024 BA Table 2-3 and 2-4). The regraded area and emergent habitat boulder field in the area of Dams 3 and 4 would be deeper and slower. Flow velocity would also be slower between the Dam 3 and Dam 2 features. Downstream of the Dam 2 features, the area near the bank would be slower, with some deeper holes developing downstream of the diversified boulder arches. However, these scour holes are all within the direct impact area. The area between Dam 2 and Dam 1 features would be slightly deeper and slower. Throughout the project reach, flow conditions would be more diversified than under existing conditions. Flow depths downstream of Pearl Street would be similar to existing conditions.

The Project was designed to minimize long-term Operation, Maintenance, Repair, Rehabilitation, and Replacement (OMRRR). Operation includes regular monitoring, inspections, data collection and reporting. These activities would not require any tracking of equipment into the riverbed and would therefore not affect unionid mussels. Maintenance includes routine, planned and scheduled upkeep of project features, equipment, or supplies necessary to maintain proper functionality of project elements. The proposed grading is anticipated to adjust to post-construction hydraulics and some localized scour and deposition may result, along with slight shifts in boulder and riprap. This is expected, and features would be left alone to adapt to river conditions. No routine maintenance is anticipated.

Repair is for currently unanticipated corrections resulting from unforeseen circumstances that are outside the design assumptions of the project. Rehabilitation is to correct anticipated shifting, wear and tear, weathering, or materials degradation by resetting features, augmenting features with additional materials, or refurbishing of features or components. Replacement includes

removal, demolition and disposal, and replacement of project features or components that cannot be repaired or rehabilitated.

Repair, rehabilitation, and/or replacement that could require instream activity would be scour or deposition that threaten public safety (flood threats, bank access, or adverse hydraulics for recreation) or infrastructure (flood wall, bank, or bridge scour). Whenever possible, repair, rehabilitation or replacement of structures would be conducted from the riverbank or, if flows and depths allow, from floating work platforms floated upstream from the Butterworth ramp with minimal impacts to the river bottom. Any debris that might hang up on riffles, bridge piers, diversified boulder arches, or rock vanes would be removed by chain sawing in place and allowing debris to float downstream, or floating debris to the riverbank for removal.

Action Area

The Action Area is defined (50 CFR 402.02) as "all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action."

The Grand River is Michigan's longest river, with a drainage area of 14,256 km^2 (5,504 mi^2). It begins in northern Hillsdale County as a series of lakes and ends at Grand Haven, MI in Lake Michigan. Hanshue and Harrington (2017) divided the river into five mainstem valley segments based on common channel and landscape features; headwaters, upper, middle, lower, and mouth segments. The headwaters flow 87 km (54 miles) to the confluence with Sandstone Creek, the upper river flows 68 km (42 miles) from Sandstone Creek to Eaton Rapids upstream of Red Cedar River, the middle river extends 97 km (60 miles) down to the mouth of the Maple River, the lower river flows 113 km (70 miles) from the Maple River to the Village of Lamont, and the mouth of the river continues for 40 km (25 miles) from Lamont to Lake Michigan.

Table 1. Action Area Description Reference Summary

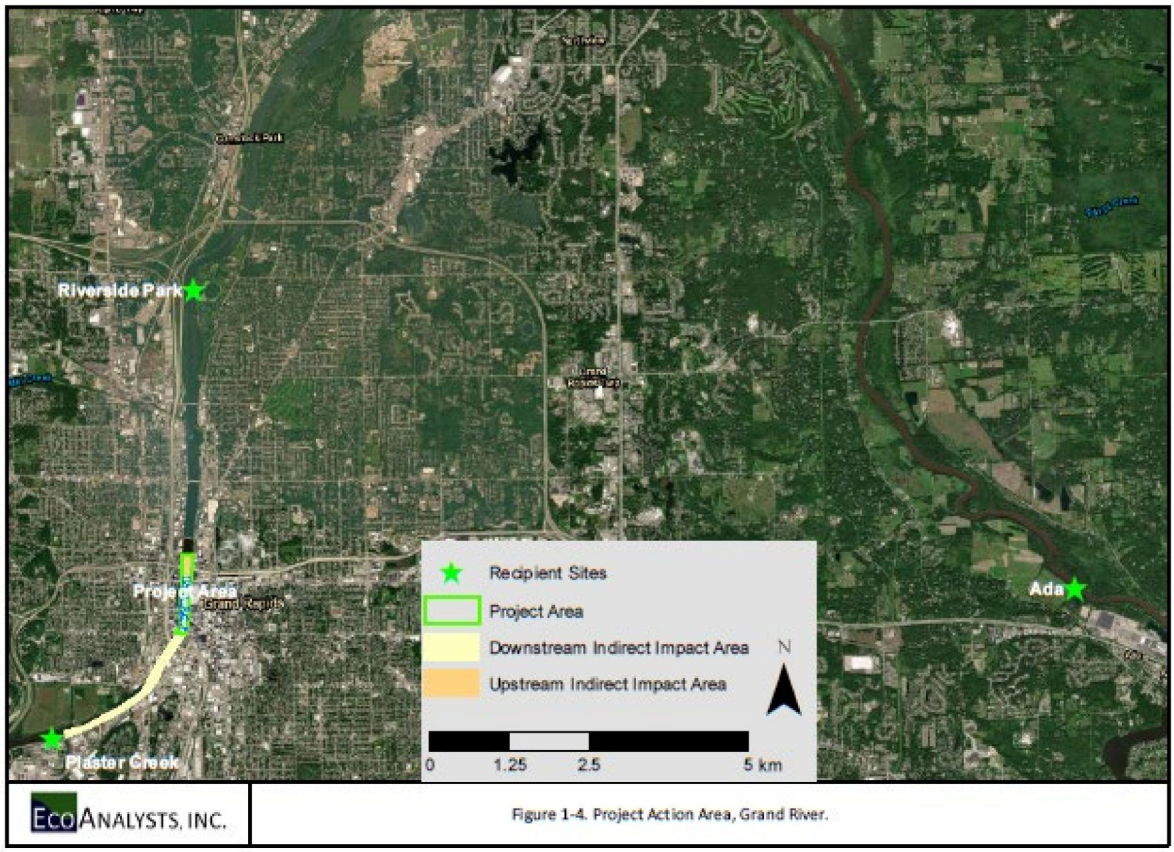
Reference Name	Location	Notes/Subcategory	Area (m^2) within Grand River
Upstream indirect impact area	Upstream edge of the Construction Area upstream to the 6th Street Dam	May experience nominally altered local hydraulics	38,420 m^2
Construction Area	300 ft upstream of Bridge Street Bridge downstream to the upstream edge of the Fulton Street Bridge	Construction indirect impact area (may experience temporary increases in turbidity during construction and altered local hydraulics)	80,185 m2
		Construction Direct impact area (physically disturbed by construction)	47,415 m^2
Downstream	Upstream edge of	Impacted by	282,600 m^2

indirect impact area	Fulton Street Bridge to the mouth of Plaster Creek	increased turbidity during construction	
Mussel Relocation Recipient Sites	Ada, Riverside Park, Plaster Creek	Sites where translocated mussels would be placed	12,050 m^2
Staging and access areas	Ah-Nab-Awen Park and some equipment may be staged north of I-196 on the east side of the river	Access to the river will only be from the park.	N/A

The USFWS has determined that the Action Area for the NRCS WFPA Project begins at Plaster Creek, 2.5 km (1.5 miles) below Fulton Street and will extend to the 6th Street Dam. The Action Area for the City/ GRWW Project includes all direct impact areas where mussels will be salvaged as well as 3 recipient sites for relocated mussels. The direct impact areas generally can be described as within the portion of the NRCS WFPA Project Action Area between Fulton Street and extending just upstream of Bridge Street. The portion of the NRCS WFPA Project Action Area from the mouth of Plaster Creek to the upstream edge of the Fulton Street Bridge will be indirectly impacted by turbidity increases during construction. The actual in river construction area for the NRCS WFPA Project is within the wetted channel of the Grand River between Bridge and Fulton Street bridges in Grand Rapids, Kent County, Michigan. Of this area (127,600 m2 (31.5 acres), 47,415 m2 would be directly impacted during construction (direct impact area). This is approximately a 50% reduction in construction impact area from the previous design, 89,195 m2 (22 acres). The river bottom would not be physically modified in approximately 80,185 m2 of the construction area (Construction Indirect Impact Area) but could be affected by turbidity and changes in local hydraulic conditions. Staging and access areas would primarily be from Ah-Nab-Awen Park. Some equipment may be staged north of I-196 on the east side of the river, but access to the river will only be from the park. The downstream indirect impact area that could be affected by turbidity increases during construction is conservatively estimated as 2.5 km (1.5 miles) from Fulton Street to Plaster Creek. The upstream indirect impact area between the 6th Street Dam and just upstream of Bridge Street would be affected by slight changes in hydraulics includes approximately 38,420 m2 (9.5 acres).

The three recipient sites for relocated mussels are also included within the Action Area. One site is downstream of Fulton Street between Plaster Creek and the M-11 Bridge. The other two sites are upstream of the 6th Street Dam; one is in Ada, 0.6 miles downstream of the Thornapple River on the left descending bank and the other is at Riverside Park on the left descending bank, 1 mile upstream of Ann Street in Grand Rapids.

Figure 1: WFPA and the City/GRWW Action Area (Source: Ecanalysts Inc. 2024 BA, Figure 1-4)



Conservation Measures

Conservation Measures are part of the proposed action; therefore, we consider them in the analysis of effects. The BA includes a list of Conservation Measures outlined below summarized for both proposed actions. Several Conservation Measures are described in greater detail following outlined measures:

1. NRCS WFPA Project - The project has changed from most of the Project Area being isolated and impacted directly (89,195 m2 direct impact Area; EcoAnalysts, 2020) to direct impact area of only 47,415 m2, a 50% reduction in area affected by the project. Rather than the river being constrained by isolation measures during construction, construction would occur in the flowing river. Only a small area (3,285 m2) at Dam 2 would be isolated during construction (June 2024 BA Table 2-9), and the area would not be isolated during sea lamprey migration season.
2. NRCS WFPA Project - Causeways have been removed from the isolated area construction design for less impact on unionid mussels, allowing more mussels to be translocated from within the isolated area.
3. NRCS WFPA Project - The footprint of causeways have been moved to overlap with proposed grading limits where possible to further reduce impacts to the river bottom.
4. NRCS WFPA Project -The number of habitat boulders has been reduced, reducing the construction impact area.
5. NRCS WFPA Project and the City/GRWW Project - Construction sequencing has been

postponed to 2025 to allow the most time possible for unionid translocation under the City/GRWW Project in 2024. In 2025, if needed, the translocation team would work with construction managers to allow mussels to be translocated before an area is under construction.

6. NRCS WFPA Project - Wetlands have been avoided to the greatest extent possible. Those that fall within direct impact areas would be covered with timber mats before any causeway construction or tracking on the river occurs.
7. NRCS WFPA Project - Construction sequencing has been changed to maintain the river grade and prevent scouring, but still maintain existing tailwater elevations during sea lamprey migration season.
8. The City/ GRWW Project - To reduce impacts to fish, fish would be salvaged from the isolation area before it is dewatered.
9. The City/GRWW Project - To prevent fish entrainment while dewatering the isolated area, a screen would be placed around the pump and a net around the pump area.
10. The City/GRWW Project - Mussels would be removed from the isolated area after water levels are reduced. Sufficient personnel would be on site to ensure mussels are removed within a 10-day period to prevent stress due to lack of flow and increased water temperatures.
11. The City/GRWW Project - Mussels in direct impact areas would be translocated under the City/GRWW Project.
12. The City/GRWW Project - Mussels not relocated would be compensated through a mitigation fund.
13. NRCS WFPA Project - Constructed features would be allowed to adjust to post-construction hydraulics, and no operation or maintenance would be required, reducing impacts to the river bottom post construction.
14. NRCS WFPA Project - Erosion and sediment control measures would be used in accordance with the Michigan Unified Keying System and approved by the City's Stormwater (NREPA Part 91) reviewers.
15. NRCS WFPA Project - Vegetation removal would only occur within the staging areas and would be minimized as much as practicable to provide access and limit any safety concerns.
16. NRCS WFPA Project - Construction staging and stockpile areas would be established, as well as areas for storage of spare oil booms and designated oiling and petroleum handling areas outside of the riparian zone.
17. NRCS WFPA Project - These areas would be isolated from the river using BMPs such as silt-fences, straw wattles, and berms. The contractor would also establish and post protocols for potential oil spill cleanup and emergency response.
18. NRCS WFPA Project - Runoff from equipment maintenance and storage areas would be directed to stabilized outlets designed to adequately convey the volume discharged. Heavy equipment would be well maintained to prevent leaks. Vehicles or other equipment would not be washed at locations where the runoff would flow directly into a watercourse or separate storm sewer.

19. NRCS WFPA Project - Construction materials, including topsoil and chemicals, would be stored, covered, or isolated to prevent runoff of pollutants and contamination of groundwater. Empty canisters, cans, or other chemical containers (e.g., hydraulic fluids, etc.), scrap wood, scrap metal, and all other waste materials would be disposed of daily or kept in sealed waste containers until they can be properly disposed of off-site, such as in a landfill. Waste materials would not be buried on-site.
20. NRCS WFPA Project - Prior to entering the watercourse, all equipment would be washed under high-pressure water with a non-harmful and biodegradable degreaser. Once in the watercourse, equipment would be inspected frequently and maintained properly to ensure no grease, oils, or chemicals are entering the watercourse. If equipment is leaking such fluids, it would be removed from the water course and repaired prior to re-entering. Equipment regularly traversing in and out of the watercourse would be cleaned under high-pressure water (i.e., wheel washing station) at a minimum once per week. Biodegradable hydraulic fluid fuel would be used in any equipment entering the water. If needed, oil booms may be placed downstream of any equipment working in the wet.
21. NRCS WFPA Project - Construction equipment would be equipped with Global Positioning Systems (GPS) to ensure all construction and in river tracking is within the direct impact areas outlined in this BA.
22. NRCS WFPA Project - Silt curtains would be used downstream of construction areas within the Project Area to reduce downstream turbidity.
23. NRCS WFPA Project - Turbidity would be monitored downstream of construction areas and in the downstream indirect impact area.

Conservation measure #8 the City/GRWW Project: Fish Salvage Plan

A small area (3,285 m2) at the Dam 2 diversified boulder arches needs to be isolated for construction. Without fish salvage, fish would be trapped in the isolated area and would die during construction. Some fish would leave the area due to construction activity disturbance during construction of causeways. Once the area is isolated, a team of biologists would electrofish and/or seine the area to remove as many remaining fish as practicable. To protect any remaining fish from impingement or entrainment by pumps, a screen would be placed over the pump and a net would be placed around the pump area. A biologist team would remain on site to collect and remove any fish that remain trapped during the water drawdown. All live fish would be identified, counted, and released into the flowing channel.

Conservation measure #10 and 1, the City/GRWW Project: Mussel Salvage Plan

Collection and Translocation Safety Limitations and Timing

The mussel collection and translocation effort would be limited by flow velocity. Safe diving/snorkeling areas would be determined based on the evaluation of the dive crew on site. If a diver/snorkeler cannot hold position, conditions would be considered unsafe. Attempts to maximize translocation efforts and efficiencies would occur if divers/snorkelers and the dive supervisor deem the hydraulic conditions safe. Portions of the direct impact area that are predicted to be ≤0.6 m/sec (2 ft/sec) at 2,500 CFS would be used a guide for dive safety, but use judgement to determine if they could work safely further riverward. The area worked would be as large as possible while maintaining diver/snorkeler safety. Divers/snorkelers would prioritize areas based on mussel abundance (highest abundance areas first), and secondly areas that that would be constructed first (Dam 1 and 2 construction area and access causeways). Additional areas would be worked as flow

conditions and time permit. One translocation crew would mobilize once flow rates are predicted to remain below 3,000 CFS for 7 days or more; a flow rate with a higher probability of occurring and at least some area being safe for collecting mussels. The mussel translocation crew would evaluate safe diving conditions at 3,000 CFS and determine the amount of area that could safely be worked. If more than 7 days of area is available, additional crews would be mobilized and mussels would be removed from as much of the direct impact areas as possible. As flows decline and additional area is workable, up to four crews would be mobilized to maximize the area that mussels could be translocated from before construction. Once translocation begins, if flows are predicted to remain above safe diving conditions as determined by the translocation crew (approximately 3,000 CFS) for 7 days or more, translocation crews would demobilize and plan to return to the site once flows are predicted to be at or below safe levels for 7 days or more. In 2025, construction would be prioritized. If mussels in parts of the direct impact areas were not collected and translocated in 2024 and river conditions are determined to be safe for collecting in 2025, the translocation crew would coordinate closely with the construction manager to determine areas where mussel collection could occur safely without interfering with construction. Mussel translocation would occur within the isolated area around Dam 2 unless flows and time allow mussel translocation to occur prior to construction of the isolation structure. Mussels would be collected after isolation and before water is drawn down. Sufficient personnel would be on site to remove as many mussels as practicable within 10 days.

Collection and Translocation Methods

Collection and translocation of mussels would occur when water temperature is above 10° C (50° F) and air temperature is between 10 and 32° C (50 and 90° F) unless permission is obtained from USFWS and MDNR to translocate outside of these temperature windows. Water temperature and water clarity would be recorded within each collection area and at the recipient sites. Each direct impact area would be divided into 5 x 10 m blocks within workable flow areas as determined by divers/snorkelers on site. Workable flow would be defined as current velocity in which the diver/snorkeler can maintain position (not be swept downstream) within the block and collect mussels. Blocks would be further divided into smaller 2 m x 1 m grids using a 3/8-inch metal that would lay flat on the river bottom grid. Each 2x1 grid is split into 1m x 1m cells and would be searched individually. Use of smaller blocks rather than a moving transect would allow collectors/snorkels to systematically search an area, but also stay within irregular search areas. Each of the 1 m x 1 m cells would be visually searched for habitat and mussels (visual search). If no habitat (i.e., bedrock or entirely non-movable rock) is found, then that 1 m2 is clear. If habitat and/or mussels are found, that 1 m2 would be excavated down to 15 cm (6 inches), collecting any mussels that are found (first pass) within an average search effort of 2 min/m2. Excavation would include moving cobble and woody debris and moving away silt, sand, and small detritus, then digging the substrate down at least 15 cm (6 inches). That 1 m2 would be excavated a second time (second pass) for an average of 2 min/m2, and if <5% of the mussels are collected on the second pass compared to the completed first pass and no state and federally listed species are found, then the 1 m2 would be declared clear. If not, it would be searched again until the <5% criteria and no state and federally listed species found threshold is reached. Searching would require an average of 2 min/m2. Once the entire 2 m x 1 m grid is clear, the 2 m x 1 m grid would be moved to the next 2 m x 1 m.

“Clear” would be defined as

1. Area is bedrock or non-diggable rock on the visual search;

2. No mussels >0.5 inches are found on the completed first dug up pass (divers/snorkelers would strive to collect all mussels, but can only have high confidence that mussels >0.5 inches would be collected);

3. Mussels are found after digging up the area (first pass), but <5% of the total number of mussels >0.5 inches found on the first pass are found after the area is dug up again (second pass) AND no State and federally listed species are found;

4. Passes continue until <5% criteria of the completed first pass is met and no state and federally listed species are found.

All areas within the direct impact areas that are deemed safe by the snorkeler/diver will be searched as above. Once an area is deemed unsafe it would not be worked unless river conditions improve. Collected unionids would be held in flowing water or in flow through tanks (under ambient water conditions) while awaiting processing and/or translocation. Unionids would be processed within a few hours of collection. All collected state and federally listed mussels would be tagged, measured (length in mm), and aged (external annuli count). State listed species would be tagged with shellfish tags, and Snuffbox will also be tagged with Passive Integrated Transponder (PIT) tags. Common species would be identified, counted, and marked with a Dremel tool (slash on the anterior ventral edge of the shell to assess growth).

Unionids would be translocated to recipient sites at the end of each day or beginning of the following day wrapped in moist towels within coolers. Once at the site, common species would be spread on the bottom by a diver/snorkeler within a defined area at a density not to exceed 1 unionid/m2 (either marked with buoys or GPS points). State and federally listed species would be hand placed on the substrate within their assigned area at a density of 1 unionid/m2. Hand placing unionids on the substrate rather than in holes dug by the diver/snorkeler allows the animal to select where it wants to be burrowed and previous studies indicate no difference in mortality or recovery with this method (Dunn et al., 2000). Based on previous translocations (H. Dunn, personal communication), 80% of the unionids within each collected area should be collected and survive translocation (estimated 15% not collected and 5% mortality of those collected). A report would be prepared within 45 days of completion of each year's translocation.

Recipient Site Selection

A survey was conducted in 2015 to identify suitable recipient sites for mussels that would be relocated from within the proposed action area (ESI 2016).

Five potential sites were identified; Ionia, Saranac, Chief Hazy Cloud, Ada, and Site 7. Of these, Ada is the largest (23,480 m^2 [5.8 acres]) site, and most of the state and federally listed species were found at this site. The best habitat within the Ada bed is 3,400 m^2 (0.8 acres) mid channel. Thirty-four (34) 10 m x 10 m areas would be established using corner markers driven into the substrate and either PVC pipe or ropes between the corner markers within this section of the site for the placement of state and federally listed species. State and federally listed species would be randomly placed 1 mussel/m^2 into the 10 x 10 areas. A PVC grid with 1 m^2 cells would be used to locate each random position within the 10 x 10 area. The remainder of the site would be used to place common species. Density within this site averaged 2.8 mussels/m^2. If density is increased no more than 50%, the site can accommodate 4,760 state and federally listed individuals and 21,000 common individuals.

Species that were not found at Ada include Pink Heelsplitter, Lilliput, Deertoe, Paper Pondshell. Pink Heelsplitter was not found at any of the investigated sites, and Deertoe was only found at Saranac. Freshwater Drum is the host for both Pink Heelsplitter and Deertoe and is sparse upstream of the 6th Street Dam (Hanshue and Harrington 2017). These species should be moved to a site just downstream of Plaster Creek. JFNew (2013d) found both of these species at the I-

196 Bridge project site. A 10 m x 10 m grid will be established, and these species will be placed in the grid within the Plaster Creek recipient site. Permanent corner markers and additional markers between the corner markers.

Animals will be able to move freely within and outside of the grid. Lilliput and Paper Pondshell are both species that occur near the bank in siltier habitat. Neither of these species were found in the Construction Direct Impact Area, but they could occur at a low frequency. Several Lilliput were collected at Riverside Park, and habitat suitable for Paper Pondshell is available. If these species are found in the Construction Direct Impact Area they will be moved to Riverside Park. A grid will be established, and these species placed in the grid.

Monitoring

Translocated unionids would be monitored within one year following each year's translocation (2024 and if needed 2025) between June and October 15 when water temperature is greater than 10° C (50° F), and air temperature is between 10 and 32° C (50 and 90° F). Up to 100, 1 m2 cells in each recipient site would be randomly selected for monitoring. A PIT tag wand would be first used to find and collect Snuffbox. A diver/snorkeler would systematically search each selected 1 m2 area. A PVC grid with 1 m2 cells would be used to facilitate searching. Since excavating all cells may destabilize substrate and render habitat unsuitable for mussels, at least 10 1-m2 cells within each area would be excavated to calibrate surface to buried ratio. The remainder would be surface searched (visual, tactile, moving rocks, logs, probing the top inch) for at least 1 minute/m2. All collected unionids would be checked for tags, recorded as tagged or not tagged, measured (length in mm), and aged (external annuli count), and Lampsilini would be checked for gravidity.

Conservation Measure 12, the City/GRWW Project: Mitigation Fund

Snuffbox and state listed species, will be negatively impacted by the NRCS WFPA Project and the City/ GRWW Project even if all direct impact areas are salvaged at 85% collection efficiency with less than 5% mortality. An additional number of Snuffbox and state listed species would be negatively impacted during repair, rehabilitation, or replacement operations, if necessary. The intended design of the proposed action to enhance habitat for aquatic species. However, there is a significant amount of uncertainty regarding creation of aquatic habitat. The actual project impacts and benefits to state and federally listed mussels cannot be anticipated given the complexities affecting the presence of mussel communities. It is uncertain what the actual as-built river features performance will be in terms of suitability for mussel-host fish presence and movements, substrate changes, maintenance activities, impact of new hydraulics on habitat, and influence of the project on sea lamprey escapement.

A fund for conservation measures that have significant benefits for mussels in the lower Grand River will be established to mitigate the loss of state and federally listed species. The purpose of the fund will be to support conservation measures that significantly benefit state and federally listed mussels after completion of the NRCS WFPA Project.

A mitigation fund would be established to offset the take for the mussels that were unable to be translocated under the Grand Rapids/GRWW Project. As many mussels as possible would be collected from direct impact areas and translocated to one of the three recipient sites under the Grand Rapids/GRWW project. The estimated area of direct impacts is 47,415 m2. Using an average unionid density of 0.3 unionids/m2, approximately 14,224 unionids occur within direct impact areas. Mussels would at least be collected and translocated from within the isolated area for Dam 2. Up to 15% of those mussels may be missed during collection, and up to 5% might die due to handling.

The maximum mitigation fund contribution would be based on $34.10/mussel (2020 BA $28.50/mussel escalated for inflation) and would not exceed $456,743 (Table 2-13 in the 2024 BA updated). This fund would be reduced by the amount of mussels that are translocated multiplied by the cost per mussel as stated above. This fund would be reduced by the amount of mussels that are expected to survive translocation (i.e., relocated minus the 5% of relocated animals anticipated to be lost due to handling stress). The mitigation fund contribution may not be reduced by a percent greater than the percent of area cleared (i.e., area of quadrats cleared from the total area of the direct impact areas). Prior to reducing the funding, the proportion of areas cleared as result of a determination of non-diggable rock must be compared to prior survey efforts to help ensure that estimates of mussels impacted are consistent with the 2024 BA. The objective of the mitigation fund would be to fund projects that provide a direct benefit to mussels to achieve the USFWS "no net loss" policy and offset any potential impacts from mussels that were unable to be translocated. The work performed through the mitigation fund would help inform future conservation and habitat restoration efforts. The USFWS, NRCS, and MDNR, would act as decision makers for the mitigation fund to determine what mitigation projects are selected for implementation. Priority would be given to projects that provide a direct benefit to mussels within the NRCS WFPA Proposed Action Area or the Lower Grand River Watershed. Specific mitigation activities, and mitigation fund management protocols would be developed in coordination with appropriate regulatory agencies.

The City and GRWW are interested in the long-term success of these habitat restoration efforts and would like to continue to partner with the USFWS, NRCS, and MDNR, on potential future projects that benefit mussels in the NRCS WFPA Project Area. The City and GRWW would advance the goals of the mitigation fund by encouraging local scientific partners including, but not limited to, the Grand Valley Metropolitan Council, Grand Rapids, Public Museum, John Ball Zoo, Grand Valley State University, and Trout Unlimited, to apply to the mitigation fund for projects that directly benefit mussels and the advancement of habitat restoration efforts in the Lower Grand River Watershed. An initial deposit would be made to the mitigation fund following the completion of the 2024 mussel translocation efforts based on the collection efficiency. A second and final deposit to the fund covering the balance of the required mitigation fund would be made following any mussel translocation activities that occur during the 2025 construction season. Any excess funds of the initial deposit would be returned if the mussel translocation exceeds the estimated collection efficiency. The financial assurance shall take the form of proof of funding deposited into an escrow account, City of Grand Rapids Commission Resolution, proof of deposit and an executed agreement with a Non-Government Organization, or another agreed upon form of financial assurance documentation.

STATUS OF THE SPECIES

Per ESA section 7 regulations (50 CFR 402.14(g)(2)), it is the USFWS's responsibility to "evaluate the current status and environmental baseline of the listed species or critical habitat." The USFWS listed the Snuffbox mussel as endangered on February 14, 2012 (77 FR 8632). Critical habitat has not been designated for this species. The following is a summary of Snuffbox general life history, distribution and status, and threats to the species.

Species Description and Life History

Snuffbox is a small- to medium-sized mussel, with males reaching lengths up to 7 cm (2.8 in) and females reaching only 4.5 cm (1.8 in; USFWS 2022). Snuffbox are sexually dimorphic. The shell is triangular (males) to ovate or oblong (females) with solid thick and inflated valves (USFWS 2022). The beak sculpture consists of three or four faint double looped bars. The

periostracum is typically yellowish, becoming darker with age, and is marked with dark green rays, blotches, or chevron-shaped markings (Carman and Goforth 2000; USFWS 2012; Ecoanalysts Inc. 2020).

Snuffbox typically occur in small- to medium-sized streams and rivers in higher flow areas of riffles and shoals (Cummings and Mayer 1992; Parmalee and Bogan 1998; Ecoanalysts Inc. 2020). Snuffbox are often observed deeply buried in the substrate, except during spawning periods (Parmalee and Bogan 1998; Ecoanalysts Inc. 2020). Adults are suspension-feeders, spending their entire lives partially or completely buried within the substrate feeding on algae, bacteria, detritus, microscopic animals, and dissolved organic material (USFWS 2022). Juvenile mussels utilize foot (pedal) feeding, consuming algae and detritus (USFWS 2022).

Reproduction starts with males releasing sperm into the water. The sperm enter the female through the incurrent siphon tube, and the eggs are fertilized internally, larvae are called glochidia (USFWS 2022). Female Snuffbox are bradytictic (long-term brooders), which means they hold the glochidia in their marsupial gills from approximately September-May (USFWS 2022). Snuffbox spawning and fertilization has been documented from mid-July to August. Unionids require a host species to complete reproductive life cycle. The Snuffbox preferred host is logperch, though in the laboratory setting they have used other darter and sculpin species (USFWS 2022). The Snuffbox's life cycle includes a brief, parasitic stage on logperch, glochidia are released by the female and encyst on the gills of logperch until they drop off as newly transformed juveniles. Glochidia typically encyst on logperch from approximately mid-May through July. Data from the Clinton River observed glochidia release starting on May 17th with a water temp of 62ºF, continuing through early-mid July (Sherman 1994; USFWS 2013).

Logperch adults prefer relatively shallow, swift riffles or raceways with gravel substrate, which corresponds with habitat where Snuffbox often occurs, but are also common in lakes and impoundments.

Distribution and Status

The Species Status Assessment (SSA) for Snuffbox was completed by the USFWS in 2022. The SSA summarizes the best available scientific information on the biological condition and viability of the species. The analysis of the current condition of Snuffbox in the SSA was conducted at the U.S. Geological Survey hydrologic unit scale (HUC) of HUC8, which is at the subbasin scale. Demographic population condition was assessed as high, moderate, low, or verylow/functionally extirpated based on specific criteria and estimated a probability of persistence over 2 lifespans of Snuffbox (40 years) (USFWS 2022). Five primary risk factors were also evaluated including water quality/contaminants, hydrological regime, landscape, connectivity, and invasive species (USFWS 2022). Risk factors were assigned a category of high, moderate, or low, and assigned a probability of persistence over 50 years (USFWS 2022).

Snuffbox was historically known from 211 streams and lakes in 18 states and Canada (USFWS 2018). Snuffbox is currently considered to be extant in 83 streams in 14 states (Alabama, Arkansas, Illinois, Indiana, Kentucky, Michigan, Minnesota, Missouri, Ohio, Pennsylvania, Tennessee, Virginia, West Virginia, Wisconsin) and Ontario, Canada (USFWS 2018, USFWS 2022). The current condition is summarized at the HUC8 scale as following: Great Lakes basin has 11 extant populations; of these, 4 are at high risk, 5 are at moderate risk, and 1 is at low risk (one population in Canada was not able to be fully analyzed); Ohio basin has 30 extant populations; 13 of which are at high risk, 15 are at moderate risk, and 2 are at low risk; Tennessee basin has five populations, three at high risk and two at moderate risk; Upper Mississippi basin has four populations, and the Lower Mississippi basin has one population, and

all populations in these basins are at high risk (USFWS 2022). The Arkansas-White-Red basin has four populations, two are at high risk, one is at moderate risk, and one is at low risk (USFWS 2022).

Threats

The conservation needs of Snuffbox are summarized in the table below taken directly from the Snuffbox SSA (i.e., "Table 2.1 Individual Needs for the snuffbox") (USFWS 2022):

Table 2.1. Individual Needs for the snuffbox.

Life Stage	Resources Needed to Complete Life Stage	Source
Fertilized eggs - spring	• Clean, flowing water • Sexually mature males upstream from sexually mature females • Appropriate spawning temperatures.	Berg et al. 2008, p. 397 Haag 2012, pp. 38–39
Glochidia - late fall to spring	• Clean, flowing water • Presence of host fish for attachment.	Strayer 2008, p. 65 Haag 2012, pp. 41–42
Juveniles - excystment from host fish to approx. age 3-4	• Clean, flowing water • Host fish dispersal • Appropriate interstitial chemistry; low salinity, low ammonia, low copper and other contaminants, high dissolved oxygen. • Appropriate substrate (clean gravel/sand/cobble) for settlement	Dimmock and Wright 1993, p. 188–190 Sparks and Strayer 1998, p. 132 Augspurger et al. 2003, p. 2,574 Augspurger et al. 2007, p. 2,025 Strayer and Malcom 2012, p. 1,787–1,788 Schwalb et al. 2011, entire
Adults - greater than ~ age 4	• Clean, flowing water • Appropriate substrate (stable gravel and coarse sand free from excessive silt) • Adequate food availability (phytoplankton and detritus) • High dissolved oxygen • Appropriate water temperature	Yeager et al. 1994, p. 221 Nichols and Garling 2000, p. 881 Chen et al. 2001, p. 214 Spooner and Vaughn 2008, p. 308

As described in the USFWS Snuffbox 5 Year Review (USFWS 2018), at the time of listing, destruction, modification, and curtailment of the species range was considered to be a threat to the species, primarily due to the construction of impoundments. While dam removals and other habitat restoration projects have improved habitat suitability on some Snuffbox streams, habitat loss and degradation continue to be one of the major threats to Snuffbox (USFWS 2018). Water quality degradation from point and non-point sources including agricultural runoff, municipal effluents, industrial sources, and spills continue to contribute sediment, organic compounds, heavy metals, pesticides, and a wide variety of newly emerging contaminants to the aquatic environment. Other factors contributing to the reduction in range include dredging and channelization, oil and gas production (including water withdrawal), and sand and gravel mining, and development. Exotic species pose a threat to Snuffbox and the host, including the zebra mussel, corbicula, round goby, and black carp, because of habitat modification, competition, and predation (USFWS 2018).

Zebra Mussels (*Dreissena polymorpha*) are native to the Baltic Sea and were introduced to the Great Lakes through the discharge of ballast water from ocean-going cargo ships. Zebra Mussels have rapidly colonized the Great Lakes, inland lakes, and rivers, which has resulted in

significant ecological impacts (Ecoanalysts Inc. 2020). Survival rates of native freshwater mussels have been shown to decline significantly with the increase in Zebra Mussel colonization (Hart et al. 2001a and 2001b).

In addition, there are other emerging threats such as disease and climate change. Little is known about diseases in freshwater mussels (Grizzle and Brunner 2009; USFWS 2018). However, mussel die-offs have been documented in Snuffbox streams, and some researchers believe that disease may be a factor contributing to the die-offs (USFWS 2018). Since listing, mussel die-offs have occurred in three Snuffbox streams including the Elk River (WV), Big Darby Creek (OH), and the Clinch River (TN) (USFWS 2018). The causes of these recent die-offs are not known. It is also not known if any Snuffbox were affected during these events (USFWS 2018). Factors associated with climate change are likely to affect regional mussel populations including changes in stream temperature regimes and precipitation levels that may indirectly result in reduced habitat and declines in host fish stocks (USFWS 2018).

Climate change has the potential to affect aquatic organisms and habitat in the Grand River. Climate change alters water temperatures, precipitation, streamflow patterns, water quality, and sediment loads (Jimenez Cisneros et al. 2014 as referenced in Ecoanalysts Inc. 2020). Climate predictions vary depending on the model used, though there are some shared similarities across models with respect to future predictions including a shift in precipitation from snow to rain (Jyrkama and Sykes 2007, Stewart 2009, Christensen et al. 2004 all as referenced in Ecoanalysts Inc. 2020), earlier snowmelt (Stewart 2009, Kunkel and Pierce 2010, as referenced in Ecoanalysts Inc. 2020), an increase in overall precipitation (Angel and Kunkel 2010, NOAA Technical Report NESDIS 142-3 2013, Stewart 2009, Pryor et al. 2014 as referenced in Ecoanalysts Inc. 2020), and warmer water temperatures (Jyrkama and Sykes 2007, Angel and Kunkel 2010, Kunkel and Pierce 2010, NOAA Technical Report NESDIS 142-3 2013, as referenced in Ecoanalysts Inc. 2020). Changes in streamflow, water quality, and temperature could alter mussel distribution, composition, abundance over time, and habitat as well as host fish habitat, distribution, and abundance (Ecoanalysts Inc. 2020). It is also possible that expansion of invasive species communities could result based on these climatic shifts expanding the threat posed currently to certain populations.

STATUS OF CRITICAL HABITAT

No critical habitat has been designated for this species.

ENVIRONMENTAL BASELINE

Regulations implementing the ESA (50 CFR 402.02) define the environmental baseline as the condition of the listed species or its designated critical habitat in the action area, without the consequences to the listed species or designated critical habitat caused by the proposed action. The environmental baseline includes the past and present impacts of all Federal, State, or private actions and other human activities in the action area, the anticipated impacts of all proposed Federal projects in the action area that have already undergone formal or early section 7 consultation, and the impact of State or private actions which are contemporaneous with the consultation in process. The consequences to listed species or designated critical habitat from ongoing agency activities or existing agency facilities that are not within the agency's discretion to modify are part of the environmental baseline.

Status of the Grand River within the Action Area

The Grand River is the longest river in the State of Michigan, stretching approximately 248 miles through an approximately 5,575 square mile basin in the southwestern portion of Michigan's

Lower Peninsula before draining into Lake Michigan near Grand Haven (Hanshue and Harrington 2017). The River runs through the center of the City of Grand Rapids, located in Kent County, Michigan. The River stretches approximately eight miles through the city. Historically the rapids in Grand Rapids stretched for a little more than one mile with a nearly uniform decent. The rapids resulted from a bedrock outcropping (an approximately 20 to 50ft thick formation named "Bayport Limestone") with scattered granitic boulders and cobble (moved by glaciers from the Canadian Shield) (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018). This bedrock formation appears to angle deeper underground as you move upriver; within the outcropping are layers that may have given the rapids a step-down appearance (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018).

The bedrock outcropping extends from about where, today, the water treatment plant is located through to Lyon Street (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018). Below Lyon Street the river channel included several small islands. Downstream of the bedrock outcrop additional boulders and cobble likely continued to approximately where Fulton Street is today (near Fulton Street the river grade drops and sand and gravel may have accumulated over larger material) (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018).

Prior to modifications of the bedrock outcrop and rapids, in low water levels the river likely shallowly spread across this bedrock outcropping (e.g., the bedrock was noted to be above low water in many locations) and portions of the channel likely dried out occasionally as the width of the river contracted during extended dry periods (e.g., during the summer months) (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018). Four of the City's dams were constructed to spread the river out during low water keeping the river bed always wet during the time when untreated sewage was discharged into the river (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018). In high water levels, the river would have spread out beyond the current banks to side channels and out into the river's historically forested flood plain (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018).

At several locations in the river channel, limestone was quarried from the bedrock outcropping. A long linear quarry on the westside of the river from start upstream in-between Webster St NW/Myrtle St NW to about 10th St NW; another quarry was located just below the current 6th Street dam on the east-side of the river, and was approximately .5 acres in size (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018). Additionally, large scattered glacial origin boulders that may have been in the channel would have likely been removed for construction purposes (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018). The Grand River's channel in the downtown reach has been reduced by approximately 30% through fill, development, and building of flood walls (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018). Additionally, bridge piers and scour protection around the piers also affect the flow of water through the downtown reach (USFWS Michigan Field Office and Michigan Department of EGLE Lansing Pers. Comm. 2018).

The historical channelization of the Grand River and the construction of dams in Grand Rapids have limited the connectivity of the Grand River above and below the 6th Street Dam. These structures have also limited the abundance of boulders and riffles, which are considered habitat for host fish species necessary for the reproductive success of many native mussels in the Grand

River. The lack of contiguous habitat within and through the Project Area may have a negative impact on the distribution and reproduction of mussels throughout the project reach.

In general, the water quality in the Grand River has been degraded over time due to municipal, stormwater, and industrial discharges, Confined Animal Feeding Operations, nonpoint discharge, airborne deposition of pollutants, and localized degradation from contaminated sediments (Hanshue and Harrington 2017). These factors have created a need to monitor the Grand River for environmental and human health parameters, including: water temperature, sediment and water chemistry, bacteria and pathogens. Within the lower reach of the Grand River, including Grand Rapids, there were 152 identified sites of environmental contamination, four solid waste landfills, 30 hazardous waste operations, and 123 oil and gas operations (Hanshue and Harrington 2017).

Status of Invasive Species in the Action Area

Sea Lamprey

Sea lamprey are native to the Atlantic Ocean and entered into the Great Lakes in the 1800's via manmade locks and shipping canals. Sea lamprey were first observed in Lake Ontario in the 1830s, but Niagara Falls served as a natural barrier preventing sea lampreys from entering the other Great Lakes (https://www.fws.gov/midwest/SeaLamprey/index.html). However, modifications to the Welland Canal in the early 1900s provided sea lampreys access to the other Great Lakes. In 1921 sea lampreys were first observed in Lake Erie and spread into Lakes Michigan, Huron and Superior (https://www.fws.gov/midwest/SeaLamprey/index.html). Adult Sea lamprey affix to prey fish and feed on their body fluids and tissues; often resulting in death of the host fish (Ecoanalysts Inc. 2020). Sea lamprey prey on most species of large Great Lakes fish such as lake trout, salmon, lake sturgeon, whitefish, burbot, walleye and catfish. The Great Lakes experienced a drastic decline in lake trout, whitefish and chub populations in the 1940s and 1950s brought on by overfishing, habitat degradation and the invasion of parasitic sea lampreys (https://www.fws.gov/midwest/SeaLamprey/index.html).

Adult sea lamprey do not feed during migration. Sea lamprey spawning habitat is characterized by steady, unidirectional water flow, and suitable gravel substrates with minimal sand (0.9 to 5.1 cm diameter; 0.4 to 2 inches), water velocity (0.5 to1.5 m/sec; 1.6 to 4.9 ft/sec), depth (13 to 170 cm; 5 to 67 inches), and temperature (10.0 to 26.1° C; 50 to 79° F) (Ecoanalysts Inc. 2020). Nest building begins when water temperature warms to 15° C (59° F) (Ecoanalysts Inc. 2020). Larval habitat is characterized by sandy areas with organic matter. Once larvae metamorphose, they swim out to the Great Lakes to feed.

In the Grand River the 6th Street Dam represents a barrier to sea lamprey at low flows and occurrence in the mainstem is restricted to the stretch of river downstream of the dam. Most of the Grand River downstream of Fulton Street has a sand substrate that could be used by sea lamprey, larvae have not been reported in the Grand River proper (Sullivan and Mullett, 2018, Ecoanalysts Inc. 2020). However, larval sea lamprey have been documented in tributaries upstream of Grand Rapids including Lowell Creek in 1962 and Rogue River in 2008, and 2022, and in Prairie Creek in 2022 (Barber and Steeves 2023; Hrodey et al. 2022). Rogue River was treated with lampricide in 2009 (Sullivan and Adair 2009). Larval lamprey were found in the Rogue River in 2022, and the area is expected to be treated with lampricide (Barber and Steeves 2023). The source of these escapement events is unknown (Barber and Steeves 2023). However, in 2006 the stop logs in the fish ladder stop log with lip were reconfigured to increase the drop for a more effective barrier (Barber and Steeves 2023). Several years after 2006, the steel lip at the top of the P. marinus barrier came loose and was replaced (Barber and Steeves 2023).

However, the loss of vertical drop needed for a sea lamprey barrier in the fish ladder still occurs at a lower river stage height than the main spillway (Barber and Steeves 2023). The 2022 larvae in Rogue River and Prairie Creek could have occurred in 2020 during a high discharge event (30,000 CFS in May 2020; Hrodey et al. 2022).

A two-year evaluation of larval and juvenile sea lamprey production potential was conducted in 2014 and 2015 to evaluate the production potential upstream of the 6th Street Dam (GLFC, 2015). The survey focused on finding native lamprey, which occupy the same habitat as P. marinus. Native lamprey were found in 463 km (287 mi) of the Grand River watershed upstream of the 6th Street Dam. Within that area there is approximately 2,957,701 m2 (730 acres) of Type I habitat (preferred mix of sand and fine organic matter) and 6,396,646 m2 (1,580 acres) of Type II habitat (acceptable shifting sand with no fine organic matter). Areas with Type I and II habitat include Bear Creek, Bellamy Creek, Crooked Creek, Fish Creek, Grand River, Honey Creek, Libhart Creek, Lowell Creek, and Maple River. If sea lamprey managed to successfully pass the 6th Street Dam, the Grand River could become one of the most productive sea lamprey tributaries to Lake Michigan (GLFC 2018, Ecoanalysts Inc. 2020). The chemicals used for sea lamprey control have the potential to significantly impact mussel communities and their hosts due to the lethal and sublethal effects caused by lampricides in both freshwater mussels and host fish (details included in the Sea Lamprey section below).

Zebra Mussels

Zebra Mussels (*Dreissena polymorpha*) are native to the Baltic Sea and were introduced to the Great Lakes through the discharge of ballast water from ocean-going cargo ships. Zebra Mussels have rapidly colonized the Great Lakes, inland lakes, and rivers, which has resulted in significant ecological impacts (Ecoanalysts Inc. 2020). Survival rates of native freshwater mussels have been shown to decline significantly with the increase in Zebra Mussel colonization (Hart et al. 2001a and 2001b). Zebra Mussels are found in the lower Grand River near the mouth and in the bayous. Woolnough (2015) reported Zebra Mussels only as weathered shells below Lyons Dam. Live Zebra Mussels were found at all sites sampled from Ionia though the Action Area, though at the time these sites were surveyed, infestation of native freshwater mussels was low (only a few freshwater mussels had attached Zebra Mussels) and only a few large Zebra Mussels (<10 per individual) were attached to native individuals (ESI, 2014, 2016, 2017, 2018; EcoAnalysts Inc. 2018). Flow regimes of the mainstem may prevent Zebra Mussels from becoming more established, as all dams on the mainstem are operated as run of the river dams and the variable flow that exists in this system is not conducive to colonization. However, recreational boating may represent a constant input of more Zebra Mussels into the river. The Flat River and lower Thornapple River, as well as many inland lakes within the basin, have also been invaded.

Status of Climate Change in the Action Area

Climate change has the potential to affect aquatic organisms and habitat in the Grand River. By altering the hydrological cycle, climate change alters water temperatures, precipitation, streamflow patterns, water quality, and sediment loads (Jimenez Cisneros et al. 2014). Climate predictions vary depending on the model used, though there are some shared similarities across models with respect to future predictions including a shift in precipitation from snow to rain (Jyrkama and Sykes 2007, Stewart 2009, Christensen et al. 2004, as referenced in Ecoanalysts Inc. 2020), earlier snowmelt (Stewart 2009, Kunkel and Pierce 2010, as referenced in Ecoanalysts Inc. 2020), an increase in overall precipitation (Angel and Kunkel 2010, NOAA Technical Report NESDIS 142-3 2013, Stewart 2009, 3rd US national climate assessment 2014, as referenced in Ecoanalysts Inc. 2020), and warmer water temperatures (Jyrkama and Sykes

2007, Angel and Kunkel 2010, Kunkel and Pierce 2010, NOAA Technical Report NESDIS 142-3 2013, as referenced in Ecoanalysts Inc. 2020). Changes in streamflow, water quality, and temperature could alter mussel distribution, composition, and abundance over time (Ecoanalysts 2020).

Average annual precipitation is expected to increase over time, and in some regions, precipitation may trend toward less frequent but more intense rainfall (USFWS 2014), with a resulting increase in frequency of extreme discharge levels. Increases in precipitation may increase river flows, changing patterns of sediment scour and deposition, and hydraulic conditions. Precipitation increases may also affect water quality and/or sediment loading in rivers. Greater runoff may carry more pollutants from urban areas, nutrients from the soil into the water, and sediment, reducing water quality. Changes in hydraulic conditions, flow, water quality, and substrate condition, have the potential to alter mussel habitat, distribution, and species composition (Goodding et al. 2019, Ecoanalysts Inc. 2020).

Precipitation may also be more dominated by rainfall events instead of snow melt, which may also impact water temperature (Ecoanalysts Inc. 2020). Increasing water temperatures themselves may affect mussels by influencing factors such as growth, burrowing behavior, byssus production, metabolic rates, and reproductive success (Hastie et al. 2003, Pandolfo et al. 2009, Archambault et al 2014, Ganser et al. 2015, as referenced in Ecoanalysts Inc. 2020). Studies have also shown that certain groups of freshwater mussels may be more thermal tolerant or sensitive. Thermally tolerant species (Threeridge (*A. plicata*), Wabash Pigtoe (*F. flava*), Washboard (*Megalonaias nervosa*), Threehorn wartyback (*O. reflexa*)) had increased clearance rates and were still able to assimilate energy at 35° C (95° F) (Spooner and Vaughn 2008, Ecoanalysts Inc. 2020). In contrast, thermally sensitive species (Mucket (*A. ligamentina*), Plain Pocketbook (*L. cardium*), Deertoe (*T. truncate*), and Pimpleback (*C. pustulosa*)) decreased clearance and depleted their energetic stores at 35°C (95° F) (Spooner and Vaughn 2008, Ecoanalysts Inc. 2020). All four of the thermally sensitive and two of the thermally tolerant species occur in the construction area for the WFPA Project and have the potential to be impacted if water temperatures increase in the future.

Alterations in temperature and flow patterns caused by climate change would similarly impact fish species in the Grand River and may potentially impact the timing of spawning, migration, habitat use, and distribution (Ecoanalysts Inc. 2020, Lynch et al. 2016). The lower Grand River mainstem and tributaries are currently home to 10 species of fish considered cold water preferential (Hanshue and Harrington 2017). As water temperatures increase, the thermal microhabitats created from inputs of cold, cold-transitional, and warm-transitional tributaries would likely decrease in size and suitability to these species (Ecoanalysts Inc. 2020). Both Lake Sturgeon (*A. fulvescens*) and River Redhorse (*M. carinatum*) use temperature cues to initiate spawning behavior, therefore changes in water temperature due to climate change has the potential to directly impact the timing of spawning events (Ecoanalysts Inc. 2020). Additionally, changes in distribution and behavior of fish host also has the potential to impact interactions between host species and freshwater mussels.

Literature suggests that invasive species would persist, and current ranges may expand under the predicted warmer conditions. Both Round Goby and Zebra Mussel may experience range expansion as water temperatures warm perpetuating the negative effects of these invasive species on aquatic ecosystems including competition for resources, displacement, and in the case of Zebra Mussels direct mortality of native freshwater mussels. Climate change may also indirectly impact mussel assemblages of the Grand River by increasing the probability of sea lamprey

escapement at the 6th Street Dam. The potential for reduced effectiveness of low-head barriers currently serving as sea lamprey barriers, could result from increased flood events and increased water temperatures during upstream migrations that influence swim performance of sea lamprey (Hansen et al. 2016, Ecoanalysts 2020). Under its current configuration, sea lamprey is most likely to breach the 6th Street Dam during high flows, which typically occur between March and April when water temperatures are below 10° C (50° F). The swimming performance of sea lamprey is relatively poor at water temperatures below 10° C (50° F). However, sea lamprey swimming performance is dramatically improved at temperatures above 15° C (59° F). Given the expected increase in water temperatures caused by climate change, high water events would be more likely to occur at warmer temperatures; if high water events occur at temperatures optimal for sea lamprey swimming performance, sea lamprey would be more likely to pass through the 6th Street Dam (Ecoanalysts Inc. 2020). Increased escapement may result in treatment of the Grand River watershed with lampricides as one potential control method. If the Grand River were treated with lampricides, freshwater mussels and their hosts could suffer direct mortality as well as sub-lethal effects.

Status of Federally Listed Species in the Action Area

Snuffbox (Epioblasma triquetra)

In the Grand River, Snuffbox occurs in the middle (Red Cedar River to Maple River) and lower (Maple River to Grand Rapids) sections of the Grand River proper and its tributaries (Hanshue and Harrington 2017). Very little mussel survey data is available downstream of Grand Rapids, as a result there is uncertainty regarding the presence of Snuffbox, though there are areas that have potentially suitable habitat for the species. There is a significant population in the vicinity of the former Lyons Dam, Village of Lyons, Ionia County (Woolnough and Barnett 2013). A large population also occurs in the Flat River, in the east channel between the dam and the confluence with the Grand River (ESI 2016).

Adult and juvenile Snuffbox were recently collected alive during surveys and relocation efforts within the Action Area. Evidence of recruitment has been observed within the Grand River, as juvenile Snuffbox have been collected throughout their range within the watershed. Snuffbox occur at a low density throughout the Action area and highly suitable habitat for Snuffbox is limited. This species comprised 0.9% of the total number of mussels recently collected between 6th Street Dam and Fulton Street.

Logperch, the primary host of Snuffbox, prefer relatively shallow, swift riffles or raceways with gravel substrate, which corresponds with habitat where Snuffbox often occurs, but are also common in lakes and impoundments. Adults (spawning and non-spawning) seem to prefer depths <1 m (<3.3 ft) and current velocity near 1 m/sec (3.3 ft/sec) over substrates of sand, gravel, and cobble, whereas young of the year prefer slightly shallower, slower waters over similar substrate (Becker, 1983; Luttrell et al., 1994; Aadland and Kuitunen, 2006). In Winter, adult logperch tend to use deeper water. In Wisconsin, logperch begin spawning in April, with the spawning season extending into June or July (Becker, 1983).

Logperch have been observed throughout the NRCS WFPA Action Area, although their preferred habitat is limited. Although preferred habitat for this species has been reported as faster flowing deeper areas, logperch was incidentally collected in a slower flowing area adjacent to a wetland during a 2013 mussel survey in the NRCS WFPA Action Area. It was also collected downstream of low-head dams in 2018-2022. Although some gravel substrate is present, substrate consists primarily of armored/compacted cobble and boulder (Figure 2-1). Softer substrate, slower flowing areas occur near the banks where in-stream or near stream vegetation is

present. Logperch represented 4.4% of the fish recently collected (2018 to 2022) in the Lower Grand River. They appear to be recruiting, as age 0 to 3 were collected in 2018 and 2022, 1 to 3 in 2020 and 2021 (M. Holtgren, Encompass, personal communication).

Status of Michigan Freshwater Mussels of State Special Concern (SC), State Threatened (ST), and State Endangered Species (SE)

Thirteen state listed mussels have the potential to occur in the action area.

Lilliput (Toxolasma parvum) (SE)

Lilliput is a small elliptical, cylindrical mussel with a shell that is relatively solid and inflated with rounded posterior and anterior ends, and a length of up to 3.8 cm (1.5 in). The periostracum has a cloth-like texture and ranges in color from dark green to dark brown with no rays. Lilliput is braydtictic, glochidia are released in July in club shaped conglutinate packets (Ecoanalysts Inc. 2020). Spawning likely occurs sometime around July, though gravid individuals have been observed throughout the year. Hosts include several Sunfish (*Centrarchidae*) species and Johnny Darter *(Etheostoma nigrum*) (Watters et al. 2009, Ecoanalysts Inc. 2020). Most of these host species have been observed within the Action Area (Ecoanalysts Inc. 2020).

Lilliput occurs in lakes, ponds, and slow flowing reaches of streams and rivers (Parmalee and Bogan 1998, Mulcrone 2005, Williams et al. 2008, Ecoanalysts Inc. 2020). It is most commonly found in soft substrates such as mud, sand, or fine gravel (Parmalee and Bogan 1998, Watters et al. 2009, Ecoanalysts Inc. 2020). In Michigan, it has been reported from only 10 counties, primarily in the southern half of the state (MNFI 2018). Live individuals have been detected during the Lyons Dam Removal surveys and relocation (Woolnough and Barnett 2013, Woolnough 2015), and at Ionia, Flat River, and Riverside Park, and as a weathered shell at Peace Park by Ecoanalysts Inc. (Ecoanalysts Inc. 2018). Ecoanalysts Inc. (2020) also detected juveniles at Riverside Park. Lilliput has not been detected between the 6th Street Dam and Fulton Street, lack of detection may be more attributed to its small size and that suitable habitat is generally siltier slow flowing areas on the margins of mussel assemblages (Ecoanalysts 2020).

Black Sandshell (Ligumia recta) (ST)

Black Sandshell is a solid, elongate and moderately compressed mussel reaching lengths up to 20 cm (7.9 in). The shell has a smooth, shiny surface that is dark green, brown, or black, with green rays visible on some individuals. Black Sandshell is bradytictic and glochidia are released in white conglutinates (Watters et al. 2009, Ecoanalysts Inc. 2020). Black Sandshell has been found to be fairly non-specific when it comes to fish host and include Rosyface Shiner (*Notropis rubellus*), Yellow Perch (*Perca flavescens*), several *Centrarchidae* species, and Sauger (*S. vitreus*, and *Sander canadensis*).

Black Sandshell occurs in rivers, lakes, and large streams in sandy mud to coarse sand or gravel at depths from a few centimeters to 2 m (6 ft) or more (Parmalee and Bogan 1998, Watters et al. 2009, Ecoanalysts Inc. 2020). In Michigan, Black Sandshell has been reported from several counties in the southern two-thirds of the state, as well as five counties in the Upper Peninsula (MNFI 2018). In the Grand River, it has only been found in the middle and lower river from Portland downstream to Grand Rapids. This species likely occurs in low abundance throughout the lower Grand River. Live adult and juvenile Black Sandshell have been detected in the Action Area (Ecoanalysts Inc. 2020).

Purple Wartyback (Cyclonaias tuberculata) (ST)

Purple Wartyback have shells that are round, heavy, and compressed to moderately inflated and reach a length of 12.7 cm (5 in). The shell surface is covered with bumps or tubercles that are an extension of the beak sculpture. The periostracum is yellowish-brown or greenish-brown in younger individuals, becoming darker brown in older individuals. Purple Wartyback are tachytictic (short-term brooders) and glochidia are released in white oblong conglutinates (Watters et al. 2009, Ecoanalysts Inc. 2020). Glochidia are present in the gills between May and late August. All reported hosts for Purple Wartyback are from the Catfish family (*Ictaluridae*), and include Black Bullhead (*Ameiurus melas*), Yellow Bullhead (*Ameiurus natalis*), Channel Catfish (*Ictalurus punctatus*), and Flathead Catfish (*Pylodictis olivaris*). Yellow Bullhead, Channel Catfish, and Flathead Catfish, have all been found in the Action Area.

Purple Wartyback is found in large creeks to large rivers, typically in coarse sand or gravel substrate (Parmalee and Bogan 1998, Watters et al. 2009, Ecoanalysts Inc. 2020). Although it is often found in moderate to swift current, it may inhabit slower-flowing areas (Parmalee and Bogan 1998, Watters et al. 2009, Ecoanalysts Inc. 2020). In Michigan, Purple Wartyback was historically found in the St. Joseph, Kalamazoo, Grand, Huron, Raisin, and Detroit Rivers, as well as Lake St. Clair (Badra 2010). Live adults and juveniles have been detected within the Action Area (Ecoanalysts Inc. 2020).

Slippershell (Alasmidonta viridis) (ST)

Slippershell are thin shelled as juveniles, becoming thick, inflated, and quadrate with age, reaching a maximum length of 60 mm (2.4 in). The periostracum is a waxy yellow, green, or tan that darkens with age. Notable bold green rays appear at all ages, are varied in width, and commonly cover the entire periostracum. Slippershell is bradytictic that keep their glochidia in their gills over the winter, then release them in the spring. Glochidia are released in a broadcast manner and connect with their host passively. Reported potential host fish include Mottled Sculpin (*C. bairdi*), Banded Sculpin (*C. carolinae*), and Johnny Darter (*E. nigrum*), both Mottled Sculpin and Johnny Darter have been reported in the lower Grand River (Clarke and Berg, 1959; Zale and Neves, 1982; Ecoanalysts Inc. 2020).

Slippershell is a small mussel typically found in small creeks and headwaters of larger rivers and occurs in a wide variety of substrate (Watters et al. 2009, Haag 2012, Ecoanalysts Inc. 2020). In Michigan, it is found throughout the state (MNFI 2018), and has been reported from the Au Gres-Rifle, Au Sable, Case, Clinton, Huron, Kalamazoo, Little Calumet-Galien, Manistique, Maple, Muskegon, Pigeon-Wiscoggin, Pine, Raisin, Shiawassee, St. Clair, St. Joseph (Maumee River and Lake Michigan drainage), St. Mary's, Thornapple, Tiffin, and Upper and Lower Grand Rivers (Badra and Goforth 2001, Carman, 2002, Badra 2010, Ecoanalysts Inc. 2020). Shells have been found in the upper and middle Grand River and one live individual was detected within the Action Area in 2017 (Ecoanalysts Inc. 2020). This is the only recent live record in the Grand River that has been detected (Ecoanalysts Inc. 2018). Given, that only one live individual was found recently, it is unclear as to whether there is a population in the mainstem.

Round Pigtoe (Pleurobema sintoxia) (SC)

Round Pigtoe have shells that are generally triangular to nearly round that are stout and thicker anteriorly and are 9.5 cm (3.7 in) in length. The periostracum is light reddish-brown becoming dark brown with age and usually without rays. Round Pigtoe are tachytictic and are gravid from approximately May through July when they then release their glochidia in conglutinate packets. Reported host fish include Central Stoneroller (*Campostoma anomalum*), Spotfin Shiner (*Cyprinella spiloptera*), Northern Redbelly Dace (*Phoxinus eos*), Southern Redbelly Dace

(*Phoxinus erythrogaster*), Bluntnose Minnow (*Pimephales notatus*), and Bluegill (*L. macrochirus*) (Hove, 1995; Watters et al., 2005 *in* Watters et al., 2009, Ecoanalysts Inc. 2020). Spotfin Shiner and Bluegill have recently been collected between 6th Street Dam and Fulton Street.

Round Pigtoe are found in medium to large rivers in mixed mud, sand, and gravel (Cummings and Mayer, 1992). It has been observed in the Cass, Clinton, Huron, Kalamazoo, Muskegon, Pine, Raisin, Shiawassee, St. Clair, St. Joseph (Lake Michigan and Maumee), Thornapple, Tiffin, and Upper and Lower Grand watersheds (Badra 2010, Ecoanalysts Inc. 2020). Live individuals have been found from Lyons Dam downstream through Grand Rapids. Live juveniles were found within the Action Area as well (Ecoanalysts Inc. 2020).

Pink Heelsplitter (Potamilus alatus) (SC)

Pink Heelsplitter has a rectangular, laterally compressed shell that becomes thicker with age, and is up to 20 cm (8 inches) in length. The periostracum varies in color from dark green to dark brown to black in older individuals and younger individuals commonly have green rays that fade with age. Pink Heelsplitter is bradytictic, gravid females have been reported from June to October and again from May to July. Freshwater Drum (*Aplodinotus grunniens*) was recently confirmed as the fish host and was collected between the 6th Street Dam and Fulton Street.

Pink Heelspiltter typically occurs in medium to large rivers, lakes, and impoundments, but rarely in smaller systems (Watters et al. 2009, Ecoanalysts Inc. 2020). It is most often found in silty sand and mud but can be found in mixed mud, sand, and gravel (Cummings and Mayer 1992, Ecoanalysts Inc. 2020). In Michigan, Pink Heelsplitter is found at the lower stretches of rivers in the lower peninsula, Lakes Erie, and Lake St. Clair (Ecoanalysts Inc. 2020). A few individuals were collected between 6th Street Dam and Fulton Street during 2013 and 2016 sampling, under the I-196 Bridge (Cardno, 2017), and between Fulton Street and the M-11 Bridge, but not at any of the sites upstream of the 6th Street Dam given that the 6th Street Dam is a barrier to passage for Freshwater Drum. The limited distribution of Pink Heelsplitter is likely attributed to the lack of passage for its host species, Freshwater Drum (*Aplodinotus grunniens*), at the 6th Street Dam (Hanshue and Harrington 2017, Ecoanalysts Inc. 2020).

Deertoe (Truncilla truncata) (SC)

Deertoe has a triangular shell that is somewhat inflated, thick, with a shallow sulcus anterior to the posterior ridge, and only reaches lengths up to 5 cm (2 in). The periostracum varies in color from yellow or green to dark brown with numerous green rays of varying width that may be broken or chevron shaped markings. Recently it was determined that Deertoe are tachytictic with gravid females reported from April or May to July (Sietman et al. 2018, Ecoanalysts Inc. 2020). Freshwater Drum is confirmed as a host for Deertoe and as mentioned above, are present in the Action Area downstream of the 6th Street Dam.

Deertoe typically occurs in medium to large rivers, though they may be found in smaller rivers and creeks as well as lakes (Parmalee and Bogan 1998, Williams et al. 2008, Watters et al. 2009, Ecoanalysts Inc. 2020). It occurs in a variety of substrates, including sand, gravel, and mud (Cummings and Mayer 1992, Parmalee and Bogan 1998, Williams et al. 2008, Ecoanalysts Inc. 2020). In Michigan, Deertoe occurs in the Detroit, Huron, Kalamazoo, Pere Marquette-White, St. Clair, St. Joseph (Lake Michigan), Tittabawassee, and the Lower Grand (Badra 2010, Ecoanalysts Inc. 2020). Live individuals have been recently found in the Grand River at the former Lyons Dam site in the Village of Lyons as well as within the Action Area where live juveniles were also documented (Woolnough and Barnett 2013, Ecoanlysts Inc. 2018,

Ecoanalysts Inc. 2020).

Ellipse (Venustaconcha ellipsiformis) (SC)

Ellipse has a shell that is solid, moderately compressed, elliptical in shape, and is up to 7.5 cm (3 in) in length. The periostracum is yellow, green, or dark tan, with dark green rays that become wavy toward the posterior end of the shell. Ellipse is bradytictic, with spawning occurring in July and August. Potential host fish include Sculpin (*Cottus* spp.), Logperch (*Percina caprodes*), and Darters (*Etheostoma* spp).

Ellipse is typically found in small to medium streams in sand and gravel substrate (Cummings and Mayer 1992, Watters et al. 2009, Ecoanalysts Inc. 2020). In Michigan, Ellipse has been reported from the Cass, Kalamazoo, Maple, Pigeon-Wiscoggin, Raisin, Shiawassee, St. Joseph (Lake Michigan and Maumee drainage), Thornapple, and Grand River basins (Badra 2010, Ecoanalysts Inc. 2020). One live individual was found near the former Lyons Dam, as well as Peace Park, Ada, Roselle Park, and in the Flat River they were the dominant species (Ecoanalysts Inc. 2018, Woolnough 2015). Mostly weathered shells have been found, but two live individuals have been collected within the Action Area (Cardno 2017, EcoAnalysts Inc. 2018, Ecoanalysts Inc. 2020).

Elktoe (Alasmidonta marginata) (SC)

Elktoe has a triangular/ trapezoidal, inflated, thin shell, and is up to 10 cm (3.9 in) in length. The periostracum is smooth, greenish yellow in color, with numerous dark green rays and dots (Cummings and Mayer, 1992; MNFI, 2018; Ecoanalysts 2020). Elktoe are bradytictic with spawning occurring in June. Glochidia are found in September and overwinter until May or June the following spring (Watters et al. 2009). Potential host fish include White Sucker (*C. commersonii*), Nothern Hogsucker (*H. nigricans*), Shorthead Redhorse (*Moxostoma macrolepidotum*), Rock Bass (*Ambloplites rupestris*), and Warmouth (*Lepomis gulosus*) (Howard and Anson, 1923 *in* Watters et al., 2009). All but Warmouth were recently collected within Grand Rapids.

Elktoe is found in large creeks to medium rivers. In Michigan, Elktoe is found in both the Upper and Lower Peninsulas, though it appears to be absent from the northern portion of the Lower Peninsula (MNFI 2018, Ecoanalysts Inc. 2020). In the Grand River, it has been collected live or as a fresh shell from Lyons Dam downstream to Fulton Street in Grand Rapids (Ecoanalysts Inc. 2018, Ecoanalysts Inc. 2020).

Creek Heelsplitter (Lasmigona compressa) (SC)

Creek Heelsplitter has an elongate shell that is thin and becomes thicker with age and is up to 8 cm (4 in) in length (Cummings and Mayer, 1992; Watters et al. 2009). The periostracum is yellow, tan, and/or greenish, frequently with rays in young individuals, turning brown to black with age (Watters et al., 2009; Cummings and Mayer, 1992). Creek Heelsplitter is bradytictic, with spawning occurring in June and July in Michigan. Creek Heelsplitter has more than 20 host fish species from several families, including Gar (*Lepisosteus* sp.), Carp family (Cyprinidae), Sucker family (Catostomidae), Catfish family (Ictaluridae), Sunfish (*Lepomis* sp.), and Darters (*Percidae*), many of which are present in the Grand River within Grand Rapids.

Creek Heelsplitter can be found throughout a watershed but is usually in creeks and headwaters of small to medium rivers (Cummings and Mayer, 1992). It was found in pools above and below riffles with compact sand and gravel, or mud patches near shore on the Huron River (Mulcrone 2018b, Ecoanalysts Inc. 2020). In larger rivers it occupies soft mud bottoms in slow-

moving currents near the edge of the river (Cummings and Mayer 1992, van der Schalie 1938, Watters 1995, Ecoanalysts Inc. 2020). In Michigan this species is found in creeks, headwater streams and small rivers throughout drainages in the lower and upper peninsula (Burch 1975, van der Schalie 1938, Ecoanalysts Inc. 2020). In the Grand River, live individuals and juveniles have been found in the Flat River and at Roselle Park, but not downstream of the 6th Street Dam through Fulton Street (Ecoanalysts 2018, Ecoanalysts Inc. 2020).

Flutedshell (Lasmigona costata) (SC)

Fluted Shell is elongate in shape with a moderately thick shell and is up to 18 cm (7 in) in length. The shell's posterior slope has prominent sculpturing consisting of about 10 – 12 heavy, rounded ridges or folds while more sculpturing is present on the lateral surface near the middle of the shell (Cummings and Mayer, 1992). The periostracum is smooth, and younger individuals often have green and brown rays while aged individuals lose color and become browner (Mulcrone, 2018c). Fluted Shell is bradytictic and likely spawn from June to July in Michigan (Lefevre and Curtis, 1912; Watters, 1995). Two glochidia forms have been observed for Fluted Shell with one presumably being able to forego the parasitic stage (Watters et al., 1998). Over 25 host fish species from several families have been reported, of which many are present in the Grand River within Grand Rapids.

In Michigan, it generally occurs in small to medium sized rivers in both the upper and lower peninsulas (van der Schalie, 1938, Burch 1975, Watters 1995, Ecoanalysts Inc. 2020). Live individuals including juveniles have been collected in the Flat River and the Grand River within the Action Area (Ecoanlysts Inc. 2020).

Paper Pondshell (Utterbackia imbecillis) (SC)

Paper Pondshell has an elongate shell that is very thin to transparent in younger individuals, reaching up to 10 cm (3.9 in) in length. The periostracum is smooth, yellow in younger individuals becoming brownish green in older individuals. Paper Pondshell is bradytictic and gravid females have been observed from April through September (Watters et al. 2009). Potential hosts are mainly from the Sunfish family, which are present within the Grand River thorough Grand Rapids.

Paper Pondshell typically occurs in slow-flowing pools and impoundments in soft sand and mud substrate (Parmalee and Bogan 1998, Williams et al. 2008, Watters et al. 2009, Ecoanalysts Inc. 2020). In Michigan, Paper Pondshell is found in the Kalamazoo, Manistique, Pere Marquette-White, St. Claire, and St. Joseph (Lake Michigan) (Badra 2010, Ecoanalysts Inc. 2020), as well as in Lake Erie (Mulcrone 2016, Ecoanalysts Inc. 2020). In the Grand River, live individuals and dead shells have been found from Lyons through Grand Rapids (Ecoanalysts Inc. 2018).

Status of Michigan State Threatened (ST) Fish

Lake Sturgeon (Acipenser fulvescens) (ST)

Lake Sturgeon the only native sturgeon species that inhabits Michigan. It is characterized by a large, torpedo-shaped body covered by rows of bony plates (scutes), a heterocercal tail, and a single dorsal fin (Auer 1999, Ecoanalysts 2020). Lake Sturgeon have a ventral, protrusible mouth with four barbels (Auer 1999, Ecoanalysts 2020). Lake Sturgeon range in color from dark slate to light brown or yellowish-olive (Smith, 1979; Pflieger 1997, Ecoanalysts 2020). Individuals greater than 40 years old are common, with individuals reported to be up to 150 years old (Scott and Crossman 1973; Pflieger 1997; Ecoanlaysts 2020).

Males mature between 12 - 16 years and females mature at 20 - 26 years. Spawning is initiated

when water temperatures reach 9 to 20° C (48 to 68° F) and spawning occurs between 11 and 18° C (52 and 64° F) (Scott and Crossman 1973; Ecclestone 2011; Chiotti et al. 2008); in the Grand River, the temperature range for initiation of spawning occurs between mid-March and early May. They spawn in or before rapids and at the base of dams (Hanshue and Harrington, 2017). Spawning sites are characterized by depths of 0.2 - 4.6 m (2 - 15 ft) with water current up to 3 m/sec (10 ft/sec) (Scott and Crossman 1973; Bruch and Binkowski 2002; Hanshue and Harrington, 2017) over clean rocky substrate in turbulent streams or rocky shoals in lakes in areas of sufficiently oxygenated water (Scott and Crossman 1973; Kempinger 1988; Pflieger 1997; Bruch and Binkowski 2002; Ecclestone 2011). The black, adhesive eggs hatch between 5 - 18 days depending on water temperature and young-of-year occupy their river of origin during the first few months of life and use shoal, run, and pool areas of large rivers with gravel and sand substrate (Holtgren and Auer 2004; Mann et al. 2011; Hanshue and Harrington, 2017). Juveniles in the Grand River seem to prefer shallow areas with sand substrate and moderate flow along river edges (Hanshue and Harrington, 2017).

The current range of Lake Sturgeon includes Arkansas, Indiana, Iowa, Kentucky, Missouri, Nebraska, Pennsylvania, Tennessee, Vermont, Michigan, Wisconsin, Minnesota, and South Dakota, though their status varies throughout their range. In Michigan, Lake Sturgeon occurs in the Great Lakes (Lake Michigan, Lake Superior, and Lake Huron), and several inland lakes and rivers. In Michigan it is known from 23 counties in Michigan's upper and lower peninsulas (MNFI 2018). Self-sustaining populations are found in the Sturgeon River, Menominee River, Black River, St. Clair River, and Detroit River (Hayes and Cafoffino 2012). An additional 19 populations are known to occur in Michigan, at population sizes of <25 adults to over 15,000 adults.

A small Lake Sturgeon population is known to occur in the mainstem of the lower Grand River and the mouth of the Grand River, but they are only believed to spawn near Plaster Creek and possibly near 6th Street Dam (M. Holtgren Encompass, pers. comm.). The Grand River population has been placed into the 'small declining' category based on a low estimated adult population size (n = 103) and declining population trajectory over the past 15 years (Hayes and Carrofino 2012). The 6th Street Dam is a barrier to spawning grounds of several Lake Michigan fish species, including Lake Sturgeon (Hanshue and Harrington 2017). MDNR biologists have reported adult and juvenile Lake Sturgeon, and incidental catch by fishermen has occurred near the 6th Street Dam. A population of between 66 and 130 fish of primarily older (>36 years) adults is estimated to occur in the lower Grand River (Hanshue and Harrington 2017).

River Redhorse (Moxostoma carinatum) (ST)

River Redhorse is a large-bodied sucker with a brown or olive coloration dorsally to brassy sides and white ventrally (Pflieger 1997; COSEWIC 2006). Crescent shaped dark spots are present on each dorso-lateral scale, caudal and dorsal fins are bright red in color, with pelvic and pectoral fins orange to red (Etnier and Starnes 1993; Pflieger 1997; COSEWIC 2006). Adults commonly reach 500 mm (1.5 ft) and up to 2 kg (4 lbs) (Pflieger 1997; Campbell 2001) and can weigh up to 7.7 kg (17 lbs) (Pflieger 1997).

River Redhorse reaches sexual maturity between three and five years (Etnier and Starnes 1993; Huston 1999) with northern populations reaching maturity later (COSEWIC 2006). Adults spawn each year, at temperatures between 18 and 24° C (64 and 75° F) (Mongeau et al. 1992; Jenkins and Burkhead 1993), which occurs between mid-May and late July in the Grand River. Evidence suggests that males excavate spawning redds tended by individual males (Hackney et al. 1967; Etnier and Starnes 1993; Pflieger 1997). Hatching occurs between five and six days post-fertilization (Jenkins

1970).

River Redhorse is found throughout the central and eastern Mississippi River system north from the Great Lakes Basin to the Gulf Slope from Florida to Louisiana (Etnier and Starnes 1993; COSEWIC 2006). This species is known from 24 states and two Canadian provinces (COSEWIC 2006). River Redhorse is known to inhabit lakes and rivers, but generally occurs in rivers with moderate to swift current and clean, rocky substrates needed for spawning (Scott and Crossman 1973; Becker 1983; Etnier and Starnes 1993; Pflieger 1997; Reid 2002; Reid 2003), with spawning individuals commonly collected within 100 m (325 ft) of rapids (Campbell 2001). River Redhorse inhabits rivers in 14 counties in Michigan's Lower Peninsula (MNFI 2018). In the Grand River, River Redhorse occurs throughout the entire Lower segment, from near Lyons to Grand Haven near the mouth of Lake Michigan and upstream into the Maple River (Hanshue and Harrington 2017). They were recently collected between 6th Street Dam and Fulton Street and were recently observed in spawning condition within the Action Area (S. Hanshue MDNR, pers. comm.). They also spawn in the Flat River, Maple River, and Fish Creek (S. Hanshue MDNR pers. comm.).

EFFECTS OF THE ACTION

The effects of the action are all consequences to listed species or critical habitat that are caused by the proposed action, including the consequences of other activities that are caused by the proposed action. A consequence is caused by the proposed action if it would not occur but for the proposed action and it is reasonably certain to occur. Effects of the action may occur later in time and may include consequences occurring outside the immediate area involved in the action (50 CFR 402.02). The following effects analysis analyzes both the effects of both of the proposed actions considered in this BO, the NRCS WFPA Project and the City/GRWW Project. All indirect effects are attributed to the NRCS WFPA Project, while direct effects will result from both proposed action and are described specifically for each project.

Direct Effects

The construction area for the NRCS WFPA Project spans from 91 m (300 ft) upstream of Bridge Street to Fulton Street (127,600 m2 (31.5 acres)). Of this 47,415 m2 (11.7 acres) would be directly impacted during construction. The direct impact area includes impact from causeways constructed in the river for access, construction of the cofferdam for Dam 2, substrate placement, grading, temporary scour protection, and general equipment tracking on the river bottom.

While the goal of the City/GRWW Project is to salvage and relocate animals from all direct impact areas within the NRCS WFPA Project direct impact areas, diving conditions may prove challenging depending on conditions within the Grand River that make such activity unsafe. At a minimum mussels will be salvaged and relocated from the isolation area for Dam 2 (3,285m2). Any fish including state listed fish within this isolated area will be released alive. The construction team would wait for fish and mussels to be moved from within the isolation area before construction could begin. This would require approximately 10 days of salvage effort.

Success of mussel relocations, in terms of conservation and survival of mussels, depends on several factors, including substrate stability, microhabitat requirements, methods of relocation, and timing (Cope and Waller 1995; Cope et al. 2003; Dunn and Sietman 1997; Dunn et al. 2000; Hamilton et al. 1997, EcoAnalysts 2020). Relocations with low mortality (< 1%) after one year have been linked to relocation sites with stable or consolidated substrate, species-specific habitat requirements, and careful handling of mussels (Dunn and Sietman 1997; EcoAnalysts 2020, 2024). The relocation will be conducted in accordance with the collection and translocation

procedures outlined in the BA and summarized in this Opinion (EcoAnalysts Inc. 2024) and the Michigan Mussel Survey Protocols and Relocation Procedures (Hanshue et al. 2019).

Despite conducting salvage and relocation activities in accordance with survey and relocation protocols, mussels still have the potential to be negatively impacted by relocation activities. Cope and Waller (1995) reported low recovery (51%) and survival (43%) following relocation due to extreme air and water temperatures, improper collection methods, handling, and transport, and a poor recipient site. Relocation studies conducted since then have demonstrated that proper handling protocols and relocation conditions such as air and water temperatures, play a significant role in reducing mortality during relocation (Ecoanalysts 2020; Dunn et al. 2000; Cope et al. 2003; Tsakiris et al. 2017). In addition to looking at survival, other studies have also looked at growth, body, condition, and movement in relocated animals versus resident animals and found no difference (Dunn et al. 2000; Tsakiris et al. 2017). However, Roznere et al. (2017) did find difference in metabolites between mussels moved to their captive facility and to Big Darby Creek from the Muskingum River, and suggested that the differences in these metabolites were consistent with physiological processes that would result in reduced growth, and mortality. The translocations analyzed in Tsakiris et al. 2017 and Dunn et al. 2000 moved mussels within the same river, whereas Roznere et al. (2017) moved mussels to a captive facility and a different river system. Results from studies looking at growth due to handling also differed. Dunn et al. (2000) and Tsakiris et al. (2017) handled mussels that remained in the recipient site and those relocated to the recipient site similarly and did not observe any change in growth that could be attributed to handling. In contrast, Haag (2009) reported a reduction in growth when mussels were only handled once a year for two years, whereas Ohlman and Pegg (2020) did not see any changes in growth and survival with no handling, handling every other week, once a week, and twice a week for 85 days. These studies used different species with different growth rates, which could influence study results. Regardless, it is clear that activities associated with relocation including air and water temperature during relocation, handling, transport, and relocation site conditions, could result in elevated stress levels in mussels, resulting in reduced growth rates and mortality in some species.

The capture, handling, temporary holding, and transport, of Snuffbox and state listed mussels during salvage and relocation have the potential to cause increased physiological stress, resulting in disruption of spawning and fertilization, growth, and feeding. While stress associated with salvage and relocation is reduced due to proper handling, the salvage effort within the isolation area presents some unique conditions including potentially elevated water temperatures and exposure due to dewatering. Due to increased physiological stress during relocation, we expect any Snuffbox and state listed mussels relocated will suffer harm in the form of impairment of essential behavior patterns. Of the freshwater mussels relocated, a small subset that are relocated may be harmed and killed (5%).

During salvage operations not all mussels are detected (e.g., juveniles, small bodied mussels, deeply burrowed individuals). Incidental take has been calculated at salvage rate of 85% for the isolated area, typically we estimate 80% detection rate, but given proposed salvage approach the City/GRWW anticipates a slightly higher detection rate. This accounts for up to 5% of the 85% collected, suffering mortality due to handling stress. Mussels that are not detected during salvage efforts in the isolated area will be killed due crushing, injury, smothering due to fill, or desiccation from exposure in unwetted areas (15%).

Snuffbox and state listed mussels that are not salvaged and relocated from any of the NRCS

WFPA Project direct impact areas will suffer direct harm or be killed due to direct mortality from crushing, injury, smothering due to construction activities, fill, or desiccation from exposure in unwetted areas. There is some uncertainty as to when NRCS WFPA Project in river construction activities will begin. Therefore, gravid females of Snuffbox and state listed mussels may be present. Species that are bradytictic (e.g., long term brooders), such as Snuffbox and state listed species including Paper Pondshell, Fluted Shell, Creek Heelsplitter, Elktoe, Ellipse, Pink Heelsplitter, Slippershell, Lilliput, and Black Sandshell, may have glochidia present in themarsupial gills of brooding females. Any glochidia present are likely to be injured, crushed, killed or experience decreased survival if released prematurely. The City/ GRWW Mitigation Fund would be adjusted according to the actual salvage efficiency.

River Redhorse and Lake Sturgeon are expected to vacate the NRCS WFPA Project construction area prior to commencement of construction activities and therefore will not suffer any direct impacts as a result of construction. Small species that are less mobile (e.g., *Cyprinidae, Percidae*), some of which serve as hosts for state and federally listed mussels, have the potential to suffer direct mortality through crushing, injury, and stranding, if they do not move out of the construction areas. Additionally, any species that use the area where construction is planned for spawning, have the potential to suffer reduced recruitment if construction activities coincide with spawning either resulting in disruption of spawning behavior or mortality of eggs and larvae. It is thought that River Redhorse spawning habitat may be present within the construction area. However, construction would be limited to lower water levels and therefore project construction should not overlap with spawning given that it occurs during higher water months such as April-early June. If construction does extend into early spring, the construction area will be unavailable for spawning and could result in a temporary loss of recruitment.

Operation, Maintenance, Repair, Rehabilitation, or Replacement

Operation, Maintenance, Repair, Rehabilitation, or Replacement (OMRRR), of structures post NRCS WFPA Project construction and project completion could require the tracking of equipment into the wetted channel. Mussels within these areas will be killed due to crushing, injury, and smothering due to fill. River Redhorse and Lake Sturgeon should be impacted by this work given that they are likely to simply move out of the area. Other smaller species that are less mobile, may suffer direct mortality as well due to injury or crushing. The maximum area potentially affected by OMRRR, is 10,000 m^2 (2.5 acres).

Indirect Effects

Mussels have the potential to be indirectly affected by the NRCS WFPA Project outside of all direct impact areas (80,185 m2 (19.8 acres)) within the construction area (upstream buffered area of Dam 4 downstream to Fulton Street) (Construction Indirect Impact Area). These areas would be indirectly impacted by temporary increases in turbidity and changes in hydraulic conditions associated with in river construction between Dam 4 and Fulton Street. Scouring of the existing riverbed outside of direct impact areas within the Construction Indirect Impact Area is not anticipated during construction. Upstream of Dam 4 to the 6th Street Dam (Upstream Indirect Impact Area, 38,420m2) is unlikely to be significantly impacted by increased turbidity and hydraulic changes given that the construction area is immediately around Dam 4. Downstream of Fulton Street (Downstream Indirect Impact Area) will likely result in increased turbidity during construction and may cause nutritive stress and potentially reproductive failure in mussels during construction. Turbidity plumes would be temporary and are not expected to cause mortality.

The majority of construction activities will be conducted within the wet and flowing channel

including: demolition of low-head dams (1,3, and 4), construction/removal of causeways, construction/removal of cofferdam for Dam 2, substrate placement, grading, temporary scour protection, and general equipment tracking on the river bottom. The work would be performed with excavators, loaders, dump trucks, and other common earth moving equipment. A total area of 80,185 m2m^2 within in the Construction Indirect Impact Area and 282,600 m2 downstream of the construction area (Downstream Indirect Impact Area, Fulton Street to Plaster Creek) will be indirectly impacted as a result of these construction activities and may experience significant hydraulic changes, increased turbidity, and changes in host fish distribution.

Intermittent exposure to inorganic Total Suspended Solids (TSS) at high levels (>600 mg/L) can cause nutritive stress, resulting in decreased growth and reproduction (Ecoanalysts 2020, Aldridge et al., 1987). Feeding of some species declined as organic TSS increased, with a threshold at 8 mg/L over a seven-month period (Gascho Landis et al., 2013; Gascho Landis and Stoeckel, 2016; Tuttle-Raycraft et al., 2017), and reproduction was affected at TSS >20 mg/L (Gascho Landis and Stoeckel, 2016). M ussels within these indirect impact areas within the Indirect Impact Area and Downstream Indirect Impact Area (Fulton Street to Plaster Creek) may experience disruption of normal respiration, feeding, growth, and reproduction, impairing essential behavior patterns resulting in harm. Snuffbox are present within the Construction Indirect Impact Area and will be harmed. Snuffbox were found at the I-196 bridge but were not detected in surveys between Plaster Creek and Fulton Street. Therefore, we do not expect Snuffbox to be impacted within the Downstream Indirect Impact Area.

Mussels outside of the area where construction is planned that are upstream (from Dam 4 to the 6th Street Dam) will also likely be indirectly affected by changes in hydraulic conditions. These individuals may be temporarily stressed. However, the severity of these effects is likely to be less given that these areas are further from direct impact areas and are unlikely to experience significant elevated levels of turbidity, thus mussels in this upstream indirect impact area are unlikely to adverse effects that rise to the level of harm.

Lake Sturgeon and River Redhorse may be present within the downstream indirect impact area (Fulton Street to Plaster Creek) and may experience temporary increases in turbidity. Both species spawn within this area near the mouth of Plaster Creek. Given that the mouth of Plaster Creek is 2.5 km (1.6 miles) downstream of the Construction Area, turbidity should be minimal, and spawning should not be significantly impacted Small species that are less mobile such as log perch, may not be able to move out of the Construction Area and may remain within indirect impact areas within the Construction Area and downstream. Behavioral changes and increased physiological stress may result (Ecoanalysts 2020).

The NRCS WFPA Project Construction Indirect Impact Area includes a total area of 80,185 m2 and the Downstream Indirect Impact Area is 282,600 m2.

Sea Lamprey

One of the primary concerns of the USFWS is the ability to maintain the 6th Street Dam as an effective sea lamprey barrier for the Grand River Watershed during and after the proposed construction of the NRCS WFPA Project. Sea lamprey treatment and survey activities using lampricides could negatively impact freshwater mussels and host fish in the upper Grand River if an escapement event occurs during or post-construction. The Sea Lamprey Control Program (SLCP) uses the lampricides TFM (3-trifluoromethyl-4-nitrophenol) and Bayluscide® [active ingredient:
5-Chloro-N-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide] to control sea lampreys in the Great Lakes. TFM and the TFM/1% niclosamide mix is applied to streams to kill larval sea lampreys

The granular formulation of Bayluscide [Bayluscide 3.2% Granular sea lamprey Larvicide, granular Bayluscide (gB)] is applied in lentic and lotic systems that are too large to be treated economically with the liquid lampricide formulations, and to survey for larval sea lampreys in areas that are too deep to effectively electrofish with AbP-2 backpack electrofisheing gear (C. Kaye, SLCP Risk Assessment pers. comm. 2020). Niclosamide, the active ingredient in Bayluscide, was first developed as a molluscide to kill snails. The granular form of Bayluscide, targets benthic larval sea lamprey habitat and therefore freshwater mussels can be particularly at risk when present within the vicinity of Bayluscide applications.

Boogaard et al. (2015) tested the toxicity of TFM on multiple life stages of the Snuffbox mussel. The study evaluated the effects of TFM on glochidia, one week old juveniles, and logperch, as well as glochidia, one week old juveniles, and adults of the ellipse (*Venustaconcha ellipsiformis*) mussel as a surrogate to the snuffbox for direct toxicological comparison. The study also evaluated juvenile recruitment success from glochidia (larval) infested logperch exposed to multiple levels of TFM. This work demonstrated that there was minimal toxicity to the larval and juvenile stage of both the ellipse and snuffbox mussels, as well as the adult stage of the ellipse mussel at concentration ratios greater than what is required or typically used to kill larval sea lampreys in streams (USFWS 2013). A comparison of the results to snuffbox glochidia indicates the life stage of the two species respond similarly to TFM. Survival was high among both species at concentrations greater than what would be encountered during treatments suggesting the risk from direct exposure to TFM is low (USFWS 2013). In the natural stream environment, glochidia are distributed directly on the gills of logperch by female snuffbox (USFWS 2013). Glochidia that are inadvertently distributed into the water column (free-floating) have almost a 100 percent chance of dying (USWFS 2013). The viability test conducted during 2011 on free-floating snuffbox glochidia demonstrated that viability decreased rapidly beginning at 12 hours after extraction (USFWS 2013). These results suggest, along with the recruitment tests where juvenile fall-off was not significantly different between the exposed and control fish, that there would be greater survival of glochidia encysted on gills (as opposed to free-floating) at concentrations tested (USFWS 2013). Results from toxicity tests on 1 week old juveniles suggest that there is no risk up to the highest concentration ratios for the snuffbox mussel and that ellipse juveniles may be more at risk at higher concentrations, although these concentrations would not be applied in the field (USFWS 2013).

Boogaard et al. (2015) also looked at the toxicity of TFM to adult logperch. Logperch were exposed to concentration levels of TFM that are typically used in the field to kill sea lampreys in streams. Exposure duration was 12 hours followed by a 12-hour post-exposure period after which mortality of logperch was assessed. Minimum lethal concentrations (MLC) for sea lampreys in this study were 2.1 mg/L. MLC values are based on concentrations of TFM required to kill 99.9% of sea lamprey larvae calculated from the pH and alkalinity of the test water (Adair and Sullivan 2009). Mortality of logperch was 15% at 2.1 mg/L TFM, but 65% at 2.7 mg/L TFM (1.3 x MLC). However, several field studies and non-target mortality observations differ from these lab results including a study by Langdon and Fiske (1991) where logperch were captured at the same rate during 2 pre-treatment surveys and 1post treatment survey in an area that had the highest mean concentration of TFM (4.7 mg/L TFM) and exposure time (11h). Another long-term study (Schuldt et al. 1996) reported 100% logperch survival in a cage study during five lampricide treatments. Kirkeeng et al. (in review) reported 90 – 100% survival of logperch between 1.0 and 1.4×MLC TFM (USFWS SLCP 2024). Survival then dropped to 55% at 1.7×MLC TFM (USFWS SLCP 2024). Until further test are conducted and prove otherwise, logperch are considered sensitive to TFM, having the potential for high levels of mortality (85%

mortality at treatments levels of 1.5 MLC) based on laboratory results. Given their critical role in snuffbox reproduction as the primary host fish, direct mortality or sub-lethal effects to logperch have the potential to impact snuffbox reproduction, which may thereby impact abundance and distribution of the mussel.

A study conducted by Newton et al. (2017) investigated the risk of mortality and sub-lethal effects (probability and duration) as a function of exposure duration among adult and sub-adult mussel species exposed to environmentally relevant concentrations of Bayluscide. Eight species of mussels were chosen based on availability and potential overlap with sea lamprey larval habitat. At each exposure duration, mortality was estimated, and a suite of sub-lethal responses including siphoning activity, gaping valves, production of mucus, and rigid foot extension was recorded. Mortality, over all exposure durations, 21 days after exposure, averaged 42% in sub-adults (range, 23-54%) and 20% in adults (range, 3-44%). For those species tested (*O. olivaria and V. iris*) as both sub-adults and adults, mortality was similar between life stages for *O. olivaria* (~23%) but more than twice as high for sub-adult (mean, 38%) compared to adults (mean, 14%) for *V. iris* . There were positive associations between duration of Bayluscide exposure and mortality in all four species exposed as sub-adults and in four of the six species exposed as adults. These results were the same positive associations seen between duration of exposure and sub-lethal responses in all four species of exposed sub-adults and four of the six species exposed as adults. Bayluscide results in mortality of mussels and indicates that the duration of exposure plays a significant role in the magnitude of mortality among mussels. This study demonstrated the longer mussels are exposed to Bayluscide the greater the mortality and sub-lethal effects. Both adults and sub-adults were sensitive to exposure, but sub-adults were affected by Bayluscide sooner (Newton et al. 2017).

While unionids absorb lampricides and experience narcotization (gaped shell and sometimes foot extended), toxicity studies have indicated that TFM exposure would not result in acute mortality at concentrations required to kill sea lamprey during stream treatments (Kaye 2021 pp. 1–50). Boogaard and Waller (2004 p. 12). Bills et al. (1992) reported that 90% of Pink Heelsplitter survived when exposed to 3.5 mg·L-1 TFM (1.0 × MLC) for 12 hours. However, only 30% survived a 12-hour exposure of 5.25 mg·L-1 TFM (1.5 × MLC). The authors noted that static tests are a worst-case scenario and surmised that survival would be higher in a stream environment. Waller et al. (1998 pp.116–118) stated that both Threehorn Wartyback and Wabash Pigtoe would survive stream treatments at TFM concentration ratios of 1.3 and 1.4 × MLC. A study conducted to test several compounds for the potential control of zebra mussels (*Dreissena polymorpha*; Bills and Waller unpublished data) found no mortality of the Pimpleback (*Cyclonaias pustulosa*), Three Ridge (*Amblema plicata*), and Pink Papershell (*Potamilus ohiensis*) held in TFM concentrations up to 8.4 mg·L-1 (3.4 × MLC) for 12 hours, and 20% mortality of the Deertoe (*Truncilla truncata*) in 6.7 mg·L-1 (2.7 × MLC; MLC = 2.5 mg·L-1). These concentrations were much greater than what would typically be applied to a stream (1.1–1.8 × MLC; Kaye 2021 pp. 5–6; L. Crieger personal communication, 2020).

Boogaard et al. (2004 pp. 1–17) reported that TFM and TFM-1% niclosamide did not produce substantial mortality among three unionid mussel species [Giant Floater (*Pyganodon grandis*), Fragile Papershell (*Leptodea fragilis*), Pink Heelsplitter (*Potamilus alatus*)] tested at concentrations typically applied during stream applications to kill larval sea lamprey. Both lampricides were more toxic to larval sea lamprey than to any of the unionid species tested. The giant floater experienced the highest mortality, which the authors attributed to the added stress of handling and holding conditions in river water at temperatures as high as 27 °C. They stated that the species can often experience a natural die off during mid to late summer (Boogaard & Waller

2004 pp. 1–17).

Waller et al. (2003 pp. 546–550) found that acute mortality did not occur when Eastern Elliptio (*Elliptio complanata*) and Eastern Floater (*Pyganodon cataracta*) juveniles and adults were exposed to TFM up to 1.6 × MLC in a mobile bioassay trailer at the White River, tributary to the Bad River (Ashland County, Wisconsin). Acute mortality of Eastern Elliptio juveniles and adults did not occur when exposed to TFM-1% niclosamide up to 1.9 × MLC. Concentrations routinely applied in the Bad River system range from 1.0–1.7 × MLC (C. Gagnon personal communication, 2020). Even at the highest concentrations, mortalities were not significantly different from the controls. However, survival was greater for Eastern Elliptio than for the Eastern Floater, and for adults relative to juveniles. Waller et al. (2003 p. 550) also found that trials conducted at lower water temperatures (13 °C versus 21 °C) resulted in higher mussel survival.

To date, no toxicological data exists on the effects of lampricide for the state listed fish species of concern with the exception of Lake Sturgeon. If the upper Grand River were proposed for a lampricide treatment, the presence of Lake Sturgeon in the mainstream would be a factor in scheduling the dates of treatment. Young Lake Sturgeon are quite sensitive to lampricide in high alkalinity streams like the Grand River. At the risk of killing larval and juvenile Lake Sturgeon during treatment, the SLCP has been asked by the State of Michigan DNR-Fisheries, Little River Band of Ottawa Indians, and USFWS-Lake Sturgeon restoration teams to treat high alkalinity Lake Sturgeon streams with significant populations, late in the season, preferably after August 15, but before the beginning of the salmon spawning run in September. This provides for a narrow window in which to treat the stream. Mitigation efforts would include the removal of young Lake Sturgeon prior to treatment, aerated tank holding, and release after the treatment to reduce the risk of mortality from lampricide. Communication and coordination of this effort begins in May of the treatment year since there is a large amount of equipment required (boats, sturgeon removal equipment and aerated tanks/trailers) and people to conduct the work.

A two-year evaluation (2014 and 2015) was conducted to determine the larval and juvenile sea lamprey production potential upstream of the 6th Street Dam (GLFC 2015; Ecoanlaysts 2020). The survey focused on documenting native lamprey as an indicator because they prefer the same habitat as sea lamprey and also quantifying suitable larval rearing habitat. Native lamprey were found in 463 km (287 mi) of the Grand River watershed upstream of the 6th Street Dam. Within that area there is approximately 2,957,701 m^2 (730 acres) of Type I habitat (preferred mix of sand and fine organic matter) and 6,396,646 m^2 (1,580 acres) of Type II habitat (acceptable shifting sand with no fine organic matter). Areas with Type I and II habitat include Bear, Bellamy, Crooked, Fish, Honey, Libhart, and Lowell Creeks, and Grand and Maple rivers. If sea lampreys managed to successfully pass the 6th Street Dam, 3,058 km (1,900 miles) could potentially be infested which would make the Grand River one of the most productive tributaries to Lake Michigan (GLFC 2018, Ecoanalysts Inc. 2020).

Infested stream reaches would need to be treated with lampricides every three to four years. Given the size of the Grand River and the volume of water that would require treatment, the most reasonable choice of treatment options would be the use of the TFM/1% niclosamide mixture. There are no data, however, on the effects of the TFM/1% niclosamide mixture to adult Snuffbox. All aspects of the previous study would need to be repeated with the TFM/1% niclosamide mixture to further assess the risk to the snuffbox if this treatment approach is to be considered. Treatment in tributaries generally involves applying lampricides from upstream of a known larvae distribution to the mouth of a streams with 1.5 x MLC for 12 hours. If larvae were found in the Grand River proper, treatment would extend from upstream of the larval habitat to

the nearest barrier, the 6th Street Dam.

The potential risk of sea lamprey escapement at the 6th Street Dam and the subsequent ecological risk that lampricides pose to the watershed, specifically freshwater mussels and their host fish, caused significant concern about the project. The NRCS WFPA Proposed Action reflects significant modification in project design and construction based on these ecological concerns from partners. The ability to maintain a significant difference between the barrier crest and tailwater elevation during springtime flows is a key component of the blockage criteria considered at sea lamprey barriers. Water temperature and velocity are also important factors. Literature indicates that sea lamprey is blocked by endurance swimming limits of 2.5 m/second (sec) (8.2 ft/sec) for 3 m (10 ft), burst speed limit of 4 m/sec (13.1 ft/sec), or a jumping barrier of at least 46 centimeters (cm) (18 in) (Hansen 1980; Hunn and Youngs 1980; McAuley 1996) and impeded at velocities >1 m/sec (3.28 ft/sec) (Almeida et al. 2007; Quintella et al. 2009). Water temperature also affects passage; burst speed and endurance is substantially reduced at water temperatures <10○ C (50○ F) (Applegate 1950; McAuley 1996).

The tailwater velocity and jumping pool barrier at the 6th Street Dam are primarily a function of tailwater elevation during the time of sea lamprey migration. Tailwater elevations were modeled over a range of typical flow rates through a given year and compared under existing, temporary, and 2024 Project conditions. Scour protection would be installed before the Dam 2 area is isolated in July/August (after sea lamprey spawning season). The temporary causeway and scour protection would be removed before the end of the construction season at the latest (not left in over winter). The additional material in the river has been modeled to have minor (0.01 ft) impact on tailwater elevation at 6th Street Dam and would not be in the river during sea lamprey spawning season. Changes to project design and construction sequence resulted in decreases or negligible changes in tailwater elevation with low probability of occurrence and were determined to have no adverse impacts to sea lamprey blockage effectiveness at the 6th Street Dam (P. Hrodey USFWS, personal communication, October 10, 2019, and 2024, Ecoanalysts 2020, 2024). Blockage criteria for sea lampreys at 6th Street Dam would be maintained through construction and post-construction for the NRCS WFPA Project.

Mitigation

The intended design of the NRCS WFPA Proposed Action is to enhance habitat for aquatic species. If aquatic habitat within the construction area improves from the current baseline condition, it is possible that long term, mussels will reseed this area, perhaps at higher densities than are currently there. If mussels are restored within this area, it is possible that the mussel community as a whole will be more abundant and diverse. However, there is a significant amount of uncertainty regarding creation of aquatic habitat suitable for freshwater mussels. The actual project impacts and benefits to state and federally listed mussels cannot be anticipated given the complexities affecting the presence of mussel communities. It is uncertain what the actual as-built river features performance will be in terms of suitability for mussel-host fish presence and movements, substrate changes, maintenance activities, impact of new hydraulics on habitat, and influence of the project on sea lamprey escapement. As a result, of the impacts resulting from the NRCS WFPA Project and the uncertainty around the successful creation of suitable mussel habitat, a Mitigation Fund will be established as part of the proposed action to fund conservation measures that have significant benefits for mussels. Priority will be given to projects that provide a direct benefit to mussels in the NRCS WFPA Project Area and/or in the lower Grand River. This fund is being established to mitigate the loss of state and federally listed species within the NRCS WFPA Project Action Area.

The purpose of the fund will be to support conservation measures that significantly benefit state and federally listed mussels into the future after completion of the NRCS WFPA Project. The intent of the Mitigation Fund would be to off-set impacts as a result of incidental take. The amount of the Mitigation Fund would vary based on salvage and relocation efficiency and essentially the total amount provided would vary with changes in mussel take. The Mitigation Fund will be used to continue efforts to conserve mussels in the Grand River such as improving and restoring aquatic habitat to benefit freshwater mussels in the Lower Grand River, performing surveys to locate other freshwater mussel populations, potentially a propagation effort, as well as other conservation actions that may improve water quality and riparian corridors, all of which will benefit Snuffbox, state listed species, and the freshwater mussel community as a whole. Therefore, while the intent of the Mitigation Fund is to offset impacts to Snuffbox and state listed mussels, the effects of this part of the proposed action will be wholly beneficial in the form of mussel conservation actions within the Grand River into the future.

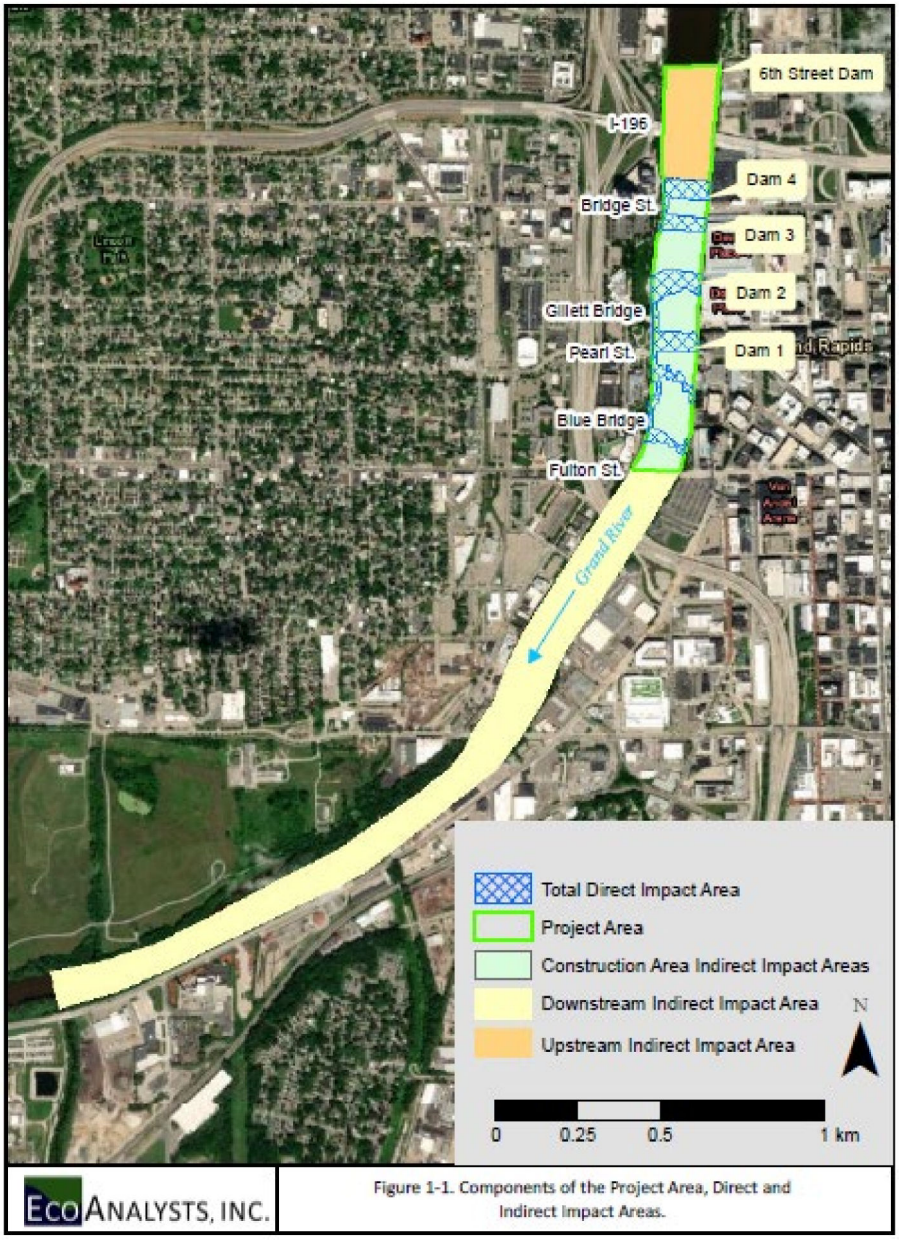


Figure 2: Direct and Indirect Impact Areas (Source: Ecoanalysts BA 2020, Figure 1-1)

Summary of Effects

Surveys conducted by Ecoanalysts Inc. to determine mussel distribution, mussel density, and species composition utilized a combination of semi-quantitative, quantitative, and qualitative survey methods (Dunn 2000). Semi-quantitative sampling consisted of searching a given area visually and tactually. Quantitative sampling consisted of excavating all substrate within a 0.25 m^2 quadrat to a depth of 15 cm (6 in). Semi-quantitative and quantitative sampling were supplemented with qualitative sampling in areas most likely to contain federal and state listed species to better estimate species richness and recover listed species. Qualitative sampling consisted of collecting as many individuals as practicable in higher density areas for 5 to 20 minutes and was geared towards finding rare species (Kovalak et al. 1986).

The area from the 6th street Dam upstream 1 mile, the NRCS WFPA Project Area, a portion of the indirect impact area below Fulton Street (500 m below), and Riverside Park were sampled in 2013 using quantitative, semi- quantitative, and qualitative methods (ESI 2014). The area from the 6th Street Dam upstream 1 mile was also quantitatively sampled in 2015, 2016, and 2017, and the NRCS WFPA Project Area was quantitatively sampled in 2016, 2017, and 2020 (ESI 2016; EcoAnalysts, 2018, 2021). Sites between Ada and Grand Rapids (Ionia, Saranac, Flat River, Chief Hazy Cloud, Ada, and Site 7) were qualitatively and quantitatively sampled in 2015 (ESI 2016). Peace Park and Roselle Park were quantitatively sampled in 2016 (ESI 2017), and Roselle Park was also quantitatively sampled in 2017 (EcoAnalysts 2018). Sites near Plaster Creek and the M-11 Bridge downstream of Plaster Creek were qualitatively sampled in 2017 (ESI 2018) and semi-quantitatively sampled in 2018 and 2020 (EcoAnalysts 2019, 2021).

Mussel density from the 6th Street Dam downstream to Fulton Street was calculated each year based on quantitative sampling:

1. 2013 – average density was 0.6 mussels/m^2 (95% CI=0.2 to 1.0 mussels/m^2, although samples were biased toward higher density areas);
2. 2016 - average density was 0.3 mussels/m^2 (95% CI=0.1 to 0.5 mussels/m^2);
3. 2017 – average density was 0.3 mussels/m^2 (95% CI=0.2 to 0.5 mussels/m^2); and
4. 2016 and 2017 – average density under the I-196 Bridge was 0.25 mussels/m^2 (Cardno, 2017).
5. 2020 - average density was 0.3 mussels/m^2 (95% CI=0.2 to 0.5 mussels/m^2)

The density for Snuffbox and all state listed mussels was based on the total average density of freshwater mussels between the 6th Street Dam and Fulton Street. Therefore, the density of Snuffbox within the upstream indirect impact area and the Construction Area is based on the total average density of all freshwater mussels, which is 0.3 mussels/m^2 (ESI 2016, 2017; EcoAnalysts 2018, 2021; Cardno 2017). The density of state listed mussels is also based on the total average density of all freshwater mussels, 0.3 mussels/ m^2, upstream of the 6th Street Dam and the NRCS WFPA Project area. Within the downstream indirect impact area, from Fulton Street to Plaster Creek density averaged only 0.1 mussels/m^2 (ESI 2018; EcoAnalysts 2019). Recent surveys in potential dredge areas found 0-2 mussels per 5-minute search and .0.9unionids/5-meter semi-quantitative sample near the mouth of Plaster Creek (ESI 2018; EcoAnalysts 2019). The density near the bank of the I-196 South Bridge was 0.9 unionids/m2 and Snuffbox were found in the relocation of the I-196 bridge (GEI 2023). The number of snuffbox and state listed mussels within the NRCS WFPA Project Action Area and the City/GRWW Project Action Area was calculated by taking the average density multiplied by the impact area multiplied by the relative abundance for each species rounded to the nearest 5 (Ecoanalysts 2020, 2024). The relative abundance of each species was calculated by taking the

percent of the total and is based off the total mussels collected by ESI in 2013, 2016, 2017, and Cardno in 2016 and 2017 (ESI 2014, 2017; Ecoanlysts 2018; Cardno, 2017).

Salvage and relocation would at a minimum be conducted within the isolated area for Dam 2. Outside the isolated area for Dam 2, mussels from within each direct impact area would salvaged and relocated in workable flows. The direct impact areas would be divided into 5 x 10 m blocks within workable flow areas. Workable flow would be defined as current velocity in which the diver/snorkeler can maintain position (not be swept downstream) within the block and collect mussels. Blocks would be further divided into smaller 2 m x 1 m grids using a 3/8 inch metal that would lay flat on the river bottom grid. Each 2x1 grid is split into 1m x 1m cells and would be searched individually. Each of the 1 m x 1 m cells would be visually searched for habitat and mussels (visual search). If no habitat (bedrock or entirely non-movable rock) is found, then that 1 m2 is clear. If habitat and/or mussels are found, that 1 m2 would be excavated down to 15 cm (6 inches), collecting any mussels that are found (first pass) with and average search effort of 2 min/m2. That 1 m2 would be excavated a second time (second pass) with an average search time of 2 min/m2, and if <5% of the mussels are collected on the second pass compared to the completed first pass and no state and federally listed species are found, then the 1 m2 would be declared clear. If not, it would need to be searched again until the <5% criteria and no state and federally listed species found threshold, is reached. Searching would require an average of 2 min/m2 Once the entire 2 m x 1 m grid is clear, the 2 m x 1 m grid would be moved to the next 2 m x 1 m grid.

Incidental Take has been calculated for the "worst case scenario," which is salvage and relocation limited to the isolated area for Dam 2. Collection efficiency in this area is expected to be 85%; however, up to 5% mortality could occur from handling, and it is estimated that 15% of the mussels would not be detected and therefore suffer mortality as well. The maximum mitigation fund contribution would be based on $34.10/mussel (2020 BA $28.50/mussel escalated for inflation) and would not exceed $456,743 (Table 2-13 updated in 2024 BA). This fund would be reduced by the amount of mussels that are expected to survive translocation (i.e., relocated minus the 5% of relocated animals anticipated to be lost due to handling stress). The mitigation fund contribution may not be reduced by a percent greater than the percent of area cleared (i.e., area of quadrats cleared from the total area of the direct impact areas). Prior to reducing the funding, the proportion of areas cleared as result of a determination of non-diggable rock must be compared to prior survey efforts to help ensure that estimates of mussels impacted are consistent with the 2024 BA.

The following tables summarize the total number of Snuffbox and state listed mussels that are likely to be harmed broken down by the specific activity within the overall proposed action. Death may occur due to direct interactions or indirect effects that result in impairment of essential behavior patterns. We did not break down the number of state listed mussels by species, but rather used the cumulative relative abundance of all state listed mussels to calculate harm. Given that the role of the overall health and abundance of the mussel community in the Action Area is critical to assessing impacts to the localized population of Snuffbox. As a result, the impact to state listed species as a whole seemed most appropriate.

Table 2: Predicted Number of Snuffbox and State Listed Mussels in Direct Impact Area excluding the Isolated Area for Dam 2 Harmed:

Total Direct impact Area Excluding Isolated Area = 44,130 m^2

Average Density of Freshwater Mussels within the Construction Area = .3 mussels/ m^2

Relative Abundance of Snuffbox = .90%

Relative Abundance of State Listed Species = 13.20 %

Number of Snuffbox within the Direct Impact Area Excluding Isolated Area = .90% *(44,130m2*.3 Snuffbox/m^2) = 119 Snuffbox

Number of state listed species within the WIW area = 13.20% *(44,130m2*.3 state listed mussels/m^2) = 1,748 state listed species

Total Number of Snuffbox Killed in Direct Impact Areas Excluding Isolated Area Areas = 119

Total Number of State Listed Species Harmed Due to Direct Mortality in WIW Areas = 1,748

Table 3: Predicted Number of Snuffbox and State Listed Mussels Present in Isolated Area for Dam 2:

Total Salvage Area within Isolated Area = 3,285 m^2

Average Density of Freshwater Mussels within the Construction Area = .3 mussels/ m^2

Relative Abundance of Snuffbox = .90%

Relative Abundance of State Listed Species = 13.20%

Number of Snuffbox within the Salvage area = .90%*(3,285m2*.3 Snuffbox/m^2) = 9 snuffbox

Number of State Listed within the Salvage area = 13.20%*(3,285*.3 state listed mussels/m^2) = 130 State Listed mussels

Total Number of Snuffbox in the Salvage Area = 9

Total Number of State Listed Mussels in the Salvage Area = 130

Table 4: Snuffbox and State Listed Mussels Detected During Salvage Operations Harmed Due to Increased Physiological Stress Impairing Essential Behavior Patterns:

The number of Snuffbox and state listed mussels detected during salvage operations that have the potential to be harmed due to increased physiological stress that impairs essential behavior patterns. Snuffbox and state listed mussels that are present within the isolated area that are salvaged have the potential to be killed due to direct interactions. Therefore, of the Snuffbox and state listed mussels detected (85% detection rate), a small number (<5%) of Snuffbox and state listed mussels may be killed due to direct interactions as a result of unknown or uncontrollable factors. The following calculations break down the number of Snuffbox and state listed mussels harmed as a result of salvage activities including the number of those salvaged that will suffer direct mortality (5%).

Snuffbox Mussels:

85% Detection Rate

9 Snuffbox * .85 detection rate = 8 Snuffbox Salvaged.

Of the 8 snuffbox salvaged, 5% will die due to unforeseen/ uncontrollable factors 8 snuffbox *.05 mortality rate = .4 Snuffbox if rounded = likely to be 0 mortality of Snuffbox.

To calculate the number of Snuffbox that will be killed due to being undetected 9 Snuffbox – 8 Snuffbox = 1

8 Snuffbox harmed due to impairment of essential behavior patterns of those likely 0 will be killed, and 1 Snuffbox will be killed as a result of being undetected during salvage.

State Listed Mussels

85% Detection Rate

130 state listed mussels * .85 detection rate = 111 state listed mussels salvaged.

Of the state listed salvaged, 5% will suffer direct mortality due to unforeseen/ uncontrollable factors

111 state listed mussels *.05 mortality rate = 6 state listed mussels (rounded).

To calculate the number of state listed mussels that will be harmed and suffer direct mortality due to being undetected 130 state listed – 111 state listed = 19

111 state listed mussels will be harmed due to impairment of essential behavior patterns of those 6 will be harmed due to direct mortality. 19 state listed will be harmed and suffer direct mortality as a result of being undetected during salvage.

Table 5: Predicted Number of Snuffbox and State Listed Mussels in Operations, Maintenance, Repair, Rehabilitation, or Replacement Harmed:

Total Repair, Rehabilitation, or Replacement Area = 10,000 m^2
Average Density of Freshwater Mussels within the Construction Area = .3 mussels/ m^2

Relative Abundance of Snuffbox = .90%

Relative Abundance of State Listed Species = 13.20 %

Number of Snuffbox within the Repair, Rehabilitation, or Replacement Area = .90% *(10,000*.3 Snuffbox/m^2) = 27 Snuffbox

Number of state listed species within the Repair, Rehabilitation, or Replacement Area = 13.20% *(10,000*.3 state listed mussels/m^2) = 396 state listed species

Total Number of Snuffbox Harmed Due to Direct Mortality in Repair, Rehabilitation, or Replacement Areas = 27

Total Number of State Listed Species Harmed Due to Direct Mortality in Repair, Rehabilitation, or Replacement Areas = 396

Table 6: Predicted Number of Snuffbox and State Listed Mussels in the Indirect Impact Area within the Construction Area Harmed:

Total Indirect Impact Area within the Construction Area = 80,185 m^2

Average Density of Freshwater Mussels within the Construction Area = .3 mussels/ m^2

Relative Abundance of Snuffbox = .90%

Relative Abundance of State Listed Species = 13.20 %

Number of Snuffbox within the Indirect Impact Area within the Construction Area = .90% *(80,185 m2*.3 Snuffbox/m^2) = 216 Snuffbox

Number of state listed species within the Indirect Impact Area within the Construction Area = 13.20% *(80,185 m^2*.3 state listed mussels/m^2) = 3,175 state listed species

Total Number of Snuffbox Harmed Due to Disruption of Normal Respiration, Feeding, Growth, and Reproduction, Impairing Essential Behavior Patterns in the Indirect Impact Area within the Construction Area = 216

Total Number of State Listed Species Harmed Due to Disruption of Normal Respiration, Feeding, Growth, and Reproduction, Impairing Essential Behavior Patterns in the Indirect Impact Area within the Construction Area = 3,175

Table 7: Predicted Number of State Listed Mussels in the Downstream Indirect Impact Area Harmed:

Total Downstream Indirect Impact Area = 282,600 m^2

Average Density of Freshwater Mussels within the Downstream Area = .1 mussels/ m^2

Relative Abundance of State Listed Species = 29.47 %

Number of State listed species within the Downstream Indirect Impact Area = 29.47% *(282,600*.1 state listed mussels/m^2) = 8,328 state listed species

Total Number of State Listed Species Harmed Due to Disruption of Normal Respiration, Feeding, Growth, and Reproduction, Impairing Essential Behavior Patterns in the Downstream Indirect Impact Area = 8,328

Cumulative Effects

Cumulative effects are those "effects of future State or private activities, not involving federal activities, that are reasonably certain to occur within the Action Area" considered in this Opinion (50 CFR 402.02).

The following are a summary of the non-federal actions that are reasonably certain to occur within the Action Area in the future and have a reasonable certainty of take of Snuffbox mussel.

- Coldbrook Water Pump Station- The project seeks to transform a property with mostly surface parking lots and storage buildings, which drain directly to the Grand River, into a prominent public recreation and outdoor education amenity. This existing site has a concrete floodwall limiting access to the river. The new site layout will be an opportunity to provide education on the importance of best management practices related to stormwater and the positive changes happening along the Grand River and its tributaries. This site will be a critical hub for river and trail access. Envisioned improvements include the following:
    - Removal of approximately 150 lineal feet of concrete floodwall allowing access into and out of the river as well as creating a naturalized edge and additional flood storage.
    - Interpretation of Coldbrook Creek to demonstrate the channel's historic alignment and educate the public on the other hidden streams in the area.
    - Flexible plaza spaces adjacent to the building provide areas for outdoor learning, events, and cultural activities, such as canoe building with the Anishinaabe and programmed outdoor recreation activities could be pursued here.
    - Mixed use redevelopment above the 100-year floodplain is anticipated at the corner of Leonard Street and North Monroe Avenue with plazas oriented towards the river.
    - A large multipurpose lawn provides flexible space with an option for future bus drop off ADA and small parking lot is located onsite.
    - An emergency access boat ramp. This project is in the master plan stage. Project is upstream of the 6th Street Dam, where mussel density is approximately 1.7/m2.
- Fish Ladder Park- Fish Ladder Park has been identified as an important community gathering spot and the fish ladder structure is an iconic piece of functional art. The park would continue to serve these purposes and the project seeks to enhance and improve the site to function with any future changes to the river. If or when the 6th Street Dam is removed, the Fish Ladder structure would be modified to continue to provide fish passage, and improvements would be implemented within the surrounding park, which would continue to be a primary hub for fishing access. Envisioned improvements include the following:
    - Viewing deck located north of the Fish Ladder.
    - Existing fish ladder structure will remain for rapids viewing and fish observation.
    - Increase the flood protection system to 100-year base flood elevation plus 3 feet.
    - Changing room, restroom, and fish cleaning station.
    - Flexible plaza and adjacent parking area to accommodate small events.
    - Sloped event lawn next to new trees, planted on the high point of the existing berm to provide shade.
    - Emergency access boat ramp.

- Upper viewing perches on the embankment link to Scribner with Fish Ladder Park, provide small lounging pockets and expand spectator areas.
- Approximately 800 lineal feet shared use trail.
- Angling and wading access steps link the river trail to the bank.
- Stormwater terraces treat onsite runoff and provide ecological interest and support habitat restoration.

This project is in the master plan stage. Project is upstream of the 6th Street Dam, where mussel density is approximately 1.7/m2.

- Wealthy St. Access- Wealthy St. Access is situated at the southern end of the downtown river corridor and a vital connector for residents within the Roosevelt Park and Black Hills Neighborhoods. The eastern edge is a City-owned parking lot with minimal use. The western edge is a small City-owned parking lot that is also minimally used, with dilapidated stairs that provide access about halfway down to the river. The stairs were originally installed for City workers to access an outfall that is now abandoned. The envisioned improvements will provide equitable river access in an area that currently consists of 15-foot-tall concrete flood walls and a neglected river edge with some trees. Please note only one of the river edges is anticipated to be improved in this project. At this time, it is unknown which side of the river the project would occur on. Envisioned improvements include the following:
    - Approximately 250 lineal feet of elevated boardwalk/ramps providing access from the existing parking lot to the river.
    - Reconfiguration of the existing parking lot with improved drop-off location.
    - Site amenities including pedestrian-scale lighting, benches, litter, and interpretive signage.
    - Vegetated rip rap.

      This project is a concept design. It is downstream of Fulton St.
- 201 Market Ave. (updated)- The existing river's edge on the east side of the Grand River between Fulton Street and Wealthy Street is approximately 2/3 of a mile. The current parcel contains buildings used to store the City's public works equipment. The river edge condition is a combination of cast in place concrete wall and steel sheet piling. Dependent upon the water level, portions of the river's edge include a sloped bank at the base of the walls. The entire length is populated with a combination of mature large trees and dense scrub-shrub underbrush providing screening of views for the current industrial and commercial uses. The conceptual designs for the river's edge propose removal of the existing floodwall to provide better access to a more natural shoreline while adding freeboard to the flood control system in order to reach the 3 feet above the 100-year base flood elevation. Flood control will be maintained by utilizing a variety of design features rising to the flood control level with gentler slopes, naturally terraced dolomitic limestone and native plantings combined with walking running and biking trails paralleling the river and joining the properties along the Grand River. The proposed trail will be connected to river access points and public right of ways using universal design guidelines, creating universal access for all to enjoy the Grand River. This In addition to the proposed improvements to the river wall, the conceptual plan is proposing the addition of two pedestrian bridges to connect the existing collegiate campus and residential developments west of the river to the proposed amphitheater and mixed-use

development east of the river. Both pedestrian bridges would be used to connect to the downtown urban trail network and are being planned structurally so the abutments land outside the river and flood control measures. Both bridges have not had feasibility studies, including hydraulics, performed on them and substantial changes could occur. The serpentine pedestrian bridge would stay within the footprint of the US-131 bridge and would be assumed to be 12 foot wide by 600 feet long (not shown on figure as it remains within footprint of US-131). The other pedestrian bridge is estimated to be 12 feet wide and approximately 500 feet long. A proposed zip line could also span the river with the structural support system outside the river flood boundaries anchoring and landing above the 100-year flood elevation. A structure (assumed 20x8 foot) to accommodate the zip line was estimated and is shown on the island but would have to be vetted with the design process.

The permit application for this project was submitted to EGLE in Spring 2024. The proposed project does not extend past the 890 CFS line, and no equipment is expected in the river. Therefore, no direct impacts to mussels are anticipated. Appropriate soil erosion and sedimentation control BMPs would be installed to minimize any potential indirect impacts to mussels.

- 6th St. Park- This park currently consists of a north/south linear trail, a restroom, fish cleaning station, small pavilion, public parking lot, and a concrete floodwall that spans the entire length of the park from I-196 to 6th Street with only one (1) point of access (which is not universally accessible) to the river located at the 6th Street Dam. Due to the concrete floodwall, there is minimal to no biodiversity along the river's edge. Additionally, there are several storm sewers that discharge into the river through the existing concrete floodwall. The southern half of the park consists of an electrical substation and remnant surface parking lots. The City acquired the parking lot parcels through a Michigan Natural Resources Trust Fund acquisition grant and has been temporarily activating the site. Permanent improvements will not proceed for several years as this is one of the anticipated staging and access sites for the Corps Project. This site will provide an opportunity to transform how the City and its citizens engage with its most valuable natural resource in one of its most prominent downtown locations. Envisioned improvements include the following:
    - 1,800 lineal feet of new shared use trail.
    - Increase the flood protection system to 100-year base flood elevation plus 3 feet.
    - Removal of approximately 740 lineal feet of concrete floodwall allowing access into and out of the river as well as creating a naturalized edge and additional flood storage.
    - River landing providing a safe and accessible public river access space.
    - A large universally accessible walk for river access.
    - Daylighted stormwater outfall and stormwater marsh provide resilient, natural stormwater treatment and re-establish a healthy river edge.
    - Stepped seating terraces at the river edge to provide an expanded, resilient rapids viewing area.
    - A shaded seating edge expands park access, even during high water events.
    - An event pavilion to accommodate concessions, restrooms, and services to support recreation.
    - An event lawn sized for markets, concerts, and a number of other uses.

- Stormwater terraces treat onsite runoff and provide ecological interest and support habitat restoration.
- A flexible mid-level terrace can host seasonal events and recreation.
- A skate park in the area near I-196.
- Non-motorized watercraft takeout point.

This project is a conceptual design and is upstream of the 6th Street Dam where mussel density is approximately 1.7/m2.

- Riverside Park- Riverside Park is Grand Rapid's largest and most prominent park for active and passive recreation users. The 182-acre park with approximately 2,000 lineal feet of river frontage lies almost entirely within the 100-year flood limit with a few exceptions along Monroe Avenue. The river edge is primarily naturalized except for some armored locations and 3 public boat launch facilities. The park also has an interior lagoon with two heavily vegetated islands. Numerous smaller improvements have been made within the park over the last 20 years, but the last major investments were implemented in the late 1990's. Due to the park's popularity, use, and location within a highly fluctuating floodplain, most of the built assets are nearing the end of their functional life cycle. Roads, bridges, trails, and other structures are in need of repair, replacement. or removal. Additionally, over 100 acres of the park consists of maintained turf. This practice, along with the surface runoff from interior roads and parking, and siltation from seasonal flooding have contributed to poor water quality within the park's lagoon. The park is also situated at the downstream end of several large storm outfall pipes. These pipes collect stormwater from an approximately 1,800-acre watershed to the east and discharge directly into the Grand River. The City's master plan contains a broad list of ambitious and exciting changes for the park that focus on the following community priorities:
  - Remove, replace, and expand non-motorized trails network within the park
  - Daylight existing stormwater low-flow and route through new bio-swales, rain gardens, constructed wetlands to collect, cleanse and infiltrate water prior to reaching the lagoon and/or Grand River.
  - Reduce road and parking impervious surfaces.
  - Increase native wetland, wet meadow, and upland plantings, especially along areas receiving surface runoff.
  - Renovate existing restrooms and maintenance facility.
  - Provide multi-purpose community waterfront center with restrooms, concessions, large event area, accessible watercraft launch, and river amphitheater.
  - Improve existing active recreation programs including sport fields, cross country course and disc golf.
  - Improve accessibility to the lagoon and river's edge as well as increase edge resiliency through use of bio-engineering techniques.
  - New dog park dedicated as off-leash area.
  - Improve all 3 existing boat launches.
  - Renovate existing play areas and incorporate nature-based play elements.

This project is only in the Master Plan phase. It would impact approximately 4,046 m2 of river, where mussel density is approximately 3/m2.

JEOPARDY ANALYSIS

Section 7(a)(2) of the ESA requires that federal agencies ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of designated critical habitat.

Jeopardy Analysis Framework

"Jeopardize the continued existence of" means to engage in an action that reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species (50 CFR 402.02). The following analysis relies on 4 components: (1) Status of the Species, (2) Environmental Baseline, (3) Effects of the Action, and (4) Cumulative Effects. The jeopardy analysis is competed wholistically considering both proposed actions and as such this Opinion emphasizes the rangewide survival and recovery needs of the listed species and the role of both Action Areas in providing for those needs. It is within this context that we evaluate the significance of both proposed federal actions (NRCS WFPA Project and the City/GRWW Project), taken together with cumulative effects, for purposes of making the jeopardy determination.

Analysis for Jeopardy

Mussel biodiversity and abundance plays a critical role in ecosystem function (Nobles and Zhang 2011). An adult freshwater mussel filters anywhere from 1 to 38 gallons of water per day (Baker and Levinton 2003, Barnhart pers. comm. 2019). A 2015 survey found that in some areas mussels can reduce the bacterial populations by more than 85% (Othman et al. 2015 in Vaughn 2017). Mussels are also considered to be ecosystem engineers, stabilizing substrate and providing habitat for other aquatic organisms (Vaughn 2017). In addition to ecosystem services, mussels play an important role in the food web, contributing critical nutrients to both terrestrial and aquatic habitats, including those that support sport fish (Vaughn 2017). Therefore, our Effects Analysis analyzed both the effects to Snuffbox as well as the broader community of state listed mussels within both Action Areas. While our Jeopardy Analysis does not characterize impacts to individual species of state listed mussels at the individual, population, and species level, we do consider the impact to the community of state listed mussels as a whole in the context of how these impacts influence the health and abundance of the Snuffbox at the population level and as a species as whole.

Impacts to Individuals – The NRCS WFPA Proposed Action includes removal of 4 low-head dams, the addition of substrate material, and installation of hydraulic features to create recreational opportunities. One of the stated goals of the project is to restore aquatic habitat diversity and suitability for native Great Lakes drainage fish and mussel species, especially threatened and endangered species in the Grand River by increasing the quantity, quality, and diversity of instream habitat features throughout the project area. As discussed in the Effects of the Action, potential effects of the action include effects to federally endangered snuffbox and state listed mussels present within both Action Areas. Effects generally include direct harm to adults, juveniles, and glochidia, due to crushing, injury, smothering, desiccation, as well as interference with normal respiration, feeding, growth, and reproduction. Any Snuffbox or state listed mussels harmed during spawning or that are gravid, may suffer reduced reproductive

output for the year as a result of lost reproductive potential or glochidia that are killed or released prematurely. In summary, we anticipate impacts to individual Snuffbox and state listed mussels species in either their annual survival or reproductive rates.

Impacts to Populations – As we have concluded that individual Snuffbox and state listed mussels are likely to experience impacts in their annual survival or reproductive rates resulting in harm. We need to assess the aggregated consequences of the anticipated impacts on the population to which these Snuffbox individuals belong.

The NRCS WFPA Project and the City/GRWW Project is expected to potentially affect the survival and reproductive output of Snuffbox and state listed mussels. A portion of Snuffbox and state listed species will be harmed by the City/GRWW Proposed Action through impairment of essential behavior patterns resulting from salvage and relocation, these impacts will be temporary and should not result in significant mortality. Snuffbox and state listed species removed from the project area through salvage and relocation, will not be permanently removed from the Grand River ecosystem. Instead, they will be relocated upstream of the NRCS WFPA Project Area. As such, while Snuffbox abundance will decrease within the NRCS WFPA Project Area, the overall population of Snuffbox within the Grand River Watershed should not be significantly impacted and change the current status of the population in the Grand River as a "stronghold" for the species. For example, localized populations of Snuffbox elsewhere in the Grand River such as in Lyons and Lowell, are much larger than the population within the NRCS WFPA Project Area. Furthermore, the critical role that the broader mussel community plays in sustaining Snuffbox health and fitness should not be severely impacted given that state listed species and Snuffbox will be relocated as a community. The critical role that the diversity and abundance of Snuffbox and state listed mussels make to the aquatic ecosystem will continue albeit in a different stretch of the Grand River.

Lastly, one of the stated goals of this project is to restore aquatic habitat diversity and suitability for native Great Lakes drainage fish and mussel species, especially threatened, endangered, and special concern native species in the Grand River NRCS WFPA Project Area. Therefore, one of the goals of project design has been to try to provide long-term benefits to fish (game and nongame species) and the mussel community by increasing the quantity, quality, and diversity of instream habitat features throughout the project area. While there is great uncertainty regarding the creation of suitable freshwater mussel habitat and it is largely experimental, the hope is that the proposed project will result in higher quality mussel habitat for freshwater mussels.

These effects are not expected to measurably decrease the fitness of Snuffbox within these Action Areas. Snuffbox occur at relatively low density in the NRCS WFPA Project Area in comparison to other areas in the Grand River Watershed. The population of Snuffbox in the NRCS WFPA Action Area is considered relatively low in terms of density and abundance in comparison to localized populations of Snuffbox elsewhere in the watershed. While cumulative effects will occur in the NRCS WFPA Action Area, the additional impacts to mussels are anticipated to be limited in spatial scale by project designs (e.g., limits to areas within project that are wadable) and some features or restored habitats will provide adequate cover to mussels from human activity. In summary, any reduction in abundance, reproduction, and growth, are likely to be small given the low abundance and density of snuffbox in the NRCS WFPA Action Area, and that some individuals will be safely relocated within the Grand River as a mussel community as a whole. Further the funding provided to help offset project impacts included in the proposed action will provide opportunities to implement additional measures that significantly benefit state and federally listed mussels in the Lower Grand River.

Impacts to Species – As we have concluded that Snuffbox mussel populations are unlikely to experience a significant reduction in fitness, there will be no harmful effects (i.e., there will be no long-term reduction in reproduction, numbers, and distribution) on snuffbox species as a whole.

CONCLUSION

We first considered the current overall rangewide status of Snuffbox mussels. We then assessed the effects of the proposed action and the potential for future cumulative effects in the NRCS WFPA Action Area on individuals, populations, and Snuffbox as a whole. As stated in the Jeopardy Analysis, we do not anticipate any long-term reductions in the overall reproduction, numbers, and distribution of Snuffbox present within the NRCS WFPA Action Area. It is the USFWS's Opinion that the NRCS WFPA Project and the City/GRWW Project as proposed, are not likely to jeopardize the continued existence of Snuffbox mussels.

INCIDENTAL TAKE STATEMENT

Section 9 of the ESA and federal regulation pursuant to section 4(d) of the ESA prohibit the take of endangered and threatened species, respectively, without a special exemption. Take is defined in section 3 of the ESA as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by the USFWS to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns including breeding, feeding, or sheltering (50 CFR § 17.3). Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the ESA provided that such taking is in compliance with the terms and conditions of this incidental take statement.

The measures described below are nondiscretionary and must be undertaken by the City of Grand Rapids/ GRWW as the non-federal representative implementing the salvage and relocation project and NRCS for the WFPA Project so that they become binding conditions of any grant or permit issued to another entity, as appropriate, for the exemption in section 7(o)(2) to apply. The City of Grand Rapids/ GRWW and NRCS has a continuing duty to regulate the activity covered by this incidental take statement. If the City of Grand Rapids/ GRWW and the NRCS: (1) fails to assume and implement the terms and conditions or (2) fails to require a grantee/permittee to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of Section 7(o)(2) may lapse. To monitor the impact of incidental take, the City of Grand Rapids/ GRWW and NRCS must report the progress of the action and its impact on the species to the USFWS as specified in the incidental take statement [50 CFR 402.14(i)(3)].

AMOUNT OR EXTENT OF TAKE

Incidental take is associated with salvage and relocation for the City/GRWW Project as well as with construction activities for the NRCS WFPA Project. The incidental take for the two projects is interdependent, such that we have one combined reasonable and prudent measure and term and condition that is generally applicable to both relocation and construction. The anticipated take is described below in Table 8.

Table 8. Anticipated Take of Snuffbox Mussel

Species	Amount of Take Anticipated (Number of Individuals)	Life Stage when Take is Anticipated	Type of Take	Take is Anticipated as a Result of	Surrogate Measure of Incidental Take
Snuffbox Mussel	119	Larvae, Juveniles, and Adults	Harm-Direct Mortality	Direct Impact Area Excluding Isolated Area for Dam 2 1. Adults and juveniles may be crushed, injured, smothered, or desiccated; and 2. Glochida in marsupial gills of gravid adult females may be crushed and injured leading to mortality and disruption of dispersal.	Direct Impact Area Excluding Isolated Area for Dam 2 = 44, 130 m^2
Snuffbox Mussel	27	Larvae, Juveniles, and Adults	Harm-Direct Mortality	Repair, Rehabilitation, or Replacement Operations 1. Adults and juveniles may be crushed, injured, smothered, or desiccated; and 2. Glochida in marsupial gills of gravid adult females may be crushed and injured leading to mortality and disruption of dispersal.	Repair, rehabilitation, or Replacement Operations = 10,000 m^2

Snuffbox Mussel	1	Larvae, Juveniles, and Adults	Harm-Direct Mortality	Salvage, Relocation, and Lack of Detection with 85% Collection Efficiency 1. Adults and juveniles may be crushed, injured, smothered, or desiccated; 2. Glochida in marsupial gills of gravid adult females may be crushed and injured leading to mortality and disruption of dispersal; and 3. Unknown factors that may result in mortality during salvage and relocation.	Salvage Area = 3,285m^2
Total Number of Snuffbox Harmed Due to Direct Mortality					**147**
State Listed Mussels	1,748	Larvae, Juveniles, and Adults	Harm-Direct Mortality	Direct Impact Area Excluding Isolated Area for Dam 2 1. Adults and juveniles may be crushed, injured, smothered, or desiccated; and 2. Glochida in marsupial gills of gravid adult females may be crushed and injured leading to mortality and disruption of dispersal.	Direct Impact Area Excluding Isolated Area for Dam 2 = 44,130 m^2
State Listed Mussels	396	Larvae, Juveniles, and Adults	Harm-Direct Mortality	Repair, Rehabilitation, or Replacement Operations 1. Adults and juveniles may be crushed, injured, smothered, or desiccated; and 2. Glochida in marsupial gills of gravid adult females may be crushed and injured leading to mortality and disruption of dispersal.	Repair, rehabilitation, or Replacement Operations = 10,000 m^2

State Listed Mussels	25	Larvae, Juveniles, and Adults	Harm-Direct Mortality	Salvage, Relocation, and Lack of Detection with 50% Collection Efficiency 1. Adults and juveniles may be crushed, injured, smothered, or desiccated; 2. glochida in marsupial gills of gravid adult females may be crushed and injured leading to mortality and disruption of dispersal; and 3. unknown factors that may result in mortality during salvage and relocation.	Salvage Area = 3,285 m^2
Total Number of State Listed Mussels Harmed Due to Direct Mortality					**2,169**
Snuffbox Mussel	8	Larvae, Juveniles, and Adults	Harm Due to Impairment of Essential Behavior Patterns	Salvage/Relocation - Capture, Handling, Temporary Holding, and Transport 1. increased physiological stress, resulting in disruption of spawning and fertilization, growth, or feeding.	Salvage Area = 3,285 m^2
Snuffbox Mussel	216	Glochida, Glochidia on Host Fish, Larvae, Juveniles, and Adults	Harm Due to Impairment of Essential Behavior Patterns	Increased Turbidity and Changes in Hydrology in the Construction Area 1. disruption of normal respiration, feeding, growth, or reproduction.	Construction Indirect Impact Area = 80,185 m^2
Total Number of Snuffbox Harmed Due to Impairment of Essential Behavior Patterns					**224**

State Listed Mussels	105 (111 individuals – of which 6 individuals accounted for under direct mortality)	Larvae, Juveniles, and Adults	Harm Due to Impairment of Essential Behavior Patterns	Salvage/Relocation - Capture, Handling, Temporary Holding, and Transport 1. Increased physiological stress, resulting in disruption of spawning and fertilization, growth, and feeding.	Salvage Area = 3,285 m^2
State Listed Mussels	3,175	Glochida, Glochidia on Host Fish, Larvae, Juveniles, and Adults	Harm Due to Impairmet of Essential Behavior Patterns	Increased Turbidity and Changes in Hydrology in the Construction and Downstream Area 1. disruption of normal respiration, feeding, growth, and reproduction.	Construction Indirect Impact Area and Downstream Indirect Impact Area = 80,185 m^2
Total Number of State Listed Mussels Harmed Due to Impairment of Essential Behavior Patterns					**3,280**

For the Snuffbox, detecting take that occurs incidental to the Action is not practical. Snuffbox are small, benthic, embedded in the substrate, and may be displaced to other areas where they would not necessarily be detected.

When it is not practical to monitor take in terms of individuals of the listed species, the regulations at 50 CFR §402.14(i)(1)(i) indicate that an ITS may express the amount or extent of take using a surrogate (*e.g.,* a similarly affected species, habitat, or ecological conditions), provided that the USFWS also:

- describes the causal link between the surrogate and take of the listed species; and
- sets a clear standard for determining when the level of anticipated take has been exceeded.

We have identified surrogate measures in our analyses of effects that satisfy these criteria for monitoring take of the species named above during Action implementation. Table 8 lists the surrogate measures for each portion of the proposed action that is likely to cause incidental take of the Snuffbox.

REASONABLE AND PRUDENT MEASURES

The USFWS believes the following reasonable and prudent measures are necessary and appropriate to minimize take of snuffbox and state listed species:

1. NRCS/ The City/GRWW – NRCS, the City, and GRWW, will install the isolation area for Dam 2 in accordance with the Terms and Conditions.
2. The City/GRWW Project - The salvage methodology (i.e., search effort) for all Snuffbox and state listed mussels must be in accordance with the Michigan Freshwater Mussel Survey Protocols and Relocation Procedures (Hanshue et al. 2019) and the Relocation Plan for this Project (Appendix A). The critical components of these documents are incorporated as Terms and Conditions.
3. The City/GRWW Project - Relocation and all capture, handling, and temporary holding of Snuffbox and state listed mussels must be in accordance with the Michigan Freshwater Mussel Survey Protocols and Relocation Procedures (Hanshue et al. 2019) and the Relocation plan for this Project (Appendix A). The critical components of these documents are incorporated as Terms and Conditions.
4. The City/GRWW Project - Post relocation monitoring surveys will be conducted in accordance with the Michigan Freshwater Mussel Survey Protocols and Relocation Procedures (Hanshue et al. 2019) and the Monitoring Plan for this Project (Appendix A). The critical components of these documents are incorporated as Terms and Conditions.
5. The City/GRWW Project - A Mitigation Fund will be established for mussel conservation (Appendix B). The critical components of this Fund are incorporated as Terms and Conditions.
6. The City/GRWW Project - Fish will be salvaged from isolation areas and in accordance with the Terms and Conditions.

TERMS AND CONDITIONS

In order to be exempt from the prohibitions of section 9 of the ESA, the NRCS and the City/GRWW must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and outline required reporting/monitoring requirements. These terms and conditions are nondiscretionary.

Terms and Conditions to fulfill RPM # 1, NRCS, the City/GRWW

1. Prior to installation of isolation area for Dam 2, NRCS, the City, and GRWW, will coordinate directly with USFWS Sea Lamprey Control Program: Peter J. Hrodey, Unit Supervisor, Sea Lamprey Control, Alternative Control and Evaluation, U.S. Fish and Wildlife Service, 1095 Cornerstone Drive, Marquette, MI 49855-9649.
2. Installation of the isolation area for Dam 2 should be implemented when the water temperature is > = 20°C, which should correspond to a date no earlier than July 1st.

Terms and Conditions to fulfill RPM # 2 the City/GRWW

1. Methodology for Salvage and Relocation within Isolation Area for Dam 2
    a. Mussels will be collected from the substrate using visual-tactile search methods. Surveyors will locate mussels by moving cobble, and woody debris; hand sweeping away silt, sand and/or small detritus; and disturbing/probing the upper five centimeters (two inches) of the substrate to increase the likelihood of mussel detection.
    b. The isolation area would be divided into 10 m wide corridors. Four or more individuals would thoroughly search (≤0.5 minute/m^2) each corridor (one

biologist/corridor) until two or fewer mussels are found per 100 m^2, <5% of the mussels found in the first pass are found in the last pass, or at least 1 min/m2 of search time has been expended, whichever comes first.

c. At least one pass would be conducted over the entire area to ensure that most freshwater mussels are collected in case of any emergency that could prevent the completion of a salvage effort (sudden rise in water level overtopping the isolation measures or other unforeseen circumstances). Additional passes would then be conducted until the aforementioned criteria are met.
d. Collection efficiency is estimated at 85% within the isolation area for Dam 2.
e. Any logperch that are not salvaged from within the isolation area and suffer mortality should be recorded and provided to the USFWS.

2. Methodology for Salvage and Relocation within Direct Impact Areas Excluding Isolated Area for Dam 2 if there are Workable Flows:
    a. Workable flow would be defined as current velocity in which the diver/snorkeler can maintain position (not be swept downstream) within the block and collect mussels.
    b. Each direct impact area would be divided into 5 x 10 m blocks. Workable flow would be defined as current velocity in which the diver/snorkeler can maintain position (not be swept downstream) within the block and collect mussels. Blocks would be further divided into smaller 2 m x 1 m grids using a 3/8 inch metal that would lay flat on the river bottom grid. Each 2x1 grid is split into 1m x 1m cells and would be searched individually. Each of the 1 m x 1 m cells would be visually searched for habitat and mussels (visual search). If no habitat (bedrock or entirely non-movable rock) is found, then that 1 m2 is clear.
    c. If habitat and/or mussels are found, the 1 m2 area would be excavated down to 15 cm (6 inches), collecting any mussels that are found (first pass) within an average search effort of 2 min/m2. Excavation includes moving cobble and woody debris and moving away silt, sand, and small detritus, then digging the substrate down at least 15 cm (6 inches). That 1 m2 would be excavated a second time (second pass) for an average of 2 min/m2, and if <5% of the mussels are collected on the second pass compared to the completed first pass and no state and federally listed species are found, then the 1 m2 would be declared clear. If not, it would need to be searched again until the <5% criteria and no state and federally listed species found threshold, is reached. Searching would require an average of 2 min/m2 . Once the entire 2 m x 1 m grid is clear, the 2 m x 1 m grid would be moved to the next 2 m x 1 m.
    d. "Clear" is defined as:
        a. Area is bedrock or non-diggable rock on the visual search;
        b. No mussels >0.5 inches are found on the completed first dug up pass (divers/snorkelers would strive to collect all mussels, but can only guarantee that mussels >0.5 inches would be collected);
        c. Mussels are found after digging up the area (first pass), but <5% of the total number of mussels>0.5 inches found on the first pass are found after the area is dug up again (second pass) AND no State and federally listed species are found;
        d. Passes continue until <5% criteria of the completed first pass is met and no state and federally listed species are found.

Terms and Conditions to fulfill RPM #3, the City/GRWW Project

1. On the day(s) of the relocation, minimum expected air temperatures should be greater than 50°F, and maximum expected air temperatures should be less than 90°F.
2. Collected freshwater mussels would be held in flowing water or in flow through tanks (under ambient water conditions) while awaiting processing and/or relocation. Freshwater mussels would be processed within a few hours of collection.
3. All collected Snuffbox and state listed species would be tagged, measured (length in mm), and aged (external annuli count).
4. Snuffbox would be tagged with Passive Integrated Transponder (PIT) tags and state listed species would be tagged with shellfish tags. Common species would be identified, counted, and marked with a Dremel tool (slash on the anterior ventral edge of the shell to assess growth).
5. Tagged Snuffbox and state listed species would be randomly assigned a recipient site grid cell within the relocation area. Once at the site, common species would be hand placed on the substrate (either marked with buoys or GPS points).
6. Snuffbox and state listed species would be hand placed on the substrate within their assigned area at a density of 1 unionid/m^2.
7. Freshwater mussels would be kept in water at ambient temperature (flowing water, flow through tanks, or buckets with frequent water changes) throughout this process and while awaiting transport to recipient sites.
8. Mussels will be transported in containers that minimize jostling or impact.
9. Freshwater mussels would be translocated to recipient sites at the end of each day or the beginning of the following day wrapped in moist towels within coolers. Mussels will be kept cool and moist during transport by covering with wet towels or burlap bags if transport time will exceed one hour or by immersion in water if less time is needed.
10. All live Snuffbox mussels will be identified to species and sexed if possible.
11. Photographic vouchers (live and shell) of all native species will be provided to MDNR and/or the USFWS's Michigan Ecological Services Field Office. Photographs of individuals will include a closeup view of the umbo and one of the valves. Any questionable species will include photographs of the left valve, right valve, and dorsal view to provide adequate reference for verification.

Terms and Conditions to fulfill RPM #4, the City/GRWW Project

1. Freshwater mussels within recipient sites would be monitored within one year of each year of salvage if that effort spans more than one year (2024/2025) between June and October 15 when water temperature is greater than 10○ C (50○ F), and air temperature is between 10 and 32○ C (50 and 90○ F).
2. Up to 100, 1 m2 cells in each recipient site will be randomly selected for monitoring. A PIT tag wand would be first used to find and collect Snuffbox. A diver/snorkeler would systematically search each selected 1 m2 area. A PVC grid with 1 m2 cells would be used to facilitate searching.
3. At least 10 1-m2 cells within each area would be excavated to calibrate surface to buried ratio. The remainder would be surface searched (visual, tactile, moving rocks, logs, probing the top inch) for at least 1 minute/m2. All collected unionids would be checked for tags, recorded as tagged or not tagged, measured (length in mm), and aged (external annuli count), and Lampsilini would be checked for gravidity.

4. Any dead marked animals would be collected and reported.
5. If any of the area where freshwater mussels were placed appears to no longer be suitable habitat (e.g., too shallow, covered with sand or silt), NRCS will consult with the MDNR and the USFWS on whether the freshwater mussels should be collected and moved to a more suitable location within the recipient site or another nearby site.
6. Species, tag numbers, initial location and final destination would be recorded.
7. A report would be prepared to summarize relocation and monitoring results. Tag numbers, lengths and ages, collection site and relocation grid of Snuffbox and state listed species would be reported. Area searched, search efficiency, and number of each species collected would be summarized.
8. Monitoring results would include recovery rate, survival rate, growth, and movement of Snuffbox and state listed species.
9. Recovery rate of each species would be calculated as number of each species collected in surface search multiplied by the ratio of total: surface estimated from excavated cells/number of each species placed in the area.
10. Survival would be estimated as estimated number of live recovered/estimated live + dead recovered.
11. Growth would be assessed by both visual observations of shell material past the slash mark on the shell and by comparison of lengths.
12. Movement would be estimated by comparing placement grid cell position with collection grid cell position.
13. Species, number, ages, and assemblage metrics (% Snuffbox and state listed species, % *A. plicata* + *L. cardium,* % ≤ 5 years old, % ≥ 15 years old, % mortality, density, % *Lampsilini*, species evenness, tribe evenness, rarefaction species richness) of resident freshwater mussels would also be summarized and compared among years.

Terms and Conditions to fulfill RPM #5, the City/GRWW Project

1. The Mitigation Fund Governance Framework will be developed in coordination with NRCS, MDNR, GRWW, the City of Grand Rapids, and the USFWS.
2. The maximum mitigation fund contribution pre-construction would be based on $34.10/mussel (2020 BA $28.50/mussel escalated for inflation) and would not exceed $456,743. This fund would be reduced by the amount of mussels that are expected to survive translocation (i.e., relocated minus the 5% of relocated animals anticipated to be lost due to handling stress). The mitigation fund contribution may not be reduced by a percent greater than the percent of area cleared (i.e., area of quadrats cleared from the total area of the direct impact areas).
3. Prior to reducing the funding, the proportion of areas cleared as result of a determination of non-diggable rock must be compared to prior survey efforts to help ensure that estimates of mussels impacted are consistent with the 2024 BA.
4. The Mitigation Fund will be established to off-set impacts to freshwater mussels as a result of the proposed project and to continue efforts to conserve mussels in the Grand River Watershed.
5. The Mitigation Fund will be established prior to in-river construction starting with the exception of construction associated with the Isolation Area for Dam 2.
6. The NRCS and the City of Grand Rapids/GRWW will establish separate funding for post relocation monitoring. As such, no mitigation funding can be used for post relocation monitoring.
7. The amount of the Mitigation Fund is based on the anticipated scenario of the collection and

relocation of 85% of freshwater mussels from the Isolation Area for Dam 2 (3,285 m^2).

8. Additional mitigation fund contribution will be made post installation for any mussel impacts that occur as result of repair, rehabilitation, or replacement operations based on the area impacted and the updated mussel density (i.e., .3 mussels per m2 or as documented in post construction monitoring) and updated mussel costs (i.e., either an estimate considered current at the time of impact or using the 2020 BA $28.50/mussel escalated for inflation if a more current updated cost estimates are not available).

Term and Condition to fulfill RPM #6 the City/GRWW and NRCS

1. The number and species of any fish that are unable to be salvaged and suffer mortality as a result of the construction and isolation process should be recorded.

MONITORING AND REPORTING REQUIREMENTS

1. The NRCS and City of Grand Rapids/GRWW shall notify the Michigan Ecological Services Field Office, via email, when salvage and relocation operations are going to begin.
2. The NRCS and City of Grand Rapids/GRWW must notify the Michigan Ecological Services Field Office within 24 hours if there is the potential for incidental take to be exceeded which would be indicated by exceedance of the surrogate measures in square meters.
3. The City/GRWW Project - A final report that includes the following information as well as the information specified in RPM #3 and associated Terms and Condition 3, should be submitted to the USFWS and MDNR within 90 days of completion of each of the salvage and relocation operations.
    a. The final area impacted broken down by each activity to inform tracking of incidental take in accordance with the surrogate measures outlined in the incidental take table.
    b. Description of conditions at the time of the survey, level of effort, Snuffbox, and state listed species collected.
    c. Number and species of fish that suffer mortality during the construction isolation and drawdown process.
    d. Description of the number of Snuffbox and state listed species, affixed with pit tags, and GPS coordinates of collection and relocation site.
    e. Photographs of representative vouchers.
    f. It should be noted if any mussel mortality is due to salvage and relocation.

The contact for daily and final reporting requirements is as follows: Jessica Pruden, U.S. Fish and Wildlife Service, Michigan Ecological Services Field Office, 2651 Coolidge Road, Suite 101, East Lansing, MI 48823, 517-351-8245, jessica_pruden@fws.gov.

The post relocation monitoring reports should be submitted to the USFWS and MDNR within 60 days of the completion of post relocation monitoring.

The contact for post relocation monitoring reporting requirements is as follows: Jessica Pruden, USFWS, at the contact information listed above.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the ESA directs federal agencies to utilize their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of endangered and

threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

The USFWS has identified the following additional actions that, if undertaken would further the conservation and assist in the recovery of snuffbox. We recognize that limited resources and other agency priorities may affect the ability of the NRCS and the City and GRWW to conduct these activities at any given time.

1. Increase number of qualified individuals able to assist with relocation under workable flows to increase the effectiveness and efficiency of relocation.
2. Conduct additional years of post-relocation monitoring to assess future survival and growth rates of relocated mussels.
3. Conduct long term monitoring to determine if freshwater mussels specifically Snuffbox and state listed species have reseeded habitat within the Direct Impact Area.
4. Conduct long term monitoring to determine how dam removal, substrate enhancement, and installation of other in river features influence/ impact freshwater mussel and native fish communities.

In order to be kept informed of actions minimizing or avoiding adverse effects, or benefitting listed species or their habitats, the USFWS requests notification if any of these additional conservation actions are carried out or if additional measures consistent with these conservation recommendations are implemented.

REINITIATION NOTICE

This concludes formal consultation on the actions outlined in your request dated April 23, 2024.June As provided in 50 CFR 402.16, reinitiation of formal consultation is required where discretionary federal agency involvement or control over the action has been retained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded as is tracked and documented in accordance with the surrogate parameters for incidental take; (2) new information reveals effects of the agency action that may affect listed species or critical habitat in a manner or to an extent not considered in this Opinion; (3) the agency action is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered in this Opinion; or (4) a new species is listed or critical habitat designated that may be affected by the action. In instances where the amount or extent of incidental take is exceeded, any operations causing such a take must cease pending reinitiation.

Biological Assessment
March 2024

EcoAnalysts, Inc.

EXECUTIVE SUMMARY

The City of Grand Rapids is pursuing PL83-566 funding with the Natural Resource Conservation Service (NRCS) to improve aquatic habitat in the Lower Grand River where it flows through downtown Grand Rapids, Kent County, Michigan. The purpose of the proposed PL83-566 action in Grand Rapids is to restore the rapids, improve public safety, restore aquatic habitat diversity and suitability for native Great lakes fish and mussel species, and enhance river access and use. The Project Area extends from 6th Street Dam to Fulton Street in downtown Grand Rapids, Kent County, Michigan. Grand Rapids Whitewater, the City of Grand Rapids, and NRCS have coordinated with the Michigan Department of Environment, Great Lakes, and Energy, Michigan Department of Natural Resources, and U. S. Fish and Wildlife Service to reduce the construction footprint, ensure fish passage, enhance aquatic habitat, diversify recreational opportunities, and restore the rapids. Additionally, the *Petromyzon marinus* barrier would be maintained at the 6th Street Dam with the same efficacy as under existing conditions. Direct impacts to threatened and endangered species (TES) would be limited to construction areas. Construction impacts have been reduced from 89,195 m^2 (22 acres) to 45,445 m^2 (11 acres), a reduction of 50% through coordination.

The four low-head dams currently within the Project Area would be removed and replaced with riffles, diversified boulder arches, and emergent habitat boulders. In the Dam 3 and 4 area, low-head dams would be removed, the river bottom would be graded, and emergent habitat boulders would be placed in the Dam 3 area. In the Dam 2 area, the low-head dam would be removed and replaced with diversified boulder arches on the west side and a riffle on the east side. In the Dam 1 area, the low-head dam would be removed and replaced with a riffle. Emergent habitat boulders would be placed throughout both the Dam 1 and 2 riffle. Two emergent boulder habitat fields would be created downstream of Pearl Street. The downstream feature would include diversified boulder arches. Boulder vanes would be created up and downstream of the Grand Rapids Public Museum carousel and on the east side to provide slack water habitat for public access.

Impacts within Direct impact areas include Take of TES mussels and disturbance of *Acipenser fulvescens* and *Moxostoma carinatum*. Unionid mussel species that would be impacted include *Epioblasma triquetra*, *Pleurobema sintoxia*, *Cyclonaias tuberculata*, *Ligumia recta*, *Potamilus alatus*, *Toxolasma parvum*, *Truncilla truncata*, *Venustaconcha ellipsiformis*, *Alasmidonta marginata*, *Alasmidonta viridis*, *Lasmigona compressa*, *Lasmigona costata,* and *Utterbackia imbecillis*. All of these species occur in other areas of the Grand River, other rivers in Michigan, and other rivers in the United States. *Pleurobema sintoxia, E. triquetra*, *T. parvum*, *V. ellipsiformis*, *A. marginata*, *A. viridis*, *L. compressa*, and *Utterbackia imbecillis* seem to be limited to upstream of Fulton Street. *Potamilus alatus* is limited to downstream of the 6th Street Dam. These species would be directly affected by this Project. The project would not jeopardize the continued existence of *E. triquetra*.

Indirect impacts during construction include minor changes in depth and velocity and increased turbidity. Turbidity would be managed through Best Management Practices.

Post construction, depth would decrease and velocity increase between the 6th Street Dam on the upstream feature. Depth and velocity would be diversified within features, and flow refugia would be created from the emergent habitat boulders. More slow flowing areas would be available near the banks, and velocity would be slower in most of the area downstream of the Dam 3 emergent habitat boulders. Rock vanes downstream of Pearl Street would provide slow flowing areas for public access.

To minimize the impacts to freshwater mussels, Grand Rapids/GRWW with the assistance of U.S. Fish and Wildlife Service would translocate mussels from Direct impact areas under the Urban Water Federal Partnership Program. Pre-construction (2024), mussels would be translocated from as much of the Direct impact area as safely possible. Mussels would also be translocated from the Dam 2 area that requires isolation for construction in 2025. Fish would also be salvaged from the isolated area. Translocated mussels would be moved to Ada, Riverside Park, or Plaster Creek recipient sites. Mussels would be monitored for survival, growth, and movement within one year of translocation (2025 and 2026).

To mitigate for mussels not translocated and for anticipated mortality during translocation, a mitigation fund would be established based on the number of mussels not translocated. The objective of the mitigation fund would be to fund projects that provide a direct benefit to mussels to achieve the USFWS "no net loss" policy and offset any potential impacts from mussels that were unable to be translocated. The work performed through the mitigation fund would help inform future conservation and habitat restoration efforts.

ACKNOWLEDGEMENTS

This Biological Assessment (BA) was completed under contract to Grand Rapids Whitewater (GRWW) as part of the efforts to restore and revitalize the Grand River in Grand Rapids. Ms. Heidi Dunn of EcoAnalysts, Inc. was the primary author of this BA. Mr. Matt Chapman (GRWW), Mr. Michael Staal (City of Grand Rapids), and Mr. Scott Prins (River Restoration [RRO]) provided project details and reviewed this document. Dr. Marty Holtgren (Encompass, LLC) provided valuable comments on fish species and habitat. Ms. Jessica Pruden and Mr. Scott Hicks (U.S. Fish and Wildlife Service [USFWS]), Mr. Patrick Ertel, Ms. Jennifer Kleitch, Dr. Tammy Newcomb, Mr. John Buszkiewicz, and Ms. Jennifer Johnson (Michigan Department of Natural Resources [MDNR]), and Luke Trumble and Amy Lounds (Michigan Department of Environment, Great Lakes, and Energy [EGLE]) provided advice throughout the informal consultation process.

ACRONYMS AND DEFINITIONS

Acronyms

BA – Biological Assessment

BMPs – Best management practices

BO – Biological Opinion

CFS – Cubic feet per second

EA – Environmental Assessment; document generally required under NEPA for Biological Assessments

EGLE – Michigan Department of Environment, Great Lakes, and Energy (formerly DEQ)

ESA – Endangered Species Act of 1973 as amended

ESI – Ecological Specialists, Inc.

FD – Freshly dead mussel shell; periostracum condition similar to live animals, valves attached, hinge line flexible, and nacre shiny; animal likely died within a few months of the survey. Species collected as FD shells are likely living in the area at a low frequency.

FERC – Federal Energy Regulatory Commission

GLFC – Great Lakes Fishery Commission

GRWW – Grand Rapids Whitewater

GVMC – Grand Valley Metro Council

IPac – Information for Planning and consultation (USFWS)

LDB – Left descending bank

MDKey – Michigan Determination Key for project review and guidance for federally listed species

MDNR – Michigan Department of Natural Resources

MDOT – Michigan Department of Transportation

MLC – Mean Lethal Concentration (lampricide)

MNFI – Michigan Natural Features Inventory

NEPA – National Environmental Policy Act

NRCS – Natural Resources Conservation Service

NREPA – Natural Resources and Environmental Protection Act

OHWM – Ordinary high-water mark; 10,000 CFS or high-water level that is within the channel

OMRRR – Operations, maintenance, repair, rehabilitation, and replacement

MHH – Modeled Hydrophysical Habitat

PIT tags – Passive Integrated Transponder tags

RDB – Right descending bank

RRO – RiverRestoration Organization

TES – Threatened, endangered, and species of special concern; includes both federal and Michigan listed species
- **FE** – Federally endangered species
- **ME** – Michigan endangered species
- **MT** – Michigan threatened species
- **MSC** – Michigan special concern species

TFM – 3-trifluoromethyl-4-nitrophenol; lampricide

TSS – Total Suspended Solids

USACE – U.S. Army Corps of Engineers

USDA – U.S. Department of Agriculture

USFWS – U.S. Fish and Wildlife Service

UWFP – Urban Waters Federal Partnership

WD – Weathered dead mussel shell; periostracum eroded more than live animals, valves attached or separate, hinge line brittle, nacre chalky; animal likely died from a few months to decades before the survey. Species only present as weathered shells are less likely than species found as FD shells to be live in the Project Area.

WSE – Wetted surface elevation (ft)

Definitions

Action Area – Area potentially affected by all aspects of the Project. Includes the Construction Area, three recipient sites (Ada, Riverside Park, Plaster Creek), downstream indirect impact area (Fulton St. to Plaster Creek), and upstream indirect impact area (Grand River from the 6th Street Dam to 91 m [300 ft] upstream of Bridge Street)

Bradytictic – Long-term brooders; refers to the length of time unionids hold glochidia in their gills

City – City of Grand Rapids

Construction Area – Includes the area from approximately 91 m (300 ft) upstream of Bridge Street Bridge to the upstream edge of the Fulton Street Bridge in downtown Grand Rapids, MI. It includes areas that would be physically disturbed during project construction (direct impact areas) and areas that would not be physically disturbed but may experience temporary increases in turbidity during construction and altered local hydraulics during and after construction (indirect impact areas).

Construction indirect impact area – Areas within the Construction Area where the river bottom would not be physically disturbed during construction but may experience temporary increases in turbidity during construction and altered local hydraulics during and after construction.

Critical flow levels used in evaluations –

890 CFS = 7Q10 flow defined as the minimum flow rate sustained for a 7-day period within a 10-year window
1000 CFS = 90% exceeded 7-day minimum flow rate
2500 CFS = 75% exceeded average daily flow rate (low flow)
3900 CFS = 50% exceeded average daily flow rate
5300 CFS = 25% exceeded average daily flow rate
7700 CFS = 10% exceeded average daily flow rate
10,000 CFS = 1 yr flood - Ordinary High-Water Mark [OHWM]
13,000 CFS = bankfull (1.5 yr flood)
18,000 CFS = 2 yr flood
26,000 CFS = 5 yr flood
31,000 CFS = 10 yr flood
35,100 CFS = 2013 spring flood
38,000 CFS = 25 yr flood
44,000 CFS = 50 yr flood
50,000 CFS = 100 yr flood

Direct impact area – River bottom area physically disturbed by construction within the Construction Area

Downstream indirect impact area – Upstream edge of Fulton Street Bridge to the mouth of Plaster Creek; area potentially impacted by increased turbidity during construction

Harm – Activity actually kills or injures. Total displacement causes harm when it results in injury or death.

Isolated area – Area isolated with isolation measures. Water level would be reduced, and mussels and fish would be salvaged before construction

Isolation measures – Aggregate bags used to isolate the Dam 2 riffle and drop structure construction area for dewatering and construction

Low-head dam – Any of four existing low-head dams between the 6th Street Dam and Fulton Street

Maintenance – Includes routine, planned and scheduled upkeep of project features, equipment, or supplies necessary to maintain proper functionality of project elements

Minimize – Measures to reduce take (e.g., reducing the footprint of direct impact, revising construction plans to avoid areas with mussels)

Mitigate – Measures to compensate for take that cannot be avoided

Modeled Hydrophysical Habitat (MHH) – Areas with current velocity under1,200 CFS conditions between 0.12 and 0.50 ft/sec; this defines areas where some current velocity (suitable to keep substrates clean of fines) occurs under low flow, but substrate is not scoured at high flow. Shear stress at 3,900 CFS >0.01 lb/sf to prevent sand deposition

Operations – Includes regular monitoring, inspections, data collection, and reporting

Project – All work occurring in Project Area

Project Area – Downstream face of the 6th Street Dam to upstream face of Fulton St. Bridge

Recipient Sites – Sites where translocated unionids would be placed (Ada, Riverside Park, and Plaster Creek)

Rehabilitation – Correcting anticipated shifting, wear and tear, weathering, or materials degradation by resetting features, augmenting features with additional materials, replacing protective coatings, or refurbishing of features or components

Repair – Unanticipated corrections resulting from unforeseen circumstances that are outside the design assumptions of the Project

Replacement – Removal, demolition and disposal, and replacement of project features or components that cannot be repaired or rehabilitated

Tachytictic – Short term brooders; refers to the length of time unionids hold glochidia in their gills

Take – "To harass, harm, pursue, hunt, shoot, wound, kill, trip, capture, or collect, or to attempt to engage in any such conduct" ESA, 1973

Take – "To harass, harm, pursue, hunt, shoot, wound, kill, trip, capture, or collect, or to attempt to engage in any such conduct of individuals of a species" Michigan DNR Part 365 of NREPA

Upstream – Area between Ann St. and the 6th Street Dam

Upstream indirect impact area - Grand River from the upstream edge of the Construction Area to the 6th Street Dam

1.0 INTRODUCTION

The City of Grand Rapids (City) is pursuing PL83-566 funding with the Natural Resource Conservation Service (NRCS) to improve aquatic habitat in the Lower Grand River where it flows through downtown Grand Rapids, Kent County, Michigan (GVMC, 2011). The funding would be used for revitalizing the rapids in the Project Area (downstream face of the 6th Street Dam to upstream face of Fulton St. Bridge; Figure 1-1) under the U.S. Department of Agriculture (USDA) NRCS Watershed Protection and Flood Prevention Act, PL83-566 program (PL83-566). To reduce the impacts on freshwater mussels from this project, The City and Grand Rapids Whitewater (GRWW) plan to relocate as many freshwater mussels as practicable from impact areas (Grand Rapids/GRWW mussel relocation project). The U.S. Fish and Wildlife Service (USFWS) has engaged in the planning for this project since Grand Rapids was first selected by the U.S. Environmental Protection Agency (USEPA) to be part of the Urban Waters Federal Partnership (UWFP) in 2013. USFWS plans to assist the City and GRWW during the mussel relocation portion of the action in this Biological Assessment (BA) (Grand Rapids/GRWW mussel relocation) where feasible.

1.1 Purpose of the Document

Natural Resource Conservation Service (NRCS) would provide funds under PL83-566 for construction and operation of a Grand River revitalization project in downtown Grand Rapids (PL83-566), which would directly and indirectly affect federal and Michigan protected species (NRCS Action). As a result of the NRCS action, unionid mussels would be translocated from direct impact areas. The USFWS will assist with aspects of the mussel translocation (USFWS Assistance). This purpose of the BA is to determine the effects both the NRCS project and the Grand Rapids/GRWW Relocation are likely to have on the federally endangered species *Epioblasma triquetra* (Snuffbox) and Michigan listed threatened, endangered, and special concern species (threatened and endangered species; TES). Adversely affecting a species may result in “take” as defined by Section 3(18) of the Endangered Species Act (ESA) and Part 365 of Michigan Department of Natural Resources (MDNR) Natural Resources and Environmental Protection Act (NREPA) Public Act 451 of 1994 as (Part 365 of NREPA); to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect an animal, or to attempt to engage in such conduct. The term "harm" is further defined by the ESA's implementing regulations (50 CFS 17.2).

1.2 Proposed Action

1.2.1 NRCS Action

The purpose of the proposed PL83-566 action in Grand Rapids is to:

> Restore the rapids, improve public safety, restore aquatic habitat diversity and suitability for native Great lakes fish and mussel species, and enhance river access and use.

This action includes removing the four low head dams, constructing riffles and boulder arches, bank vane structures, and creating emergent habitat boulder fields (Figure 1-2). The PL83-566 funding, along with additional private and public funding, would be used to revitalize habitat in the Project Area. The current design reduces construction and permanent impacts from the previous Project design.

A BA was previously submitted, and a Biological Opinion (BO) obtained on a previous design in 2020 (EcoAnalysts, 2020; USFWS, 2020). A 404 permit application for the previous design was submitted to Environment, Great Lakes, Energy (EGLE) in 2022. Following objections from U.S. Environmental Protection Agency (USEPA), the City of Grand Rapids (City) withdrew the permit application in March of

2023. NRCS, Grand Rapids WhiteWater (GRWW) and the City worked with EGLE and Michigan Department of Natural Resources (MDNR) to modify the previous design to avoid and minimize impacts to freshwater mussel and fish species. Figure 1-3 shows the previous proposed project. Appendix A shows the design that was coordinated with EGLE and MDNR in September 2023.

Changes that were incorporated into this design to reduce construction and permanent impacts included:

- Between Blue Bridge and Fulton Street
    - The boulder wave structure on the west side of the channel was replaced with an augmented boulder vane structure with a reduced footprint and surrounding scattered boulders.
    - The scour pool downstream of the wave structure would not occur.
    - Excavation beneath Blue Bridge in the previous design needed for construction access and increased flood conveyance is no longer needed.
    - Total estimate permanent direct impact area in this section of the reach have been reduced from 1.0 acres to 0.2 acres.
- Between Pearl and Blue Bridge
    - The hydraulic feature in this area, which included a boulder wave structure on the west connected to a constructed riffle structure on the east, has been replaced with an emergent habitat boulder field and a series of bank vane structures to provide slack water near designated access points on the bank.
    - The recovery pool of the previous design has been removed.
    - Total estimated permanent direct impact area in this section of the reach has been reduced from 1.2 acres to 0.1 acres
- Between Gillett and Pearl Street (Location of Dam 1)
    - The hydraulic feature at Dam 1, which included a boulder wave structure on the west side connected to a constructed riffle structure on the east side, has been replaced with a single constructed riffle with emergent habitat boulders and moved downstream to have more overlap with the Dam 1 removal footprint.
    - The recovery pool of the previous design has been removed.
    - Total estimated permanent direct impact area in this section of the reach has been reduced from 1.9 acres to 1.4 acres.
- Between Bridge and Gillett Street (Location of Dam 2)
    - The hydraulic feature at Dam 2, which included a boulder wave structure on the west connected to a constructed riffle structure on the east, has been replaced with a hydraulic feature that combines constructed riffles on either side of the river with a series of boulder arches in the center of the channel. The new hydraulic feature has a reduced footprint.
    - The recovery pool of the previous design has been removed. Small scour pools are included directly downstream of the boulder arches, similar to other Michigan projects that have implemented W-weir or Aadland rock arch designs.
    - Total estimated permanent direct impact area in this section of the reach has been reduced from 3.0 acres to 1.5 acres
- Between Bridge Street and Gillet (Location of Dam 3)

  - The dam removal limits have been expanded, based on coordination with EGLE, to include a re-grading of the channel upstream of Dam 3.
  - Emergent habitat boulders are proposed to be placed within the dam removal footprint.
  - Total estimated permanent direct impact area in this section of the reach has been changed from 0.2 acres to 1.2 acres.
- Upstream of Bridge Street (Location of Dam 4)
  - The dam removal limits have been expanded based on coordination with EGLE, to include re-grading of the channel upstream of Dam 4.
  - Total estimate permanent direct impact area in this section of the reach has been changed from 0.3 acres to 1.6 acres

Total estimated permanent direct impact area for the project was reduced from 7.6 acres to 6.1 acres.

Additionally, construction of the new design would be performed primarily in the wet, negating the need for most of the isolation areas previously proposed for construction. The current preferred design meets the project purpose while avoiding and minimizing impacts to mussel and fish species.

Informal consultation with U.S. Fish and Wildlife Service (USFWS) was initiated in October 2023 (Table 1-1). A series of meeting between NRCS, GRWW, City, USFWS, MDNR, and EGLE have been held to discuss the design and to further avoid, minimize, and mitigate impacts to the river, fish, and unionid mussels. Of the 127,600 m^2 (31.5 acres) Construction Area, 45,445 m^2 (11 acres) would be directly impacted during construction (direct impact area) of this project. This is approximately a 50% reduction in impact area from the previous design, 89,195 m^2 (22 acres).

The Construction Area addressed in this BA encompasses the Grand River from approximately 91 m (300 ft) upstream of the Bridge Street Bridge to the upstream face of the Fulton Street Bridge; approximately 880 m (2,894 ft) upstream to downstream and 145 m (476 ft) wide for a total area of 127,600 m^2 (31.5 acres) (Figure 1-1). The Action Area addressed in this BA includes the construction direct and indirect impact areas, all construction staging and access areas, downstream indirect impact area, and upstream indirect impact area (Figure 1-1).

1.2.2 Grand Rapids/GRWW Relocation

The NRCS action would result in direct impacts in areas where project features would be constructed and from causeways constructed to access construction areas (Figure 1-1). The purpose of the Grand Rapids/GRWW Relocation is to translocate unionid mussels from direct impact areas of the NRCS action. The Action Area for this project includes the direct impact areas from which unionids would be collected and translocated, and the Recipient Sites where collected unionids would be placed (Figure 1-4).

1.3 Species Considered in this BA

Under Section 7 of the ESA, federal agencies (both NRCS and USFWS) are required to consider two main issues with respect to a TES: 1) whether the proposed action is likely to jeopardize the continued existence of the species; and 2) whether the proposed action would destroy or adversely modify designated critical habitat for that species. If an endangered or threatened species is present and may be adversely affected, formal consultation with the USFWS must be initiated.

Ecological Specialists, Inc. (ESI) and EcoAnalysts, Inc. (formerly ESI) performed unionid mussel surveys within the NRCS and USFWS Project Areas in 2013, 2015, 2016, 2017 and 2020 to determine if TES were present and assess species richness, abundance, and distribution (ESI, 2014, 2016, 2017a; EcoAnalysts, 2018, 2021). Additionally, Cardno (2017) conducted a survey and translocation of unionid mussels from the Michigan Department of Transportation (MDOT) I-196 Bridge construction area in 2016 and 2017.

Freshwater unionid mussels (average density 0.3 unionids/m^2) occur in the Project Area. Species richness is high (20 live unionid species), and the federally endangered *E. triquetra* and state TES have recently been collected (Table 1-2). Fish surveys have also been conducted in the project reach as part of an NRCS monitoring program (EnCompass, 2020). Two Michigan threatened fish species (*Moxostoma carinatum,* River Redhorse; *Acipenser fulvescens,* Lake Sturgeon) and host fish for unionid mussel TES also occur in the Project Area (Table 1-3).

USFWS Information for Planning and Consultation (IPac) system was queried to determine what other federal species might occur in the Project Area (Appendix B). The list included three bat species, *Myotis sodalis* (Indiana Bat), *Myotis septentrionalis* (Northern Long-ear Bat), and *Perimyotis subflavus* (Tricolor Bat), one bird species, *Grus americana* (Whooping Crane), one reptile, *Sistrurus catenatus* (Eastern Massasauga Rattlesnake), and one insect, *Lycaeides melissa samuelis* (Karner Blue Butterfly) that are endangered or threatened or proposed as endangered or threatened. A DKey was completed to determine if these species would be affected by the project. A "no effect" determination was received for *M. sodalis*, *L. m. samuelis*, *D. plexippus*, *M. septentrionalis*, *P. subflavus*, and *G. americana*. A "may effect" determination was returned for *S. catenatus* and *E. triquetra*. After further consultation, USFWS determined that no habitat was available for *S. catenatus* in the project area, but E. triquetra could be adversely affected. Critical Habitat for *E. triquetra* is not currently designated, but *E. triquetra* would be adversely affected. Both Construction (NRCS project) and translocation (Grand Rapids/GRWW Relocation) effects on *E. triquetra* are discussed in this BA.

Michigan Natural Features Inventory (MNFI) was consulted for a list of state endangered, threatened or special concern species for Canal Park and Ah-Nab-Awen Park improvements (rare species review #3507) in 2023 with the same project area as this project to comply with NREPA part 365 (Appendix B). Several TES freshwater mussel species and one fish species were listed as occurring within 1 mile of the Project Site; *E. triquetra*, *Cyclonaias tuberculata* (Purple Wartyback), *Potamilus* (*Leptodea) leptodon* (Scaleshell), *Ligumia recta* (Black Sandshell), and *Alasmidonta viridis* (Slippershell), and *M. carinatum* (River Redhorse).

All of these species have recently been collected in the Project Area, except *P. leptodon* (Table 1-2 and 1-3) and are included in this assessment. Special concern mussel species on the MNFI list known to occur in the Project Areas and included in this assessment include *Truncilla truncata* (Deertoe), *Venustaconcha ellipsiformis* (Ellipse), *Alasmidonta marginata* (Elktoe), *Pleurobema sintoxia* (Round Pigtoe), *Lasmigona costata* (Flutedshell), and *Potamilus alatus* (Pink Heel-splitter).

Species not included on the MNFI list that have been included in this assessment include *A. fulvescens* (Michigan threatened) and *Utterbackia imbecillis* (Paper Pond Shell, Michigan special concern), as these species have recently been collected alive or as fresh shells in or near the Project Areas (Table 1-2 and 1-

3). *Toxolasma parvum* (Lilliput, Michigan endangered) is also included, as it was recently collected live upstream of the Project Areas near Riverside Park and may be present in the Project Areas (ESI, 2014).

Potamilus leptodon is not included, as the record was pre-1930 and was thought to be a misidentification by S. Hanshue (personal communication). Species on the MNFI list that have not recently been collected alive or as fresh shells in the Project Areas include *Cambarunio (Villosa) iris* (Rainbow), and *Lasmigona compressa* (Creek Heel-splitter) (Table 1-2). Other Michigan endangered or threatened species that are not included in this assessment include plant species, reptiles, and insects that typically do not occur in an urban setting such as the Project Area.

This BA is prepared in accordance with legal requirements set forth under Section 7 of the ESA (16 U.S.C. 1536[c]). Michigan TES are also included in this BA to facilitate MDNR review under Part 365 of NREPA. This BA describes NRCS and Grand Rapids/GRWW projects, unionid mussel and fish distribution within the lower Grand River, and the potential direct and indirect effects projects may have on unionids, threatened fish, and host fish species. Conservation measures that would be implemented to avoid and minimize impacts and mitigation measures to compensate for unavoidable impacts are also described.

As *E. triquetra* and Michigan TES were collected within the Action Areas, formal consultation, a Biological Opinion (BO) and Incidental Take Authorization are requested for both projects under Section 7 of the ESA. Michigan Threatened/Endangered Species Permits for both Proposed Actions is also being requested pursuant to part 365 of NREPA.

2.0 PROJECT DESCRIPTION

The NRCS Project in the Grand River would revitalize an 880 m (2,887 ft) stretch of the river flowing through the City of Grand Rapids (City). The Project is designed to restore aquatic connectivity and enhance habitat for fish and aquatic life, including Michigan TES and federally endangered *E. triquetra*. Collaboration with agencies has resulted in a project that improves aquatic habitat and recreational opportunities, while minimizing direct impacts to the river bottom, ensuring fish passage, and maintaining the existing *P. marinus* barrier at the 6th Street dam.

The Grand Rapids/GRWW relocation project would translocate unionid mussels from direct impact areas of the NRCS project to three recipient sites; Ada, Riverside Park, and Plaster Creek.

2.1 NRCS Project

Only 1% of the river habitat in the lower peninsula of Michigan is composed of rapid-type habitat, which is important to the life cycle of many aquatic species (Daugherty et al., 2009). Rapid-type habitat is defined as a river area with a relatively steep energy gradient, coarse bed substrates, and non-uniform distribution of flow velocities. High gradient areas have been eliminated and fragmented in many Michigan watersheds and their rehabilitation is highly desirable (Dodge, 1998; Wesley, 2005). The historic rapids of the Grand River that ran through the City were important for subsistence, socially and culturally for Native Americans. These rapids also established the namesake for the City. The ecosystem processes and recreational functions of the rapids-type habitat have been degraded by dams, channelization, dredging, and urban development over more than 170 years.

Five dams have been constructed within the historic rapids, including the 6th Street Dam and four low-head dams. The 6th Street Dam was constructed over 170 years ago. It was initially constructed in 1849 to increase water-power in the canal that went around the rapids on the left descending side of the river (http://www.mfhn.com/glsdb/rivers/grandriver.html#canalrapids). It also facilitated the floating of logs over the bedrock outcrop rapid upstream of Leonard Street on the left descending side of the river. The last known maintenance on this structure was in 1929. Concrete erosion due to water flow and abrasion, joint deterioration, cracks, holes, and other localized deterioration have increased the likelihood that the dam could fail and the need to be maintained or replaced soon (Vos, 2015). Four low-head dams were subsequently constructed downstream of the 6th Street Dam to add grade control and maintain channel-width during low flow to prevent the concentration of raw sewage that was discharged into the river. Part 315 or 307 of the NREPA does not regulate dams in the Project Reach, as they do not meet the criteria for regulation. However, dams are regulated by part 301 of NREPA.

Dredging and mining of large substrate downstream of the 6th Street Dam has occurred in the channel. In addition, the river is laterally constrained at high flow by over a mile of floodwalls or berms on both sides of the channel. These modifications have created a straight and uniform channel with little diversity in flow depth, substrate, or flow velocity that limits natural aquatic ecosystem processes, and constrains the physical, chemical, and biological processes of the river (Figure 2-1).

The City, in collaboration with GRWW, proposes revitalizing the Grand River within the City between 91 m (300 ft) upstream of Bridge Street to Fulton Street, Grand Rapids, Kent County, Michigan (Figure 1-2). The proposed Project is within an urbanized reach of the Grand River where rapids historically existed

within the City. Between Lake Michigan and Ada, Michigan, a distance of approximately 97 river km (60 river miles), river gradient sufficient enough to restore rapid habitat only exists between Ann Street and Fulton Street. The area between Bridge and Fulton Street is currently a relatively homogeneous river channel. Through removing low-head dams, creating riffles and diversified boulder arches, and creating emergent habitat boulder fields, the NRCS Project seeks to improve public safety, restore aquatic habitat diversity and suitability for native Great lakes fish and mussel species, and enhance river access and use.

Locations upstream and downstream of the Project Area that would result in less take to TES were considered. However, between Lake Michigan and Ada, Michigan, a distance of approximately 97 river km (60 river miles), river gradient sufficient enough to create rapid-type habitat only exists between Ann Street and Fulton Street. The Project purpose could not be met in any other area.

This urbanized stretch of river places constraints on the complete restoration of the rapids to pre-development conditions due to existing infrastructure and public uses: the channel complex was historically over 427 m (1,400 ft) wide but is now restricted in floodwalls to approximately 160 m (600 ft) wide (Carey et al., 2016). The pre-developed channel was not only significantly wider but had multiple side channels and islands and likely covered a much broader area during periods of flooding. The existing encroachments of infrastructure on the river (floodwalls, bridges, properties, and other facilities) renders restoration to pre-development conditions infeasible.

2.1.1. Project Location

The Action Area (Figure 1-1) for the NRCS Project includes:

- Project area (Downstream face of the 6th Street Dam to upstream face of Fulton St. Bridge);
- Construction Area (between 91 m [300 ft] upstream of Bridge Street and the upstream edge of Fulton Street within the Grand River),
    - Direct impact areas include the area where the river bottom would be physically disturbed by construction within the Construction Area (Figure 1-1),
    - Indirect impact areas within the construction area include the area where the river bottom will not be physically disturbed during construction within the Construction Area (Figure 1-1);
- Upstream indirect impact (upstream edge of the Construction Area to the 6th Street Dam);
- Downstream indirect impact area (upstream edge of Fulton Street Bridge to the mouth of Plaster Creek);
- Staging and access areas adjacent to the Project Area (Ah-Nab-Awen Park); and
- 3 Recipient sites for relocation of mussels (Figure 1-4).

The Construction Area is within the wetted channel of the Grand River between Bridge and Fulton Street bridges in Grand Rapids, Kent County, Michigan. Of the 127,600 m^2 (31.5 acres) Construction Area, 45,445 m^2 (11 acres) would be directly impacted during construction (direct impact area) (Table 2-1). This is approximately a 50% reduction in construction impact area from the previous design, 89,195 m^2 (22 acres). The river bottom would not be physically modified in approximately 82,155 m^2 (20 acres) of the Construction Area (construction indirect impact area), but could be affected by turbidity and changes in local hydraulic conditions. Staging and access areas would primarily be from Ah-Nab-Awen Park (park). Some equipment may be staged north of I-196 on the east side of the river, but access to the river will

only be from the park. The downstream indirect impact area that could be affected by turbidity increases during construction is conservatively estimated as 2.5 km (1.5 miles) from Fulton Street to Plaster Creek. The upstream indirect impact area between the 6th Street Dam and the Construction Area that would be affected by slight changes in hydraulics includes approximately 38,420 m^2 (9.5 acres).

The three recipient sites include a mussel bed at Ada, MI, where the majority of mussels will be relocated, Riverside Park, where any *T. parvum* or *U. imbecillis* would be relocated, and Plaster Creek, where any *T. truncata* and *P. alatus* would be relocated (Figure 1-4).

2.1.2 Evaluation Metrics

Metrics that could affect freshwater mussel and fish species that were evaluated in this analysis included;

- Direct impact areas during construction,
- Permanent impact areas after construction is complete,
- Transient sand (areas of deposition and scour)
- Lamprey barrier hydraulics (prevent lamprey escapement),
- Fish passage,
- Host fish habitat,
- Unionid habitat, and
- "Take" of TES species.

Area affected by construction (direct impact areas) considered all areas that would be impacted by causeways constructed to access and work in construction areas in the dam removal and riffle construction areas, and tracking in the river needed for placement of emergent habitat boulder fields, diversified boulder arches, and rock pile vanes downstream of Pearl Street. See Appendix C for construction plans.

Permanent impact area includes a sum of all structures that would not be available to freshwater mussels post-construction. This includes boulders and rock used for riffles, diversified boulder arches, emergent habitat boulder fields, rock vanes, and transient sand.

Transient sand was based on sediment transport analysis. Sand initiates motion from upstream of the 6th Street Dam at approximately 3,900 CFS (approximately 50% exceedance flow). At lower flow rates, sand supply into the Project Area is limited, and active deposition is unlikely. Depositional sand areas were estimated from shear stress analysis at 3,900 CFS. If an area did not produce suitable hydraulics (shear stress >0.01 lbs/ft^2) for mobilizing sand at 3,900 CFS, it was assumed depositional. The flow rate of 3,900 CFS was chosen as it approximately corresponds to the initiation of sand load transport from the upstream river reaches. Identified areas are anticipated to have some amount of local deposition; however, sand in these areas would also be remobilized at flow rates at or below approximately 10,000 CFS. Due to the transient nature of these areas, they were excluded from mussel habitat area.

Lamprey barrier hydraulics were evaluated based on literature values for blockage criteria and modeling of hydraulic conditions at the 6th Street Dam (Appendix D). Literature indicates that *Petromyzon marinus* (Sea Lamprey) is blocked by endurance swimming limits of 2.5 m/second (sec) (8.2 ft/sec) for 3 m (10 ft), burst speed limit of 4 m/sec (13.1 ft/sec), or a jumping barrier of at least 46 centimeters (cm) (18 in)

(Hansen, 1980; Hunn and Youngs, 1980; McAuley, 1996) and impeded at velocities >1 m/sec (3.28 ft/sec) (Almeida et al., 2007; Quintella et al., 2009). Water temperature also affects passage; burst speed and endurance is substantially reduced at water temperatures <10° C (50° F) (Applegate, 1950; McAuley, 1996).

The tailwater velocity and jumping barrier at the 6th Street Dam are primarily a function of tailwater elevation. Decreases or negligible changes in tailwater elevation with low probability of occurrence were determined to have no adverse impacts to *P. marinus* barrier effectiveness (P. Hrodey, GLFC, personal communication, October 10, 2019). Tailwater elevations were modeled over a range of typical flow rates through a given year and compared under existing, temporary, and 2025/2026 Project conditions (Appendix D).

Spawning and larval habitat for *P. marinus* was qualitatively evaluated using literature values for preferred conditions. Physical factors essential for successful *P. marinus* reproduction include steady, unidirectional water flow, and suitable gravel substrates (0.9 to 5.1 cm diameter; 0.4 to 2 inches) with very little sand, water velocity (0.5 to1.5 m/sec; 1.6 to 4.9 ft/sec), depth (13 to 170 cm; 5 to 67 inches), and temperature (10.0 to 26.1° C; 50 to 79° F) (Manion and Hanson 1980). Nest building begins when water temperature warms to 15° C (59° F) (Applegate 1950, SLCB, 2017). Preferred larval habitat (Type I substrate) consists of silt with minor sand and detritus in depositional area (SLCB, 2017).

Fish passage was evaluated by identifying 15 swim paths that might pose a challenging route for upstream fish passage based on flows of 2,500 CFS, 3,900 CFS, and 7,500 CFS in consultation with MDNR and EGLE, peer review literature, and a panel of fish experts (Appendix E). Depth and velocity under these flows are shown in Appendix F. Targeted depths for passage were ≥0.25 m (0.75 ft) to allow fish headroom. Deeper areas under higher flows (0.76 m; 3 ft) were evaluated for use as flow refugia. Ichthyomechanics (Katopodis and Gervais, 2016) were used to evaluate if a fish group would be capable of upstream passage and the proportion of fish expected to pass. *Stizostedion vitreum* (Walleye) group was used for fish of spawning sizes 0.38 m (15 in.), 0.43 m (17 in.) and 0.51 m (20 in.) in total length. *Acipenser fulvescens* group was used for larger fish, 1.5 m (60 in.) in total length. See Appendix E for fish passage report.

Host fish habitat availability was evaluated by identifying habitat for host fish groups at various flows (2,500 CFS [75% exceedance, typical low flow], 3,900 CFS [approximately 50% exceedance], 7,500 CFS approximately 10% exceedance]) (Appendix F). Habitats were identified from depth, velocity, and substrate maps created from hydraulic models. Host fish that occur within the Project Area include Cyprinidae (Minnows; hosts for *P. sintoxia* and *L. costata*), Catostomidae (Suckers; host for *A. marginata*, *L. costata*), Ictaluridae (Catfish; host for *C. tuberculata*, *L. costata*, *U. imbecillis*), Centrarchidae (Sunfish and Bass; hosts for *P. sintoxia*, *L. recta*, *T. parvum*, *A. marginata*, *L. costata*, *U. imbecillis*), Percidae (Perches; hosts for *E. triquetra*, *L. recta*, *T. parvum*, *V. ellipsiformis*, *A. viridis*, *L. costata*, *U. imbecillis*), and *Aplodinotus grunniens* (Freshwater drum; host for *L. recta*, *P. alatus*, *T. truncata*, and *L. costata*) (Table 1-3).

Fish hosts were grouped based on habitat preferences. Cyprinidae are typically found along slow flowing sloping river margins. *Lepomis* sp. (Sunfish within the Centrarchidae), *Catostomus commersoni* (White Sucker), and many juvenile fish are typically found in areas with moderate depth and slow velocity with

cover in the form of large rock, vegetation, and/or woody debris. Adult Ictaluridae and *Micropterus* sp. (Bass species) are typically found in deeper, slow flowing pools. *Etheostoma* sp. and *Percina* sp. (Darters), juvenile Ictaluridae, and juvenile Catostomidae prefer riffles (fast moving shallow river area, less turbulent than rapids). Other Catostomidae species (*Moxostoma* sp. [Redhorse], *Ictiobus* sp. [Buffalo], *Hypentilium nigricans* [Hogsucker]) prefer raceways (areas with moderate depth and flow velocity and low turbulence). *Aplodinotus grunniens* prefers open water habitats (deeper pools and raceways).

Changes in unionid mussel habitat were evaluated by comparing available aquatic area (wetted areas under 890 CFS without sand deposition or permanent structures that unionids could occupy) and Modeled Hydrophysical Habitat (MHH; hydrophysical areas that unionids seem to prefer and should occur at higher densities).

Changes in unionid mussel habitat were evaluated by comparing available aquatic area (wetted areas under 890 CFS without sand deposition or permanent structures that unionids could occupy) and Modeled Hydrophysical Habitat (MHH; hydrophysical areas that unionids seem to prefer and should occur at higher densities). Unionid habitat is difficult to quantify. Factors that affect unionid presence and distribution include substrate stability (measured as shear stress divided by critical shear stress; shear ratio), some current velocity or turbulence under low flow conditions (allowing waste removal and delivery of oxygen, food, and calcium), adequate food (bacteria, phytoplankton), temperature conditions for reproduction (spawning, glochidia release from the female, and juvenile release from the host fish), good water quality (unionids are particularly sensitive to ammonia, heavy metals, and chlorine), and host fish availability (Wang et al., 2007; Strayer, 2008; Wang et al., 2010). Unionid mussels could be limited by any of the above factors, and not all of these factors were evaluated in the Project Area. Substrate in the Project Area is currently very coarse and compact, as the supply of smaller substrate (gravel, sand) entering this reach is limited, and existing scour potential is insufficient to move the armored larger substrate. Unionids were generally found in flow refugia near banks and downstream of structure in unionid surveys conducted in 2013, 2016, 2017, and 2020 (Figure 2-2). The Project would only affect physical habitat, which seems to be limiting, and only physical habitat is included in this analysis. However, other factors could also affect unionid colonization post-construction.

Area available for unionid mussels post-project was calculated as wetted area at 7Q10 flow (minimum flow rate sustained for a 7-day period within a 10-year window) of approximately 890 cubic feet per second (CFS), minus permanent impact areas that would have substrate not conducive to mussels; substrate either too hard and fast for burrowing or transient sand (mussels could be washed in and out at various flows). Unionids could colonize available areas at a similar density to existing (0.3 unionids/m^2).

To evaluate where mussels would be most likely to reside or recolonize, a hydrophysical habitat model (modeled hydrophysical habitat [MHH]) was developed by EcoAnalysts and RiverRestoration Organization (RRO) based on physical habitat conditions where some current velocity (suitable to keep substrates clean of fines) occurs under low flow, but substrate is not scoured at high flow. The MHH parameters included areas with current velocity during 1,200 CFS conditions between 0.12 and 0.50 ft/sec. Shear stress at 3,900 CFS >0.01 lb/sf defined conditions preventing sand deposition and scour.

Take in direct and Indirect Impact areas was calculated as the impact area multiplied by the average density of mussels in the Project Area (0.3 unionids/m^2). Take within direct impact areas would be reduced by the Grand Rapids/GRWW relocation Project (see Section 2.2).

2.1.3 Existing Conditions

Existing conditions provide a baseline for comparing existing hydraulics and channel dynamics to the Project. Physical characteristics of the channel within the Project Area are shown in Figure 2-1 and Appendix F. Under existing conditions approximately 167,353 m^2 (41 acres) is wetted under 890 CFS. Approximately 643 m^2 (0.16 acres) is occupied by the four low head dams (Table 2-1). Unionids are scattered among the remaining 166,710 m^2 at a low density of 0.3 unionids/m^2, but seem to be slightly more abundant along the banks (Figure 2-2). MHH area is approximately 6,080 m^2 (1.5 acres), primarily along the banks (Figure 2-3). A total of 20 live unionid species have been collected within the Project Area, including *E. triquetra*, *P. sintoxia*, *C. tuberculata*, *L. recta*, *P. alatus*, *T. truncata*, *V. ellipsiformis*, *A. marginata, A. viridis*, and *L. costata* (Table 1-2). Seventy-three (73) fish species have been collected in the Project Area including *M. carinatum* and *A. fulvescens* (Table 1-3).

The 6th Street Dam is considered an effective barrier to *P. marinus* migration (GLFC, 2018). Hydraulic conditions at the 6th Street Dam and fish ladder are thought to be an effective barrier to *P. marinus* (Table 2-3 and Table 2-4). A jump of <0.5 m (18 in) is needed for *P. marinus* to escape over a barrier. Less than 0.5 m (18 in) barrier occurs under existing conditions at 26,000 CFS (Table 2-3). However, current velocity is prohibitive at this flow (Appendix D). A few *P. marinus* have been collected upstream of the dam in the Lowell Creek (1965) and the Rogue River (2008 and 2022; Barber and Steeves, 2023). The spawning status of *P. marinus* within the Project Area is unknown due to lack of sampling; however, larval habitat does not appear to be present (P. Hodrey, SLCP, personal communication).

Fish passage under existing conditions is impeded by the four low-head dams. Fish passage is impeded at the two upstream low-head dams during low flow, and is restricted by high flow velocity on the RDB between Bridge Street and Pearl St. Bridge (Figure 2-1; see Holtgren, 2024; Appendix E). Existing conditions allow jumping fish to pass upstream of the 6th Street Dam using the fish ladder on the right descending bank (RDB). The largest jump distance from the wetted surface elevation (WSE) to the invert on the fish ladder under existing conditions is approximately 0.26 m (0.86 ft) (Table 2-4).

Seventy-three (73) species of fish have been recorded in the Project Area, 55 of which were collected in recent surveys (Table 1-2). Gradual sloping margins for Cyprinidae and juvenile fish are limited to the RDB in the upstream portion of the Project Area (Table 2-6). Cover is primarily in the form of riprap on the low-head dams and a few willow trees that are inundated near the banks in wetland areas. Few areas with cover, moderate depth, and slow current suitable for *Lepomis* sp. and juvenile fish are currently available. Deeper pools for Ictaluridae and *Micropterus* sp. occur along the LDB between I-196 and Bridge Street, near some of the bridge piers, and between Pearl and Fulton Street. Riffles with large boulders for *Percina caprodes* (Logperch) are not present under existing conditions, but *P. caprodes* was collected downstream of low-head dams in a recent survey (M. Holtgren, Encompass, pers. comm.) and during mussel sampling near wetland along the LDB. Most of the existing habitat is raceway and open water, suitable for *Moxostoma* sp. and *A. grunniens* (Table 2-5; Appendix F).

2.1.4 NRCS Project

The NRCS project includes removing the four low head dams and creating riffles, diversified boulder arches, emergent habitat boulder fields, and rock vanes (Appendix C). Through coordination with USFWS, MDNR, and EGLE, improving public safety, achieving fish passage and aquatic enhancement targets, maintaining the *P. marinus* barrier at the 6th Street dam, diversifying recreational opportunities, and restoration of rapids were identified as important elements. Through a collaborative process these elements were identified, and the Project configuration modified from the 2020 project where possible to maximize each element and reduce impacts to the river.

Through continued coordination with EGLE and MDNR, the September 2023 design has been revised to achieve shared project goals and also avoid and minimize impacts to the existing streambed. EGLE and MDNR also provided feedback on ways to further avoid and minimize the temporary impact areas during construction. The project team has worked closely with the construction management advisor for the project to further reduce temporary construction impacts, while also maintaining a feasible construction plan. The primary reduction in temporary impacts during construction was made by moving away from larger isolation areas and greater volumes of temporary cofferdams and causeways to only one small isolation area and much less temporary fill for causeways. Additionally, through ongoing efforts to further minimize temporary impacts, the causeways within the isolation area were removed so that the entire area could be unimpacted during mussel relocation. Additionally, the footprint areas of the causeways have been overlapped with proposed grading limits wherever possible to minimize the cumulative direct impact footprint for the project. Lastly, the number of habitat boulders with footer boulders has been reduced, which may result in settling of boulder into the existing bed over time, but also a reduced impact footprint during construction. Wetlands have been avoided to the greatest extent possible. Those that fall within direct impact areas would be covered with timber mats before any causeway construction or tracking on the river occurs.

Collaboration with agencies has resulted in a project that improves aquatic habitat and recreational opportunities, while minimizing direct impacts to the river bottom, ensuring fish passage, and maintaining the existing *P. marinus* barrier at the 6th Street dam. Continued collaboration with EGLE, MDNR, and USFWS is planned throughout the formal consultation, 404 permit, and Environmental Assessment (EA) process. However, impacts would not be greater than described in this BA.

The construction methods presented below include avoidance and minimization measures to the greatest extent practicable and have benefited from collaboration with agency representatives, stakeholders, and the interested public. 60% construction plans are provided in Appendix C. The future contractor may propose other means and methods but impacts and effects to TES would be no greater than those described herein. Any changes to construction and/or final project design would be discussed with USFWS, MDNR, NRCS, and EGLE to ensure take no greater than estimated in this BA or subsequent BO. This clause would be stipulated in all bidding documents. The contractor would be responsible for developing a care-of-water plan with best management practices (BMPs).

To minimize impacts to freshwater mussels within direct impact areas, mussels would be relocated from as much area as possible during the 2024 field season (June 1 to October 15) under the Grand Rapids/GRWW relocation Project (see Section 2.2)

Equipment staging would be primarily within Ah-Nab-Awen Park. Some equipment may be staged on the east bank between I-196 and the 6th Street Dam, but the river would only be accessed from Ah-Nab-Awen Park. Erosion and sediment control measures would be used in accordance with the Michigan Unified Keying System and approved by the City's Stormwater (NREPA Part 91) reviewers. Standard erosion and sediment control measures are described in Appendix C.

Prior to in-stream construction, the contractor would conduct overall project mobilization, delineate the project limits, and implement erosion control and BMPs. This would include placing barriers/signs, installing safety fencing, and isolating the Project site from the general public. The contractor would also field locate all existing utilities.

The contractor would remove designated vegetation and protect-in-place bridges, utilities, and landscape features (boulders, trees) as required. Vegetation removal would only occur within the staging areas and would be minimized as much as practicable to provide access and limit any safety concerns. Vegetation removal in staging areas would be limited to smaller shrubs and urban trees. Construction staging and stockpile areas would be established, as well as areas for storage of spare oil booms and designated oiling and petroleum handling areas outside of the riparian zone. These areas would be isolated from the river using BMPs such as silt-fences, straw wattles, and berms. The contractor would also establish and post protocols for potential oil spill cleanup and emergency response.

Equipment used in construction would include construction equipment such as excavators, loaders, cranes, and haul trucks. General considerations for all equipment maintenance and storage areas would prescribe to EGLE guidelines. Runoff from equipment maintenance and storage areas would be directed to stabilized outlets designed to adequately convey the volume discharged. Heavy equipment would be well maintained to prevent leaks. Vehicles or other equipment would not be washed at locations where the runoff would flow directly into a watercourse or separate storm sewer. Construction materials, including topsoil and chemicals, would be stored, covered, or isolated to prevent runoff of pollutants and contamination of groundwater. Empty canisters, cans, or other chemical containers (e.g., hydraulic fluids, etc.), scrap wood, scrap metal, and all other waste materials would be disposed of daily or kept in sealed waste containers until they can be properly disposed of off-site, such as in a landfill. Waste materials would not be buried on-site.

Prior to entering the watercourse, all equipment would be washed under high-pressure water with a non-harmful and biodegradable degreaser. Once in the watercourse, equipment would be inspected frequently and maintained properly to ensure no grease, oils, or chemicals are entering the watercourse. If equipment is leaking such fluids, it would be removed from the water course and repaired prior to re-entering. Equipment regularly traversing in and out of the watercourse would be cleaned under high-pressure water (i.e., wheel washing station) at a minimum once per week. Biodiesel fuel would be used in any equipment entering the water. If needed, oil booms may be placed downstream of any equipment working in the wet.

All in-river construction work is expected to be conducted with river conditions approximately ≤3,900 CFS. However, the construction crew on site would ultimately decide on conditions they can safely work under.

Limiting construction to lower flows allows construction to occur in the wet, negating the need for most of the isolation measures previously proposed. Causeways of imported clean coarse aggregate would be installed along the west bank to access the Dam 1, 3, and 4 construction areas, as well as the bank vane structures and the emergent habitat boulder fields downstream of Pearl Street. The Dam 2 construction area would be accessed directly from the staging area. Construction equipment would be equipped with Global Positioning Systems (GPS) to ensure all construction and in river tracking is within the direct impact areas outlined in this BA.

To maintain flow conditions for in-river work and ~~a~~void and minimize potential temporary increases in tailwater elevations at 6th Street Dam, the following construction sequencing has been developed. This sequencing has been established through coordination with the construction management advisor and regulatory agencies as the most feasible means for construction and to minimize direct impacts to the channel.

Causeways would be installed before removal of dams or construction of proposed improvements. The construction causeways for Dams 1 and 2 should be installed first. Construction of proposed improvements could then occur at any location downstream of Dam 3 as the first construction activities, with the Dam 2 feature being prioritized first (if construction begins in spring/early summer). Installation of the access causeway and construction of proposed improvements to Dam 3, including the removal of the dam, would not occur until the cofferdam within the Dam 2 construction area is removed and the contractor is confident the Dam 2 feature will be completed within the same construction season. The installation of the access causeway and the removal of Dam 4 would not occur until the Dam 2 feature has been fully constructed.

Isolation measures at Dam 2 would be installed as soon as flows are low enough after Spring melt or after *P. marinus* migration season ends (approximately July 1), whichever occurs first. If flows are low enough before the *P. marinus* migration season ends, isolation measures would be installed if approved after coordination with the USFWS Sea Lamprey Control Program. Isolation measures would be removed immediately following the completion of the work on the west side of Dam 2. Construction within the isolation measures would require approximately three weeks. The isolation measures would not be left in the river overwinter. The modeled impacts to tailwater at 6th Street Dam were evaluated and considered at length during the development of the construction sequencing and modeled increases in tailwater have been avoided and minimized to the greatest extent practicable. Refer to Table 2-3 and Appendix D for the modeled tailwater elevations at 6th Street Dam during the anticipated temporary construction conditions.

The Dam 2 construction area would be accessed from the Ah-Nab-Awen Park staging area via an access ramp (Appendix C). Temporary causeways of clean imported aggregate would be constructed around the outside of the area to be isolated for construction of the diversified boulder arches, and around the construction area for the east side riffle feature (Figure 2-4). A cofferdam constructed of aggregate bags filled with clean imported material would be installed inside the causeways. The causeways cannot be used to isolate the area, as the rock used for the causeway is too permeable. Aggregate bags cannot be used for the causeway, as they not designed to hold construction equipment.

Fish would likely move out of this area during construction of the causeway. However, once the area is isolated, the area would be electofished and/or seined to remove as many fish that remain as practicable. Unionid mussels would be collected and translocated (see Section 2.2, Grand Rapids/GRWW relocation Project). Water would then be pumped out. A screen would be placed around the pump and a net around the pump area to limit entrainment of fish. During pumping, if fish remain in the area, a crew would be on site to collect and remove fish from the isolated area. Because the lack of flow and potentially increased water temperature may stress unionid mussels inhabiting the isolated area, sufficient personnel would be on site to limit the unionid collection time to less than 10 days (see Section 2.2 for details).

Once mussels are removed from the isolated area, Dam 2 would be removed, and a diversified hydraulic structure would be constructed at its location. The proposed structure would include constructed riffles with emergent habitat boulders on either side of a series of boulder arches and scour holes. (Figure 1-2). Once the west side is complete, the cofferdams would be removed and the proposed improvements on the east side would be constructed, using previously installed causeways to access.

On the east side of the river, Dam 2 would be demolished and removed, and the proposed riffle structure would be constructed. The riffle would be constructed of stable imported alluvium and stabilized with imported riprap with a D_{50} of 30 cm (12 in), with large emergent habitat boulders placed throughout. Riffle slope would be 50:1. The isolation measure and causeways would be removed following the completion of Dam 2 feature construction. Temporary causeways would be removed following construction. The resulting features would provide a diversity of depths and flows for aquatic habitat, as well as recreation. Boulders provide structure for fish and flow refugia for mussels.

Causeways to, and along, Dams 3 and 4 would be installed and the dams demolished and removed. The channel upstream of the dams would be regraded after dam removal. Emergent habitat boulders would also be placed within the Dam 3 removal and regraded area. Dam 3 would be accessed from the north end of Ah-Nab-Awen Park, and Dam 4 would be accessed from a temporary causeway extending from the park to Dam 4. Temporary causeways would be removed following construction. Habitat boulders would provide structure for fish and flow refugia for mussels.

Dam 1 would be demolished and removed, and replaced with a riffle. The Dam 1 construction area would be accessed via a causeway that would run from Ah-Nab-Awen Park along the west bank to the Dam 1 construction area. Temporary causeways would be constructed on the upstream and downstream sides of the proposed riffle feature. The low-head dam would be demolished and removed. The riffle would be constructed with stable imported alluvium, and stabilized with imported riprap (D_{50}, 30 cm [12 in]), and have a slope of 50:1. Emergent habitat boulders would be placed throughout the riffle. Temporary causeways would be removed following construction. The resulting feature would provide a diversity of depths and flows for aquatic habitat and for recreation. Boulders provide structure for fish and flow refugia for mussels.

Two emergent habitat boulder fields would be constructed between Pearl and Fulton Streets. Both areas would be accessed from a causeway extending from Ah-Nab-Awen Park to the construction areas. Emergent habitat boulders on the west side would be placed from the causeway, while boulders on the east half of the river would be placed while tracking in the river. Boulder vanes would be constructed

upstream and downstream of Grand Rapids Public Museum Carousel and on the east bank to create slack water for public access to the river. The emergent habitat boulder fields provide structure for fish and flow refugia for mussels.

Between Blue and Fulton Street, diversified boulder arches would be created on the west side of the river and emergent habitat boulder field on the east side. Access would be provided by extending the causeway along the west bank downstream of Blue Bridge. The emergent habitat boulder field would be constructed by tracking in the river. Proposed improvements would provide a diversity of flows and cover for aquatic species, including structure for fish and flow refugia for mussels.

Once features are in place, some changes in depth and flow would result. Depths upstream of Bridge Street would be faster and shallower. Tailwater elevations are expected to be lower than existing, maintaining the existing *P. marinus* barrier (Table 2-3 and 2-4). The regraded area and emergent habitat boulder field in the area of Dams 3 and 4 would be deeper and slower. Flow velocity would also be slower between the Dam 3 and Dam 2 features. Downstream of the Dam 2 features, the area near the bank would be slower, with some deeper holes developing downstream of the diversified boulder arches. However, these scour holes are all within the direct impact area. The area between Dam 2 and Dam 1 features would be deeper and slower, but no changes in contours is expected. Depth would be greater in the Dam 1 features and flow more variable than under existing conditions. Flow velocities would be more variable downstream of Pearl Street, but depth should be similar to existing conditions (see Appendix F).

The Project was designed to minimize long-term Operation, Maintenance, Repair, Rehabilitation, and Replacement (OMRRR). Operation includes regular monitoring, inspections, data collection and reporting. These activities would not require any tracking of equipment into the river bed and would therefore not affect unionid mussels. Maintenance includes routine, planned and scheduled upkeep of project features, equipment, or supplies necessary to maintain proper functionality of project elements. The proposed grading is anticipated to adjust to post-construction hydraulics and some localized scour and deposition may result, along with slight shifts in boulder and riprap. This is expected, and features would be left alone to adapt to river conditions. No routine maintenance is anticipated. Therefore, maintenance would not affect unionid mussels.

Repair is for currently unanticipated corrections resulting from unforeseen circumstances that are outside the design assumptions of the project. Rehabilitation is to correct anticipated shifting, wear and tear, weathering, or materials degradation by resetting features, augmenting features with additional materials, or refurbishing of features or components. Replacement includes removal, demolition and disposal, and replacement of project features or components that cannot be repaired or rehabilitated. Repair, rehabilitation, and/or replacement that could require instream activity would be scour or deposition that threaten public safety (flood threats, bank access, or adverse hydraulics for recreation) or infrastructure (flood wall, bank, or bridge scour). Whenever possible, repair, rehabilitation or replacement of structures would be conducted from the river bank or, if flows and depths allow, from floating work platforms floated upstream from the Butterworth ramp with minimal impacts to the river bottom. Any debris that might hang up on riffles, bridge piers, diversified boulder arches, or rock vanes would be removed by chain sawing in place and allowing debris to float downstream, or floating debris to the riverbank for removal.

Tracking equipment in the river would only be used when these activities could not be completed from the bank or floating work platform. The greatest impact would occur if equipment needed to track from the existing emergency access at Ah-Nab-Awen Park to the diversified boulder arches downstream of Blue Bridge. The most direct route to each feature (considering bottom contours) would be followed. If possible (flow velocity permitting), the tracking path and area needing repair, rehabilitation, or replacement would be searched for mussels, and mussels would be translocated to recipient sites.

2.1.5 NRCS Project Impacts

No actions associated with site preparation would affect habitat for mussels or fish, as it occurs in the upland, and runoff and sedimentation would be prevented by BMPs. None of the trees that would be removed appear to be suitable roost trees for *M. sodalis* or *M. septentrionalis*, and trees would be replaced post-construction.

Project elements that could directly affect TES mussels include any actions that would affect freshwater unionid mussels and/or their habitat. TES would be harmed (killed or injured) by construction of temporary causeways and a cofferdam structure, substrate placement, grading, and equipment tracking within the river channel. Once the Project is constructed, the proposed grading is anticipated to adjust to post-construction hydraulics and some localized scour and deposition may result, along with slight shifts in boulder and riprap, all within direct impact areas. No routine maintenance is anticipated. Some repair, rehabilitation, and/or replacement may be needed in the case of unforeseen circumstances that would threaten public safety or infrastructure. TES could be harmed (killed or injured) if this involves tracking in the wet and flowing river. Translocating unionid mussels to minimize adverse effects is proposed.

Habitat for unionid mussels would be modified by changes in local hydraulic conditions, substrate constituents, flow velocity and depth, and host fish habitat. Predicted habitat changes are anticipated to benefit TES, fish hosts, and other fish species without increasing *P. marinus* spawning, larval habitat, or escapement probability or impeding fish passage.

The area that would be affected by project construction includes the area from 91 m (300 ft) upstream of Bridge Street to the upstream face of Fulton Street, an area of 127,600 m^2 (31.5 acres) (Table 2-1). Of this, 45,445 m^2 (11 acres) would be directly impacted during dam removal, and causeway and feature creation. If unionid mussels are evenly scattered throughout the direct impact areas, approximately 123 *E. triquetra*, 1,922 Michigan TES, and 11,588 other unionid species could be impacted during construction (Table 2-1). Unionids not relocated from direct impact areas could be crushed by construction activities. As many unionids as practicable would be translocated from direct impact areas before construction to minimize these impacts. However, unsafe diving/collection conditions may prevent some unionids from being removed (see Grand Rapids/GRWW relocation project, Section 2.2). Those not relocated would be considered Take and mitigated through a mitigation fund (see Section 2.3).

Indirect project impacts within the Construction Area (areas where the river bottom will not be physically disturbed during construction) include temporary increases in turbidity during construction and slight changes in local hydraulics (changes in flow velocity) during and after construction. No changes in depth or scour are expected during construction outside of direct impact areas. The area of indirect impact

within the construction area is approximately 82,155 m^2 (20 acres). Approximately 222 *E. triquetra*, 3,475 Michigan TES, and 20,950 other unionids could be affected by increases in turbidity and slight changes in local hydraulics (Table 2-1).

Indirect project impacts downstream of Fulton Street also include potential increased turbidity during construction (downstream indirect impact area). The river between Fulton Street and 500 m (1,640 ft) downstream was sampled for mussels in 2013 (ESI, 2014). Substrate was primarily sand, with the LDB being deeper with more flow and the RDB very shallow. Only 12 mussels were collected, and density averaged 0.1 unionids/m^2 (Table 2-7). The Grand River near the mouth of Plaster Creek was sampled in 2017 and 2018 (ESI, 2018; EcoAnalysts, 2019, 2021), and the I-196 South Bridge was sampled by JFNew (2013d), and mussels were relocated from the I-196 south bridge by GEI (2023). Few mussels were collected in any of these surveys, and substrate was primarily sand or silt, except near the I-196 bridge (downstream of Plaster Creek), where flow was greater and substrate was sand, gravel, and cobble (GEI, 2023). Less than three mussels per five-minute search were collected by ESI (2018), and only five mussels were collected by JFNew (2013d). However, almost 4000 mussels were relocated from the I-196 bridge in 2021/2022, including *E. triquetra* (GEI, 2023). A few Michigan TES have also been collected live (*C. tuberculata*, *L. recta*, *P. alatus*, *T. truncate, L. compressa*) (Table 2-7). Based on a conservative 0.1 mussels/m^2, approximately 28,250 mussels could occur in the downstream indirect impact area (Table 2-1). The mussels that occur within this reach could be temporarily affected by turbidity plumes. BMPs would be in place to reduce turbidity and a monitoring program in place to detect turbidity and initiate corrective actions.

Although sedimentation would be contained within direct impact areas and BMPs would be installed, turbidity increases within the construction area indirect impact areas and downstream indirect impact area may affect unionids. Prolonged periods of turbidity can affect feeding and reproduction (Aldridge et al., 1987; Gascho Landis et al., 2013; Gascho Landis and Stoeckel, 2016; Tuttle-Raycraft et al., 2017). Intermittent exposure to inorganic Total Suspended Solids (TSS) at high levels (>600 mg/L) can cause nutritive stress, resulting in shift to catabolism, decreasing glycogen reserves resulting in decreased growth and reproduction (Aldridge et al., 1987). Feeding of some species declined as organic TSS increased, with a threshold at 8 mg/L over a seven-month period (Gascho Landis et al., 2013; Gascho Landis and Stoeckel, 2016; Tuttle-Raycraft et al., 2017), and reproduction was affected at TSS >20 mg/L (Gascho Landis and Stoeckel, 2016).

Temporary increases in turbidity could affect mussel feeding, respiration, and spawning success, but are not expected to result in mortality. Mussels tend to close up and burrow into the substrate when disturbed by increased turbidity and changes in flow. This could result in reduced feeding and use of glycogen reserves, resulting in reduced fitness for reproduction and/or overwintering. Host fish behavior might also be modified within indirect impact areas. This could also result in decreased recruitment during construction.

Most large mobile fish would likely vacate the Construction Area due to activity. Small benthic fish in the direct impact areas could be harmed by equipment or buried beneath the causeways. *Moxostoma carinatum* may spawn in the Project Area. Spawning would likely occur before construction under higher water levels. If spawning conditions overlap with construction, recruitment of *M. carinatum* and other

species that use the Project Area may decline in the 2-year period in which construction activities are planned, but these species likely spawn in other sections of the Grand River outside of the Project Area. BMPs would be used to reduce turbidity to the greatest extent practicable. Some small benthic fish may be more affected than larger more mobile fish. However, turbidity would be monitored and a plan to reduce any unanticipated turbidity in place. Effects to small benthic fish would be temporary.

Fish, including host fish and *A. fulvescens* and *M. carinatum*, could also be affected by temporary increases in turbidity downstream of Fulton Street. Generally, fish are more mobile than mussels and would seek areas of less turbidity. However, increased suspended sediment can result in short-term physiological and behavioral effects such as displacement of fish, intraspecific aggression, disruption in migratory patterns, disruption in reproductive pairing and spawning success, changes in predator-prey interactions, changes in food web dynamics, and changes in larval disbursement and settlement (Kjelland et al., 2015 and references therein). These effects could be positive, negative, or neutral depending on the species, duration and frequency of exposure, and level of exposure.

Both *A. fulvescens* and *M. carinatum* are thought to spawn at the mouth of Plaster Creek (S. Hanshue, MDNR, personal communication). Both of these species spawn in the Spring when turbidity levels are higher than during other times of the year, and the increase in turbidity 2.5 km (1.6 miles) downstream of the Construction Area should be minimal. Spawning of these species should not be impacted by turbidity increases in the Construction Area. Additionally, water levels are typically higher during Spring spawning than are needed for construction. Construction is unlikely to be occurring during spawning season.

Indirect impacts upstream of the Construction Area include hydraulic changes between 6th Street Dam and 91 m (300 ft) upstream of Bridge Street (upstream indirect impact area); primarily some areas of slightly increased velocity and slightly decreased depth between I-196 and the construction area due to the demolition of the two low-head dams near Bridge Street (Appendix F). The project would not have negative permanent impacts to the effectiveness of 6th Street Dam as a barrier to *P. marinus*; tailwater elevations at the dam will not be increased due to the project and the dam will maintain its current effectiveness as a *P. marinus* barrier (Table 2-3; Appendix D). Tailwater elevations may increase less than 0.1 m (0.4 ft) during construction and will be lower post-construction.

After construction, most of the area would be available for recreational use and aquatic habitat. Deeper pools would provide habitat for Ictaluridae and other larger fish species. Shallow sloping banks with relatively low flow velocity would provide fish passage and habitat for Cyprinidae. Boulders would provide cover for Centrarchidae and juvenile fish. Boulders within riffle areas would provide habitat for darters such as *P. caprodes*, juvenile Ictaluridae, and juvenile Catostomidae. Riffles would also provide spawning areas for Catostomidae and Ictaluridae (Table 2-5).

Fish passage has also been thoroughly examined and the project modified to allow fish passage (Appendix E). At least 50% of the fish can pass along at least one swim path in each river reach (Table 2-6).

Mussel habitat is also expected to improve post-construction, although it may take several years for mussels to colonize. Mussels would still be more abundant along banks in slower flowing areas, but are

also expected to colonize flow refugia created by boulders within riffles and emergent habitat boulder fields (Figure 2-3). Modeled hydrophysical habitat suggests physical habitat would be available for mussels in approximately 7,565 m^2(1.9 acres), a slight increase over existing conditions (Table 2-1).

2.1.6 Conservation Measures

Conservation Measures for the NRCS project included further reduction in construction impacts with design modifications, mussel relocation from Direct Impact areas, and fish salvage from the isolated area. A mitigation fund would also be created to compensate for any unionid mussels not translocated from direct impact areas under the Grand Rive/GRWW relocation project.

NRCS, GRWW, and the City have coordinated with USFWS, EGLE, and MDNR over the past year to reduce project impacts to the river, fish, and mussels.

- The project has changed from most of the Project Area being isolated and impacted directly (89,195 m^2 direct impact Area; EcoAnalysts, 2020) to direct impact area of only 45,445 m^2, a 50% reduction in area affected by the project. Rather than the river being constrained by isolation measures during construction, construction would occur in the flowing river. Only a small area (3,285 m^2) at Dam 2 would be isolated during construction (Table 2-9), and the area would not be isolated during *P. marinus* migration season.
- Causeways have been removed from the isolated area construction design for less impact on unionid mussels; allowing more mussels to be translocated from within the isolated area.
- The footprint of causeways have been moved to overlap with proposed grading limits where possible to further reduce impacts to the river bottom.
- The number of habitat boulders has been reduced, reducing the construction impact area.
- Construction sequencing has been postponed to 2025 to allow the most time possible for unionid translocation under the Grand River/GRWW relocation project in 2024. In 2025, if needed, the translocation team would work with construction managers to allow mussels to be translocated before an area is under construction.
- Wetlands have been avoided to the greatest extent possible. Those that fall within direct impact areas would be covered with timber mats before any causeway construction or tracking on the river occurs.
- Construction sequencing has been changed to maintain the river grade and prevent scouring, but still maintain existing tailwater elevations during *P. marinus* migration season.
- To reduce impacts to fish, fish would be salvaged from the isolation area before it is dewatered.
- To prevent fish entrainment while dewatering the isolated area, a screen would be placed around the pump and a net around the pump area.
- Mussels would be removed from the isolated area after water levels are reduced. Sufficient personnel would be on site to ensure mussels are removed within a 10 day period to prevent stress due to lack of flow and increased water temperatures.
- Mussels in direct impact areas would be translocated under the Grand River/GRWW relocation Project (see Section 2-2).
- Mussels not relocated would be compensated through a mitigation fund.
- Constructed features would be allowed to adjust to post-construction hydraulics, and no operation or maintenance would be required, reducing impacts to the river bottom post-construction.

BMPs approved during the EGLE permitting process would be used to minimize impacts in indirect impact areas.

- Erosion and sediment control measures would be used in accordance with the Michigan Unified Keying System and approved by the City's Stormwater (NREPA Part 91) reviewers.
- Vegetation removal would only occur within the staging areas and would be minimized as much as practicable to provide access and limit any safety concerns.
- Construction staging and stockpile areas would be established, as well as areas for storage of spare oil booms and designated oiling and petroleum handling areas outside of the riparian zone. These areas would be isolated from the river using BMPs such as silt-fences, straw wattles, and berms. The contractor would also establish and post protocols for potential oil spill cleanup and emergency response.
- Runoff from equipment maintenance and storage areas would be directed to stabilized outlets designed to adequately convey the volume discharged. Heavy equipment would be well maintained to prevent leaks. Vehicles or other equipment would not be washed at locations where the runoff would flow directly into a watercourse or separate storm sewer.
- Construction materials, including topsoil and chemicals, would be stored, covered, or isolated to prevent runoff of pollutants and contamination of groundwater. Empty canisters, cans, or other chemical containers (e.g., hydraulic fluids, etc.), scrap wood, scrap metal, and all other waste materials would be disposed of daily or kept in sealed waste containers until they can be properly disposed of off-site, such as in a landfill. Waste materials would not be buried on-site.
- Prior to entering the watercourse, all equipment would be washed under high-pressure water with a non-harmful and biodegradable degreaser. Once in the watercourse, equipment would be inspected frequently and maintained properly to ensure no grease, oils, or chemicals are entering the watercourse. If equipment is leaking such fluids, it would be removed from the water course and repaired prior to re-entering. Equipment regularly traversing in and out of the watercourse would be cleaned under high-pressure water (i.e., wheel washing station) at a minimum once per week. Biodiesel fuel would be used in any equipment entering the water. If needed, oil booms may be placed downstream of any equipment working in the wet.
- Construction equipment would be equipped with Global Positioning Systems (GPS) to ensure all construction and in river tracking is within the direct impact areas outlined in this BA.
- Silt curtains would be used downstream of construction areas within the Project Area to reduce downstream turbidity,
- Turbidity would be monitored downstream of construction areas and in the downstream indirect impact area.

The current design meets the project purpose with significantly reduced impacts, achieves fish passage and aquatic enhancement throughout the project area, diversifies recreational opportunities, and restores the rapids. Additionally, the *P. marinus* barrier at the 6th Street Dam would be maintained with the same efficacy as under existing conditions.

A small area (3,285 m^2) at the Dam 2 diversified boulder arches needs to be isolated for construction. Without fish salvage, fish would be trapped in the isolated area and would die during construction. Some fish would leave the area due to construction activity disturbance during construction of causeways. Once

the area is isolated, a team of biologists would electrofish and/or seine the area to remove as many remaining fish as practicable. To protect any remaining fish from impingement or entrainment by pumps, a screen would be placed over the pump and a net would be placed around the pump area. A biologist team would remain on site to collect and remove any fish that remain trapped during the water drawdown. All live fish would be identified, counted, and released into the flowing channel. Any deceased large edible size fish would be offered to the public. A lined dumpster would be on site for disposal of non-edible dead fish.

2.2 Grand Rapids/GRWW Relocation Project

The Grand Rapids/GRWW Relocation Project would consist of collecting as many mussels as possible from the NRCS Project direct impact areas with USFWS assistance (Figure 1-1) and translocating them to three recipient sites (Figure 1-4). The area that would be affected by project construction includes the area from 91 m (300 ft) upstream of Bridge Street to the upstream face of Fulton Street, an area of 127,600 m^2 (31.5 acres) (Table 2-1). Of this, 45,445 m^2 (11 acres) would be directly impacted during dam removal, and causeway and feature creation. If unionid mussels are evenly scattered throughout the direct impact areas, approximately 123 *E. triquetra*, 1,922 Michigan TES, and 11,588 other unionid species could be impacted during construction (Table 2-1). Unionids not relocated from direct impact areas could be crushed by construction activities. As many unionids as practicable would be translocated from direct impact areas before construction in 2024 to minimize these impacts. However, unsafe diving/collection conditions may prevent some unionids from being removed.

2.2.1 Recipient Sites

A survey was conducted in 2015 to identify suitable recipient sites for mussels that would be translocated from NRCS Project impact areas (ESI, 2016). Five potential sites were identified; Ionia, Saranac, Chief Hazy Cloud, Ada, and Site 7. Of these, Ada is the largest (23,480 m^2 [5.8 acres]) site, and most of the TES were found at this site (Tables 2-7 and 2-8). The best habitat within the Ada bed is 3,400 m^2 (0.8 acres) mid channel (Figure 2-5). As many 10 m x 10 m areas as needed to accommodate TES would be established using corner markers driven into the substrate and either PVC pipe or ropes between the corner markers within this section of the site for the placement of TES. TES would be hand placed 1 unionid/m^2 into the 10 x 10 areas. A PVC grid with 1 m^2 cells would be used to delineate positions within the 10 x 10 area. The remainder of the site would be used to place common species. Density within this site averaged 2.8 unionids/m^2. If density is increased no more than 50%, the site can accommodate 4,760 TES individuals and 21,000 common individuals (Table 2-8). If mussels could be collected from all of the direct impact areas, approximately 98 *E. triquetra*, 1,440 Michigan TES, and 9,369 common individuals are expected based on collecting 80% of the unionids (Table 2-9). Landowners near the site would be contacted before any work is conducted.

Species that were not found at Ada include *P. alatus*, *T. parvum*, *T. truncata*, and *U. imbecillis*. *Potamilus alatus* was not found at any of the investigated sites, and *T. truncata* was only found at Saranac. *Aplodinotus grunniens* is the host for both *P. alatus* and *T. truncata* and is sparse upstream of the 6th Street Dam (Hanshue and Harrington, 2017). The river reach between Plaster Creek and the M-11 Bridge was investigated for a suitable recipient site in 2020 (EcoAnalysts, 2021). A suitable site with both species and suitable substrate was found just downstream of Plaster Creek (Figure 2-6). This is a small area, but very

few *P. alatus* and *T. truncata* would be expected in direct impact areas. A 10 m x 10 m area would be established in the most stable substrate of this area for these species.

Toxolasma parvum and *U. imbecillis* are both species that occur near the bank in siltier habitat. Neither of these species were found in the Project Area, but they could occur at a low frequency. A site along the edge of Riverside Park was investigated in 2013 as a staging area (ESI, 2014); however, since mussels were present, the area would not be used during NRCS Project construction. Several *T. parvum* were collected at Riverside Park, and habitat suitable for *U. imbecillis* was available. If these species are found in the Project Area they would be moved to Riverside Park (Figure 2-7). A 10 x 10 area would be established for these species.

Collection and translocation of mussels would occur when water temperature is above 10° C (50° F) and air temperature is between 10 and 32° C (50 and 90° F) unless permission is obtained from USFWS and MDNR to translocate outside of these temperature windows.

2.2.2 Collection and Translocation Safety Limitations and Timing

The collection and translocation effort would be limited by flow velocity. Michigan Department of Transportation (MDOT) indicated that divers were unable to safely work and translocate mussels from the I-196 bridge project, which is upstream of the Project Area, above 3,000 CFS due to high velocities. Dam 4 slows flow velocities between the 6th Street Dam and Dam 4 (Figure 2-1). Therefore, the flow velocity upstream of Dam 4 (at the MDOT project) during 3,000 CFS is equivalent to flow velocities downstream of Dam 4 (within the project area) during 1,200 to 1,500 CFS. Conditions suitable for relocating mussels at the I-196 bridge downstream of the project area were limited to <2,000 CFS (GEI, 2023).

ESI/EcoAnalysts experience in the Project Area (sampling in 2013- flows 1,860 CFS to 2,410 CFS), 2016 (flows 2,100 CFS to 3,000 CFS), 2017 (flows 1,300 CFS to 1,600 CFS), and 2020 (flows in September 3,400 CFS, October 2,000 CFS to 2,400 CFS) indicated that most (but not all) of the NRCS Project Area was sampleable at flows ≤2,500 CFS. At flows >2,500 CFS sampling became difficult and only the area along the west bank upstream of Dam 2 was accessible at 3,400 CFS. At 3,400 CFS, they moved from upstream to downstream, as moving upstream was not possible. Sampling was aborted mid-day as flows rose above 3,400 CFS. Equipment had to be floated down and across the river, then up a steep bank into the parking lot downstream of Fulton Street. Even at flows <2,500 CFS, moving equipment upstream to Ah-Nab-Awen Park at the end of the day was very difficult. Even at flows <1,500 CFS the west bank from the Grand Rapids Public Museum to just up of Fulton Street was not sampleable.

Sampling at all flows required holding a diver/snorkeler in place for a few minutes to dig a 0.25 m^2 quadrat. Translocation requires a diver to not just hold position, but move freely around an area to search for and collect mussels. Flows required for translocating mussels would be lower than required for sampling.

Relocating mussels at flows lower than 1,500 CFS would be ideal. However, 1,500 CFS flow has a very low probability of not being exceeded (frequency of <5%) and may not occur within the next few years (Table 2-10). A higher probability maximum flow was therefore considered that would allow at least some unionid mussels to be collected and translocated within the 2024 season.

Ecological Specialists, Inc. (ESI) dive teams have conducted over 45 translocations since 1990 in small, medium, and large rivers. Dunn and Sietman (1997), Dunn et al. (2000), and Cope et al. (2003) are often cited in methods for translocations and were the basis for the translocation protocols developed for Wisconsin and West Viriginia. The West Virginia protocol was the basis for the Ohio and Michigan freshwater mussel protocols. Ms. Dunn also teaches the sampling and translocation portions of the "Conservation Biology of Freshwater Mussels" and teaches "Scientific River Diving Safety" at the Department of Interior National Conservation Training Center. In her experience, safe diving/snorkeling conditions are limited to ≤0.3 m/sec (1 ft/sec); however, since depths are 1.2 m (≤4 ft) in most of the direct impact areas (Appendix F), divers/snorkelers should be able to relocate mussels in 0.6 m/sec (≤2 ft/sec) current.

Based on 2D modeling results, approximately 20% of the direct impact areas would have flow velocity ≤0.6 m/sec (2 ft/sec) at 2,500 CFS. At higher flows, very little of the direct impact area is expected to have safe diving/snorkeling conditions; 13% of direct impact areas would have flow velocities ≤0.6 m/sec (2 ft/sec) at 3,000 CFS, and only 6% at 3,500 CFS. Some of the area along the west bank where causeways are proposed, and some of the Dam 4 area may be accessed up to 3,000 CFS. Areas further riverward and along the east bank would likely only be workable at less than 2,500 CFS. However, the velocity and flow that is workable is ultimately decided by the diver/snorkelers on site.

Areas unable to have mussel translocation due to safety include areas within 10 meters of dams and areas determined to be too swift for a diver/snorkeler to hold position. Flow velocity near the dams is higher and more turbulent and could result in a diver/snorkeler being swept over or downstream of the dam, or being caught in a hydraulic downstream of the dam. The Grand Rapids Fire Department also discourages activity within 10 m of the dams.

2,500 CFS has a 37-72% probability of being exceeded during mid-July to October 1 (Table 2-10). 3,000 CFS has a 4-67% probability of being exceeded during mid-July to October 1. 3,500 CFS has a 0-60% probability of being exceeded during mid-July to October 1.

Safe diving/snorkeling areas would be determined based on the evaluation of the dive crew on site. If a diver/snorkeler cannot hold position, conditions would be considered unsafe. Attempts to maximize translocation efforts and efficiencies would occur if divers/snorkelers and the dive supervisor deem the hydraulic conditions safe. Figure 2-8 shows portions of the direct impact area that are predicted to be ≤0.6 m/sec (2 ft/sec) at 2,500 CFS. Divers/snorkelers would use these polygons, generated from modeling results at 2,500 CFS as a guide, but use judgement to determine if they could work safely further riverward. The area worked would be as large as possible while maintaining diver/snorkeler safety.

Hopefully, safe diving conditions would occur throughout the 2024 season and all mussels within direct impact areas could be collected and translocated. However, that probability is very low. Therefore, divers/snorkelers would prioritize areas based on mussel abundance (highest abundance areas first), and secondly areas that that would be constructed first (Dam 1 and 2 construction area and access causeways) (Figure 2-8). Additional areas would be worked as flow conditions and time permit.

The National Oceanic and Atmospheric Administration (NOAA) would be contacted to obtain flow predictions for the Grand River during non-flood periods if possible. One translocation crew would mobilize once flow rates are predicted to remain below 3,000 CFS for 7 days or more; a flow rate with a higher probability of occurring and at least some area being safe for collecting mussels. The mussel translocation crew would evaluate safe diving conditions at 3,000 CFS and determine the amount of area that could safely be worked. If more than 7 days of area is available, additional crews would be mobilized and mussels would be removed from as much of the direct impact areas as possible (see Table 2-11 for areas and estimated times). As flows decline and additional area is workable, up to four crews would be mobilized to maximize the area that mussels could be translocated from before construction. Once translocation begins, if flows are predicted to remain above safe diving conditions as determined by the translocation crew (approximately 3,000 CFS) for 7 days or more, translocation crews would demobilize and plan to return to the site once flows are predicted to be at or below safe levels for 7 days or more.

In 2025, construction would be prioritized. If mussels in parts of the direct impact areas were not collected and translocated in 2024 and river conditions are determined to be safe for collecting in 2025, the translocation crew would coordinate closely with the construction manager to determine areas where mussel collection could occur safely without interfering with construction.

Mussel translocation would occur within the isolated area around Dam 2 unless flows and time allow mussel translocation to occur prior to construction of the isolation structure. Mussels would be collected after isolation and before water is drawn down. Sufficient personnel would be on site to remove as many mussels as practicable within 10 days.

2.2.3 Collection and Translocation Methods

Collection and translocation of mussels would occur when water temperature is above 10° C (50° F) and air temperature is between 10 and 32° C (50 and 90° F) unless permission is obtained from USFWS and MDNR to translocate outside of these temperature windows. Water temperature and water clarity would be recorded within each collection area and at the recipient sites.

Each direct impact area would be divided into 5 x 10 m blocks within workable flow areas as determined by divers/snorkelers on site. Workable flow would be defined as current velocity in which the diver/snorkeler can maintain position (not be swept downstream) within the block and collect mussels. Tethering and additional weight would be used as needed. However, added weight can impair movement. Blocks would be further divided into smaller 1 m x 5 m rows using a PVC grid. The grid would consist of 5, 1 x 1 m^2 cells. Use of smaller blocks rather than a moving transect would allow collectors/snorkels to still systematically search an area, but also stay within irregular search areas.

Each of the 1 m x 1 m cells would be visually searched for habitat and mussels (visual search). If no habitat (bedrock or entirely non-movable rock) is found, then that 1 m^2 is clear. If habitat and/or mussels are found, that 1 m^2 would be excavated down to 15 cm (6 inches), collecting any mussels that are found (first pass) within a minimum search effort of 2 min/m^2. Excavation would include moving cobble and woody debris and moving away silt, sand, and small detritus, then digging the substrate down at least 15 cm (6 inches). That 1 m^2 would be excavated a second time (second pass) for a minimum of 1 min/m^2, and if <5% of the mussels are collected on the second pass compared to the completed first pass and no TES are

found, then the 1 m^2 would be declared clear. If not, it would need to be searched again until the <5% criteria and no TES is reached. Searching would require an average of 2 min/m^2 for the first pass and 1 m/m^2 for the second pass.

Once the entire 1 m x 5 m row is clear, the 1 m x 5 m grid would be moved to the next 1 m x 5 m.

"Clear" would be defined as

1. Area is bedrock or non-diggable rock on the visual search,
2. No mussels >0.5 inches are found on the completed first dug up pass (divers/snorkelers would strive to collect all mussels, but can only guarantee that mussels >0.5 inches would be collected),
3. Mussels are found after digging up the area (first pass), but <5% of the total number of mussels >0.5 inches found on the first pass are found after the area is dug up again (second pass) AND no TES are found.
4. Passes continue until <5% criteria of the completed first pass is met and no TES are found.

All areas within the direct impact areas that are deemed safe by the snorkeler/diver will be searched as above. Once an area is deemed unsafe it would not be worked unless river conditions improve.

Collected unionids would be held in flowing water or in flow through tanks (under ambient water conditions) while awaiting processing and/or translocation. Unionids would be processed within a few hours of collection. All collected TES would be tagged, measured (length in mm), and aged (external annuli count). Michigan TES would be tagged with shellfish tags, and *E. triquetra* would also be tagged with Passive Integrated Transponder (PIT) tags. Common species would be identified, counted, and marked with a Dremel tool (slash on the anterior ventral edge of the shell to assess growth). Unionids would be kept in water at ambient temperature (flowing water, flow through tanks, or buckets with frequent water changes) throughout this process and while awaiting transport to recipient sites. Unionids would be translocated to recipient sites at the end of each day or beginning of the following day wrapped in moist towels within coolers. Once at the site, common species would be spread on the bottom by a diver/snorkeler within a defined area at a density not to exceed 1 unionid/m^2 (either marked with buoys or GPS points). TES would be hand placed on the substrate within their assigned area at a density of 1 unionid/m^2. Hand placing unionids on the substrate rather than in holes dug by the diver/snorkeler allows the animal to select where it wants to be burrowed and previous studies indicate no difference in mortality or recovery with this method (Dunn et al., 2000).

Unionids could be stressed by handling and translocation; however, the above methods would minimize stress as much as possible. Results differ among studies that looked at mortality and/or reduced growth due to handling and translocation. Cope and Waller (1995) found that recovery and survival after translocation averaged 51% and 43%, respectively. Low survival and recovery were attributed to water and air temperature extremes, improper collection methods, improper handling and transport, and substrate instability at the recipient site. Subsequent translocations that reduced handling, kept animals in oxygenated water before and during transport or kept animals moist during transport and translocated mussels to stable recipient sites had very little mortality (Dunn et al., 2000; Cope et al., 2003; Tsakiris et

al., 2017). Survival, growth, and movement were similar between translocated mussels and those from the recipient site (all collected, measured, aged, marked) in four translocations (Dunn et al., 2000). Tsakiris et al. (2017) also compared survival, growth, and body condition in translocated vs. resident *Amblema plicata* (Three-ridge) and *Quadrula houstonensis* (since placed in synonymy with *Cyclonaias pustulosa* [Pimpleback]; FMCS, 2023) and found no difference in *A. plicata* and only minor differences in *Q. houstonensis*. Survival in two translocations was 85 to 100% after two years (Cope et al., 2003). Dunn et al. (2000), Cope et al. (2003), and Tsakiris et al. (2017) all used similar handling and transport methods. Roznere et al. (2017) did find difference in metabolites between mussels moved to their captive facility and to Big Darby Creek from the Muskingum River, and suggested that the differences in these metabolites were consistent with physiological processes that would result in reduced growth and mortality. The aforementioned translocations moved mussels within the same river, whereas Roznere et al. (2017) moved mussels to a captive facility and a different river system.

Results from studies looking at growth due to handling also differed. Both Dunn et al. (2000) and Tsakiris et al. (2017) handled mussels that remained in the recipient site and those relocated to the recipient site similarly. Since both groups of animals were handled similarly, any change in growth due to handling would not have been observed. Reduction in *Q. pustulosa* (changed to *Cyclonaias pustulosa*; Williams et al., 2017) growth with handling was reported by Haag (2009) when mussels were only handled once a year for two years. However, Ohlman and Pegg (2020) compared changes in *Lampsilis cardium* (Pocketbook) length with no handling, handling every other week, once a week, and twice a week for 85 days and saw no mortality and no difference in growth. Species differed between these studies; *C. pustulosa* is a thicker shelled, slower growing species than *L. cardium*. Handling and translocating mussels could result in stress, which could manifest in reduced growth and mortality in some species. However, stress can be significantly reduced through proper handling.

Based on previous translocations (H. Dunn, personal communication), 80% of the unionids within each collected area should be collected and survive translocation (estimated 15% not collected and 5% mortality of those collected) (Table 2-12).

A report would be prepared within 45 days of completion of each year's translocation.

2.2.4 Monitoring

Translocated unionids would be monitored within one year following each year's translocation (2024 and if needed 2025) between June and October 15 when water temperature is greater than 10° C (50° F), and air temperature is between 10 and 32° C (50 and 90° F) or whatever monitoring schedule is provided in the BO. Up to 100, 1 m^2 cells in each recipient site would be randomly selected for monitoring. A PIT tag wand would be first used to find and collect *E. triquetra*. A diver/snorkeler would systematically search each selected 1 m^2 area. A PVC grid with 1 m^2 cells would be used to facilitate searching. Since excavating all cells may destabilize substrate and render habitat unsuitable for mussels, at least 10 1-m^2 cells within each area would be excavated to calibrate surface to buried ratio. The remainder would be surface searched (visual, tactile, moving rocks, logs, probing the top inch) for at least 1 minute/m^2. All collected unionids would be checked for tags, recorded as tagged or not tagged, measured (length in mm), and aged (external annuli count), and Lampsilini would be checked for gravidity.

The area within 5 m around the grid would also be searched with a PIT tag wand and visually searched for relocated mussels to detect mussels that may have moved out of the grid area.

A report would be prepared at the end of each year to summarize translocation and monitoring results. Tag numbers, lengths and ages, collection site and translocation grid of TES would be reported in an Appendix. Area searched, search efficiency, and number of each species collected would be summarized. Monitoring results would include recovery rate, survival rate, growth, and movement of TES. Recovery rate of each species would be calculated as number of each species collected in surface search multiplied by the ratio of total:surface estimated from excavated cells/number of each species placed in the area. Survival would be estimated as estimated number of live recovered/estimated live + dead recovered. Growth would be assessed by both visual observations of shell material past the slash mark on the shell and by comparison of lengths. Movement would be estimated by comparing placement grid cell position with collection grid cell position.

2.3 Mitigation Fund

As many mussels as possible would be collected from direct impact areas and translocated to one of the three recipient sites under the Grand Rapids/GRWW project (see Section 2.2). The estimated area of direct impacts is 45,445 m^2. Using an average unionid density of 0.3 unionids/m^2, approximately 13,633 unionids occur within direct impact areas (Table 2-9). Mussels would at least be collected and translocated from within the isolated area. Up to 15% of those mussels may be missed during collection, and up to 5% might die due to handling. Minimum number of mussels that would be translocated would be 830 mussels, with mortality of 12,803 mussels (Table 2-12). If mussel collection in all of the direct impact area can be safely done, then with 15% of the mussels missed and 5% mortality due to handling, the maximum number of mussels that would be relocated would be 11,486.

A mitigation fund would be established to offset the take for the mussels that were unable to be translocated under the Grand Rapids/GRWW Project. The maximum mitigation fund contribution would be based on $34.10/mussel (2020 BA $28.50/mussel escalated for inflation) and would not exceed $436,589 (Table 2-13). This fund would be reduced by the amount of mussels that are translocated multiplied by the cost per mussel as stated above. The objective of the mitigation fund would be to fund projects that provide a direct benefit to mussels to achieve the USFWS “no net loss” policy and offset any potential impacts from mussels that were unable to be translocated. The work performed through the mitigation fund would help inform future conservation and habitat restoration efforts.

USFWS, NRCS, and MDNR would act as decision makers for the mitigation fund to determine what mitigation projects are selected for implementation. Priority would be given to projects that provide a direct benefit to mussels within the Project Area or the Lower Grand River Watershed. Specific mitigation activities, and mitigation fund management protocols would be developed in coordination with appropriate regulatory agencies.

The City and GRWW are interested in the long-term success of these habitat restoration efforts and would like to continue to partner with USFWS, NRCS, and MDNR on potential future projects that benefit mussels in the Project Area. The City and GRWW would advance the goals of the mitigation fund by encouraging local scientific partners including, but not limited to, the Grand Valley Metropolitan Council, Grand Rapids

Public Museum, John Ball Zoo, Grand Valley State University, and Trout Unlimited, to apply to the mitigation fund for projects that directly benefit mussels and the advancement of habitat restoration efforts in the Lower Grand River Watershed.

An initial deposit would be made to the mitigation fund following the completion of the 2024 mussel translocation efforts based on the collection efficiency. A second and final deposit to the fund covering the balance of the required mitigation fund would be made following any mussel translocation activities that occur during the 2025 construction season. Any excess funds of the initial deposit would be returned if the mussel translocation exceeds the estimated collection efficiency. The financial assurance shall take the form of proof of funding deposited into an escrow account, City of Grand Rapids Commission Resolution, proof of deposit and an executed agreement with a Non-Government Organization, or another agreed upon form of financial assurance documentation.

2.4 NRCS and Grand Rapids/GRWW Project Schedule

A proposed project schedule is provided in Table 2-14. This BA is expected to be submitted to USFWS in March 2024. A Biological Opinion from USFWS is expected before July 2024, allowing the USFWS project of mussel translocation to proceed in August, once river levels are safe. Information in the BA would be used to complete the Draft Environmental Assessment (EA). Once the EGLE permit is granted and PL83-556 funds are received, the mobilization and construction can begin. Construction would begin in 2025 to allow as much time as possible for mussel translocation. Mussels in areas that were not collected and translocated in 2024 and not under construction may also be translocated in 2025 if river conditions permit. Mussels would also be translocated from the isolated area in the Dam 2 construction area in 2025, once the area is isolated and water drawn down. Construction is expected to take up to two construction seasons; however, construction is highly dependent on safe river levels.

3.0 ENVIRONMENTAL SETTING AND BIOLOGICAL RESOURCES

Information in this section is largely based on information in Hanshue and Harrington (2017), supplemented with data collected by Ecological Specialists, Inc/EcoAnalysts (mussels) and EnCompass (fish).

The Grand River is Michigan's longest river, with a drainage area of 14,256 km^2 (5,504 mi^2). It begins in northern Hillsdale County as a series of lakes and ends at Grand Haven, MI in Lake Michigan. Hanshue and Harrington (2017) divided the river into five mainstem valley segments based on common channel and landscape features: headwaters, upper, middle, lower, and mouth segments (Figure 3-1). The headwaters flow 87 km (54 miles) to the confluence with Sandstone Creek, the upper river flows 68 km (42 miles) from Sandstone Creek to Eaton Rapids upstream of Red Cedar River, the middle river extends 97 km (60 miles) down to the mouth of the Maple River, the lower river flows 113 km (70 miles) from the Maple River to the Village of Lamont, and the mouth of the river continues for 40 km (25 miles) from Lamont to Lake Michigan.

The Action Area is within the Lower Grand River, which extends from the confluence with the Maple River downstream to the Village of Lamont (Figure 3-1). The Lower Grand River is within a glacial-fluvial valley formed approximately 14,000 years ago. Several major tributaries enter the lower Grand River, including the Maple, Flat, Thornapple, and Rogue Rivers (Hanshue and Harrington, 2017). Annual flow patterns are typical of most Michigan streams and include high flows in Spring and Fall, and low flows in late Summer and Winter. Seasonal flow stability was rated as moderately unstable approximately 64 km (40 miles) upstream at Ionia, MI, but is somewhat more stable in Grand Rapids due to inputs from the Flat, Thornapple, and Rogue Rivers, as well as groundwater inputs (Mandle and Westjohn, 1989 *in* Hanshue and Harrington, 2017).

Mean annual flow in Grand Rapids from 1901-2005 was 3,775 CFS (Hanshue and Harrington, 2017). Low flow (7Q10) is approximately 890 CFS. Under existing conditions, the bedrock shelf upstream of Leonard Street in Grand Rapids is submerged at all flows. Bankfull flow (1.5 yr flood) is 13,000 CFS. At 23,000 CFS, the 6th Street Dam becomes submerged. Ten (10), 25, and 100-year flood levels are 31,000 CFS, 38,000 CFS, and 50,000 CFS, respectively. The 2013 flood peaked at 35,100 CFS in Grand Rapids.

Anthropogenic alterations in the Project Area include narrowing of the river, placement of floodwalls, quarrying of bedrock, removal of glacial boulders, channel dredging, and installation of a series of low-head dams over the last two centuries. Recently the I-196 bridge (within the upstream indirect impact area) was widened. Cofferdams to facilitate construction extended into the river channel, increasing the tailwater levels at the 6th Street Dam and altering hydraulics. Construction duration was approximately 2 years.

The Grand River within Grand Rapids was estimated to be 430 m (1,400 ft) wide before modification. The width is currently approximately 140 to 200 m (450 to 600 ft) (Hanshue and Harrington, 2017). Floodwalls are present on both banks throughout most of the Project Area. Approximately 229,366 m^3 (300,000 yds^3) of gravel, cobble and boulder were dredged to fill the city riverfront. The 6th Street Dam was constructed at its present location in 1849 for water power in the canal around the rapids and to facilitate log flotation over the upstream bedrock shelf. It is presently classified as a grade control structure and maintains

approximately 2.4 m (8 ft) of head. Four low-head dams were constructed downstream of the 6th Street Dam in 1931 as part of a project to provide and maintain dilution water for raw sewage that was being discharged into the river. These dams maintain an average of 0.6 m (2 ft) of head each.

3.1 Habitat

The Grand River offers a wide gradient of aquatic habitat types. Topography within the watershed ranges from flat glacial till in the headwaters, to rolling ground moraine in the upper, middle, and lower segments, to sandy lake plains in the mouth segment. Mainstem river gradient is variable: the highest average gradient is in the headwaters segment (0.8 m/km [4.2 ft/mi]), although much of this gradient is accounted for by a relatively small section of river that steps down over glacial moraine. Upper and middle segment gradients are intermediate at 0.3 m/km (1.7 ft/mi) and 0.6 m/km (3.0 ft/mi), respectively. The lower segment is relatively flat, averaging 0.15 m/km (0.8 ft/mi); however, gradient is significantly higher in the City (1.7 m/km [9 ft/mile]). In particular, the segment of the Grand River between Ann and Fulton Street was formerly rapids dropping approximately 5.5 m (18 ft) over a 3.2 km (2 mile) reach. This high gradient is a result of an elevated bedrock sill composed of Bayport Limestone and Michigan Formation dolostone in the channel bottom through the City of Grand Rapids (Churches and Wampler, 2013). The mouth segment has a very low average gradient at 0.05 m/km (0.3 ft/mi).

Except for the mouth, every mainstem segment of the Grand River is impounded. The headwaters contain five dams, all of which represent barriers to the movement of fish and other aquatic life. Thirteen (13) dams exist on the upper segment, the three largest of which are Federal Energy Regulatory Commission (FERC) licensed hydropower dams. None of the three hydropower dams on the upper segment have fish passage provisions in their FERC licenses. The middle segment is impounded by four registered dams and one remnant dam; all four registered dams on the middle segment provide some form of fish passage. One of these dams, Lyons, was recently removed by USFWS and MDNR to increase connectivity within the river, and Webber Dam in Portland, MI is now the closest upstream dam to the Project (90 km [56 miles] upstream of Grand Rapids). The lower segment of the Grand River is impounded by the dam complex at Grand Rapids (6th Street Dam and smaller low-head dams); while the 6th Street Dam is equipped with a fish ladder, it still represents a barrier to non-potadromous species such as *S. vitreus*, Catostomidae, *A. fulvescens*, and host fish species.

The river channel in the headwaters is characterized as low gradient with moderate sedimentation. Throughout much of the upper segment, the river is low gradient with a wide forested floodplain; large woody material, overhanging vegetation and deep runs are common, with submerged vegetation and pools less common. In the middle segment, the channel widens and becomes less shaded resulting in prominent aquatic vegetation beds; streambed substrates range from coarse sands and gravel to localized bedrock in this section. The lower segment is categorized as a large warm river; however, several smaller cold, cold-transitional, and warm-transitional tributaries discharge to the mainstem, providing a variety of thermal microhabitats. Channel form is diverse in the lower segment, ranging from relatively shallow riffles and runs to deep pools. However, the reach within Grand Rapids is uniform due to channelization, floodwalls, and dams. The mouth offers large river habitat with mostly fine sediments. Sections of the mouth exhibit a braided channel that provides nursery habitat for juvenile *A. fulvescens* and other fish species. Throughout these segments, habitat diversity is likely reduced, as the highest gradient and most hydraulically diverse habitats are inundated by impoundments.

Topography in the lower segment of the Grand River ranges from flat lake plains in the northeast to gently sloping moraines in central portions to moderately steep sloping ridges in the west. The western portion of the lower segment represents the greatest relief in all of the Grand River catchment. Land use is described as 59% agriculture, 20% forest land, 10% rangeland, 7% urban and residential, and approximately 4% wetlands, lakes, and streams. Major tributaries in this section include the Maple, Flat, Thornapple, and Rogue Rivers. With the exception of the Maple River, major tributaries exhibit relatively stable flow patterns; inputs from these tributaries also help to stabilize the mainstem as gauged at Grand Rapids. The Grand River had significant water quality problems prior to the Clean Water Act due to raw sewage input, industrial discharge, and non-point source pollution. However, current water quality is generally good, although an exceedance of the mercury standard was documented in Ionia County and exceedance of pathogen standard was reported from combined sewer effluent in Kent County, although combined sewage overflows have been eliminated within Kent County.

3.2 Aquatic Resources

3.2.1 Unionid Mussels

The Grand River historically supported a diverse unionid assemblage, and at least 32 species have been reported from the Grand River; 14 from the headwaters, 16 from the upper river, 23 from the middle river, and 32 from the lower river (Table 3-1). Many of the anthropogenic changes have affected unionid assemblages in the Grand River: logging, urbanization, and impoundment in the floodplain have changed local hydrological conditions, a reduction of floodplain vegetation has contributed to increased water temperature (lack of shading) and decreased water quality (lack of nutrient filtration), and discharge of sewage into the river undoubtedly had an effect on unionid assemblages, as juvenile unionids are particularly sensitive to unionized ammonia (Augspurger et al., 2003; Wang et al., 2011a; Strayer and Malcom, 2012; Gillis et al., 2017).

The Grand River continues to support a diverse unionid assemblage; although no recent data for the headwaters and upper segments is available, recent surveys from the lower and middle segments account for 27 species (Table 3-2). Twenty-two (22) species have been found between City of Portland and the mouth of the Maple River, including *E. triquetra*, *L. recta*, *T. parvum*, *C. tuberculata*, *P. sintoxia*, *T. truncata*, *V. ellipsiformis*, *Cambarunio* (formerly *Villosa*) *iris* (Rainbow), *A. marginata*, *Lasmigona compressa* (Creek Heelsplitter), *L. costata*, and *U. imbecillis* (Table 3-2). Twenty-seven (27) species have been recently (1999 to present) collected between the Maple River and the M-11 Bridge in Grand Rapids, including *E. triquetra*, *L. recta*, *T. parvum*, *C. tuberculata*, *P. sintoxia*, *P. alatus*, *T. truncata*, *V. ellipsiformis*, *A. marginata*, *A. viridis*, *L. compressa*, *L. costata*, and *U. imbecillis* (Table 3-2). Unionid species that have not been collected from the Grand River since 1950 include *Obliquaria reflexa* (Three-horned Wartyback) and *Obovaria olivaria* (Hickorynut) (Hanshue and Harrington, 2017).

The lower Grand River still supports 26 of the 32 species that historically occurred in the lower river, including the federally endangered *E. triquetra,* as well as an additional 12 species listed as endangered, threatened, species of special concern, or species of greatest conservation need in Michigan (Table 3-1). Although still species rich, many species have declined in abundance (Hanshue and Harrington, 2017). Most of the species that were commercially harvested seem to be less abundant, but non-commercial species also seemed to have declined, perhaps due to temperature, water quality, and habitat changes

(Hanshue and Harrington, 2017). Coker et al. (1919) reported density of approximately 32 unionids/m^2 in the lower Grand River, whereas the highest recent density was reported by Woolnough and Barnett (2013) below Lyons Dam (6.5 unionids/m^2). Downstream of the Maple River, the highest reported density was at Peace Park (4.5 unionids/m^2; Table 2-7). Other sites surveyed between the Maple River and Project Area were investigated as monitoring sites and recipient sites for Project-related monitoring and translocation plans; these sites include Ionia (density of 2.4 unionids/m^2, 16 live species), Saranac (density of 3.4 unionids/m^2, 17 live species), Peace Park (density of 4.5 unionids/m^2, 14 live species), Chief Hazy Cloud (density of 4.0 unionids/m^2, 9 live species), Ada (density of 2.8 unionids/m^2, 12 live species), Site 7 (density of 0.7 unionids/m^2, 3 live species), Riverside Park (density of 1.6 unionids/m^2, 10 live species), Roselle Park (density of 3.4 to 3.6 unionids/m^2, 14 live species), and Upstream (2.2 unionids/m^2, 15 species; Table 2-7). The area between 6th Street Dam and Fulton Street had the second lowest density of sites surveyed in the lower Grand River, 0.3 unionids/m^2, although 20 species were found in recent survey and translocation efforts (Table 2-7). Species that have not been collected from the lower Grand River since 1950 include *Elliptio crassidens* (Elephantear), *O. reflexa*, *O. olivaria*, and *C. iris* (Table 3-1). *Elliptio crassidens* was likely an artifact of the former button industry (S. Hanshue, MDNR, personal communication). Species that have declined in abundance include *Actinonaias ligamentina* (Mucket), *A. marginata*, *Eurynia dilatata* (Spike), and *P. sintoxia* (Goforth et al., 2000). Species that are stable or increasing include *A. plicata*, *E. triquetra*, *L. cardium, C. pustulosa*, *Quadrula quadrula* (Mapleleaf), *T. truncata*, and *Fusconaia flava* (Wabash Pigtoe), as multiple year classes were found for these species in 1999 (Goforth et al., 2000), and recruitment was observed in recent surveys (Table 3-3).

In general, the lower Grand River between Ionia and the Project Area consists of deeper silt/sand pools and shallower sandy runs in wider areas of the river. Velocity increases where the river constricts, resulting in shallower, swifter areas with coarse rocky (cobble, boulder, gravel) substrate. The area between Ann Street and the 6th Street Dam (Upstream) is impounded by the 6th Street dam. Substrate consists of bedrock or sand in many areas, but areas of heterogeneous sand, gravel, and cobble are present (ESI, 2014). The Project Area is currently rather homogeneous with respect to depth, substrate, and flow (Figure 2-1). Downstream of Fulton Street, gradient is less, and substrate becomes sandier, although a few areas with coarser substrate were found (ESI, 2014; ESI, 2018; EcoAnalysts, 2019, 2021). Habitat and unionids observed at recently surveyed sites are summarized below. These sites were sampled with a combination of quantitative, semi-quantitative, and qualitative sampling techniques.

The surveys utilized a combination of semi-quantitative, quantitative, and qualitative survey methods to determine mussel distribution, mussel density, and species composition (Dunn, 2000). Semi-quantitative sampling consisted of searching a given area (either a transect [Upstream] or a delineated cell [Project Area]) visually and tactually. Although a specified area was searched, not all mussels were recovered, as 30 to 60% of mussels can be buried and not visible on the substrate surface (Smith et al., 2001). However, a larger area can be searched in a short time period. Semi-quantitative sampling is preferred for determining mussel distribution, as results yield a relative estimate of unionids if applied consistently (Dunn, 2000). However, quantitative sampling is needed to obtain an accurate estimate of density, species relative abundance, and age distribution (Miller and Payne, 1988). Quantitative sampling consisted of excavating all substrate within a 0.25 m^2 quadrat to a depth of 15 cm (6 in) into a 6-mm (0.25-in) mesh bag. Bag contents were rinsed through a 6-mm (0.25-in) sieve, and mussels were sorted from substrate and debris. Although more accurate, quantitative sampling is labor intensive, and fewer individuals and

species are recovered. Semi-quantitative and quantitative sampling were supplemented with qualitative sampling in areas most likely to contain TES to better estimate species richness and recover TES. Qualitative sampling consisted of collecting as many individuals as practicable in higher density areas for five to 20 minutes. Since the number of species increases logarithmically with the number of individuals collected, qualitative sampling is the best means of finding rare species (Kovalak et al., 1986).

Upstream, Project Area, from 0 to 500 m downstream of Fulton Street, and Riverside Park were sampled in 2013 using quantitative, semi-quantitative, and qualitative techniques (ESI, 2014). Upstream was also quantitatively sampled in 2015, 2016, and 2017, and the Project Area was quantitatively sampled in 2016, 2017, and 2020 (ESI, 2016, 2017; EcoAnalysts, 2018, 2021). Sites between Ada and Grand Rapids (Ionia, Saranac, Flat River, Chief Hazy Cloud, Ada, and Site 7) were qualitatively and quantitatively sampled in 2015 (ESI, 2016). Peace Park and Roselle Park were quantitatively sampled in 2016 (ESI, 2017), and Roselle Park was also quantitatively sampled in 2017 (EcoAnalysts, 2018). Sites near Plaster Creek and the M-11 Bridge downstream of Plaster Creek were qualitatively sampled in 2017 (ESI, 2018) and semi-quantitatively sampled in 2018 and 2020 (EcoAnalysts, 2019, 2021).

Ionia

The Ionia site was along the RDB of the Grand River near Ionia, MI (Figure 3-1), and was approximately 9,400 m^2 (2.3 acres). Substrate was primarily cobble, gravel, and sand, with bedrock and boulder also present. Water depth ranged from 0.3 to 1.5 m (1 to 5 ft); relative current velocity was fast toward the upstream and downstream ends of the site, and moderate elsewhere (Table 3-4).

The Ionia site harbored a moderately dense, species-rich unionid assemblage. A total of 110 unionids of 16 species were collected in qualitative and quantitative samples combined, including *E. triquetra* and several state-listed species (Table 2-7). Catch per unit effort in qualitative samples was 39.8 unionids/hour, and density was 2.4 ± 1.0 unionids/m^2.

Saranac

The Saranac site was along the LDB of the Grand River near Saranac, MI, and encompassed approximately 5,650 m^2 (1.4 acres) upstream of the Saranac Bridge (Figure 3-1). Substrate in most samples was cobble, gravel, and sand, with some boulder present in a few samples in the downstream half of the area. Water depth ranged from 0.2 to 1.5 m (0.5 ft to 5 ft); relative current velocity was fast at the upstream end of the site and moderate to slow elsewhere (Table 3-4).

The Saranac site harbored a moderately dense, species-rich unionid assemblage. A total of 106 unionids of 17 species were collected in qualitative and quantitative samples combined, including *E. triquetra* and several state-listed species (Table 2-7). One additional species was collected as a freshly dead shell. Catch per unit effort in qualitative samples was 31.5 unionids/hour, and density was 3.4 ± 1.1 unionids/m^2.

Flat River

The Flat River site extended approximately 600 m upstream from its confluence with the Grand River, in the east channel and encompassed approximately 12,100 m^2 (3 acres) (Figure 3-1). Gravel was the primary substrate with smaller amounts of cobble and sand. Depth ranged from 0.2 to 0.9 m (0.5 ft to 3 ft), and current velocity was moderate (Table 3-4).

The site supported a dense (6.6 unionids/m^2) species rich (16 species) unionid assemblage. A total of 287 unionids were collected in qualitative and quantitative samples combined (Table 2-7). *Epioblasma triquetra* and several Michigan TES were collected. Catch per hour was 169.7 unionids/hour.

Peace Park

The Peace Park site was along the RDB of the Grand River approximately 4 km (2.5 miles) upstream of the Thornapple River (Figure 3-1) and encompassed approximately 6,750 m^2 (1.7 acres). Substrate in most samples was cobble, gravel, and sand, with silt and clay more prevalent near the bank (Table 3-4). Water depth ranged from 0.6 to 2.8 m (2 to 9 ft); relative current velocity was fast in the upstream portion of the site and declined with distance downstream.

The Peace Park site harbored a higher density, species-rich unionid assemblage. Only quantitative samples were collected, but 77 unionids of 14 live unionid species were recovered. *Epioblasma triquetra* and several state-listed species (*P. sintoxia*, *C. tuberculata*, and *V. ellipsiformis*) were collected. Density averaged 4.5 ± 1.3 unionids/m^2 (Table 2-7).

Chief Hazy Cloud

The Chief Hazy Cloud site was a small area (approximately 1,990 m^2 [0.5 acres]) along the RDB of the Grand River, approximately 2 km (1.2 miles) downstream of the Thornapple River (Figure 3-1). Substrate was primarily cobble with smaller amounts of gravel and sand. Water depth ranged from 0.3 to 0.8 m (1 to 2.5 ft), and relative current velocity was moderate to slow (Table 3-4).

The Chief Hazy Cloud site supported a moderately dense, moderately species rich unionid assemblage. Twenty (20) unionids of nine species were collected in quantitative samples, including *E. triquetra* and Michigan species of special concern *P. sintoxia* and *A. marginata*. One additional species was collected as a freshly dead shell. Density at this site was 4.0 ± 1.7 unionids/m^2 (Table 2-7).

Ada

The Ada site was approximately 3 km (1.9 miles) downstream of the Thornapple River, just upstream of a riffle (Figure 3-1). The bed spanned the left descending two-thirds of the channel, encompassing an area of approximately 23,480 m^2 (5.8 acres) (Figure 2-5). Substrate in the upstream half of the area was primarily gravel, sand, and shell, with more cobble present in the downstream half. Water depth ranged from 0.3 to 1.2 m (1 to 4 ft), and relative current velocity was moderate (Table 3-4).

The Ada site supported a moderately dense and species rich unionid assemblage. Thirty-seven (37) live unionids of 12 species were collected in quantitative samples, including *E. triquetra* and several Michigan listed species (*L. recta, P. sintoxia, A. marginata,* and *V. ellipsiformis*). An additional two species were collected as fresh dead shells, suggesting these species may occur in low abundance. Density in the unionid concentration was 2.8 ± 0.9 unionids/m^2 (Table 2-7).

Roselle Park

The Roselle Park mussel bed was approximately 6 km (3.7 miles) downstream of the Thornapple River (Figure 3-1). The bed spanned most of the river channel and encompassed approximately 44,300 m^2 (10.9

acres). Depths at Roselle Park ranged from 0.3 to 3.4 m (1 to 11 ft), with the greatest depths occurring mid-channel towards the upstream end of the site (Table 3-4). Substrate was a mix of gravel and sand, with boulder and cobble more prevalent along the RDB, and sand more common along the LDB. Relative current velocity was fast to moderate.

The Roselle Park site supported a moderately dense and species rich unionid assemblage. A total 14 species were collected in quantitative samples in 2016 and 2017, including *E. triquetra* and several Michigan listed species (*P. sintoxia*, *C. tuberculata*, *L. recta, V. ellipsiformis*). Three additional species, including Michigan special concern species *A. marginata* and *U. imbecillis*, were collected as fresh shells, indicating they likely reside in the area at a low density. Density in the unionid concentration averaged 3.6 ± 1.0 unionids/m^2 in 2016 and 3.4 ± 0.8 unionids/m^2 in 2017 (Table 2-7).

Site 7

Site 7 was a shallow run, approximately 750 m (0.5 miles) downstream of the Rogue River, covering 6,675 m^2 (1.6 acres) of river along the RDB (Figure 3-1). Substrate was primarily a mix of boulder, cobble, gravel, and sand; water depths ranged from 0.2 to 0.6 m (0.5 to 2 ft), and relative current velocity was moderate to slow (Table 3-4).

Unionid abundance and species richness were low at Site 7. Only four live unionids of three common species were collected in quantitative samples. Five additional species, including *E. triquetra,* were collected as weathered dead shells. Although the individual was outside of the quadrat, one live *E. triquetra* individual was observed during quantitative sampling. This site had the lowest density of all sampled sites at 0.7 ± 0.7 unionids/m^2 (Table 2-7).

Riverside Park

The area surveyed adjacent to Riverside Park was approximately 2.6 km (1.6 miles) upstream of the Project Area with an area of 8,650 m^2 (2.1 acres) (Figure 3-1). Substrate was primarily sand with silt and clay near the bank (Table 3-4). Depth ranged from 0.2 to 0.6 m (0.5 to 2 ft), and current velocity was slow.

Unionid abundance was fairly low, although several species were collected at Riverside Park. A total of 297 unionids of 10 species were collected in qualitative and quantitative samples combined (Table 2-7). Most of these unionids were collected in qualitative samples. Density averaged 1.6 ± 1.2 unionids/m^2 in quantitative samples. No live *E. triquetra* were found; however, a fresh shell was found in a muskrat midden on the bank, suggesting this species occurs at a low density at this site. Michigan TES collected at Riverside Park include *P. sintoxia* and *T. parvum*. A fresh shell of *U. imbecillis* was also found.

Upstream

The Upstream site was between the 6th Street Dam and 1.6 km (1 mile) upstream of the dam. The site was a slow flowing pool due to the backwater effect of the 6th Street Dam. Near the upstream end of the site, substrate was sand over mixed boulder, cobble, and gravel, transitioning to a thin layer of sand over bedrock along the LDB, with a deeper sand, gravel, boulder thalweg along the RDB. Substrate became sandier near the 6th Street Dam. Depths were generally <1.0 m (<3.3 ft) along the LDB upstream of Leonard Street due to the bedrock shelf but exceeded 2.0 m (6.6 ft) in the thalweg upstream of the dam.

Mussels appeared to be more abundant in the upstream most portion of this reach, primarily near the banks, immediately downstream of Leonard Street, and mid-channel between Leonard and 6th Street. Abundance declined approaching 6th Street. Mussel density in the Upstream site averaged 2.1 unionids/m^2 (average of 2013, 2016 and 2017 samples) and 15 species were collected live (Table 2-7). *Amblema plicata* was the most commonly collected species, accounting for 54.3% of individuals collected (Table 2-7). TES were found throughout the Upstream site and comprised an average of 5.3% of live unionids. TES in this reach include *P. sintoxia* (live), *C. tuberculata* (live), *E. triquetra* (live), *L. recta* (live), *A. marginata* (FD), and *U. imbecillis* (FD).

6th Street Dam to Fulton Street

Habitat between the 6th Street Dam and Fulton Street is currently a very rocky, swift armored area with pockets of softer substrate along banks and flow refugia behind boulders (Figure 2-1). Substrate is primarily composed of boulder, cobble, gravel, and sand, with most of the river bottom armored due to high current velocities between the dams and historical removal of boulders to facilitate the passage of flood flows. Depths at most sampling locations were less than 1 m (3 ft), although depths greater than 1 m (3 ft) were commonly encountered along the LDB between the 6th Street Dam and Bridge Street low-head dam (Figure 2-1; Appendix F).

Although too few mussels were present in quantitative samples to determine distribution (Figure 2-2), qualitative searches conducted in 2013 revealed a few areas with mussels within 10 m (30 ft) of the banks and associated with in-stream vegetation (wetlands), as well as within other flow refugia with more permeable substrate (ESI, 2014). Mussel density in quantitative samples averaged 0.6 unionids/m^2 in 2013 (95% CI=0.2 to 1.0 unionids/m^2, although samples were biased toward higher density areas), 0.3 unionids/m^2 (95% CI=0.1 to 0.5 unionids/m^2) in 2016, 0.3 unionids/m^2 (95% CI=0.2 to 0.5 unionids/m^2) in 2017, and 0.3 unionids/m^2 (95% CI=0.2 to 0.5 unionids/m^2) in 2020 (Table 1-2). Density under the I-196 bridge averaged 0.25 unionids/m^2 in 2016 and 2017 (Cardno, 2017). Project Area density was based on average density between the dam and Fulton Street, 0.3 unionids/m^2 (ESI 2016, 2017; EcoAnalysts 2018, 2021; Cardno, 2017; Table 1-2).

A total of 20 live species have recently been collected between the 6th Street dam and Fulton Street (Table 1-2). *Lampsilis cardium* (34.0%) and *A. plicata* (28.4%) were the most commonly collected species (Table 1-2). TES collected in this reach include *P. sintoxia* (live), *C. tuberculata* (live), *E. triquetra* (live), *L. recta* (live), *P. alatus* (live), *T. truncata* (live), *V. ellipsiformis* (live), *A. marginata* (live), *A. viridis* (live), *L. costata* (live), and *U. imbecillis* (FD). Total relative abundance of TES was 14.1%. Approximately 35,778 unionid mussels may occur between the 6th Street Dam and Fulton Street Bridge based on the average density of 0.3 unionids/m^2 (Table 1-2). Approximately 13,634 unionid mussels may occur within this Project's direct impact areas, and 24,647may occur within the Construction Area indirect impact areas (Table 2-1).

Fulton Street to M-11 Bridge

A few areas have been surveyed for mussels between Fulton Street and the M-11 Bridge downstream of Grand Rapids. Gradient is lower than in the Project Area and substrate is primarily loose sand. Unionid mussels seem to be scattered within the sand. Semi-quantitative, quantitative, and qualitative samples were collected 0 to 500 m (1,500 ft) downstream of Fulton Street, but only 12 mussels of six species were found, and density averaged only 0.1 unionids/m^2 (Table 2-7). Recent surveys in potential dredge areas

found 0 to 2 mussels per 5-minute search and 0.9 unionids/5-meter semi-quantitative sample near the mouth of Plaster Creek (ESI, 2018; EcoAnalysts, 2019). Some areas of higher density are present, as density near the bank of the I-196 South Bridge was 0.9 unionids/m^2 (JFNew, 2013d), and *E. triquetra* were found in the relocation for the I-196 bridge (GEI, 2023).

3.2.2 Fish

Little is known about the historical fish assemblages of the Grand River, but fish, particularly *A. fulvescens*, were an important food source for people during both pre-settlement and European settlement times (Hanshue and Harrington, 2017). Like unionids, anthropogenic influence has impacted composition and distribution of the fish assemblage of the Grand River. Effects of point and nonpoint source pollutants, dams, logging, agriculture, and urban development have altered and fragmented habitat necessary for spawning, feeding, and refuge. One hundred eight (108) fish species representing 23 families are currently known in the Grand River watershed, including introduced species and species that seasonally utilize the mainstem and/or tributaries (Hanshue and Harrington, 2017). Contributing to the diversity of the fish assemblage are the various cold, cold-transitional, and warm-transitional tributaries that feed the mainstem; these tributaries create a wide variety of thermal microhabitats that are utilized by various species with different thermal preferences, and the potadromous fish that seasonally migrate upstream are an important recreational fishery.

Species in the headwaters include several Centrarchidae species, and intolerant species such as *Moxostoma* sp., *Etheostoma* sp., and *Percina* sp. (Hanshue and Harrington, 2017). Fish families characteristic of the upper river include Centrarchidae, Cyprinidae, and Catostomidae. Common game fish include *Esox lucius* (Northern Pike), *S. vitreus*, and *Ictalurus punctatus* (Channel Catfish). These species are also common in the middle river, and larger river species such as *Moxostoma anisurum* (Silver Redhorse), *Carpiodes cyprinus* (Quillback) and *Pylodictis olivaris* (Flathead Catfish) also inhabit the middle river segment. The middle river is the upstream boundary for *Oncorynchus tshawytscha* (Chinook), *Oncorynchus kisutch* (Coho), and *O. mykiss*, recreationally important species in the Grand River. These species pass the 6th Street Dam via the fish ladder on the RDB. The lower river supports a diverse assemblage of Catostomidae, Cyprinidae, and Centrarchidae and good populations of game fish (*I. punctatus*, *P. olivaris*, *M. salmoides*, *M. dolomieu*, and *S. vitreus*). Most of these fish species also serve as hosts for freshwater mussels (Table 1-3). Seasonal migration of potadromous fish from Lake Michigan adds *Coregonus clupeaformis* (Lake Whitefish), *Prosopium cylindraceum* (Round Whitefish), *Salvelinus namaycush* (Lake Trout), *Catostomus catostomus* (Longnose Sucker), *A. fulvescens*, *Salmo trutta* (Brown Trout), *O. mykiss*, *O. tshawytscha*, and *O. kisutch* (Hanshue and Harrington, 2017). Michigan TES fish that occur within the watershed and are incorporated into this BA include the Michigan threatened *A. fulvescens* that occurs downstream of the 6th Street Dam and *M. carinatum* that occurs throughout the lower river and is known to spawn in the Project Area and near Plaster Creek (S. Hanshue, MDNR, pers. comm.).

Seventy-three (73) fish species occur in the lower Grand River, including two Michigan threatened species, *A. fulvescens* and *M. carinatum* (Table 1-3). The range of *M. carinatum* extends throughout the lower Grand River and into the Maple River; however, *A. fulvescens* is only known to occur downstream of 6th Street Dam. Five species that are primarily found in smaller streams are restricted to upstream of the dam; 11 species that are primarily big river/Great Lakes/invasive species are restricted to downstream of

the dam (Table 1-3). Forty-five (45) of the 73 species in the lower Grand River serve as fish hosts for at least one of the unionid species that occurs in the Project Area (Table 1-3). The lower Grand River is also very important as a recreational fishery. Game fish such as *S. vitreus* and *M. dolomieu* are abundant, and the *O. tshawytscha* and *O. kisutch* run in the Fall and *O. mykiss* run in the Spring and Fall are important to regional recreation.

The historic rapids that occurred within the Project Area provided important spawning habitat for *A. fulvescens*, *C. clupeaformis*, and *S. namaycush* (Hanshue and Harrington, 2017). Alterations to the Project Area's physical habitat and water quality dramatically altered the historic fish community. Currently, fish passage and movement within the Project Area is limited by the low-head dams and fish migration is limited by the 6th Street Dam. Riffle habitat is lacking, and deeper pools are limited (Table 2-5; Appendix F). *Acipenser fulvescens* are restricted to downstream of the 6th Street Dam. However, the Project Area does provide an important recreational fishery for *S. vitreus*, Catostomidae, *P. olivaris*, *I. punctatus*, and *M. dolomieu* and *M. carinatum* use the area for spawning. The area is also heavily fished during the Winter and Spring *S. vitreus,* and *O. mykiss* run and Fall *O. tshawytscha*, *O. kisutch*, and *O. mykiss* run. A recent fish survey (M. Holtgren, Encompass, pers. comm.) conducted between Dam 4 and Plaster Creek found 55 fish species. Species included several Cyprinidae, Catostomidae, Ictaluridae, *Lepomis* sp., *Micropterus* sp., *Etheostoma* sp., and *Percina* sp. (Table 1-3). Most of the species requiring cover and/or flow were found downstream of low-head dams in the recent survey.

3.3 Invasive Species

Invasive species can negatively impact aquatic ecosystems through dramatic modifications to food webs, alterations of biogeochemical cycles, and declines in native biodiversity. Invasive species are of particular concern in the context of the Project, as the existing 6th Street Dam represents a barrier to the upstream passage of certain invasive species. Invasive species of concern to the Project Area include *Neogobius melanostomus* (Round Goby), *P. marinus*, and *Dreissena polymorpha* (Zebra Mussel). Although *Dreissena rostriformis bugensis* (Quagga Mussel) occurs in Lake Michigan near the mouth of the Grand River, they have not been reported in the Grand River (USGS nonindigenous aquatic species website, accessed February 20, 2024; https://nas.er.usgs.gov/viewer/omap.aspx).

Neogobius melanostomus is a small, bottom-dwelling goby native to central Eurasia. In Michigan, *N. melanostomus* was reported from the Shiawassee, Flint, Saginaw, and Thunder Bay Rivers (Lake Huron drainage) and the River Raisin (Lake Erie drainage). It was also reported from lower Lake Michigan and the Chicago Sanitary and Shipping Canal (Fuller et al., 2016a). Grand River records include from its mouth to the 6th Street Dam to upstream of the I-96 bridge (USGS nonindigenous aquatic species database). It was recently 7% of the fish collected between 2018 and 2022 downstream of Dam 4, and was more abundant then *P. caprodes* (4.4%) (M. Holtgren, Encompass, pers. comm.). They were also reported in Indian Mill Creek (Grand Valley State University, 2017; W. Ogilvie, GVMC, personal communication).

Neogobius melanostomus may impact native fishes by eating the eggs and fry of other bottom-dwelling fish such as Cottoidea (Sculpins), *Percina* sp., and *Etheostoma* sp. (Fuller et al., 2016a); this in turn impacts native unionid assemblages, as many native bottom-dwelling species serve as host fish for unionids. They also prey on *A. fulvescens* eggs (Hay-Chmielewski and Whelan, 1997). *Neogobius melanostomus* may also pose a threat to nest-guarding fish such as *M. dolomieu* (Steinhart et al., 2004). *Neogobius melanostomus*

may compete with native fish for food, though studies have yielded variable results. French and Jude (2001) suggested *N. melanostomus* may compete with benthic fish for invertebrate prey; however, Burkett and Jude (2015) found that there was little diet overlap between *N. melanostomus* and most small benthic fish (*in* Fuller et al., 2016a).

Petromyzon marinus is an endemic parasite to the Atlantic Ocean and its tributaries. This species is primarily marine, but spawns in freshwater rivers (Fuller et al., 2016b). Adult *P. marinus* affix to prey fish and feed on their body fluids and tissues; this parasitism often results in death of the host fish (Phillips et al., 1982 *in* Fuller et al., 2016b). *Petromyzon marinus* are implicated in the decline of fisheries in the Great Lakes (Coble et al., 1990; Fuller et al., 2016b), and may also cause mortality in freshwater fish found in tributaries. The 6th Street Dam represents a barrier to *P. marinus* at low flows, and *P. marinus* occurrence in the mainstem is restricted to the stretch of river downstream of the dam. No *P. marinus* were collected in recent fish surveys (M. Holtgren, Encompass, pers. comm.). However, larval *P. marinus* were reported from Grand River tributaries upstream of Grand Rapids: Lowell Creek in 1965 and Rogue River in 2008 and 2022, and in Prairie Creek in 2022 (Barber and Steeves, 2023; Hrodey et al, 2022). Rogue River was treated with lampricide in 2009 (Sullivan and Adair, 2009). Larval lamprey were found in the Rogue River in 2022, and the area is expected to be treated with lampricide (Barber and Steeves, 2023). The source of these escapement events is unknown (Barber and Steeves, 2023). However in 2006, the stop logs in the fish ladder stop log with lip were reconfigured to increase the drop for a more effective barrier (Barber and Steeves, 2023). Several years after 2006, the steel lip at the top of the *P. marinus* barrier came loose and was replaced (Barber and Steeves, 2023). However, the loss of vertical drop needed for a *P. marinus* barrier in the fish ladder still occurs at a lower river stage height than the main spillway (Barber and Steeves, 2023). The 2022 larvae in Rogue River and Prairie Creek could have occurred in 2020 during a high discharge event (30,000 CFS in May 2020; Hrodey et al., 2022).

A two-year evaluation of larval and juvenile sea lamprey production potential was conducted in 2014 and 2015 to evaluate the production potential upstream of the 6th Street Dam (GLFC, 2015). The survey focused on finding native lamprey, which occupy the same habitat as *P. marinus*. Native lamprey were found in 463 km (287 mi) of the Grand River watershed upstream of the 6th Street Dam. Within that area there is approximately 2,957,701 m^2 (730 acres) of Type I habitat (preferred mix of sand and fine organic matter) and 6,396,646 m^2 (1,580 acres) of Type II habitat (acceptable shifting sand with no fine organic matter). Areas with Type I and II habitat include Bear Creek, Bellamy Creek, Crooked Creek, Fish Creek, Grand River, Honey Creek, Libhart Creek, Lowell Creek, and Maple River (Table 3-5). If *P. marinus* managed to successfully pass the 6th Street Dam, 3,058 km (1,900 miles) of the Grand River and tributaries could potentially be affected, and the Grand River could become one of the most productive *P. marinus* tributaries to Lake Michigan (GLFC, 2018).

Adult *P. marinus* do not feed during migration. They spawn in gravel substrates, which could harbor unionid mussels. Larval lamprey prefer sandy areas with organic matter, which are not preferred habitat for most mussel species. Once larvae metamorphose, they swim (although weakly) to Lake Michigan, where they feed. They typically do not feed in the Grand River. Although both *P. marinus* and unionids are filter feeders, since they do not occupy the same habitat, competition is unlikely.

Treating for *P. marinus* with lampricides could affect host fish and therefore be detrimental to unionid mussels. Although 3-trifluoromethyl-4-nitrophenol (TFM) and TFM/1% nicloamide (lampricides) do not appear to be lethal to most unionid mussel species, TFM/1% nicloamide can lead to narcosis in unionid mussels, which could increase vulnerability to predation and displacement by high water events (Boogaard et al., 2004). Bayluscide (nicloamide) exposure at current application levels can have lethal and sublethal effects to some unionid mussel species (Newton et al., 2017), and TFM can cause mortality to *P. caprodes*, a host fish for *E. triquetra*, and may affect other host fish species (Ictaluridae) at high concentrations (Boogaard et al., 2003 and 2015). In streams with unionid mussels, Bayluscide is not recommended (Boogaard and Riveria, 2011), and limiting TFM to 1.3x mean lethal concentration (MLC) is recommended to prevent mortality to *P. caprodes* in streams with *E. triquetra* (USFWS, 2013). However, a few other freshwater mussels have been tested (*Pyganodon grandis* [Floater], *Potamilus (formerly Leptodea) fragilis* [Fragile Papershell], and *V. ellipsiformis*) that are more sensitive to TFM than *E. triquetra* (Boogaard et al., 2004; Boogaard et al., 2015).

Although neither adult nor larval *P. marinus* appear to compete with unionid mussels, stream reaches where larvae are found would need to be treated with lampricides every three to four years. Treatment in tributaries generally involves applying lampricides from upstream of known *P. marinus* larvae to the confluence of the Grand River with 1.5x the mean lethal concentration (MLC) for 12 hours. If larvae were found in the Grand River proper, treatment would extend from upstream of the larval habitat to the nearest barrier, the 6th Street Dam. However, most of the Grand River downstream of Fulton Street has a sand substrate that could be used by *P. marinus*, but *P. marinus* larvae have not been reported in the Grand River proper (Sullivan and Mullett, 2018).

Dreissena polymorpha is native to the Baltic Sea and was introduced to the Great Lakes through the discharge of ballast water from ocean-going cargo ships. *Dreissena polymorpha* has rapidly colonized the Great Lakes, inland lakes, and rivers, and has caused significant ecological and economic harm to the region (Pimentel et al., 2000). *Dreissena polymorpha* is found in the lower Grand River near the mouth and in the bayous. Dispersal through human activities, such as the discharge of bilge or live-well waters containing veligers, has likely hastened the spread of *D. polymorpha* throughout the basin; the Flat River and lower Thornapple River, as well as many inland lakes within the basin, have also been invaded. *Dreissena polymorpha* impact ecosystems by reducing the biomass of phytoplankton significantly following invasion (Benson and Raikow, 2010). Survival rates of native unionid mussels have been shown to decline significantly with the increase in *D. polymorpha* colonization (Hart et al., 2001a, 2001b).

Dreissena polymorpha are known to occur throughout the lower Grand River at a low abundance (Badra, 2010). Woolnough (2015) reported *D. polymorpha* only as weathered shells below Lyons Dam. Live *D. polymorpha* were found at all sites sampled from Ionia though the Project Area; however, at the time these sites were surveyed, infestation of native unionids was low (only a few unionids had attached *D. polymorpha*) and only a few large *D. polymorpha* (<10 per individual) were attached to native individuals (ESI, 2014, 2016, 2017a, 2018; EcoAnalysts, 2018, 2021). Flow regimes of the mainstem may prevent *D. polymorpha* from becoming more established, as all dams on the mainstem are operated as run of the river dams and the variable flow that exists in this system is not conducive to *D. polymorpha* colonization. However, recreational boating may represent a constant input of more *D. polymorpha* into the river.

3.4 Climate Change

Climate change could affect habitat and aquatic resources in the Grand River. By altering the hydrological cycle, climate change alters water temperatures, precipitation, streamflow patterns, water quality, and sediment loads (Jimenez Cisneros et al., 2014), thereby changing in-stream habitat over time. Future predictions of climate change vary according to the multitude of prediction models used; however, commonalities between models include: a shift in Winter precipitation from snow to rain (Jyrkama and Sykes, 2007; Stewart, 2009; Christensen et al., 2004), earlier snowmelt (Stewart, 2009; Kunkel and Pierce, 2010), an increase in overall precipitation (Angel and Kunkel, 2010; NOAA Technical Report NESDIS 142-3, 2013; Stewart, 2009; 3rd US national climate assessment, 2014), and warmer water temperatures (Jyrkama and Sykes, 2007; Angel and Kunkel, 2010; Kunkel and Pierce, 2010; NOAA Technical Report NESDIS 142-3, 2013). Changes in streamflow, water quality, and temperature could alter mussel distribution and composition over time. These changes could lead to reductions in overall abundance, and/or may cause assemblages to shift toward species that are more tolerant of fluctuating streamflow, reduced water quality, and/or increased temperature.

Average annual precipitation is expected to increase over time, and in some regions, precipitation may trend toward less frequent but more intense rainfall (USFWS, 2014), with a resulting increase in frequency of high and low discharge levels. Increases in precipitation may increase river flows, changing patterns of sediment scour and deposition. Substrate composition may trend toward coarser constituents as more fines are removed by higher flows. Lower flows during droughts may result in more sediment deposition and/or drying out of channel margins. High and low discharge magnitude and frequency, and resulting local hydraulic changes, seem to be closely associated with the presence/absence of freshwater mussels (Morales et al., 2006a and 2006b; Young, 2006; Steuer et al., 2008; Zigler et al., 2008 and 2010). Since unionid habitat appears to be closely tied to hydraulic variables such as shear stress, alterations in streamflow that alter hydraulic variables could change mussel habitat conditions and therefore mussel distribution and species composition (Goodding et al., 2019).

Precipitation increases may also affect water quality and/or sediment loading in rivers. Greater runoff may carry more pollutants from urban areas and nutrients from the soil into the water, reducing water quality. Increased runoff may also increase soil erosion, leading to higher sediment loads that could alter both substrate composition (via increased deposition of sediment) and water quality. Since the Grand River within Grand Rapids is constricted within floodwalls and most of the floodplain is paved, increased sedimentation should be minimal, but increased urban runoff could affect water quality. Unionids as a group are particularly sensitive to contaminants such as ammonia (Augspurger et al., 2003; Wang et al., 2011a; Strayer and Malcom, 2012; Gillis et al., 2017) and heavy metals (Wang et al., 2010, 2011b). Decreased water quality has been implicated in the decline of unionids throughout the country, although additional research is needed to relate laboratory studies and field conditions (Cope et al., 2008).

Changes in habitat due to altered precipitation patterns are driven by slowly rising temperatures. Additionally, the Grand River has snow melt dominated peak flows concentrated around March 15. Climate change may shift the peak flows to be more dominated by rainfall events and have a corresponding shift in water temperature. Increasing water temperatures themselves may affect unionids by influencing factors such as growth, burrowing behavior, byssus production, metabolic rates, and

reproductive success (Hastie et al., 2003; Pandolfo et al., 2009; Archambault et al., 2014; Ganser et al., 2015).

Additionally, temperature may affect some species more than others. Spooner and Vaughn (2008) identified two distinct groups of unionids in their investigations of clearance rates and nutrient excretion at different temperatures. Thermally tolerant species (*A. plicata*, *F. flava*, *Megalonaias nervosa* [Washboard], and *O. reflexa*) had increased clearance rates and were still able to assimilate energy at 35° C (95° F). In contrast, thermally sensitive species (*A. ligamentina*, *L. cardium*, *T. truncata*, and *C. pustulosa*) decreased clearance and depleted their energetic stores at 35°C (95° F). Mortality of three of the four thermally sensitive species was observed at 37-38° C (98.6-100.4° F) (Spooner and Vaughn, 2008).

Rising water temperature associated with climate change could result in a shift in species composition to more thermally tolerant species. All four of the thermally sensitive and two of the thermally tolerant species tested by Spooner and Vaughn (2008) occur in the Project Area (Table 1-2). Thermally tolerant and sensitive species comprise 33.1% and 42.7% of the unionids in the Project Area (Table 1-2). However, increased water temperature is unlikely to cause mortality of the species found in the Grand River. Water temperature rarely exceeds 25° C (77° F) in the Grand River within the Project Area. Lethal effects were not observed for thermally sensitive species in Oklahoma until 37 to 38° C (98.6-100.4° F) (Spooner and Vaughn, 2008), which would require a temperature increase of more than 10° C (18° F) in the Project Area.

Two climate change scenarios were recently evaluated for effects to *E. triquetra* (USFWS, 2022). Risks were based on predicted changes in hydrological regime, landscape alteration, habitat degradation, contaminants, connectivity, and invasive species. Scenario 1 is under high carbon emissions and increasing population growth. Scenario 2 is under medium to low carbon emissions, with population increase, then decline, and the introduction of clean and resource-efficient technology (see USFWS, 2022 for details). Currently, the Grand River *E. triquetra* population is considered to be in a high demographic condition (> 75 individuals, more than 30 river miles, with juveniles <5 years old observed in the past 5 years), but with a moderate risk due to contaminants, landscape alterations, connectivity, and invasive species. Under both scenarios demographic conditions are expected to decline; to low levels under scenario 1 and moderate conditions under scenario 2. Under both scenarios, contaminants (ammonia, chloride, copper, nitrate, and metals) are expected to increase but remain in the moderate range. Landscape changes (urbanization) are expected to increase into the high risk range in Scenario 2.

Alterations in temperature and flow patterns caused by climate change would similarly impact fish species in the Grand River. Climate change would primarily impact the timing of key behaviors (migrations, spawning; Lynch et al., 2016), but may also influence spatial distributions and habitat use/availability. Unionid mussels are dependent on host fish to complete their life cycle, and host fish distribution is an important factor in unionid distribution (Schwalb et al, 2013). However, many mussel species are more thermally tolerant than their fish hosts (Pandolfo et al., 2012), and increasing water temperature may prevent the interaction of mussels with their hosts. Many mussels may be more susceptible to flow alterations than fish (Spooner et al., 2011), which may also influence the presence of host fish at the time of glochidia release. The obligate interaction of mussels and their fish host compounds the effects of climate change on unionid mussels (Pandolfo et al., 2012).

Variation in hydrologic conditions plays an important role in the life cycle of many aquatic species (Poff and Ward 1989; Richter et al., 1996). Seasonal high flows trigger many fish species to migrate to upstream spawning areas. Increases in frequency of high and low discharge levels acts to destabilize streamflow patterns, likely reducing the reproductive success (Starrett, 1951; Coon, 1987; Strange et al., 1992; Bovee et al., 1994; Nuhfer et al., 1994), as well as growth and survival (Coon, 1987; Seelbach, 1986) of many fish species. Additionally, nearly all fish species occurring in the Grand River require a specific range of temperatures at which successful spawning can occur. The expected increase in water temperature may further impede reproductive success by altering the timing of the spawn or shortening the length of time water temperatures are within acceptable spawning ranges.

Further impeding reproductive success is the increased sediment scour and/or sediment loading resulting from increased precipitation. Shifts in bedload components have the potential to alter spawning habitat for many fish species, particularly lithophilous spawners that require clean gravel substrate. While the urban landscape that surrounds the Grand River Project Area is less likely to be impacted by sediment loads, agricultural areas outside of the City of Grand Rapids may experience localized sediment scour/loading.

In addition to disrupting spawning habitat and timing, climate change may decrease the present distribution of certain species based on thermal suitability. Increases in water temperature are expected to impact thermally sensitive fish species most dramatically. The lower Grand River mainstem and tributaries are currently home to 10 species of fish considered cold water preferential (Hanshue and Harrington, 2017; Table 1-2). As water temperatures increase, the thermal microhabitats created from inputs of cold, cold-transitional, and warm-transitional tributaries would likely decrease in size and suitability to these species.

Climate change is expected to impact the state threatened *A. fulvescens* and *M. carinatum* primarily by altering the timing of spawning events. Both threatened species use temperature cues to initiate spawning behavior, with *M. carinatum* spawning when temperatures reach 18-24° C (64-75° F) (Mongeau et al., 1992; Jenkins and Burkhead, 1993) and *A. fulvescens* spawning at temperatures between 9-20° C (48-68° F) (Scott and Crossman, 1973; Ecclestone, 2011). With water temperatures expected to warm earlier in the Spring, spawning events of these species may occur earlier in the year. *Moxostoma carinatum*, which inhabit the entirety of the lower Grand River, may also be influenced by habitat alterations in parts of its range: this species generally occurs in rivers with moderate to swift current and clean, rocky substrates needed for spawning (Scott and Crossman, 1973; Becker 1983; Etnier and Starnes, 1993; Pflieger, 1997; Reid, 2002; Reid, 2003), and increased sediment loading/scour may impact spawning habitat in portions of the lower Grand River.

Climate change may indirectly impact the native fish and mussel assemblages of the Grand River by increasing the probability of *P. marinus* breaching the 6th Street Dam. Warmer Winter temperatures in the Great Lakes are expected to favor expansion of *P. marinus* (Rahel et al., 2008). With warmer temperatures, and potentially longer feeding seasons, *P. marinus* should experience increased growth, resulting in larger lampreys, increased mortality on fish, and increased lamprey fecundity (Hansen et al., 2016). Increased flood events, another consequence of climate change, may benefit *P. marinus* by reducing the effectiveness of low-head barriers that currently impede upstream spawning migrations (Hansen et al., 2016). Under its current configuration, *P. marinus* is most likely to breach the 6th Street

Dam during high flows, which typically occur between March and April when water temperatures are below 10° C (50° F). The swimming performance of *P. marinus* is relatively poor at water temperatures below 10° C (50° F), thus minimizing the likelihood of a high-water breach. However, *P. marinus* swimming performance is dramatically improved at temperatures above 15° C (59° F). Given the expected increase in water temperatures caused by climate change, high water events would be more likely to occur at warmer temperatures; if high water events occur at temperatures optimal for *P. marinus* swimming performance, *P. marinus* would be more likely to pass the 6th Street Dam.

Literature suggests that invasive species would persist, and current ranges may expand under the predicted warmer conditions. With an upper-end thermal tolerance of 33.4° C (92.1° F), *N. melanostomus* is well suited to warmer waters (Kornis and Vander Zanden, 2010). Increased water temperatures would allow the *N. melanostomus* geographic range to shift northwards (i.e., Lake Superior and tributaries) and should benefit it throughout much of its invasive range, as temperatures would approach energetically optimal temperatures. Increased water temperatures may lead to faster growth rates, thereby enhancing its ability to directly compete with native species through resource competition, spawning interference, and displacement (Rahel et al., 2008).

The invasive *D. polymorpha* may also expand in range as colder climates gradually become warmer; however, *D. polymorpha* has a relatively low upper-end thermal tolerance (30° C [86° F]) and increases in temperature beyond this point could result in *D. polymorpha* die-offs (Rahel et al., 2008). Extended periods of high temperature are linked to declines in *D. polymorpha* density; temperature increases that result in mass die-offs can have severe ecological implications, creating a pulse of nutrients into a system and reversing previous large effects on chlorophyll concentrations and water transparency (White et al., 2015). While some studies point out the thermal tolerances of *D. polymorpha* may be range-limiting (Rahel et al., 2008; White et al., 2015), others suggest the adaptability of this organism may enhance its ability to exploit warmer climates (Gallardo et al., 2013). *Dreissena polymorpha* is known to occupy significantly different ecological niches in the Pont-Caspian region, Europe, and North America, providing evidence of its ability to repeatedly adapt to new environmental conditions. Environmental niche models, which include climate models, predict that a progressive spatial temporal stretching of the environmental tolerance limits would lead to continued range expansion of this species (Gallardo et al., 2013).

4.0 SPECIES CONSIDERED

Federal Threatened and Endangered species that could potentially occur in both Project Areas include:

- *Epioblasma triquetra* (Snuffbox Mussel).

Michigan TES that could occur in the Project Area include:

- *Ligumia recta* (Black Sandshell);
- *Toxolasma parvum* (Lilliput);
- *Cyclonaias tuberculata* (Purple Wartyback);
- *Alasmidonta viridis* (Slippershell);
- *Acipenser fulvescens* (Lake Sturgeon);
- *Moxostoma carinatum* (River Redhorse);
- *Pleurobema sintoxia* (Round Pigtoe);
- *Potamilus alatus* (Pink Heelsplitter);
- *Truncilla truncata* (Deertoe);
- *Venustaconcha ellipsiformis* (Ellipse);
- *Cambarunio (Villosa) iris* (Rainbow);
- *Alasmidonta marginata* (Elktoe);
- *Lasmigona compressa* (Creek Heelsplitter);
- *Lasmigona costata* (Fluted Shell); and
- *Utterbackia imbecillis* (Paper Pondshell).

4.1 Federally Endangered Species

Epioblasma triquetra (Snuffbox Mussel)

Epioblasma triquetra was federally listed as an endangered species on February 14, 2012 (77 FR 8632). *Epioblasma triquetra* is a small to medium-sized mussel, with males reaching lengths up to 7 cm (2.8 in) and females reaching only 4.5 cm (1.8 in; USFWS, 2012). The shell is triangular (males) to ovate or oblong (females) with solid thick and inflated valves (Cummings and Mayer, 1992). The anterior part of the shell is rounded, and the posterior end is truncated in males, but expanded in females (WIDNR, 2015). The obvious posterior ridge is high and rounded, and the slope is wide and flat. The posterior ridge in females is covered with small ridges and grooves, and the posterioventral edge of the shell is finely toothed (Cummings and Mayer, 1992). The beak sculpture consists of three or four faint double looped bars. The periostracum is typically yellowish, becoming darker with age, and is marked with dark green rays, blotches, or chevron-shaped markings (Carman and Goforth, 2000; USFWS, 2012). The inside of the shell is white, becoming iridescent posteriorly, with a gray-blue tinge in the beak cavity. The unique shell shape, coloration, and high degree of inflation distinguish *E. triquetra* from other mussel species.

Female *E. triquetra* are bradytictic (long-term brooders), and the brooding period is between September and May (Parmalee and Bogan, 1998). *Epioblasma* spp. are unique in that they "capture" their hosts. Hosts are attracted by a brightly colored mantle in the gaping shell. When a fish investigates, the female snaps her valves shut, trapping the host's head and expelling glochidia while holding the host captive (Barnhart et al., 2008). Recent investigations into the life history of *E. triquetra* indicate that several darter and sculpin species can successfully serve as hosts. Juveniles have been successfully reared from *P. caprodes*, *Percina maculata* (Blackside Darter), *Etheostoma caeruleum* (Rainbow Darter), *Etheostoma exile* (Iowa Darter), *Fundulus olivaceus* (Blackspotted Topminnow), *Cottus bairdi* (Mottled Sculpin), *Cottus carolinae*

(Banded Sculpin), *Cottus hypselurus* (Ozark Sculpin), *Micropterus salmoides* (Largemouth Bass), and *Culaea inconstans* (Brook Stickleback) (Sherman, 1993; Yeager and Saylor, 1995; Barnhart et al., 1998; Hove and Kapuscinski, 1998; Hillegass and Hove, 1997). Of these identified hosts, only four have been collected in the lower Grand River: *P. caprodes*, *P. maculata*, *E. caeruleum*, and *M. salmoides*; all have been observed in Grand Rapids (Table 1-3). *Percina caprodes* appears to be the primary host (USFWS, 2023).

Percina caprodes adults prefer relatively shallow, swift riffles or raceways with gravel substrate, which corresponds with habitat where *E. triquetra* often occurs, but are also common in lakes and impoundments. Adults (spawning and non-spawning) seem to prefer depths <1 m (<3.3 ft) and current velocity near 1 m/sec (3.3 ft/sec) over substrates of sand, gravel, and cobble, whereas young of the year prefer slightly shallower, slower waters over similar substrate (Becker, 1983; Luttrell et al., 1994; Aadland and Kuitunen, 2006). In Winter, adult *P. caprodes* tend to use deeper water. In Wisconsin, *P. caprodes* begin spawning in April, with the spawning season extending into June or July (Becker, 1983).

Percina caprodes have been observed throughout the Project Area, although their preferred habitat is limited. Although preferred habitat for this species has been reported as faster flowing deeper areas, *P. caprodes* was incidentally collected in a slower flowing area adjacent to a wetland during a 2013 mussel survey in the Project Area. It was also collected downstream of low-head dams in 2018-2022. Although some gravel substrate is present, substrate consists primarily of armored/compacted cobble and boulder (Figure 2-1). Softer substrate, slower flowing areas occur near the banks where in-stream or near stream vegetation is present. *Percina caprodes* represented 4.4% of the fish recently collected (2018 to 2022) in the Lower Grand River. They appear to be recruiting, as age 0 to 3 were collected in 2018 and 2022, 1 to 3 in 2020 and 2021 (M. Holtgren, Encompass, personal communication).

Epioblasma triquetra typically occur in small- to medium-sized streams and rivers in the higher flow of riffles and shoals (Cummings and Mayer, 1992; Parmalee and Bogan, 1998). *Epioblasma triquetra* are often deeply buried in the substrate, except during spawning periods (Parmalee and Bogan, 1998). They have been observed more frequently with gravel substrate in the Grand River (Woolnough, 2015).

Epioblasma triquetra range includes most of the Mississippi, Ohio, and Great Lakes Drainages. Although *E. triquetra* was historically known from 211 streams and lakes in 18 states and Canada, the current distribution has been reduced to only 83 streams and lakes in 14 states (Alabama, Arkansas, Illinois, Indiana, Kentucky, Michigan, Minnesota, Missouri, Ohio, Pennsylvania, Tennessee, Virginia, West Virginia, Wisconsin) and Ontario, Canada (USFWS, 2022). Of these 83 streams, only eight are considered to harbor stronghold populations (sizable population and generally distributed over a more or less contiguous length of stream of 48 river km [30 miles]): Wolf River (Wisconsin), Bourbeuse River (Missouri), Clinch River (Tennessee and Virginia), Paint Rock River (Alabama), French Creek (Pennsylvania), AuSable River (Ontario), and Sydenham River (Ontario) (USFWS, 2012).

The recent status assessment analyzed stream segments by HUC 8 units (USFWS, 2022). *Epioblasma triquetra* is currently known from 55 HUC 8 units. Only six, Lower Grand River (Michigan), Wolf River (Wisconsin), French Creek (Pennsylvania/New York), Lower St. Croix River (Wisconsin/Minnesota), Bourbuese River (Missouri), and Spring River (Arkansas) are considered to be in high demographic

condition (> 75 individuals, more than 30 river miles, with juveniles <5 years old observed in the past 5 years). Both the Lower Grand, Wolf River, and French Creek are considered at moderate risk, while Lower St. Croix, Bourbeuse, and Spring River are considered high risk (USFWS, 2022).

In Michigan, *E. triquetra* is primarily found in rivers in the eastern and southeastern portions of the state, but also occurs in some western counties such as Kent County. Records of *E. triquetra* exist for the following Michigan counties: Berrien, Gratiot, Huron, Ionia, Kent, Livingston, Macomb, Midland, Monroe, Newaygo, Oakland, Saginaw, St. Clair, St. Joseph, Tuscola, Washtenaw, and Wayne (MNFI, 2018), and live individuals were recently reported in Clinton County (D. Woolnough, Central Michigan University, pers. comm.). *Epioblasma triquetra* were historically known to occur in southeastern rivers in the Lake Erie drainage, northeastern rivers draining into Saginaw Bay (Lake Huron), and the Grand, Muskegon, and St. Joseph Rivers in the Lake Michigan drainage to the west (Mulcrone, 2006a). It is still extant in southeastern rivers of the Lake Erie drainage and in the Grand River drainage (Mulcrone, 2006a). A shell (somewhat fresh) was recently found in the Muskegon River, and they may still be extant (P. Badra, MNFI, pers. comm.). Eight of the 10 Michigan populations are considered significant populations (small, generally restricted to shorter river reaches, with limited recruitment): Grand River, Flat River, Belle River, Clinton River, Huron River, Davis Creek, South Ore Creek, and Portage River (USFWS, 2012). The Lower Grand was considered to be in high demographic condition and at moderate risk (USFWS, 2022). However, this population is predicted to decline under further climate change scenarios (see Section 3.4).

In the Grand River, *E. triquetra* occurs in the middle (Red Cedar River to Maple River) and lower (Maple River to Grand Rapids, MI) sections of the Grand River proper and its tributaries (Table 3-1), with the downstream limit near Fulton Street in Grand Rapids (Hanshue and Harrington, 2017). Neither Coker et al. (1919) or van der Schalie (1948) reported it in the Grand River, although these studies focused primarily on commercial size species. Goforth et al. (2000) found several individuals in the Grand River in the same area surveyed by van der Schalie (Maple River to Grand Rapids), including young individuals. It could have been missed by van der Schalie (1948), as he used a crowfoot bar for collecting, whereas Goforth et al. (2000) hand collected while diving. Since this species is small and tends to bury in the substrate, it could have been missed in previous surveys. It has recently (2013 to present) been collected from near Lyons, MI to Fulton Street in Grand Rapids (Table 3-2), with recruitment reported in several areas (Table 3-3). Since this reach is nearly 85 river km (53 miles), it should be considered a stronghold population.

Epioblasma triquetra occurs throughout the lower Grand River (Table 2-7; Figure 4-1). Within this reach, *E. triquetra* was primarily in areas with cobble, gravel, sand substrate with moderately high current velocity, and was absent from areas with primarily silt and/or sand substrate and swifter riffles with compact boulder/cobble substrate (ESI, 2014, 2016, 2017a; EcoAnalysts, 2018). A very abundant population occurs near Lyons Dam, where it comprised 18.3 and 16.7% of the assemblage in two of the sampled areas (Woolnough and Barnett, 2013). Areas with higher abundance of *E. triquetra* consistently contained more gravel than areas where they were not collected (Woolnough and Barnett, 2013; Woolnough, 2015). A large population also occurs in the Flat River, in the left descending channel between the dam and the confluence with the Grand River (ESI, 2016).

Sites where *E. triquetra* was recently collected alive include Ionia, Saranac, Flat River, Peace Park, Chief Hazy Cloud, Ada, Roselle Park, Upstream, the Project Area, and at the I-196 south bridge (Table 2-7, Figure

4-1). A fresh shell was also collected at Riverside Park. Between 6th Street Dam and Fulton Street, *E. triquetra* was collected on the RDB and mid-channel immediately upstream and under the I-196 Bridge, and on the LDB just upstream of low-head dam upstream of Gillett Bridge (Figure 4-2). Based on their distribution under the I-196 Bridge, they could occur anywhere within the Project Area, but were more abundant near the bank. Some evidence of recruitment has been observed within the Grand River, as juvenile *E. triquetra* were collected at Ionia, Saranac, Flat River, and Ada, Roselle Park, and between 6th Street Dam and Fulton Street (Table 3-3). This species comprised 0.9% of the total number of mussels recently collected between 6th Street Dam and Fulton Street and would be adversely affected by Project construction (Table 2-1). However, the amount of riffle habitat with gravel substrate with project features would improve with the Project (Appendix F).

4.2 Michigan TES Species

Ligumia recta (Black Sandshell) - Threatened

Ligumia recta is a solid, elongate and moderately compressed mussel reaching lengths up to 20 cm (7.9 in). The shell has a smooth, shiny surface that is dark green, brown, or black, with green rays visible on some individuals. The anterior end of the shell is rounded. The posterior of the female has a long, rounded marsupial swelling and ends in a blunt point about two-thirds of the way up the margin, whereas the posterior of the male shell ends in a blunt point near the middle of the margin. The nacre is variable from white, pink, and salmon to deep purple, and is iridescent posteriorly (Parmalee and Bogan, 1998).

Ligumia recta is bradytictic. Numerous papillae along the mantle edge undulate to attract a fish host. This species displays both during the day and night (Corey et al., 2006). Glochidia are released in white conglutinates (Watters et al., 2009). Steg and Neves (1997) reported glochidia of *L. recta* to exhibit a low degree of host specificity in laboratory tests. Reported fish hosts include *Notropis rubellus* (Rosyface Shiner), several Centrarchidae species, *Perca flavescens* (Yellow Perch), *S. vitreus*, and *Sander canadensis* (Sauger) (Young, 1911; Lefevre and Curtis, 1912; Steg and Neves, 1997; Hove et al., 1998; Watters et al., 1999; Khym and Layzer, 2000 *in* Watters et al., 2009). Many fish species identified as suitable hosts for *L. recta* have been collected from the Grand River in Grand Rapids (Table 1-3).

Habitat requirements for these host fish vary. Most Centrarchidae prefer low-velocity pool habitat over substrates ranging from soft silt to boulder (Edwards and Twomey, 1982; Edwards et al., 1982a, 1982b; Stuber et al., 1982a, 1982b; Becker, 1983; Aadland and Kuitunen, 2006). These species also display strong preferences for cover, such as vegetation or woody debris (Edwards and Twomey, 1982; Edwards et al., 1982a, 1982b; Stuber et al., 1982a, 1982b; Aadland and Kuitunen, 2006). Spawning and nesting habitat preferences are similar, with most species spawning in low-velocity areas in or near vegetation. Spawning occurs over a range of substrates, from soft mud (*Pomoxis nigromaculata* [Black Crappie]) to sand and gravel (*Lepomis macrochirus* [Bluegill], *Lepomis cyanellus* [Green Sunfish]; Edwards and Twomey, 1982; Edwards et al., 1982a, 1982b; Stuber et al., 1982a, 1982b; Aadland and Kuitunen, 2006). Spawning water temperature and timing are species specific, but spawning temperatures for Centrarchidae generally occur from May to August in the Grand River. *Sander vitreus* and *P. flavescens* are tolerant of a range of conditions but are most often found in generally low velocities over clean, rocky substrate (McMahon et al., 1984; Aadland and Kuitunen, 2006). Preferred *S. vitreus* spawning habitats are shallow shoreline areas, riffles, and shoals with rocky substrate and good water circulation, whereas *P. flavescens* prefer slow moving water, usually near aquatic vegetation (Becker, 1983; McMahon et al., 1984; Aadland and

Kuitunen, 2006). *Sander vitreus* spawn when water temperatures are between 5.6 and 10.0° C (42 and 50° F) (Becker, 1983), which typically occurs from mid-April to early May in the Grand River. *Perca flavescens* typically spawn between April and early May when water temperatures are between 7.2 and 11° C (45 and 52° F). (Becker, 1983). The Project should improve physical habitat for many of these species.

Ligumia recta occurs in rivers, lakes, and large streams in sandy mud to coarse sand or gravel at depths from a few centimeters to 2 m (6 ft) or more (Parmalee and Bogan, 1998; Watters et al., 2009). Although this species typically occurs in areas with at least moderate current, it has been found in varying conditions from slackwater to swift current (Williams et al., 2008; Watters et al., 2009). *Ligumia recta* range includes much of the eastern and central United States and Canada. *Ligumia recta* occur from the Great Lakes basin south to the Gulf Coast (Parmalee and Bogan, 1998). In Michigan, *L. recta* has been reported from several counties in the southern two-thirds of the state, as well as five counties in the Upper Peninsula (MNFI, 2018).

In the Grand River, *L. recta* has only been found in the middle and lower river (Table 3-1), from Portland, MI to downstream of Grand Rapids (Table 3-2; Figure 4-3). This species likely occurs in low abundance throughout the lower Grand River. It was only found in a few of the recently sampled sites (Saranac, Flat River, Ada, Roselle Park, Upstream, Project Area, Plaster Creek, and I-196 south; Table 2-7), although most of the sites upstream of the Project Area were only sampled with quantitative methods, and additional species would likely be collected with qualitative methods (Dunn, 2000). *Ligumia recta* was collected alive and scattered between 6th Street Dam and Fulton Street in 2013, 2016, 2017, and 2020 and several were also found throughout the I-196 translocation area (Cardno, 2017) (Table 1-2; Figure 4-4). It was also found downstream of Fulton Street within the indirect impact area (Table 2-7). Live juveniles of this species were collected from Ada, Roselle Park, and the Project Area, indicating that some recruitment is occurring within the lower Grand River (Table 3-3). This species comprised 2.9% of the mussels collected between 6th Street Dam and Fulton Street (Table 1-2). It would be adversely affected by Project construction, but the amount of physical habitat suitable for this species in the Project Area is expected improve with the Project.

<u>*Toxolasma parvum* (Lilliput) – Endangered</u>

Toxolasma parvum is a small elliptical or cylindrical mussel, reaching a length of up to 3.8 cm (1.5 in). The shell is relatively solid and inflated, and the anterior and posterior ends are rounded (Cummings and Mayer, 1992; Mulcrone, 2005). The umbos are inflated and slightly elevated above the hinge line (Cummings and Mayer, 1992). Beak sculpture consists of several angled concentric ridges (Cummings and Mayer, 1992; MNFI, 2018). The periostracum has a cloth-like texture and ranges in color from dark green to dark brown with no rays. The nacre is silvery or bluish-white and iridescent (Cummings and Mayer, 1992; Mulcrone, 2005).

Toxolasma parvum is bradytictic. Glochidia are released in July and spawning likely occurs soon after. Gravid individuals have been observed throughout the year (Mulcrone, 2005; MNFI, 2018). Glochidia are released in club-shaped conglutinates. Females possess a caruncle on the mantle margin that likely acts as a lure to attract host fish. Reported hosts include several Centrarchidae species and *Etheostoma nigrum* (Johnny Darter) (Watters et al., 2009). Most of these potential host species have been observed in the Grand River within Grand Rapids (Table 1-3). Centrarchidae species are most often associated with low-

velocity pools and cover such as submerged vegetation or woody debris. Spawning occurs in similar habitats over substrates ranging from soft mud to sand and gravel (Edwards et al., 1982a; Stuber et al., 1982a, 1982b; Aadland and Kuitunen, 2006). Spawning water temperature and timing are species specific, but Centrarchidae hosts generally spawn from May to August (Becker, 1983). In contrast, *E. nigrum* adults (spawning and non-spawning) prefer slow riffles (velocities 30-59 cm/sec [1-2 ft/sec]) over sand, gravel, and cobble substrate (Aadland and Kuitunen, 2006). *Etheostoma nigrum* typically spawn between April and June when water temperatures are between 11.7 and 21.1° C (53 and 70° F) (Becker, 1983). Slower current velocity areas of the Project Area (particularly areas near the bank) may be suitable for *E. nigrum* but only a few have been found in the project area (M. Holtgren, Encompass, personal communication). Low velocity pools suitable for Centrarchidae species are lacking in the Project Area; however, several Centrarchidae species have been collected in the lower river. *Lepomis macrochirus* comprised 16% of the fish collected in recent surveys (M. Holtgren, Encompass, personal communication). More slow flowing areas for these species would be available with the Project (Table 2-5; Appendix F).

Toxolasma parvum occurs in lakes, ponds, and slow flowing reaches of streams and rivers (Parmalee and Bogan, 1998; Mulcrone, 2005; Williams et al., 2008). It is most commonly found in soft substrates such as mud, sand, or fine gravel (Parmalee and Bogan, 1998; Watters et al., 2009). The range for this species includes the Great Lakes and Mississippi River drainages from New York to southern Canada and south to Louisiana. It also occurs in the Rio Grande system in Texas (NatureServe, 2015). In Michigan, *T. parvum* has been reported from only 10 counties, primarily in the southern half of the state (MNFI, 2018). This species was not reported from any of the historic surveys of the Grand River (Coker et al., 1919; van der Schalie, 1948; Goforth et al., 2000; Badra and Goforth, 2002; Badra and Goforth, 2003), but was recently collected live in the Grand River near Lyons Dam (Woolnough and Barnett, 2013; Woolnough, 2015), and at Ionia, Flat River, and Riverside Park, and as a weathered shell at Peace Park (Table 2-7; Figure 4-5).

Although it has not been collected between the 6th Street Dam and Fulton Street (Table 1-2), it could occur at a very low frequency in slower flowing areas. Its rarity in samples may be due to its affinity for slower, siltier areas on the edges of mussel assemblages, and its small size rather than its actual rarity in the Action Area. Given the rarity of this species in recent surveys, the status of *T. parvum* recruitment within the Action Area cannot be determined; however, juveniles were observed at Riverside Park (Table 3-3). It could be adversely affected by Project construction, but the amount of slow flowing near bank habitat for this species in the Project Area is expected to improve with the Project (Table 2-5, Appendix F).

<u>*Cyclonaias tuberculata*</u> <u>(Purple Wartyback) – Threatened</u>

Cyclonaias tuberculata shells are round, heavy, and compressed to moderately inflated (Cummings and Mayer, 1992). Shells may reach a length of 12.7 cm (5 in). The anterior end of the shell is rounded, while the posterior end is somewhat truncated, with a wing behind the umbo. The beaks are relatively small and low, and beak sculpture consists of numerous wavy ridges (Cummings and Mayer, 1992; MNFI, 2018). Most of the surface of the shell is covered with bumps or tubercles that are an extension of the beak sculpture. The periostracum is yellowish-brown or greenish brown in younger individuals, becoming darker brown in older individuals. The nacre is typically deep purple but may be white with a purple tinge (Cummings and Mayer, 1992; MNFI, 2018).

Cyclonaias tuberculata is tachytictic (short-term brooder). Glochidia are typically present in the gills between May and late August (Haggerty et al., 1995 *in* Watters et al., 2009). Glochidia are released in white oblong conglutinates (Watters, 2008 *in* Watters et al., 2009). This species displays inflated mantle tissue to attract host fish (Sietman et al., 2012). All reported hosts for *C. tuberculata* are Ictaluridae, and include *Ameiurus melas* (Black Bullhead), *Ameiurus natalis* (Yellow Bullhead), *Ictalurus punctatus* (Channel Catfish), and *Pylodictis olivaris* (Flathead Catfish) (Hove, 1997; Hove and Kurth, 1997 *in* Watters et al., 2009). Of these, *A. natalis*, *I. punctatus* and *P. olivaris* have been reported from the lower Grand River (Table 1-3). Ictaluridae habitat preferences vary among life stages. Adults are typically found in deep pools with cover such as large rocks or woody debris (McMahon and Terrell, 1982; Lee and Terrell, 1987; Aadland and Kuitunen, 2006). Young individuals also prefer some cover but are more commonly found in shallower areas with moderate flow and rocky substrate (McMahon and Terrell, 1982; Lee and Terrell, 1987; Aadland and Kuitunen, 2006). Nests are typically located in holes in the streambank, rock crevices, or near submerged debris, and an absence of cover may inhibit reproductive success (McMahon and Terrell, 1982; Lee and Terrell, 1987). All three Ictaluridae host fish found in the Grand River typically spawn between May and July, when water temperatures are above 22.0° C (72° F). Deeper slow flowing pools with cover are lacking in the Project Area, as are shallow riffles. Both of these habitat types would be more abundant with the Project (Table 2-5, Appendix F).

Cyclonaias tuberculata is found in large creeks to large rivers, typically in coarse sand or gravel substrate (Parmalee and Bogan, 1998; Watters et al., 2009; MNDNR, 2015). Although it is often found in moderate to swift current, it may inhabit slower-flowing areas (Parmalee and Bogan, 1998; Williams et al., 2008; Watters et al., 2009). *Cyclonaias tuberculata* primarily occurs in the Mississippi River drainage, but is also found in the Lake St. Clair, Lake Michigan, and Lake Erie drainages (Parmalee and Bogan, 1998; MNFI, 2018). Their range includes the Mississippi River and Great Lakes drainages from Virginia and North Carolina northwest to Minnesota, and south to Mississippi and Arkansas (NatureServe, 2015). In Michigan, *C. tuberculata* was historically found in the St. Joseph, Kalamazoo, Upper and Lower Grand, Huron, Raisin, and Detroit Rivers, as well as Lake St. Clair (Badra, 2010). It has been collected from the middle and lower Grand River from the early 1900's to recent studies, from Lyons, MI to downstream of Fulton Street (Table 3-1 and 3-2).

Cyclonaias tuberculata likely occurs throughout the lower Grand River; it has been recently found alive or as a fresh shell in most of the sampled sites (Ionia, Saranac, Peace Park, Ada, Roselle Park, Upstream, 6th Street Dam to Fulton Street, and between Fulton and Plaster Creek; Table 2-7; Figure 4-6). Between 6th Street Dam and Fulton Street, *C. tuberculata* was primarily found along the LDB upstream of Gillett Bridge in 2013, 2017, and 2020 (Figure 4-7) and was scattered throughout the I-196 bridge area in 2016/2017 (Cardno, 2017). This species appears to be actively reproducing within the lower Grand River, as live juveniles were collected from the Ionia, Peace Park, and Roselle Park, as well as between 6th Street Dam and Fulton Street (Table 3-3). It comprised 2.9% of the unionid mussels recently collected in the between 6th Street Dam and Fulton Street (Table 1-2). This species would be adversely affected by Project construction, but the amount of swift run habitat for this species in the Project Area is expected to improve with the Project (Table 2-5, Appendix F).

Alasmidonta viridis (slippershell) – Threatened

Alasmidonta viridis have thin shells as juveniles and become thick, inflated and quadrate with age. Shells may reach a length of 60 mm (2.4 in), but most are smaller. Each margin is either straight or broadly rounded making the overall lateral view shape quadrate. The umbo presents wide and low with a beak sculpture of two or three irregular ribs shaped in double looped patterns (Watters et al., 2009). The periostracum is a waxy yellow, green, or tan that darkens with age. Notable bold green rays appear at all ages, are varied in width, and commonly cover the entire periostracum. Growth lines are clearly marked by concentric grooves and wrinkles (Clarke, 1981). The nacre is white and often iridescent posteriorly.

Alasmidonta viridis is most likely a bradytictic (long-term) brooder that keep their glochidia in marsupia over Winter until released in Spring. Outer gills of the female fill with glochidia that turn brown as they mature. Glochidia are released from the outer gills by broadcast with no containment and connect with their host fish through passive entanglement (Watters, 2008; Haag, 2012).

Reported potential host fish include *C. bairdi*, *C. carolinae*, and *E. nigrum* (Clarke and Berg, 1959; Zale and Neves, 1982). *Cottus bairdi* has been reported in tributaries to the lower Grand River, and *E. nigrum* have been reported from the Grand River within Grand Rapids (Hanshue and Harrington, 2017*). Etheostoma nigrum* is common and widespread throughout streams from clear to turbid with varying silt loads, and is considered a pioneer species, as it establishes itself in disturbed areas (Becker, 1983). Slower current velocity areas of the Project Area (particularly areas near the bank) may be suitable for *E. nigrum*. More of this habitat type would be available with the Project (Table 2-5, Appendix F).

Alasmidonta viridis is a small mussel typically found in small creeks and headwaters of larger rivers. *Alasmidonta viridis* occurs in a wide variety of substrate, but is considered intolerant to impoundment (Watters et al., 2009; Haag 2012). It is frequently found buried in sand substrate near large boulders (Dunn, pers. obs.). Its range includes the Mississippi River, Lake Michigan, Lake Huron, Lake St. Clair, and Lake Erie drainages (Clarke, 1981). In Michigan, it is found throughout the state (MNFI, 2018), and has been reported from the Au Gres-Rifle, Au Sable, Case, Clinton, Huron, Kalamazoo, Little Calumet-Galien, Manistique, Maple, Muskegon, Pigeon-Wiscoggin, Pine, Raisin, Shiawassee, St. Clair, St. Joseph (Maumee River and Lake Michigan drainages), St. Mary's, Thornapple, Tiffin, and Upper and Lower Grand Rivers (Badra and Goforth, 2001; Carman, 2002; Badra, 2010).

Dead shells have been found in the upper and middle Grand River, and one was collected alive within the Project Area in 2017 (Table 1-2, Table 2-7, Figure 4-8 and 4-9). This is the only recent live record in the Grand River. This species is not typical of large rivers such as the lower Grand River (MNFI, 2018). The presence of only one individual suggests that a population may not occur in the Grand, but that this is a stray individual washed in from a tributary stream or dropped from a host fish that strayed into the river. However, to be conservative, it is included in this analysis. Its host fish, *E. nigrum*, occurs in the Grand River (Hanshue and Harrington, 2017) and was collected in recent surveys (Table 1-3). This species could be adversely affected by Project construction, but the emergent boulder habitats (large rocks in slower velocity) could provide physical habitat for this species (Appendix F).

Acipenser fulvescens (Lake Sturgeon) - Threatened

Acipenser fulvescens is Michigan's only native sturgeon species and is characterized by a large, torpedo-shaped body covered by rows of bony plates (scutes). *Acipenser fulvescens* has a heterocercal tail (asymmetric with a longer upper lobe), and a single dorsal fin (Auer, 1999). The snout is pointed with a ventral, protrusible mouth with four barbels (Auer, 1999). Young *A. fulvescens* have large, asymmetric dark patches while adults are uniform in color, ranging from dark slate to light brown or yellowish olive (Smith, 1979; Pflieger, 1997). *Acipenser fulvescens* can be long-lived and individuals greater than 40 years old are common, with individuals reported to be up to 150 years old (Scott and Crossman, 1973; Pflieger, 1997). Females have a longer life span and attain greater sizes than males and can reach sizes greater than 91 kg (200 pounds [lbs]) and lengths greater than 2.4 m (8 ft) (Scott and Crossman, 1973; Pflieger, 1997).

Like other sturgeon species, *A. fulvescens* exhibits delayed maturation (Priegel and Wirth, 1974). Males mature between 12 - 16 years and females mature at 20 - 26 years. Males migrate to spawning sites before females (Priegel and Wirth, 1977) and females spawn every 2 - 7 years (Priegel and Wirth, 1977; Lyons and Kempinger, 1992) and exhibit spawning site fidelity (Lyons and Kempinger, 1992; Ecclestone, 2011; Welsh et al., 2010). Spawning is initiated when water temperatures reach 9 to 20° C (48 to 68° F) and spawning occurs between 11 and 18° C (52 and 64° F) (Scott and Crossman, 1973; Ecclestone, 2011; Chiotti et al., 2008); in the Grand River, the temperature range for initiation of spawning occurs between mid-March and early May. They spawn in or before rapids and at the base of dams (Hanshue and Harrington, 2017). Spawning sites are characterized by depths of 0.2 - 4.6 m (2 - 15 ft) with water current up to 3 m/sec (10 ft/sec) (Scott and Crossman, 1973, Bruch and Binkowski, 2002; Hanshue and Harrington, 2017) over clean rocky substrate in turbulent streams or rocky shoals in lakes in areas of sufficiently oxygenated water (Scott and Crossman, 1973; Kempinger, 1988; Pflieger, 1997; Bruch and Binkowski, 2002; Ecclestone, 2011). Females may release up to 700,000 eggs (Becker, 1983; Pflieger, 1997). The black, adhesive eggs hatch between 5 - 18 days depending on water temperature and larvae drift downstream without parental care (Kempinger, 1988; Chiotti et al., 2008). Young-of-year *A. fulvescens* occupy their river of origin during the first few months of life and use shoal, run, and pool areas of large rivers with gravel and sand substrate (Holtgren and Auer, 2004; Mann et al. 2011; Hanshue and Harrington, 2017). Juveniles in the Grand River seem to prefer shallow areas with sand substrate and moderate flow along river edges (Hanshue and Harrington, 2017).

Acipenser fulvescens has historically been found throughout the upper and middle Mississippi River basin and the Great Lakes and Hudson Bay drainages south to the Tennessee River and its tributaries and Coosa River to west in the Missouri River (Etnier and Starnes, 1993). *Acipenser fulvescens* is presumed to be extirpated in Alabama, North Carolina, North Dakota, and West Virginia, and possibly extirpated in Georgia and Kansas. *Acipenser fulvescens* occurs at variable degrees in Arkansas, Indiana, Iowa, Kentucky, Missouri, Nebraska, Pennsylvania, Tennessee, Vermont, Michigan, Wisconsin, Minnesota, and South Dakota.

In Michigan, *A. fulvescens* occurs in the Great Lakes (Lake Michigan, Lake Superior, and Lake Huron), and several inland lakes and rivers. In Michigan it is known from 23 counties in Michigan's upper and lower peninsulas (MNFI, 2018). Self-sustaining populations are found in the Sturgeon River, Menominee River, St. Clair River, and Detroit River (Hayes and Cafoffino, 2012). An additional 19 populations are known to occur in Michigan, at population sizes of <25 adults to over 15,000 adults.

A small *A. fulvescens* population is known to occur in the mainstem of the lower Grand River and the mouth of the Grand River, and adults have been observed during spawning season below the 6th Street dam (M. Holtgren, Encompass, personal communication). Within the Action Area**,** it is restricted to downstream of the 6th Street Dam (Figure 4-10, Hanshue and Harrington, 2017). The Grand River population has been placed into the 'small declining' category based on a low estimated adult population size (n = 103) and declining population trajectory over the past 15 years (Hayes and Carrofino, 2012). The 6th Street Dam is a barrier to spawning grounds of several Lake Michigan fish species, including *A. fulvescens* (Hanshue and Harrington, 2017). MDNR biologists have reported adult and juvenile *A. fulvescens*, and incidental catch by anglers has occurred near the 6th Street Dam. A population of between 66 and 130 fish of primarily older (>36 years) adults is estimated to occur in the lower Grand River (Hanshue and Harrington, 2017). This species should not be adversely affected by Project construction, as it would likely stay out of the area with construction activity. *Acipenser fulvescens* migration routes at least up to I-196 would be available with the Project (Holtgren, 2024; Appendix E). Turbidity may increase during construction within the indirect impact area; however, *A. fulvescens* is known to occur in a wide range of turbidity, clarity, and oxygen levels (COSEWIC, 2017). If they are temporarily displaced by turbidity, they are likely to seek nearby clear water (in Plaster Creek) until suitable conditions exist. Additionally, temperature suitable for spawning generally occurs in the Grand River in the Spring under turbid conditions. However, BMPs would be used to reduce turbidity as much as practicable, and turbidity would be monitored and adaptively managed.

<u>*Moxostoma carinatum* (River Redhorse) – Threatened</u>

Moxostoma carinatum is a large-bodied sucker with a brown or olive coloration dorsally to brassy sides and white ventrally (Pflieger, 1997; COSEWIC, 2006). Crescent shaped dark spots are present on each dorso-lateral scale, caudal and dorsal fins are bright red in color, with pelvic and pectoral fins orange to red (Etnier and Starnes, 1993; Pflieger, 1997; COSEWIC, 2006). Adults commonly reach 500 mm (1.5 ft) and up to 2 kg (4 lbs) (Pflieger, 1997; Campbell, 2001) and can weigh up to 7.7 kg (17 lbs) (Pflieger, 1997) and reach ages between eight and approximately 30 years (Etnier and Starnes, 1993; Campbell, 2001). The lower lips are broken into parallel folds (plicae) without papillae (Pflieger, 1997; COSEWIC, 2006). The lower lip has a straight to slightly obtuse posterior margin, forming a slightly v-shaped angle, and the dorsal fin is straight to slightly concave (Pflieger, 1997; COSEWIC, 2006). *Moxostoma carinatum* differs from other *Moxostoma* spp. In having a heavy pharyngeal arch bearing molariform teeth rather than comb-like teeth (Etnier and Starnes 1993; Jenkins and Burkhead, 1993; Pflieger, 1997). Breeding males develop small tubercles on head, body, and fins (Etnier and Starnes, 1993; Pflieger, 1997)

Moxostoma carinatum reaches sexual maturity between three and five years (Etnier and Starnes, 1993; Huston, 1999) with northern populations reaching maturity later (COSEWIC, 2006). Adults spawn each year, at temperatures between 18 and 24° C (64 and 75° F) (Mongeau et al., 1992; Jenkins and Burkhead, 1993), which occurs between mid-May and late July in the Grand River. MNFI (2018), however, reports the spawning season from late July to late August. Evidence suggests that males excavate spawning redds tended by individual males (Hackney et al., 1967; Etnier and Starnes, 1993; Pflieger, 1997) and exhibit ritualized spawning displays (Hackney et al., 1967; Etnier and Starnes, 1993). Females release between 9,000 and 23,000 yellow, adhesive eggs (Etnier and Starnes, 1993; Campbell, 2001). Hatching occurs between five and six days post-fertilization (Jenkins, 1970).

Moxostoma carinatum is found throughout the central and eastern Mississippi River system north from the Great Lakes Basin to the Gulf Slope from Florida to Louisiana (Etnier and Starnes, 1993; COSEWIC, 2006). This species is known from 24 states and two Canadian provinces (COSEWIC, 2006). *Moxostoma carinatum* is known to inhabit lakes and rivers, but generally occurs in rivers with moderate to swift current and clean, rocky substrates needed for spawning (Scott and Crossman, 1973; Becker 1983; Etnier and Starnes, 1993; Pflieger, 1997; Reid, 2002; Reid, 2003), with spawning individuals commonly collected within 100 m (325 ft) of rapids (Campbell, 2001).

Moxostoma carinatum inhabits rivers in 14 counties in Michigan's lower peninsula (MNFI, 2018). *Moxostoma carinatum* occurs throughout the entire Lower segment of the Grand River, from near Lyons to Grand Haven near the mouth of Lake Michigan and upstream into the Maple River (Hanshue and Harrington, 2017; Figure 4-11). They were recently collected between 6th Street Dam and Fulton Street (Table 1-3) and were recently observed in spawning condition within the Project Area (S. Hanshue, MDNR, personal communication). They also spawn in the Flat River, Maple River, and Fish Creek (S. Hanshue, MDNR, personal communication). This species would likely avoid the Project Area during Project construction, although spawning typically occurs in Spring when water levels would likely be too high for project construction to occur. Turbidity may increase at the downstream end of the indirect impact area, where *M. carinatum* has been known to spawn (S. Hanshue, MDNR, personal communication). BMPs would be used to reduce turbidity as much as practicable, and turbidity would be monitored and adaptively managed. This species may experience reduced recruitment during the 2-year period in which construction activities are planned (July 2021 – June 2023), but across the Grand River watershed, loss of year classes should be buffered by spawning that occurs outside of the Project Area. Habitat for *M. carinatum* should be improved with the completion of the Project (Appendix F).

Pleurobema sintoxia (Round Pigtoe) – Species of Special Concern

Pleurobema sintoxia shells are generally triangular, but frequently nearly round. The dorsal margin is nearly straight, ventral margin gently curved, anterior end broadly rounded, and posterior end truncated above and rather pointed ventrally. Shells are stout and thicker anteriorly. Shells are to 9.5 cm (3.7 in) long and are compressed (smaller streams) to inflated (larger rivers); the posterior ridge is rounded and flattened but not prominent. Beaks are broad, high, and directed forward with sculpture consisting only of a few small tubercles on the posterior ridge. The periostracum is light reddish-brown becoming dark brown with age and usually without rays. The nacre is white, pink, or salmon and iridescent posteriorly (Oesch, 1984).

Pleurobema sintoxia is tachytictic (short-term brooder); it is gravid as early as May until late July. Glochidia are released in white leaf-shaped conglutinates (Watters et al., 2009). Reported host fish are primarily Cyprinidae and *Lepomis* sp., and include *Campostoma anomalum* (Central Stoneroller), *Cyprinella spiloptera* (Spotfin Shiner), *Phoxinus eos* (Northern Redbelly Dace), *Phoxinus erythrogaster* (Southern Redbelly Dace), *Pimephales notatus* (Bluntnose Minnow), and *L. macrochirus* (Hove, 1995; Watters et al., 2005 *in* Watters et al., 2009). *Cyprinella spiloptera, P. notatus,* and *L. macrochirus* have recently been collected between 6th Street Dam and Fulton Street (Table 1-3). *Cyprinella spiloptera* and *P. notatus* have similar habitat preferences; although preferences vary somewhat with life stage, both species appear to prefer slow to moderate current with silt, sand, and gravel substrate (Aadland and Kuitunen, 2006). Both

Cyprinidae species spawn between May and September when water temperature is above 21.1° C (70° F). In contrast, *L. macrochirus* prefer low-velocity pools with cover such as vegetation or woody debris (Stuber et al., 1982b; Aadland and Kuitunen, 2006). *Lepomis macrochirus* typically spawn between May and August, when water temperatures are above 19.4° C (67° F) (Becker, 1983). Within the Project Area, shallow near-bank areas containing smaller substrate constituents (silt, sand, gravel) seem to be suitable for *C. spiloptera* and *P. notatus*. This habitat would be increased with the Project (Table 2-5, Appendix F).

Pleurobema sintoxia is found in medium to large rivers in mixed mud, sand, and gravel (Cummings and Mayer, 1992). In Tennessee, this species was most abundant in medium-sized and large rivers in current on a firm substrate of coarse gravel and sand at depths of less than 1 m (3 ft) to more than 6 m (20 ft). (Parmalee and Bogan, 1998). *Pleurobema sintoxia* was historically distributed from New York and Ontario west to South Dakota, Kansas, and Oklahoma, and south to Louisiana and Alabama. This species is considered vulnerable to critically imperiled in most of the states in which it occurs (NatureServe, 2015).

Pleurobema sintoxia has been observed in most of the major drainages in the southern portion of the Lower Peninsula, including the Cass, Clinton, Huron, Kalamazoo, Muskegon, Pine, Raisin, Shiawassee, St. Clair, St. Joseph (Lake Michigan and Maumee), Thornapple, Tiffin, and Upper and Lower Grand watersheds (Badra, 2010). In the Grand River, it historically occurred throughout the river, but now seems to occur only in the middle and lower river (Table 3-1). It has recently (since 2013) been found alive from Lyons Dam downstream through Grand Rapids (Table 3-2). It was collected alive in most of the sampled sites: Ionia, Saranac, Flat River, Peace Park, Chief Hazy Cloud, Ada, Riverside Park, Roselle Park, Upstream, and between 6th Street Dam and Fulton Street in low numbers (Table 2-7; Figure 4-12). A few were collected immediately downstream of the 6th Street Dam (Figure 4-13), and a few were found scattered under the I-196 Bridge (Cardno, 2017). This species appears to be actively reproducing within the lower Grand River, as live juveniles were collected from Ionia, Saranac, Peace Park, Ada, Roselle Park, and Upstream (Table 3-3). Frequency between 6th Street Dam and Fulton Street averaged 0.4% (Table 1-2). *Pleurobema sintoxia* would be adversely affected during Project construction, but physical habitat should be improved with the Project (Appendix F).

<u>*Potamilus alatus* (Pink Heelsplitter) – Species of Special Concern</u>

Potamilus alatus is a relatively large species, reaching lengths of up to 20 cm (8 inches). The shell is somewhat rectangular, laterally compressed, and thin in young and moderately thick in older shells (Cummings and Mayer, 1992; Mulcrone, 2018a). The anterior end of the shell is rounded, while the posterior end is bluntly squared or truncated. The umbos are slightly above the hinge line and flattened. Beak sculpture is fine, concentric lines (Mulcrone, 2018a). Posterior to the umbos, a large wing is typically present. The periostracum varies in color from dark green to dark brown to black in older individuals. Younger individuals commonly have green rays that fade with age. The nacre is purple or pinkish purple but rarely white and highly iridescent (Cummings and Mayer, 1992).

Potamilus alatus is bradytictic. Gravid females have been reported from June to October and again from May to July (Watters et al., 2009). *Aplodinotus grunniens* was recently confirmed as a host fish (Sietman et al., 2018) and was recently collected between the 6th Street Dam and Fulton Street (Table 1-3). *Aplodinotus grunniens* are bottom dwellers that feed on mollusks. They can be found in a range of habitats but appear to prefer deeper pools of rivers, and low-velocity areas of medium to large rivers over mixed

sand and silt (Smith, 1979; Aadland and Kuitunen, 2006; Hanshue and Harrington, 2017). *Aplodinotus grunniens* are pelagic spawners that typically spawn when water temperatures are between 18.9 and 22.2° C (35 and 72° F) (Becker, 1983), which occurs from mid-May to late June in the Grand River. The distribution of *A. grunniens* in the Grand River appears to be primarily downstream of the 6th Street Dam (Hanshue and Harrington, 2017). Some habitat for this species is available in the Project Area, and habitat should also be available with the Project (Table 2-5, Appendix F).

Potamilus alatus typically occurs in medium to large rivers, lakes, and impoundments, but rarely in smaller systems (Watters et al., 2009). It is most often found in silty sand and mud but can be found in mixed mud, sand, and gravel (Cummings and Mayer, 1992) and also in slower moving waters (Oesch, 1984). *Potamilus alatus* is found throughout the Mississippi River system as well as the upper St. Lawrence River and Lakes Erie and St. Clair and the lower reaches of rivers in the lower peninsula. It ranges from western Pennsylvania to Minnesota stretching west to Kansas and Nebraska then south to Arkansas (NatureServe, 2018). In Michigan, *P. alatus* is found at the lower stretches of rivers in the lower peninsula, and in Lakes Erie and St. Clair (Burch, 1975). *Potamilus alatus* has not been reported in the headwaters, upper, or middle reaches of the Grand River (Table 3-1). A few individuals were collected between 6th Street Dam and Fulton Street during 2013 and 2016 sampling (Figure 4-14), under the I-196 Bridge (Cardno, 2017), and between Fulton Street and the M-11 Bridge, but not at any of the sites upstream of the 6th Street Dam (Table 2-10; Figure 4-15). Their distribution is likely limited by the inability of *A. grunniens* to travel upstream of the 6th Street Dam. Between the 6th Street Dam and Fulton Street, they occur at a frequency of 0.5% (Table 1-2). Given the rarity of *P. alatus* in recent surveys, the recruitment status of this species cannot be determined. *Potamilus alatus* would be adversely affected during Project construction, but physical habitat should be improved with the Project (Appendix F).

Truncilla truncata (Deertoe) – Species of Special Concern

Truncilla truncata is a relatively small species, reaching lengths up to 5 cm (2 in). The shell is triangular, somewhat inflated, and relatively thick (Cummings and Mayer, 1992; Mulcrone, 2006b). The anterior end of the shell is rounded, while the posterior end is bluntly pointed or truncated. A shallow sulcus is present anterior to the posterior ridge, which is sharply angled. The umbos are prominent and raised above the hinge line. Beak sculpture consists of three to five fine double-looped ridges. The periostracum varies in color from yellow or green to dark brown and is typically marked with numerous green rays of varying width. Rays may be composed of fine broken lines or chevron-shaped markings. The nacre is typically white, but may occasionally be pink (Cummings and Mayer, 1992; Mulcrone, 2006b).

Truncilla truncata was thought to be bradytictic but was recently reported as tachytictic (short-term brooder; Sietman et al., 2018). Gravid females have been reported from April or May to July (Watters et al., 2009; Sietman et al., 2018). Potential host fish may include *A. grunniens* and *S. canadensis* (Wilson, 1916 *in* Watters et al., 2009), and *A. grunniens* has been confirmed as a suitable host (Marshall et al., 2018; Sietman et al., 2018). *Aplodinotus grunniens* is known to occur in the Grand River downstream of the 6th Street Dam, while *S. canadensis* has not been reported from the lower Grand River (Hanshue and Harrington, 2017). *Aplodinotus grunniens* are bottom dwellers that feed on mollusks. They can be found in a range of habitats but appear to prefer low-velocity areas of medium to large rivers over mixed sand and silt (Smith, 1979; Aadland and Kuitunen, 2006). *Aplodinotus grunniens* are pelagic spawners that typically spawn when water temperatures are between 18.9 and 22.2° C (35 and 72° F) (Becker, 1983),

which occurs from mid-May to late June in the Grand River. Most of the *T. truncata* in the Grand River occur downstream of the 6th Street Dam (Hanshue and Harrington, 2017). Although *A. grunniens* primarily occurs downstream of the 6th Street Dam, a few have been collected above the dam (S. Hanshue, MDNR, personal communication) and a few *T. truncata* have also been found above the dam.

Truncilla truncata typically occurs in medium to large rivers, though they may be found in smaller rivers and creeks as well as lakes (Parmalee and Bogan, 1998; Williams et al., 2008; Watters et al., 2009). It occurs in a variety of substrates, including sand, gravel, and mud (Cummings and Mayer, 1992; Parmalee and Bogan, 1998; Williams et al., 2008). *Truncilla truncata* is found throughout the Mississippi River system, as well as the Lake Michigan, Lake Erie, and Lake St. Clair drainages. It ranges from New York to Virginia in the east and from North Dakota to Texas in the West, and from Canada south to Louisiana (NatureServe, 2015). In Michigan, *T. truncata* is primarily found in the southern half of the Lower Peninsula. It occurs in the Detroit, Huron, Kalamazoo, Pere Marquette-White, St. Clair, St. Joseph (Lake Michigan), Tittabawassee, and the Lower Grand (Badra, 2010).

Truncilla truncata was not reported in the Grand River by Coker et al. (1919) or van der Schalie (1948), but Goforth et al. (2000) found multiple age classes in the middle and lower river. More recently (2013 to 2022), it was collected alive near Lyons Dam (Woolnough and Barnett, 2013), near Saranac, between the 6th Street Dam and Fulton Street, and downstream to the M-11 Bridge (Table 2-7; Figure 4-16 and 4-17). Both the Saranac Site and the area between the 6th Street Dam and Fulton Street contained live juveniles, suggesting *T. truncata* is actively reproducing within the lower Grand River (Table 3-3). *Truncilla truncata* frequency averaged 1.7% between 6th Street Dam and Fulton Street (Table 1-2). *Truncilla truncata* would be adversely affected during Project construction, but physical habitat should be improved with the Project (Appendix F).

<u>*Venustaconcha ellipsiformis* (Ellipse) – Species of Special Concern</u>

Venustaconcha ellipsiformis is a small mussel, reaching lengths up to 7.5 cm (3 in). The shell is solid, moderately compressed, and elliptical in shape (Cummings and Mayer, 1992; Badra, 2007a). The anterior end is rounded, and the posterior end is bluntly pointed and often pinched. The umbos are low and raised only slightly above the hinge line. Beak sculpture consists of three to four fine double-looped ridges (Cummings and Mayer, 1992; Badra, 2007a). The periostracum is yellow, green, or dark tan, with dark green rays that become wavy toward the posterior end of the shell. The nacre is white, occasionally tinged with orange in the beak cavity (Cummings and Mayer, 1992; Badra, 2007a).

Venustaconcha ellipsiformis is bradytictic. Spawning is reported to occur in July and August (Watters et al., 2009). Potential host fish include *Cottus* spp., *P. caprodes*, and *Etheostoma* spp. (Watters et al., 2009). *Percina caprodes* and *E. caeruleum* have similar habitat preferences: adults prefer relatively shallow, swift riffles or raceways with gravel substrate. Adults (spawning and non-spawning) seem to prefer depths near 1 m (3 ft) and current velocity near 1 m/sec (3 ft/sec) over substrates of sand, gravel, and cobble, whereas young of the year prefer slightly shallower, slower waters over similar substrate (Becker, 1983; Aadland and Kuitunen, 2006). In Wisconsin, both *P. caprodes* and *E. caeruleum* begin spawning in April, with the spawning season extending into June or July (Becker, 1983). *Etheostoma nigrum* adults (spawning and non-spawning) prefer slow riffles (velocities 30-59 cm/sec [1-2 ft]) over sand, gravel, and cobble substrate (Aadland and Kuitunen, 2006). *Etheostoma nigrum* typically spawn between April and June when water

temperatures are between 11.7 and 21.1° C (53 and 70° F) (Becker, 1983). The Project Area currently offers limited habitat for *P. caprodes, E. nigrum,* and *E. caeruleum*, although some primarily gravel substrate is present (Figure 2-1), and all three species were collected in recent surveys (Table 1-3). Slower current velocity areas of the Project Area (particularly areas near the bank) may be suitable for *E. nigrum*. Physical habitat for all *Etheostoma* sp. and *Percina* sp. would be expanded with the Project (Table 2-5; Appendix F).

Venustaconcha ellipsiformis is typically found in small to medium streams in sand and gravel substrate (Cummings and Mayer, 1992; Watters et al., 2009). It is limited to the Interior Basin and occurs from Michigan and Indiana west to Minnesota and south to Missouri and Oklahoma (Badra, 2007a; NatureServe, 2015). In Michigan, *V. ellipsiformis* has been reported from the Cass, Kalamazoo, Maple, Pigeon-Wiscoggin, Raisin, Shiawassee, St. Joseph (Lake Michigan and Maumee drainage), Thornapple, and Grand River basins (Badra, 2010). *Venustaconcha ellipsiformis* historically occurred throughout the Grand River and has more recently been found in the middle and lower Grand (Table 3-1). Although rare, one individual was recently found alive near Lyons Dam (Woolnough, 2015). A few were also found at Peace Park, Ada, and Roselle Park, and they were the dominant species in the Flat River (Table 2-7; Figure 4-18). Mostly weathered shells have been found between the 6th Street Dam and Fulton Street, but one live individual was collected in August 2017 (Figure 4-19) and one live individual was collected under the I-196 bridge (Cardno, 2017). One live juvenile was collected from Ada, and several were found in the Flat River (Table 3-3). They may be more abundant in tributaries within the lower Grand, as they comprised 33% of the community in the lower Flat River (ESI, 2016). Between the 6th Street Dam and Fulton Street, frequency averaged 0.1% (Table 1-2). *Venustaconcha ellipsiformis* would be adversely affected during Project construction, but physical habitat should be improved with the Project (Appendix F).

Cambarunio iris (Rainbow) – Species of Special Concern

Cambarunio (Villosa) iris is a small mussel typically found in small to medium sized streams. It occurs in the eastern portion of the United States in the Ohio and Upper Mississippi River basins, and the Great Lakes system from Lake Huron to Lake Ontario (Parmalee and Bogan, 1998; Badra, 2007b). In Michigan, *C. iris* is primarily found in the southern portion of the state. It has been reported from the Cass, Clinton, Detroit, Huron, Kalamazoo, Maple, Muskegon, Pigeon-Wiscoggin, Pine, Raisin, Shiawassee, St. Clair, St. Joseph (Lake Michigan and Maumee drainage), Thornapple, Tiffin, and Grand River systems (Badra, 2010). Dead shells have been found in the lower Grand River and were collected between 6th Street Dam and Fulton Street (Table 1-2). The only live recent record for this species is the one individual collected below Lyons Dam (Woolnough, 2015). Since this species does not appear to be extant in the Action Area, it would not be adversely affected by the Project and is not included in this analysis.

Alasmidonta marginata (Elktoe) – Species of Special Concern

Alasmidonta marginata is a medium-sized mussel, reaching lengths up to 10 cm (3.9 in) (Cummings and Mayer, 1992). The shell is triangular or trapezoidal, inflated, and thin. The anterior end is rounded, and the posterior end is bluntly pointed, with a prominent posterior ridge (Cummings and Mayer, 1992). The posterior slope is covered with fine ridges. The umbos are large and located near the center of the shell. Beak sculpture consists of three to four heavy double-looped ridges (Cummings and Mayer, 1992; MNFI, 2018). The periostracum is smooth, greenish yellow in color, with numerous dark green rays and dots

(Cummings and Mayer, 1992; MNFI, 2018). The nacre is bluish white and may occasionally have salmon near the beaks, and the foot is bright orange (Cummings and Mayer, 1992; MNFI, 2018).

Alasmidonta marginata is bradytictic. Spawning typically occurs in June. Glochidia are found in September and overwinter until the following May or June (Watters et al., 2009). Potential host fish include *C. commersonii*, *H. nigricans*, *Moxostoma macrolepidotum* (Shorthead Redhorse), *Ambloplites rupestris* (Rock Bass), and *Lepomis gulosus* (Warmouth) (Howard and Anson, 1923 *in* Watters et al., 2009). However, these potential hosts were observed as natural infestations, and transformation has not been observed (Host fish database, accessed 2024). More recently Bloodsworth et al. (2013) transformed this species in the laboratory on *C. commersoni*, *H. nigricans*, *Erimyzon oblongus* (Eastern Creek Chubsucker), *M. macrolepidotum*, *Moxostoma erythrurum* (Golden Redhorse), *M. anisurum*, *Luxilus zonatus* (Bleeding Shiner), *Luxilus chrysocephalus* (Common Shiner), *Luxilus cornutus* (Striped Shiner), *Margariscus margarita* (Allegheny Pearl Dace), *Notemigonus crysoleucas* (Golden Shiner), *Nocomis biguttatus* (Hornyhead Chub), *Fundulus catenatus* (Northern Studfish), *Fundulus diaphanus* (Banded Killifish), *Fundulus olivaceus* (Blackspotted Topminnow), *Poecilia reticulata* (Guppy), *Culaea inconstans* (Brook Silverside), *C. bairdi*i, and *C. carolinae*, suggesting they are host generalists similar to other Anodontini. Many of these potential hosts were recently collected within Grand Rapids (Table 1-3)

Alasmidonta marginata is found in large creeks to medium rivers. It most often occurs in reaches with relatively fast current and substrates of mixed sand, gravel, and/or cobble (Parmalee and Bogan, 1998; Williams et al., 2008; Watters et al., 2009; MNFI, 2018). This species is found in the Mississippi River and Great Lakes drainages, as well as the Susquehanna River in Pennsylvania (Atlantic Slope drainage) (Watters et al., 2009). It ranges from Canada in the north to Alabama in the south and is found from New York to Virginia in the east and North Dakota to Oklahoma in the west (NatureServe, 2015). In Michigan, *A. marginata* is found in both the Upper and Lower Peninsulas, though it appears to be absent from the northern portion of the Lower Peninsula (MNFI, 2018). This species is known to occur in the upper (historical), middle, and lower Grand River (Table 3-1). It has been collected live or as a fresh shell from Lyons Dam to downstream of Fulton Street in Grand Rapids (Table 3-2). Within recently sampled areas, a few live individuals were collected from Ionia, Saranac, Flat River, Chief Hazy Cloud, Ada, and at the I-196 south bridge (Table 2-7; Figure 4-20); recent recruitment was evident, as live juveniles were collected at each of these sites (Table 3-3). Fresh shells were also found at Peace Park, Roselle Park, Upstream, and within the downstream indirect impact area (Table 2-10). Between the 6th Street Dam and Fulton Street, fresh shells were found near the dam and along the left descending bank (Figure 4-21), and live individuals were collected under the I-196 Bridge (Cardno 2017). Frequency of *A. marginata* between 6th Street Dam and Fulton Street averaged 0.7% (Table 1-2). *Alasmidonta marginata* would be adversely affected during Project construction, but physical habitat should be improved with the Project (Appendix F).

<u>*Lasmigona compressa* (Creek Heelsplitter) – Species of Special Concern</u>

Lasmigona compressa shell is small to medium sized with lengths up to 8 cm (4 in), elongate, and relatively thin (Cummings and Mayer, 1992) but becomes moderately thick with age (Watters et al., 2009). The anterior of the shell is rounded while the posterior end is bluntly pointed with a squared tip. The posterior ridge is prominent, and the slope is formed into a small, sculptureless wing. Umbos are slightly above the hinge line and beak sculpture is heavy double-loops (Mulcrone, 2018b). The periostracum is yellow, tan, and/or greenish, frequently with rays in young individuals, turning brown to black with age (Watters et

al., 2009; Cummings and Mayer, 1992). Shell nacre is white with often a salmon, yellow, or greenish tint under the hinge; most specimens have gold or brown Tulberg layers (Watters et al., 2009).

Lasmigona compressa is bradytictic. Spawning is reported to occur in May (Ortmann, 1919; Baker, 1928) but individuals may spawn from June to July in Michigan (Mulcrone, 2018b). More than 20 host fish species from several families, including *Lepisosteus* sp. (Gar), Cyprinidae, Catostomidae, Ictaluridae, *Lepomis* sp., and Percidae, have been reported. Many of these potential hosts have been reported from the Grand River within Grand Rapids (Table 1-3). Since preferred habitat varies for these fish species, it may be assumed host fish occur throughout the Grand River.

Lasmigona compressa can be found throughout a watershed but is usually in creeks and headwaters of small to medium rivers (Cummings and Mayer, 1992). It was found in pools above and below riffles with compact sand and gravel, or mud patches near shore on the Huron River (Mulcrone, 2018b). In larger rivers it occupies soft mud bottoms in slow-moving currents near the edge of the river (Cummings and Mayer, 1992; van der Schalie, 1938; Watters, 1995). This species is found in the Canadian Interior Basin, the Upper Mississippi, Ohio, and St. Lawrence River systems extending from Saskatchewan to Nebraska and eastward to Vermont and Quebec, and the Hudson River system in New York (Mulcrone, 2018b). In Michigan, this species is found in creeks, headwater streams and small rivers throughout drainages in the lower and upper peninsula (Burch, 1975; van der Schalie, 1938). It was historically found in the Grand River headwaters and upper and middle reaches but has only been found in the lower reach in recent years (Table 3-1). It was recently found in the Flat River, at Roselle Park, and at the I-196 south bridge (Table 2-7; Figure 4-22). Juveniles were found in the Flat River, and one juvenile was collected at Roselle Park in 2017 (Table 3-3), which suggests some reproduction may be occurring in the lower Grand River. It was not found at any other sites, including between the 6th Street Dam and Fulton Street (Table 2-7). However, there is a chance that it could occur in the Project Area at a very low frequency. It could be adversely affected during construction if it occurs in the Project Area, but slower flowing areas near the bank preferred by this species should increase with the Project (Appendix F).

<u>*Lasmigona costata* (Flutedshell) – Species of Special Concern</u>
Lasmigona costata is a moderately sized unionid with lengths up to 18 cm (7 in) and is ovate and elongate in shape. The shell is moderately thick, compressed to moderately inflated. The anterior end is uniformly rounded, the posterior end is truncated above and angular where the posterior ridge meets the margin of the shell. The dorsal and ventral margins are straight to slightly curved. Umbos are low and not raised above the hinge line. Beak sculpture is composed of three or four concentric and sometimes sinuate ridges. The periostracum is smooth, and younger individuals often have green and brown rays while aged individuals lose color and become browner (Mulcrone, 2018c). The shell's posterior slope has prominent sculpturing consisting of about 10 – 12 heavy, rounded ridges or folds while more sculpturing is present on the lateral surface near the middle of the shell (Cummings and Mayer, 1992).

Lasmigona costata is bradytictic. Gravid females have been observed from early August to late May in the Huron River (Michigan) and likely spawn from June to July in Michigan (Lefevre and Curtis, 1912; Watters, 1995). Two glochidia forms have been observed for *L. costata* with one presumably being able to forego the parasitic stage (Watters et al., 1998). Over 25 host fish species from several families have been reported. Many of these potential hosts have been reported from the Grand River within Grand Rapids

(Table 1-3). Since preferred habitat varies for these fish species, it may be assumed host fish are present in the Grand River and the Project Area.

Lasmigona costata is in the Mississippi River system, including the Tombigbee River system. To the north it occurs in the St. Lawrence system from north of Lake Superior to Lake Champlain and the Ottawa River. In the Hudson Bay drainage, it is found in the Red and Winnipeg systems (Watters et al., 2009; Mulcrone, 2018c). *Lasmigona costata* is generally sporadic in distribution where it is found. In Michigan, it generally occurs in small to medium sized rivers in both the upper and lower peninsulas (van der Schalie, 1938; Burch, 1975; Watters, 1995). Historically, *L. costata* was found in the headwaters and upper reach of the Grand River and has recently been collected in the middle and lower reaches (Table 3-1). It was relatively abundant in the Flat River, Upstream, and between the 6th Street Dam and Fulton Street, but few individuals were collected at other surveyed sites (Table 2-7; Figure 4-23). Recent recruitment was evident, as live juveniles were collected at Ionia, Flat River, Chief Hazy Cloud, Riverside Park, Upstream, and between the 6th Street Dam and Fulton Street (Table 3-3). *Lasmigona costata* was found throughout the area between 6th Street Dam and Fulton Street (Figure 4-24), and frequency averaged 4.0% (Table 1-2). *Lasmigona costata* would be adversely affected during Project construction, but physical habitat should be improved with the Project (Appendix F).

Utterbackia imbecillis (Paper Pondshell) - Species of Special Concern

Utterbackia imbecillis is a small- to medium-sized mussel, reaching lengths up to 10 cm (3.9 in) (Cummings and Mayer, 1992). The shell is elongate, compressed in young individuals, becoming inflated in older individuals. The anterior end is rounded, and the posterior end is somewhat pointed (Cummings and Mayer, 1992). The shell is very thin and may be transparent in younger individuals. The umbos are positioned anteriorly, flattened, and do not extend above the hinge line. Beak sculpture is double-looped, with several fine wavy ridges (Cummings and Mayer, 1992; Mulcrone, 2016). The periostracum is smooth, yellow in younger individuals and on the beaks of older individuals, becoming brownish green in older individuals. The nacre is white to bluish white (Cummings and Mayer, 1992; Mulcrone, 2016).

Utterbackia imbecillis is bradytictic. Gravid females have been observed from April through September (Watters et al., 2009), and MNFI (2018) reports the active gravid period as year-round. Potential host fish are primarily Centrarchidae, but glochidia have been successfully transformed in the laboratory on some Cyprinidae, non-fish species (*Ambystoma tigrinum* [Tiger Salamander], *Rana catesbeiana* [Bullfrog]), and numerous non-native fish species (Watters et al., 2009; Mulcrone, 2016). Many of these potential hosts have been reported from the Grand River within Grand Rapids (Table 1-3). Habitat preferences of Centrarchidae hosts are generally similar; most prefer low velocity pools and spawn over sand or gravel substrate (Edwards et al., 1982b; Stuber et al., 1982a, 1982b; Aadland and Kuitunen, 2006). Slow moving, relatively deep, pool-type habitat that may be suitable for centrarchid species is currently lacking in the Project Area but would be improved with the Project.

Utterbackia imbecillis typically occurs in slow-flowing pools and impoundments in soft sand and mud substrate (Parmalee and Bogan, 1998; Williams et al., 2008; Watters et al., 2009). This species is found in the Mississippi River, Great Lakes, and Atlantic slope drainages. It is found throughout the eastern half of the United States and portions of Canada, from Ontario south to Alabama, and as far west as New Mexico (NatureServe, 2015). In Michigan, *U. imbecillis* is found in the Kalamazoo, Manistique, Pere Marquette-

White, St. Claire, and St. Joseph (Lake Michigan) (Badra, 2010), as well as in Lake Erie (Mulcrone, 2016). This species was not reported by van der Schalie (1948) or Coker et al. (1919) but was found in the middle and lower river in more recent surveys (Table 2-7). It has been found either alive or as a fresh shell from Lyons through Grand Rapids (Table 3-2). The only site where this species was found alive in recent surveys was within the mussel bed at Saranac (Table 2-7). However, shells were found at Riverside Park, Roselle Park, Upstream, between the 6th Street Dam and Fulton Street, and at the I-196 south bridge (Table 2-7; Figure 4-25 and 4-26). It may occur in slow flowing areas along the RDB in the Project Area, but at a low frequency. No live juveniles have been collected in recent surveys (Table 3-3); given the rarity of *U. imbecillis*, the recruitment status of this species cannot be determined. If it occurs within the Project Area, it would be adversely affected during construction. Slow flowing near bank habitat area would improve with the Project, but soft sand and silt substrate are not expected (Appendix F).

4.3 Species Considered in the BA

The primary species considered for both projects in this BA is the federally endangered mussel *E. triquetra*.

Michigan TES could potentially be listed as federally threatened or endangered within the life of both projects. Freshwater mussel species that occur in the Action Area and are listed in Michigan (*L. recta*, *T. parvum*, *C. tuberculata*, *A. viridis*, *P. sintoxia*, *P. alatus*, *T. truncata*, *V. ellipsiformis*, *A. marginata*, *L. compressa*, *L. costata*, and *U. imbecillis*) are considered in this BA. Freshwater fish species listed in Michigan that occur in the Action Area (*A. fulvescens* and *M. carinatum*) are also considered in this BA. *Cambarunio* (*Villosa) iris* is not considered, as this species has not been found alive in the lower Grand River.

5.0 EFFECTS OF PROPOSED ACTION

The construction area for the NRCS project spans from 91 m (300 ft) upstream of Bridge Street to Fulton Street, 127,600 m^2 (31.5 acres). Of this 45,445 m^2 (11 acres) would be directly impacted during construction, and the areas between direct impact areas (82,155 m^2; 20 acres) would be indirectly impacted by temporary increases in turbidity and changes in flow patterns associated with causeways and features constructed in the river. Scouring of the existing riverbed outside of direct impact areas is not anticipated during construction. Upstream indirect impacts during construction (38,420 m^2; 9.5 acres) would be limited to slight changes in depth and velocity depending on what construction and project features are in the river. Construction sequencing has been developed to ensure increases in modeled tailwater levels are avoided and minimized during *P. marinus* migration. Barrier criteria for *P. marinus* would be maintained through construction and post-construction, and Great Lakes Fish Commission (GLFC) who monitors the Grand River for *P. marinus*, have been notified of the project.

Downstream indirect impacts (282,600 m^2; 70 acres) are expected to be minor. Turbidity may increase between Fulton Street and Plaster Creek during construction. To minimize turbidity, BMPs would be implemented where appropriate as approved by EGLE, and turbidity would be monitored and adaptively managed. A turbidity monitoring and an adaptive management plan would be developed during the permitting process. The exact construction methods used by the contractor would not be known until the contractor is selected. The construction methods presented in Section 2 describe a feasible construction configuration and represent the maximum allowable take of unionid mussels, but the contractor would be encouraged to develop methods that would affect fewer unionid mussels. Take is estimated on construction described in Section 2:

The Project would be constructed from causeways constructed in the river or with equipment tracking on the river bottom. One small area within the Dam 2 direct impact area would be isolated from the flow of the river for construction. All unionids, and any fish that do not leave the direct impact areas, outside the isolation area may be crushed under causeways or by tracking equipment, excavation, grading, and placement of rock. To minimize mortality of unionid mussels, mussels would be collected and translocated from as much area as practicable within direct impact areas under the Grand Rapids/GRWW project. If an equal mussel density of 0.3 unionids/m^2 is assumed throughout the direct impact areas (45,445 m^2), approximately 123 *E. triquetra*, 1,800 Michigan TES, and 11,711 other mussels occur in direct impact areas (Table 5-1). If mussels can be translocated from all of the direct impact area (best case), with a collection efficiency of 85% and 5% mortality due to handling, take would only be from translocation and is expected to include 19 *E. triquetra*, 283 Michigan TES, and 1,845 common species (Table 5-2). This would be the minimum Take (Table 5-4).

Under worst case conditions (maximum Take), mussels would at least be translocated from within the small, isolated area (3,285 m^2). The construction team would need to wait for fish and unionids to be moved from within the isolated area before construction. A maximum of 10 days of mussel translocation is allocated for this effort. Approximately 9 *E. triquetra*, 130 TES, and 847 common species occur in the isolated area (Table 5-1). Collection efficiency in this area is expected to be 85%; however, up to 5% mortality could occur from handling. Take from the translocation effort is expected to include 1 *E. triquetra*, 21 TES, and 133 common species (Table 5-2). Worst case, mussels would only be collected from the isolated area, mussels in other parts of the direct impact area would be negatively impacted. Take

from direct impact areas where mussels are not translocated would include 114 *E. triquetra*, 1,670 Michigan TES, and 10,865 common species (Table 5-3). Total take (uncollected direct impact areas + translocation Take) would include 115 E. *triquetra*, 1,690 Michigan TES, and 10,998 other mussels (Table 5-4).

The most likely scenario is if river conditions permit, mussels should be translocated from the isolated area and all areas with ≤0.6 m/sec (2 ft/sec) velocity. The estimated number of mussels in low velocities areas combined includes 31 *E. triquetra*, 456 Michigan TES, and 2,966 other individuals. Translocation Take would include 3 *E. triquetra*, 51 Michigan TES, and 334 other individuals (Table 5-2). An additional 88 *E. triquetra*, 1,298 Michigan TES, and 8,445 other mussels would be killed in areas where collection could not occur due to unsafe conditions (Table 5-3). Total take under this scenario (direct impact areas >0.6 m/sec [not translocated] + translocation take) would be 92 *E. triquetra*, 1,349 Michigan TES, and 8,779 common mussels (Table 5-4).

Mussels may also be temporarily affected by increased turbidity and changes in local hydraulic conditions in Construction Area indirect impact areas. No scour holes are expected to develop during construction outside of direct impact areas. Host fish activity in these areas may be altered. Turbidity would be monitored and adaptively managed to minimize these effects. The area of construction indirect impact area is approximately 82,155 m^2 (Table 5-5). Approximately 21,171 mussels, including 222 *E. triquetra* and 3,253 Michigan TES could occur in the Construction Area indirect impact area (Table 5-5). These mussels could be temporarily stressed during construction or host fish may not be available during glochidial release, and a few year classes may be lost.

Approximately 11,526 mussels including 104 *E. triquetra* and 1,521 Michigan TES could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes in the upstream indirect impact area (6th Street Dam to 91 m [300 ft.] upstream of Bridge Street) are not expected to have an adverse effect on unionid mussels.

Approximately 28,260 mussels including 55 *E. triquetra* and 9,510 Michigan TES could occur in the downstream indirect impact area (Table 5-5). Although mussel density within the downstream indirect impact area (Fulton Street to Plaster Creek) is very low (approximately 0.1/m^2), increased turbidity during construction may cause nutritive stress and potentially reproductive failure in some areas during construction. Turbidity plumes would be temporary and are not expected to cause mortality. Additionally, turbidity would be monitored and adaptively managed to reduce impacts.

Most fish should vacate the Project Area due to construction activity and as many as practicable would be salvaged from within the isolated area. However, some mortality of small fish (Cyprinidae, Percidae, juvenile fish) is expected. Some of these species may be unionid hosts; however, this should not affect the reproductive success of mussels in direct impact areas during construction, as no mussels would be in the area to reproduce. Mussels in Construction Area indirect impact areas may lose a few year classes.

Most fish species that might use the Project Area for spawning (*S. vitreus* and *Moxostoma* spp.) typically spawn during the high-water periods of April through early June, construction would be limited to lower water levels. *Acipenser fulvescens* may not use the Project Area for spawning (S. Hanshue, MDNR,

personal communication), but would likely move to other reaches of the Grand River during construction. *Moxostoma carinatum* may use the Project Area for spawning (S. Hanshue, MDNR, personal communication), but *M. carinatum* spawns in the Spring during high water and would not be expected to spawn while construction is occurring.

Both *M. carinatum* and *A. fulvescens* may spawn within the downstream indirect impact area near Plaster Creek. Increases in turbidity that might occur should not impact spawning, as these species typically spawn during high water when turbidity is high. *Moxostoma carinatum* also spawns in other areas of the Grand River.

Some impacts to mussels could also occur if OMRRR is needed. The maximum amount of area needed for OMRRR is expected to be 10,000 m^2 if equipment needs to track into the river. Approximately, 27 *E. triquetra*, 396 Michigan TES, and 2,577 common mussels could be within the area affected by tracking (Table 5-6). If possible, mussels would be translocated from any areas that might be impacted to minimize Take.

Once the project is complete, habitat would be available for most fish and mussel species that occurred prior to the project. A few areas of scour forming deeper holes may occur downstream of the Dam 2 diversified boulder arches, but holes would be within the area previously affected by construction. Overall, current velocity would be greater upstream of I-196 and depth would be shallower. Within emergent habitat boulder fields, depth would increase, velocity would be slower and flow refugia would be provided behind boulders. More slow flowing area would also be available along banks. Habitat for host fish should improve. Mussel habitat may also improve, as less area would have scouring flows and more flow refugia would be available.

Most of the fish species that occur in the Project Area, including those that serve as hosts for TES, also occur upstream and downstream of the Project Area (Table 1-3). Colonization by mobile fish species should occur within a few years of completed construction and use by migratory fish species would be expected soon after construction is complete. Although *P. caprodes* are considered sedentary, they can travel long distances (Schwalb et al., 2011). *Percina caprodes* and other *Percina* and *Etheostoma* species were found over 2 km (1.2 miles) upstream of a dam removal on Mill Creek, a Huron River tributary, within four years after dam removal and installation of a rock arch structure (Braunscheidel, 2014; MDNR, unpublished data).

The actions and time required for unionids to successfully utilize created habitat is largely experimental. Natural recolonization by unionid mussels could require several years due to the need for biofilm and bacteria to colonize within the substrate, invertebrates to colonize, and host fish to colonize, particularly sedentary host fish such as *P. caprodes*. Although literature on fish and invertebrate colonization of created habitat is available, little is known on recolonization by unionid mussels. Fish and invertebrate colonization of restored river areas often occurs within a few years depending on mobility of species, proximity to a seed source, food source availability, and availability of suitable habitat (Malmqvist et al., 1991; Detenbeck et al., 1992; Peterson and Baylay, 1993; Miller, 2006; Stoll et al., 2014; Li et al., 2016), although maturation of an invertebrate assemblage after restoration may require decades (Winking et al., 2016). Unionid mussel recolonization rates are not well documented but appear to be a function of

hydrophysical habitat (substrate, flow) stability, host fish mobility, and proximity to a seed source (Eckblad, 1999; ESI, 2000; Haag, 2012; J. Clayton, WVDNR, personal communication; Dunn, personal observation). It may require decades to establish a species rich, reproducing assemblage.

A few unionid habitat creation projects (Miller, 2006; Kelner, 2015) and recolonization studies (ESI, unpubl. data; J. Clayton, WVDNR, unpubl. data) have been documented. An artificial riffle/pool sequence was constructed in a side channel below a dam in the Tombigbee River in early 1980's. Invertebrates colonized the riffle in the Tombigbee River within three months, and invertebrate density and diversity were similar to nearby natural gravel bars within one year (Miller, 2006). Fish also recolonized within one year. In the year following construction, 39 fish species were collected in the riffle, including Cyprinidae, *Etheostoma* sp., and *Percina* sp. Juveniles of a few common unionid species (*O. reflexa*) were collected in invertebrate samples immediately following construction. However, intensive unionid sampling was not conducted until 16 years later, lending scant information on unionid recolonization rates.

A unionid habitat creation project was also conducted in Pool 11 of the Mississippi River in an area where unionids previously did not reside (USACE, 1989). The project goal was to establish a self-sustaining unionid assemblage by creating both fish and unionid habitat using host fish and unionid habitat criteria. A dense, species rich unionid assemblage (31 unionids/m^2, 26 live species; ESI, 2013) occurred approximately 8 km (5 miles) upstream of the project (seed source). The project was completed in 1992 and qualitatively assessed in 2000, and unionids were observed in depositional areas among large boulders; however, no quantitative information was provided. The area was not quantitatively monitored for unionids until 2014 (Kelner, 2015). In 2014, density ranged from 0.8 to 4.8 unionids/m^2 and 14 species were collected. All unionids were ≤10 years old, indicating they colonized >10 years post-construction (Kelner, 2015).

A few recolonization studies are currently being conducted in areas where unionids were removed for construction or were removed during cleanup efforts. Unionids are recolonizing a bridge construction area on the New River in West Virginia (ESI, 2017b) and in a coal spill area in the Mississippi River (ESI, unpubl. data). In both cases, juvenile unionids and opportunistic unionid species were present within a few years; within three years on the New River and one year in the Mississippi River. Within four years, unionid density in the Mississippi River area was approximately the same as the reference assemblage, and other metrics (rarefaction richness, % fresh dead shells, % ≤5 years old, % tolerant species, % Tribe Lampsilini, species evenness, tribe evenness, 75th percentile abundance) were similar to the reference assemblage. However, in both areas, unionid assemblages (seed sources) were present immediately adjacent to the affected site (affected site was within the mussel bed area).

After 10 years, a unionid assemblage on the Ohio River has recolonized with similar species and density to pre-mussel kill (ESI, 2002; Janet Clayton, WVDNR, pers. comm.). In this area, other mussel beds occurred within a few kilometers upstream and natural recolonization was supplemented with propagated individuals. Other killed-off unionid beds within the same pool but further away from good seed sources did not recolonize as quickly, although other stressors may have contributed to the lack of recolonization (Janet Clayton, WVDNR, personal communication).

From these examples, it can be concluded that initial colonization by unionids requires a few years with a unionid assemblage immediately adjacent to the site to over 10 years with farther removed seed sources and no addition of unionids from propagation or other sources. A diverse unionid assemblage occurs upstream of the Project Area, which should supply a natural recolonization source for Project Area colonization. Unionids and host fish within the upstream and construction indirect impact areas would also be available to facilitate recolonization. However, the time required for substrate to acquire necessary biotic components for unionid survival and for a mussel assemblage to become established is unknown.

Once construction is complete, recreational use of the Project Area may increase. Shallow, slow flowing areas near the banks would be more accessible to waders and anglers, and canoeing and kayaking would be more frequent. Unionid mussels that recolonize the area may be stressed by handling and/or boaters dragging boats over shallow areas. Post-project harm could be partially mitigated through educational programs by project partners that would be developed in the future.

6.0 CUMULATIVE EFFECTS

At EGLE's request, the City provided a list of Projects planned along the Grand River. The submittal letter along with descriptions of the projects and potential impacts of the projects to TES is provided in Appendix G. These projects would be consulted on separately and are not part of the projects discussed above. Updates since that memo was compiled are mentioned here. The 14 projects include:

- Corps of Engineers Project of replacing the the 6th Street Dam with an Adjustable Hydraulic Structure. This is a federal project and not considered in Cumulative Effects for this BA.
- Lyon Edge Project- This project is in the conceptual design phase. No work is proposed in the Grand River. Mussel and fish would not be affected.
- East River Edge Project (Campau)- The project is along the east bank, upstream of Fulton St. *E. triquetra* and *L. recta* may be in the project area. MDNR and USFWS coordinated on this project. USFWS concluded there was no reasonable certainty of take to *E. triquetra*, as the project was above the low water 890 CFS mark.
- GRPM Riverfront- Work only extends 0.3 m (1 ft) into the river and is expected to have minimal impact on fish and freshwater mussels. MDNR and USFWS coordinated on this project. USFWS concluded there was no reasonable certainty of take to *E. triquetra*, as the project was above the low water 890 CFS mark.
- Leonard St. to Ann St. Trail- No work will be in the river.
- Coldbrook Water Pump Station- This project is in the master plan stage. Project is upstream of the 6th Street Dam, where mussel density is approximately 1.7/m^2. TES mussels could potentially be affected by this project. Mussel translocation is planned to minimize impacts. USFWS and MDNR would be coordinating on this project.
- Fish Ladder Park- This project is in the master plan stage. Project is upstream of the 6th Street Dam, where mussel density is approximately 1.7/m^2. TES could be in the river near this area. The project is only in the Master Plan phase.
- Wealthy St. Access- This project is a concept design. It is downstream of Fulton St., where no *E. triquetra* have been found and mussel density averages 0.1/m^2. Michigan TES mussels could be affected. Mussels would be translocated to minimize impacts.
- 201 Market Ave. (updated)- This project is expected to submit for a permit application to EGLE in Spring 2024. The proposed project does not extend past the 890 CFS line, and no equipment is expected in the river. Therefore, no direct impacts to mussels are anticipated. Appropriate soil erosion and sedimentation control BMPs would be installed to minimize any potential indirect impacts to mussels.
- Canal Park (updated)- No activity would be in the river. A removable kayak dock would be added to this park and would be anchored to the floodwall. There would be no direct placement onto the riverbed. Minor impacts from shading of the riverbed from the kayak dock are expected.
- 6th St. Park- This project is a conceptual design and is upstream of the 6th Street Dam where mussel density is approximately 1.7/m^2. TES could be impacted. A mussel translocation is planned.
- Riverside Park- This project is only in the Master Plan phase. It would impact approximately 4,046 m^2 of river, where mussel density is approximately 3/m^2. TES could be impacted, and a mussel translocation is planned.
- Ah-Nab-Awen Park south- No impacts on wildlife and habitat, including TES, as this project is out of the river and within current park space.

7.0 CONCLUSION AND DETERMINATION OF EFFECTS

The Project may affect and is likely to adversely affect *E. triquetra* under Section 7 of the ESA, and result in take of *E. triquetra*, *L. recta*, *C. tuberculata*, *A. viridis*, *P. sintoxia*, *P. alatus*, *T. parvum*, *T. truncata*, *V. ellipsiformis*, *A. marginata*, *L. compressa*, *L. costata*, and *U. imbecillis* as defined in NREPA part 365. Effects would be minimized through collection and translocation; however, all individuals would be harmed and considered take, and some stress and possibly mortality of those translocated may occur. Temporary turbidity may have temporary effects on mussels within the Construction Area indirect impact area and downstream indirect impact areas. Turbidity would be minimized through use of BMPs, monitoring, and adaptive management. Increases in tailwater elevations at the 6th Street Dam would be avoided and minimized during construction and avoided after construction to maintain the *P. marinus* barrier. An 18 inch vertical barrier to *P. marinus* would be maintained during and after construction at similar flow rates as existing conditions. The Project would not jeopardize the continued existence of *E. triquetra*, as it is not endemic to the Grand River, populations occur throughout the lower Grand River and the Midwest, and aquatic habitat is designed to be improved with the Project.

The Project could result in take of *A. fulvescens* and *M. carinatum* under NREPA part 365. They may be prevented from using the Project Area during construction, but habitat is designed to be improved by the Project. They may be temporarily affected by increased downstream turbidity. Both species may spawn near Plaster Creek (S. Hanshue, MDNR, personal communication). Plaster Creek is approximately 2.5 km (1.5 miles) downstream of the Project Area and increases in turbidity would be minimal in this area. Additionally, these species spawn in the Spring, when turbidity is normally high, and construction would not occur during their spawning season.

Five of the non-federal projects planned (or being planned) near or within Grand Rapids could impact mussel and fish species. Riverside Park is in a high density unionid area (3/m^2) and could affect *E. triquetra* and Michigan TES. Fish Ladder Park and 6th Street Park are all upstream of the 6th Street Dam, where mussel density is approximately 1.7/m^2 and *E. triquetra* and Michigan TES could be affected. East River Edge Project is just upstream of Fulton St. along the east bank; this is within the Project Area and could affect *E. triquetra* and Michigan TES. Wealthy Street access project is downstream of Fulton Street and could affect *E. triquetra* and Michigan TES. USFWS and MDNR would be consulted on these projects as they progress.

7.1 Federal Endangered Species

Epioblasma triquetra (Snuffbox)

The NRCS Project may affect and is likely to adversely affect *E. triquetra*, but would not jeopardize the continued existence of this species. *Epioblasma triquetra* occur at a low frequency (0.9%) within the Project Area. An estimated 123 *E. triquetra* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *E. triquetra* from within at least the isolated area to minimize harm and 5% mortality is expected during translocation (Table 5-2). At a minimum, 19 *E. triquetra* would be directly harmed during translocation if all unionids in direct impact areas are translocated (Table 5-4). If only mussels in the isolated area are translocated, 115 *E. triquetra* could be directly harmed (Table 5-4). An additional 27 could be harmed by OMRRR activities (Tables 5-6). OMRRR take would be reduced by translocation if practical. Approximately 104 *E. triquetra* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not

expected to adversely affect *E. triquetra*. Approximately 222 *E. triquetra* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. Based on relative abundance at the I-196 bridge, approximately 55 *Epioblasma triquetra* may occur downstream of Fulton Street and could be indirectly affected by any downstream increased turbidity.

The Grand River harbors a stronghold population of this species between Lyons, MI to Fulton Street, approximately 85 river km (53 river miles), and harbors one of the few populations with a high demographic status (reproducing population) in the United States or Canada (USFWS, 2012, 2022). The Project may temporarily shorten this stretch of habitat to 84 river km (52.4 river miles), and not jeopardize the continued existence of this species. Habitat created by the Project between Bridge Street and Fulton Street is expected to improve habitat for *E. triquetra* and its host *P. caprodes*. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

7.2 Michigan Endangered Species

Toxolasma parvum (Lilliput)

The Project could result in take of *T. parvum*. *Toxolasma parvum* has not been collected within the Project Area. However, they were collected upstream at the Riverside Park and Ionia sites. *Toxolasma parvum* have not recently been collected from the downstream indirect impact area, but a few individuals could be affected by increased turbidity. A few *T. parvum* could be adversely affected by this Project. This species is fairly common in other areas of its range, although only in its preferred habitat.

7.3 Michigan Threatened Species

Cyclonaias tuberculata (Purple Wartyback)

The NRCS Project would result in take of *C. tuberculata*. *Cyclonaias tuberculata* occur at a frequency of 2.9% within the Project Area. An estimated 390 *C. tuberculata* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *C. tuberculata* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 61 *C. tuberculata* could be negatively impacted during translocation (Table 5-4). If only mussels in the isolated area are translocated, 366 *C. tuberculata* could be negatively impacted (Table 5-4). An additional 86 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 330 *C. tuberculata* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *C. tuberculata*. Approximately 705 *C. tuberculata* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Cyclonaias tuberculata* has been collected downstream of Fulton Street and an estimated five could be indirectly affected by any downstream increased turbidity (Table 5-5).

The Grand River harbors a reproducing population of *C. tuberculata* at least from Lyons, MI to downstream of Fulton Street, over 85 river km (53 river miles). The Project may temporarily shorten this stretch of habitat by 880 m (2,894 ft). This species occurs in many other rivers in the Midwest. Habitat created by the Project between Bridge and Fulton Street is expected to improve habitat for *C. tuberculata* and its Ictaluridae hosts. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

Ligumia recta (Black Sandshell)

The NRCS Project would result in take of *L. recta*. *Ligumia recta* occur at a frequency of 2.9% within the Project Area. An estimated 394 *L. recta* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *L. recta* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). At a minimum, 62 *L. recta* would be directly impacted during translocation if all unionids in direct impact areas are translocated (Table 5-4). If only mussels in the isolated area are translocated, 370 *L. recta* could be directly impacted (Table 5-4). An additional 87 could be directly impacted by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 333 *L. recta* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *L. recta*. Approximately 712 *L. recta* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Ligumia recta* has been collected downstream of Fulton Street and an estimated 255 could be indirectly affected by any downstream increased turbidity.

The Grand River harbors a reproducing population of *L. recta* at least from Lyons, MI to downstream of Fulton Street, over 85 river km (53 river miles). The Project may temporarily shorten this stretch of habitat by 880 m (2,894 ft). This species occurs in many other rivers in the Midwest. Habitat created by the Project between Bridge and Fulton Street is expected to improve habitat for *L. recta* and its hosts. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

Alasmidonta viridis (Slippershell)

The Project could result in take of *A. viridis*. *Alasmidonta viridis* historically occurred throughout the Grand River, but only one individual has been reported since 1950. This individual was collected within the Project Area. This species is typically found in small streams and may have been a stray individual dropped from a host fish. It may be more common in tributary streams within the Grand River watershed. There is a chance that a few *A. viridis* would be adversely affected by this Project (Tables 5-4, 5-5, 5-6).

Although rare in the Grand River, it has been reported in several Michigan rivers and occurs throughout the Great Lake and Mississippi River basin.

Acipenser fulvescens (Lake Sturgeon)

The Project could result in take of *A. fulvescens*. *Acipenser fulvescens* occur from the mouth of the Grand River to the 6th Street Dam. They would not have use of parts of the Project Area during construction.

They have been observed within the Project Area, but the closest suspected spawning area is in Plaster Creek, 2.5 km (1.6 miles) downstream of the Project Area. Additionally, *A. fulvescens* spawns in the Spring, when turbidity is normally high, and construction would not occur during their spawning season. The Project would not directly or indirectly affect *A. fulvescens* spawning.

Moxostoma carinatum (River Redhorse)

The Project may result in take of *M. carinatum*. *Moxostoma carinatum* occur from the mouth of the Grand River to at least Lyons, MI and in the Maple River. They would not have use of parts of the Project Area during construction. They have been recently collected within the Project Area and may spawn in the Project Area. Recruitment of this species in the Grand River may be reduced during Project construction; however, project construction is not expected to occur during their spawning season. They should return after the Project is completed. They have also been reported to spawn near Plaster Creek, 2.5 km (1.6 miles) downstream of the Project Area. Increases in turbidity near Plaster Creek should be minimal and spawning should not be affected.

7.4 Michigan Species of Special Concern

Pleurobema sintoxia (Round Pigtoe)

The NRCS Project would result in take of *P. sintoxia*. *Pleurobema sintoxia* occur at a frequency of 0.4% within the Project Area. An estimated 59 *P. sintoxia* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *P. sintoxia* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 9 *P. sintoxia* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 55 *P. sintoxia* could be directly affected (Table 5-4). An additional 13 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 50 *P. sintoxia* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *P. sintoxia*. Approximately 106 *P. sintoxia* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Pleurobema sintoxia* has not been collected downstream of Fulton Street, but may occur there and a few could be indirectly affected by any downstream increased turbidity.

The Grand River harbors a reproducing population of this species at least from Lyons, MI to Fulton Street, over 85 river km (53 miles). The Project may temporarily shorten the stretch of *P. sintoxia* habitat by 880 m (2,894 ft), but this species occurs throughout the Midwest. Habitat created by the Project between Bridge and Fulton Street is expected to improve habitat for *P. sintoxia* and its Cyprinidae hosts. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

Potamilus alatus (Pink Heelsplitter)

The NRCS Project would result in take of *P. alatus*. *Potamilus alatus* occur at a frequency of 0.5% within the Project Area. An estimated 74 *P. alatus* occur in the direct impact area (Table 5-1). The Grand

Rapids/GRWW relocation project would translocate 85% of *P. alatus* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 12 *P. alatus* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 69 *P. alatus* could be directly affected (Table 5-4). An additional 16 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 62 *P. alatus* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *P. alatus*. Approximately 133 *P. alatus* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Potamilus alatus* was collected downstream of Fulton Street, approximately 705 could be indirectly affected by any downstream increased turbidity.

This species appears to be limited to downstream of the 6th Street Dam along with its host *A. grunniens*. They have been found at several sites downstream of Fulton Street and are fairly common in the Mississippi River basin. Habitat created by the Project between Bridge and Fulton Street is expected to improve habitat for *P. alatus* and *A. grunniens*. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

Truncilla truncata (Deertoe)

The NRCS Project would result in take of *T. truncata*. *Truncilla truncata* occur at a frequency of 1.7% within the Project Area. An estimated 230 *T. truncata* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *T. truncata* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 36 *T. truncata* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 216 *T. truncata* could be directly affected (Table 5-4). An additional 51 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 195 *T. truncata* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *T. truncata*. Approximately 417 *T. truncata* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Truncilla truncata* has been collected downstream of Fulton Street and an estimated 8,530 could be indirectly affected by any downstream increased turbidity.

This species appears to primarily occur downstream of the 6th Street Dam along with its host *A. grunniens*. They have been found downstream of Fulton Street and a few have been found upstream of the Project Area. They are fairly common in the Mississippi River basin. Habitat created by the Project between Bridge and Fulton Street is expected to improve habitat for *T. truncata* and *A. grunniens*. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

Venustaconcha ellipsiformis (Ellipse)

The NRCS Project would result in take of *V. ellipsiformis*. *Venustaconcha ellipsiformis* occur at a frequency of 0.06% within the Project Area. An estimated 8 *V. ellipsiformis* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *V. ellipsiformis* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 1 *V. ellipsiformis* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 8 *V. ellipsiformis* could be directly affected (Table 5-4). An additional 2 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 7 *V. ellipsiformis* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *V. ellipsiformis*. Approximately 15 *V. ellipsiformis* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Venustaconcha ellipsiformis* has not been collected downstream of Fulton Street, but may occur there and a few could be indirectly affected by any downstream increased turbidity.

They have been found in the Grand River at least from Lyons, MI to Fulton Street, over 85 river km (53 river miles). The Project would temporarily shorten their stretch of habitat by 880 m (2,894 ft). Habitat created by the Project between Bridge and Fulton Street is expected to improve habitat for *V. ellipsiformis* and its *Percina* sp. and *Etheostoma* sp. hosts. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

Alasmidonta marginata (Elktoe)

The NRCS Project would result in take of *A. marginata*. *Alasmidonta marginata* occur at a frequency of 0.7% within the Project Area. An estimated 98 *A. marginata* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *A. marginata* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 15 *A. marginata* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 92 *A. marginata* could be directly affected (Table 5-4). An additional 22 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 83 *A. marginata* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *A. marginata*. Approximately 177 *A. marginata* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. A few *A. marginata* were collected downstream of Fulton Street at the I-196 bridge, and a few could be indirectly affected by any downstream increased turbidity.

The Grand River harbors a reproducing population of this species at least from Lyons, MI to Fulton Street, over 85 river km (53 river miles). The Project would temporarily shorten this stretch of habitat by 880 m (2,894 ft), but this species occurs throughout the Midwest. Habitat created by the Project between Bridge

and Fulton Street is expected to improve habitat for *A. marginata* and its hosts. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

Lasmigona compressa (Creek Heelsplitter)

The Project may result in take of *L. compressa*. *Lasmigona compressa* has not been collected within the Project Area or in the indirect impact areas, but a few were collected during a survey of the I-196 bridge downstream of Plaster Creek. They were also collected upstream at the Roselle Park site. There is a chance that a few *L. compressa* would be adversely affected by this Project. This species typically occurs in creeks and headwaters of small to medium streams throughout the Midwest.

Lasmigona costata (Flutedshell)

The NRCS Project would result in take of *L. costata*. *Lasmigona costata* occur at a frequency of 4.0% within the Project Area. An estimated 543 *L. costata* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *L. costata* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 85 *L. costata* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 510 *L. costata* could be directly affected (Table 5-4). An additional 119 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 459 *L. costata* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *L. costata*. Approximately 981 *L. costata* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Lasmigona costata* has not been collected downstream of Fulton Street, but may occur there and a few could be indirectly affected by any downstream increased turbidity.

The Grand River harbors a reproducing population of this species at least from Ionia, MI to Fulton Street. The Project would temporarily shorten this stretch of habitat by 880 m (2,894 ft), but this species occurs throughout the Midwest. Habitat created by the Project between Bridge and Fulton Street is expected to improve habitat for *L. costata* and its hosts. However, habitat creation for unionid mussels is experimental and colonization of the Project Area could take several years.

Utterbackia imbecillis (Paper Pondshell)

The Project Could result in take of *U. imbecillis*,. A fresh shell of *U. imbecillis* was collected within the Project Area, and shells or live individuals have been recently collected from Lyons, MI to the Project Area. There is a chance that a few *U. imbecillis* would be adversely affected by this Project. This species typically occurs in backwater or muddy near bank areas that are not common in the Project Area. A few may be collected during the translocation, and a few could be affected by this Project. This species has not recently been collected within the indirect impact area, but a few individuals could be affected. Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize downstream turbidity. This species has been recently collected live or as a fresh shell from Lyons to Fulton Street, and it is common in other parts of its range.

No. species				75	59	73	53	

[1] Modified from Hanshue and Harrington (2017); P=Present, recent (2017 to 2022) collected between Dam 4 and Plaster Creek (M. Holtgren, 2024, pers. comm)

[2] I=Introduced, MT=Michigan threatened species (Hanshue and Harrington, 2017)

[3] Based on distribution maps in Hanshue and Harrington (2017)

[4] Either natural (NT) or laboratory (LT) transformation observed for at least one of the species in the Project Area (Freshwater Mussel Host Database https:https://mollusk.inhs.illinois.edu/57-2/, 2024)

[5] USGS (https://nas.er.usgs.gov/viewer/omap.aspx; 2024); N. Badgett (pers. comm, EcoAnalysts)

Table 2-1. Existing and Currnt Project areas and impacts to unionid mussels.

	Existing	2024 Project
Total wetted area at 890 CFS (m2)	167,353	166,020
Permanent impact area	643	4,638
Area available for mussel colonization[1]	166,710	161,382
Estimated no. of mussels in available area	50,013	48,415
Modeled Hydrophysical Habitat[2]	6,080	7,565
Construction Area		127,600
Direct Impact Area	0	45,445
Epioblasma triquetra	-	123
Michigan TES	-	1,800
Other unionid species	-	11,711
Indirect Impact Area		82,155
Epioblasma triquetra	-	222
Michigan TES	-	3,253
Other unionid species	-	21,171
OMRRR mussel area[3]		10,000
Epioblasma triquetra	-	27
Michigan TES	-	396
Other unionid species	-	2,577
Upstream Indirect Impact Area4		38,420
Epioblasma triquetra	-	104
Michigan TES	-	1,521
Other unionid species	-	9,901
Downstream Indirect Impact Area[5]		282,600
Epioblasma triquetra	-	0
Michigan TES	-	8,325
Other unionid species	-	28,250

[1]890 wetted area minus dams, boulders, transient sand, and rock or structures that mussels cannot occupy

[2] Areas with current velocity under 1,200 CFS conditions between 0.12 and 0.50 ft/sec; this defines areas with some flow under low flow, but not scouring flow.

Shear stress at 3,900 CFS >0.01 lb/sf to prevent sand deposition

[3] OMRRR (operation, maintenance, repair, rehabilitation, and replacement)

[4] 6th Street Dam to Construction Area

[5] Fulton St. to Plaster Creek - No live *E. triquetra* have been found downstream of Fulton, insufficient data on Michigan TES species to evaluate

Nomenclature follows FMCS (2023)

FD = Freshly dead shell, WD = Weathered dead shell, SF = Subfossil

[1]FE = federally endangered (USFWS, 2024); ME = Michigan endangered, MT = Michigan threatened, MSC = Michigan species of special concern (https://mnfi.anr.msu.edu/species/animals; accessed February 2024)

[2]ESI (2016); [3]ESI (2017a); EcoAnalysts (2018); [4] ESI (2014) quantitative samples only

[5]Number collected based on combination of quantitative and qualitative samples in 2013 (ESI, 2014);
species found in other studies (JFNew, 2013a, b, c, d; Cardno, 2017) or years (ESI, 2017a; ESI, 2018; EcoAnalysts, 2018, 2019, 2020) are indicate with an L (live)

[6]EcoAnalysts (2021); Species collected by EcoAnalysts (2019) are indicted with an L (live)

[7]Includes Sites 13 and 14 (ESI, 2016; ESI, 2018) and Site I196S (JFNew, 2013b; GEI, 2023); see Figure 3-1

[8]Based on quantitative samples only; [9]Samples were not distributed throughout the Project Area, samples were biased toward higher density areas

Table 2-8. Recipient site areas available for placing TES.[1]

	Ionia	Saranac	Peace Park	Chief Hazy Cloud	Ada	Site 7	Riverside Park[2]	Plaster Creek[2]	Total
Area (m^2)	9,421	5,650	6,749	1,991	23,480	6,675	8,650	286	62,902
Density	2.4	3.4	4.5	4.0	2.8	0.7	1.6	-

No. Michigan TES (13.20%)	1,670	130	20	1	1,690	1,298	326	49	2	1,349	1,798	270	13	283
No. common species (85.80%)	10,865	847	127	6	10,998	8,445	2,120	318	16	8,779	11,711	1,757	88	1,845

Table 2-13. Potential unionid mortality and resulting mitigation fund.

	Potential Unionid Mortality[1]			Mitigation Fund[2]		
	All Direct Impact Areas translocated	Isolated and ≤2ft/sec areas translocated	Only isolated area translocated	All Direct Impact Areas translocated	Isolated area and ≤2ft/sec areas translocated	Only isolated area translocated
Area (m^2)	45,445	8,225	42,160			
No. unionids (0.3/m^2)	2,147	10,220	12,803	$73,214.06	$348,502.00	$436,589.67
No. *E. triquetra* (0.90%)	19	92	115			
No. Michigan TES (13.20%)	283	1,349	1,690			
No. common species (85.80%)	1,844	8,779	10,998			

[1] 15% not relocated within collected area and 5% not surviving relocation

[2]Mitigation fund based on mortality x $34.10; $28.50 used in the 2020 BA adjusted for inflation between 2020 and 2024.

Table 2-14. Anticipated permitting and construction schedule.

Task/Milestone	Schedule[1]
Final Biological Assessment Submitted to NRCS	February 2024
NRCS Submittal of Biological Assessment (BA) to USFWS	February 2024
USFWS Formal Consultation of BA	February to May 2024
Biological Opinion	June/July 2024
Endangered species permits issued by MDNR	April 2024
MDNR scientific collecting permit	May-24
Mussel translocation[2]	August to October 2024
Publish Draft EA for Public Review	April 2024
Prepare Draft Final EA	May 2024
EGLE Permit Submission	March 2024
Final EA	June 2024
EGLE Review	90 days
EGLE permit receipt	June 2024
Construction Mobilization	April to May 2025
Construction	June 2025 to October 2026

[1] Dates are tentative

[2] Some translocation may occur in 2025

Table 3-1. Unionid mussel records from the Grand River.[1]

Appendix A. Summary of Project Changes: 2023 B3 Conceptual Design

Summary of Project Changes: 2023 B3 Conceptual Design

Since the 2022 permit submittal of Alternative 3a, the following changes have been made to the proposed project improvements. The list below only summarizes changes to proposed post-project conditions and does not include detail on changes to temporary construction conditions at this time. Coordination with the new construction manager has been initiated and updates to construction sequencing and means and methods will be determined through that process. A complete new set of drawings will be developed to reflect the new design.

Summary of changes to proposed improvements:

1. Between Blue Bridge and Fulton Street
    - The boulder wave structure on the west side of the channel has been replaced with an augmented boulder vane structure with a reduced footprint and surrounding scattered boulders.
    - The previous design included a recovery pool downstream of the wave; this pool has been removed from the design. There may be a small scour pool directly downstream of the vane structure, similar to other Michigan projects that have implemented W-weir or Aadland rock arch designs.
    - The previous design also contained some excavation beneath blue bridge for construction access and increased flood conveyance; changes to this will be determined through coordination with the construction manager and ongoing flood impact modeling.
    - The east side of the channel is largely the same as previously proposed, with scattered boulders in the same general location.
    - Total estimated permanent direct impact area in this section of the reach has been reduced from **1.0 acres to 0.2 acres**.
2. Between Pearl and Blue Bridge
    - The hydraulic feature here, which included a boulder wave structure on the west connected to a constructed riffle structure on the east, has been replaced with scattered boulder and a series of vane structures to provide slack water near designated access points on the banks. The layout of scattered boulder and vane structures is still being designed and evaluated from a flood modeling impact standpoint.
    - The recovery pool of the previous design has been removed.
    - Total estimated permanent direct impact area in this section of the reach has been reduced from **1.2 acres to 0.1 acres.**
3. Between Gillett and Pearl Street (Location of Dam 1)
    - The hydraulic feature here, which included a boulder wave structure on the west side connected to a constructed riffle structure on the east, has been replaced with a single constructed riffle and moved downstream to have more overlap with the dam 1 removal footprint.
    - The recovery pool of the previous design has been removed.
    - Total estimated permanent direct impact area in this section of the reach has been reduced from **1.9 acres to 1.4 acres.**

4. Location of Dam 2
    - The hydraulic feature here, which included a boulder wave structure on the west connected to a constructed riffle structure on the east, has been replaced with a hydraulic feature that combines constructed riffles on either side of the river with a series of boulder drop structures in the center of the channel. The new hydraulic feature has a reduced footprint.
    - The recovery pool of the previous design has been removed. Small scour pools are included directly downstream of the boulder drop structures, similar to other Michigan projects that have implemented W-weir or Aadland rock arch designs.
    - Total estimated permanent direct impact area in this section of the reach has been reduced from **3.0 acres to 1.5 acres.**
5. Location of Dam 3
    - The dam removal limits have been expanded to include re-grading of the channel upstream of Dam 3.
    - Per coordination with EGLE in Fall 2021 for creation of alternative 2b, the grading limits around Dams 3 and 4 were expanded to provide a more gradual sloping riverbed when the dams were removed. EGLE requested the expanded grading limits be the baseline for the 2023 design concept.
    - Scattered boulder is proposed to be placed within the dam removal footprint.
    - Total estimated permanent direct impact area in this section of the reach has been changed from **0.2 acres to 1.2 acres.**
6. Location of Dam 4
    - The dam removal limits have been expanded to include re-grading of the channel upstream of Dam 4.
    - Per coordination with EGLE in Fall 2021 for creation of alternative 2b, the grading limits around Dams 3 and 4 were expanded to provide a more gradual sloping riverbed when the dams were removed. EGLE requested the expanded grading limits be the baseline for the 2023 design concept.
    - Total estimated permanent direct impact area in this section of the reach has been changed from **0.3 acres to 1.6 acres.**

Total estimated total permanent direct impact area for the project has been reduced **from 7.6 acres to 6.1 acres**. A figure comparing the areas of permanent direct impact between Alternative 3a and the current Re-design concept is attached.

Summary of changes to modeled tailwater elevations at 6th Street Dam

The previous project design (Alternative 3a) proposed lowering the upstream hydraulic control elevation from a uniform elevation of 595' (Dam 4 crest) to a variable crest elevation of approximately 593'. This lowering of two feet resulted in decreases in modeled tailwater elevations at 6th Street Dam of up to 0.5' at low flow and similar tailwater elevations (or very small decreases) during flood flows, when Dam 4 (and all proposed grade control) is submerged by several feet.

The elevation to which the upstream hydraulic control of the reach was proposed to be lowered in the previous design was driven by project goal to avoid modeled increased tailwater at 6th Street Dam as a means to demonstrate that the effectiveness of the dam as a barrier to sea lamprey would not be

adversely impacted. This goal was balanced with the goal of avoiding increased velocities and scour potential upstream of the project area to 6th Street Dam. Over the last 100 years, Dam 4 has been providing a level of protection to bed mobility and infrastructure, as well as decreased velocities that the angling community has become accustomed to. Therefore, the proposed upstream crest elevation was set to maintain these conditions to the highest degree possible, while also meeting the lamprey barrier effectiveness goal. None of this has changed as part of the re-design effort.

For these reasons, modeled tailwater elevations for the re-designed concept remain very similar to those of Alternative 3a. These modeled tailwater elevations are compared in the table below. All water surface elevations are based on SRH-2D modeling results.

Table 1: Changes to proposed modeled tailwater elevations at 6th Street Dam.

Flowrate (cfs)	Existing Conditions (ft)	Alternative 3a		Re-design Concept	
		Tailwater Elev. (ft)	Change in Tailwater (ft)	Tailwater Elev. (ft)	Change in Tailwater (ft)
1,200	595.9	595.6	-0.3	595.6	-0.3
2,500	596.7	596.4	-0.3	596.4	-0.3

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

Official Species List
The attached species list identifies any Federally threatened, endangered, proposed and candidate species that may occur within the boundary of your proposed project or may be affected by your proposed project. The list also includes designated critical habitat if present within your proposed project area or affected by your project. This list is provided to you as the initial step of the consultation process required under section 7(c) of the Endangered Species Act, also referred to as Section 7 Consultation.

Under 50 CFR 402.12(e) (the regulations that implement section 7 of the Endangered Species Act), the accuracy of this species list should be verified after 90 days. You may verify the list by visiting the IPaC website (https://ipac.ecosphere.fws.gov/) at regular intervals during project planning and implementation. To update an Official Species List in IPaC: from the My Projects page, find the project, expand the row, and click Project Home. In the What's Next box on the Project Home page, there is a Request Updated List button to update your species list. Be sure to select an "official" species list for all projects.

Consultation requirements and next steps
Section 7 of the Endangered Species Act of 1973 requires that actions authorized, funded, or carried out by Federal agencies not jeopardize Federally threatened or endangered species or adversely modify designated critical habitat. To fulfill this mandate, Federal agencies (or their designated non-Federal representative) must consult with the Fish and Wildlife Service if they determine their project may affect listed species or critical habitat.

There are two approaches to evaluating the effects of a project on listed species.

Approach 1. Use the All-species Michigan determination key in IPaC. This tool can assist you in making determinations for listed species for some projects. In many cases, the determination key

will provide an automated concurrence that completes all or significant parts of the consultation process. Therefore, we strongly recommend screening your project with the **All-Species Michigan Determination Key (Dkey)**. For additional information on using IPaC and available Determination Keys, visit https://www.fws.gov/media/mifo-ipac-instructions (and click on the attachment). Please carefully review your Dkey output letter to determine whether additional steps are needed to complete the consultation process.

Approach 2. Evaluate the effects to listed species on your own without utilizing a determination key. Once you obtain your official species list, you are not required to continue in IPaC, although in most cases using a determination key should expedite your review. If the project is a Federal action, you should review our section 7 step-by-step instructions before making your determinations: https://www.fws.gov/office/midwest-region-headquarters/midwest-section-7-technical-assistance. If you evaluate the details of your project and conclude "no effect," document your findings, and your listed species review is complete; you do not need our concurrence on "no effect" determinations. If you cannot conclude "no effect," you should coordinate/consult with the Michigan Ecological Services Field Office. The preferred method for submitting your project description and effects determination (if concurrence is needed) is electronically to EastLansing@fws.gov. Please include a copy of this official species list with your request.

For all **wind energy projects** and **projects that include installing communications towers >450 feet that use guy wires**, please contact this field office directly for assistance, even if no Federally listed plants, animals or critical habitat are present within your proposed project area or may be affected by your proposed project.

Migratory Birds
Please see the "Migratory Birds" section below for important information regarding incorporating migratory birds into your project planning. Our Migratory Bird Program has developed recommendations, best practices, and other tools to help project proponents voluntarily reduce impacts to birds and their habitats. The Bald and Golden Eagle Protection Act prohibits the take and disturbance of eagles without a permit. If your project is near an eagle nest or winter roost area, see our Eagle Permits website at https://www.fws.gov/program/eagle-management/eagle-permits to help you avoid impacting eagles or determine if a permit may be necessary.

Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/partner/council-conservation-migratory-birds.

We appreciate your consideration of threatened and endangered species during your project

planning. Please include a copy of this letter with any request for consultation or correspondence about your project that you submit to our office.

- Wetlands

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Michigan Ecological Services Field Office
2651 Coolidge Road Suite 101
East Lansing, MI 48823-6360
(517) 351-2555

PROJECT SUMMARY

Project Code: 2024-0036384
Project Name: Grand rapids whitewater lower reach
Project Type: Restoration / Enhancement of Waterbody
Project Description: Direct impact areas extend from 300 ft above Dam 4 to Fulton Street bridge. Causeways will be constructed for equipment to remove existing low head dams and create riffles and drop structures. Indirect impact areas extend upstream to the 6th street dam and downstream to the mouth of Plaster Creek. Construction would like to begin in September 2024 and will likely extend thru 2025. Construction equipment will be staged at Ah-nab-awen park.

Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@42.9618622,-85.67743905554654,14z

Counties: Kent County, Michigan

ENDANGERED SPECIES ACT SPECIES

There is a total of 8 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Note that 1 of these species should be considered only under certain conditions.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

MAMMALS

NAME	STATUS
Indiana Bat *Myotis sodalis* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/5949 General project design guidelines: https://ipac.ecosphere.fws.gov/project/OCKXVTBBYBEV5P5UBNVETDRRT4/documents/generated/6982.pdf	Endangered
Northern Long-eared Bat *Myotis septentrionalis* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/9045	Endangered
Tricolored Bat *Perimyotis subflavus* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/10515	Proposed Endangered

BIRDS

NAME	STATUS
Whooping Crane *Grus americana* Population: U.S.A. (AL, AR, CO, FL, GA, ID, IL, IN, IA, KY, LA, MI, MN, MS, MO, NC, NM, OH, SC, TN, UT, VA, WI, WV, western half of WY) No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/758	Experimental Population, Non-Essential

REPTILES

NAME	STATUS
Eastern Massasauga (=rattlesnake) *Sistrurus catenatus*	Threatened

No critical habitat has been designated for this species.
This species only needs to be considered under the following conditions:
- For all Projects: Project is within EMR Range

Species profile: https://ecos.fws.gov/ecp/species/2202
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/OCKXVTBBYBEV5P5UBNVETDRRT4/documents/generated/5280.pdf

CLAMS

NAME	STATUS
Snuffbox Mussel *Epioblasma triquetra*	Endangered

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/4135

INSECTS

NAME	STATUS
Karner Blue Butterfly *Lycaeides melissa samuelis*	Endangered

There is **proposed** critical habitat for this species.
Species profile: https://ecos.fws.gov/ecp/species/6656

Monarch Butterfly *Danaus plexippus*	Candidate

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/9743

CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

USFWS NATIONAL WILDLIFE REFUGE LANDS AND FISH HATCHERIES

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS OR FISH HATCHERIES WITHIN YOUR PROJECT AREA.

BALD & GOLDEN EAGLES

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act[1] and the Migratory Bird Treaty Act[2].

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats[3], should follow appropriate regulations and consider implementing appropriate conservation measures, as described in the links below. Specifically, please review the "Supplemental Information on Migratory Birds and Eagles".

---

1. The Bald and Golden Eagle Protection Act of 1940.
2. The Migratory Birds Treaty Act of 1918.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

There are bald and/or golden eagles in your project area.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, see the PROBABILITY OF PRESENCE SUMMARY below to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Bald Eagle *Haliaeetus leucocephalus* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Dec 1 to Aug 31

PROBABILITY OF PRESENCE SUMMARY

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read "Supplemental Information on Migratory Birds and Eagles", specifically the FAQ section titled "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (▪)

Green bars; the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during that week of the year.

Breeding Season (▪)
Yellow bars; liberal estimate of the timeframe inside which the bird breeds across its entire range.

Survey Effort (|)

Vertical black lines; the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

WETLANDS

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

In Reply Refer To: January 15, 2024
Project code: 2024-0036384
Project Name: Grand rapids whitewater lower reach

Subject: Consistency letter for 'Grand rapids whitewater lower reach' for specified federally threatened and endangered species and designated critical habitat that may occur in your proposed project area consistent with the Michigan Determination Key for project review and guidance for federally listed species (Michigan Dkey).

Dear Heidi Dunn:

The U.S. Fish and Wildlife Service (Service) received on **January 15, 2024** your effect determination(s) for the 'Grand rapids whitewater lower reach' (the Action) using the Michigan DKey within the Information for Planning and Consultation (IPaC) system. The Service developed this system in accordance with the Endangered Species Act of 1973 (ESA) (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.).

Based on your answers and the assistance of the Service's Michigan DKey, you made the following effect determination(s) for the proposed Action:

Species	**Listing Status**	**Determination**
Eastern Massasauga (=rattlesnake) (*Sistrurus catenatus*)	Threatened	May affect
Indiana Bat (*Myotis sodalis*)	Endangered	No effect
Karner Blue Butterfly (*Lycaeides melissa samuelis*)	Endangered	No effect
Monarch Butterfly (*Danaus plexippus*)	Candidate	No effect
Northern Long-eared Bat (*Myotis septentrionalis*)	Endangered	No effect
Snuffbox Mussel (*Epioblasma triquetra*)	Endangered	May affect
Tricolored Bat (*Perimyotis subflavus*)	Proposed Endangered	No effect
Whooping Crane (*Grus americana*)	Experimental Population, Non-Essential	No effect

Please carefully review this letter. Your Endangered Species Act requirements are not complete.

Eastern Massasauga (EMR):
EMR may be present in the Action area. The following projects are not within the scope of the Michigan DKey: prescribed fire; new roads or trails that create a permanent barrier to EMR movement; projects that alter hydrology permanently, or temporarily if during the inactive season; projects that are large in scale; and projects that do not apply recommended conservation measures. Project-specific review is needed for these types of projects. **Please coordinate with the Michigan Ecological Services Field Office to further evaluate effects of the Action on EMR.**

Freshwater Mussels:
Federally listed mussels may be present in the Action area. Projects may affect listed mussels if they may permanently affect local hydrology, directly impact a Group 3 stream[1] (e.g., stream/road crossings, new stormwater outfall discharge, dams, other in-stream work, etc.), and/or indirectly impact a Group 3 stream or riparian zone (e.g., cut and fill, horizontal directional drilling, construction, vegetation removal, discharge, etc.). **Please coordinate with the Michigan Ecological Services Field Office to further evaluate effects of the Action on Federally listed mussels.**

Freshwater mussels are one of the most critically imperiled groups of organisms in the world. In North America, 65% of the remaining 300 species are vulnerable to extinction (Haag and Williams 2014). Implementing measures to conserve and restore freshwater mussel populations directly improves water quality in lakes, rivers, and streams throughout Michigan. An adult freshwater mussel filters anywhere from 1 to 38 gallons of water per day (Baker and Levinton 2003, Barnhart pers. comm. 2019). A 2015 survey found that in some areas mussels can reduce the bacterial populations by more than 85% (Othman et al. 2015 in Vaughn 2017). Mussels are also considered to be ecosystem engineers, stabilizing substrate and providing habitat for other aquatic organisms (Vaughn 2017). In addition to ecosystem services, mussels play an important role in the food web, contributing critical nutrients to both terrestrial and aquatic habitats, including those that support sport fish (Vaughn 2017). Taking proactive measures to conserve and restore freshwater mussels will improve water quality, which has the potential to positively impact human health and recreation in the State of Michigan.

---

[1]The Group 3 is a specific list of stream segments within known counties that contain habitat likely to be occupied by listed mussels (see Michigan Freshwater Mussel Survey Protocol and Relocation Procedures for additional information).

Bald and Golden Eagles:
Bald eagles, golden eagles, and their nests are protected under the Bald and Golden Eagle Protection Act (54 Stat. 250, as amended, 16 U.S.C. 668a-d) (Eagle Act). The Eagle Act prohibits, except when authorized by an Eagle Act permit, the “taking” of bald and golden eagles and defines “take” as “pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb.” The Eagle Act’s implementing regulations define disturb as “…to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, (1) injury to an eagle, (2) a decrease in its productivity, by substantially

interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

If the Action may impact bald or golden eagles, additional coordination with the Service under the Eagle Act may be required. For more information on eagles and conducting activities in the vicinity of an eagle nest, please visit https://www.fws.gov/library/collections/all-about-eagles. In addition, the Service developed the National Bald Eagle Management Guidelines (May 2007) in order to assist landowners in avoiding the disturbance of bald eagles. The full Guidelines are available at https://www.fws.gov/media/national-bald-eagle-management-guidelines-0.

If you have further questions regarding potential impacts to eagles, please contact Chris Mensing, Chris_Mensing@fws.gov or 517-351-2555.

Monarch butterfly and other pollinators
In December 2020, after an extensive status assessment of the monarch butterfly, we determined that listing the monarch under the Endangered Species Act is warranted but precluded by higher priority actions to amend the Lists of Endangered and Threatened Wildlife and Plants. Therefore, the Service added the monarch butterfly to the candidate list. The Service will review its status each year until we are able to begin developing a proposal to list the monarch.

The Endangered Species Act does not establish protections or consultation requirements for candidate species. Some Federal and State agencies may have policy requirements to consider candidate species in planning. We encourage implementing measures that will remove or reduce threats to these species and possibly make listing unnecessary.

For all projects, we recommend the following best management practices (BMPs) to benefit monarch and other pollinators.

Monarch and Pollinator BMP Recommendations

Consider monarch and other pollinators in your project planning when possible. Many pollinators are declining, including species that pollinate key agricultural crops and help maintain natural plant communities. Planting a diverse group of native plant species will help support the nutritional needs of Michigan's pollinators. We recommend a mix of flowering trees, shrubs, and herbaceous plants so that something is always blooming and pollen is available during the active periods of the pollinators, roughly early spring through fall (mid-March to mid-October). To benefit a wide variety of pollinators, choose a wide range of flowers with diverse colors, heights, structure, and flower shape. It is important to provide host plants for any known butterfly species at your site, including native milkweed for Monarch butterfly. Incorporating a water source (e.g., ephemeral pool or low area) and basking areas (rocks or bare ground) will provide additional resources for pollinators.

Many pollinators need a safe place to build their nests and overwinter. During spring and summer, leave some areas unmowed or minimize the impacts from mowing (e.g., decrease frequency, increase vegetation height). In fall, leave areas unraked and leave plant stems standing. Leave patches of bare soil for ground nesting pollinators.

Avoid or limit pesticide use. Pesticides can kill more than the target pest. Some pesticide residues can kill pollinators for several days after the pesticide is applied. Pesticides can also kill natural predators, which can lead to even worse pest problems.

Planting native wildflowers can also reduce the need to mow and water, improve bank stabilization by reducing erosion, and improve groundwater recharge and water quality.

Resources:

https://www.fws.gov/initiative/monarchs
https://www.fws.gov/library/collections/pollinators

Coordination with the Service is not complete if additional coordination is advised above for any species. Please email our office at MIFO_DKey@fws.gov and attach a copy of this letter, so we can discuss methods to avoid or minimize potential adverse effects to those species.

Summary of conservation measures for your project You agreed to the following conservation measures to avoid adverse effects to listed species and our concurrence is only valid if the measures are fully implemented. These must be included as permit conditions if a permit is required and/or included in any contract language.

Hydrologic changes
Any effects to hydrology will not result in a significant change in the elevation of surface water upstream or downstream or in the local groundwater (i.e., will not result in changes to elevations of more than 6 inches or result in inundation).

Karner blue butterfly
Avoid ground disturbance and use of chemicals in oak savannah habitat and wild lupine, if present.

The action will not include temporary or permanent lighting of roadway(s), facility(ies), and/or parking lot(s).

Action Description
You provided to IPaC the following name and description for the subject Action.

1. Name

Grand rapids whitewater lower reach

2. Description

The following description was provided for the project 'Grand rapids whitewater lower reach':

> Direct impact areas extend from 300 ft above Dam 4 to Fulton Street bridge. Causeways will be constructed for equipment to remove existing low head dams and create riffles and drop structures. Indirect impact areas extend upstream to the 6th street dam and downstream to the mouth of Plaster Creek. Construction would like to begin in September 2024 and will likely extend thru 2025. Construction equipment will be staged at Ah-nab-awen park.

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@42.9618622,-85.67743905554654,14z

QUALIFICATION INTERVIEW

1. Are there any possible effects to any listed species or to designated critical habitat from your project or effects from any other actions or projects subsequently made possible by your project?

   Select "Yes" even if the expected effects to the species or critical habitat are expected to be 1) extremely unlikely (discountable), 2) can't meaningfully be measured, detected, or evaluated (insignificant), or 3) wholly beneficial.

   Select "No" to confirm that the project details and supporting information allow you to conclude that listed species and their habitats will not be exposed to any effects (including discountable, insignificant, or beneficial effects) and therefore, you have made a "no effect" determination for all species. If you are unsure, select YES to answer additional questions about your project.

   Yes

2. This determination key is intended to assist the user in the evaluating the effects of their actions on Federally listed species in Michigan. It does not cover other prohibited activities under the Endangered Species Act (e.g., for wildlife: import/export, Interstate or foreign commerce, possession of illegally taken wildlife, purposeful take for scientific purposes or to enhance the survival of a species, etc.; for plants: import/export, reduce to possession, malicious destruction on Federal lands, commercial sale, etc.) or other statutes. Click yes to acknowledge that you must consider other prohibitions of the ESA or other statutes outside of this determination key.

   Yes

3. Is the action the approval of a long-term (i.e., in effect greater than 10 years) permit, plan, or other action? (e.g., a new or re-issued hydropower license, a land management plan, or other kinds of documents that provide direction for projects or actions that may be conducted over a long term (>10 years) without the need for additional section 7 consultation).

   No

4. Is the action being funded, authorized, or carried out by a Federal agency?

   Yes

5. Does the action involve the installation or operation of wind turbines?

   No

6. Are there at least 30 days prior to your action occurring? Endangered species consultation must be completed before taking any action that may have effects to listed species. The Service also needs 30 days to review projects before we can verify conclusions in some dkey output letters. For example, if you have already started some components of the project on the ground (e.g., removed vegetation) before completing this key, answer “no” to this question. The only exception is if you have a Michigan Field Office pre-approved emergence survey (i.e., if you have conducted pre-approved emergence surveys for listed bats before tree removal, you can still answer yes to this question).

   Yes

7. Does the action involve constructing a new communication tower or modifying an existing communications tower?

   No

8. Does the activity involve aerial or other large-scale application of any chemical (including insecticide, herbicide, etc.)?

   No

9. Does your project include water withdrawal (ground or surface water) greater than 10,000 gallons/day?

   No

10. Will your action permanently affect hydrology?

    Yes

11. Will your project have any direct impacts to a stream or river (e.g., Horizontal Directional Drilling (HDD), hydrostatic testing, stream/road crossings, new storm-water outfall discharge, dams, other in-stream work, etc.)?

    Yes

12. Does your project have the potential to indirectly impact the stream/river or the riparian zone (e.g., cut and fill, horizontal directional drilling, hydrostatic testing, construction, vegetation removal, discharge, etc.)?

    Yes

13. Are you applying for one of the following Michigan EGLE/Army Corps of Engineers joint permit application Minor Permit (MP) Categories:
MP 3 - Boat Hoist; MP 5 - Boal Wells; MP 7 - Completed Enforcement Actions; MP 12 - Dock;
MP 21 - Fish and Wildlife Habitat Structures;
MP 22 - Ford Stream Crossings for Commercial Forestry Operations;
MP 28 - Maintenance and Repair of Serviceable Structures;
MP 45 - Temporary Recreational Structures;
MP 48 - Wetland Habitat Restoration and Enhancement?

    Verify the MP category number and associated description matches your project/ application (https://www.michigan.gov/documents/egle/WRD-Minor-Project-Categories_733320_7.pdf). If you don't know what category applies for your project, answer no to this question.

    No

14. Are you applying for one of the following Michigan EGLE/Army Corps of Engineers joint permit application General Permit (GP) Categories:
GP A - Aids to Navigation;
GP C - Clear Span Bridge;
GP E - Culverts - Small;
GP J - Dry Fire Hydrant;
GP O - Minor Permit Revisions and Transfers;
GP Q - Mooring Buoy;
GP W - Scientific Measuring Devices;
GP X - Snow Road Stream Crossings for Forestry Operations;
GP Z - Spring Piles and Piling Clusters;
GP DD - Wetland Habitat Restoration and Enhancement?

    Verify the GP category number and associated description matches your project/ application (https://www.michigan.gov/documents/deq/wrd-general-permit-categories_555828_7.pdf). If you don't know what category applies for your project, answer no to this question.

    No

15. Will your action disturb the ground or existing vegetation? This includes any off road vehicle access, soil compaction, digging, seismic survey, directional drilling, heavy equipment, grading, trenching, placement of fill, pesticide application, vegetation management (including removal or maintenance using equipment or chemicals), cultivation, development, etc.

    No

16. Is the action a utility-scale solar development project?

    No

17. [Hidden semantic] Does the action intersect the MOBU AOI?

    Automatically answered
    Yes

18. Under the ESA, monarchs remain warranted but precluded by listing actions of higher priority. The monarch is a candidate for listing at this time. The Endangered Species Act does not establish protections or consultation requirements for candidate species. Some Federal and State agencies may have policy requirements to consider candidate species in planning. We encourage implementing measures that will remove or reduce threats to these species and possibly make listing unnecessary. If your project will have no effect on monarch butterflies (for example, if your project won't affect their habitat or individuals), then you can make a "no effect" determination for this project. Are you making a "no effect" determination for monarch?

    Yes

19. [Hidden Semantic] Does the action intersect the Eastern massasauga rattlesnake area of influence?

    Automatically answered
    Yes

20. In a previous answer in this key, you indicated your project will have permanent effects to hydrology. Will the hydrological impacts result in a significant change in the elevation of surface water upstream or downstream, or in the local groundwater elevations?

    A significant change is one where the elevations are expected to change more than 6 inches or result in inundation.

    Yes

21. [Semantic] Does the action area intersect the snuffbox area of influence?

    Automatically answered
    Yes

22. [Hidden Semantic] Does the action intersect the Karner blue butterfly area of influence?

    Automatically answered
    Yes

23. Will the action occur in oak savanna, oak or pine barrens, openings within oak forest, old fields in association with oak forest, or openings or rights-of-way with abundant native grasses and wildflowers?

    Yes

24. Is the larval host plant, wild lupine, present on site? If unsure, select YES.

    No

25. [Hidden Semantic] Does the action area intersect the whooping crane (ex. Pop) area of influence?

    Automatically answered
    Yes

26. Have you determined that the action will have no effect on individuals within the whooping crane nonessential experimental population (NEP)?

    Yes

27. The project has the potential to affect federally listed bats. Does the action area contain any known or potential bat hibernacula (natural caves, abandoned mines, or underground quarries)?

    No

28. Has a presence/absence bat survey or field-based habitat assessment following the Service's Range-wide Indiana Bat and Northern Long-eared Bat Summer Survey Guidelines been conducted within the action area?

    No

29. Does the action involve removal/modification of a human structure (barn, house or other building) known to contain roosting bats?

    No

30. Does the action include removal/modification of an existing bridge or culvert?

    No

31. Does the action include temporary or permanent lighting of roadway(s), facility(ies), and/or parking lot(s)?

    No

32. Does the action include one or more of the following: (1) tree cutting/trimming, (2) prescribed fire, (3) pesticide (including insecticide and/or rodenticide), and/or (4) herbicide/fungicide application?

    No

33. [Hidden Semantic] Does the action area intersect the Indiana bat AOI?

    Automatically answered
    Yes

34. [Hidden Semantic] Does this project intersect the northern long-eared bat area of influence?

    Automatically answered
    Yes

35. [Hidden semantic] Does the action intersect the Tricolored bat AOI/SLA/range?

    Automatically answered
    Yes

36. The tricolored bat was proposed for listing as endangered on September 13, 2022. In Michigan, the tricolored bat was rare pre-white nose syndrome (WNS) and is exceedingly rare post-WNS. The species has been observed in 12 Michigan counties to date, largely during the fall or winter. With very few exceptions, the species has not been observed in Michigan in the summer months, and no maternity colonies have been found. During winter, tricolored bats hibernate in caves, abandoned mines, and abandoned tunnels ranging from small to large in size. During spring, summer and fall months, they roost primarily among leaf clusters of live or recently dead deciduous/hardwood trees.

    Are you making a no effect determination on this project for the tricolored bat?

    Yes

Re: Rare Species Review #3507 – Canal Park and Ah-Nab-Awen Park Improvements

Hello:

The location for the proposed project was checked against known localities for rare species and unique natural features, which are recorded in the Michigan Natural Features Inventory (MNFI) natural heritage database. This continuously updated database is a comprehensive source of existing data on Michigan's endangered, threatened, or otherwise significant plant and animal species, natural plant communities, and other natural features. Records in the database indicate that a qualified observer has documented the presence of special natural features. The absence of records in the database for a particular site may mean that the site has not been surveyed. The only way to obtain a definitive statement on the status of natural features is to have a competent biologist perform a complete field survey.

Under Act 451 of 1994, the Natural Resources and Environmental Protection Act, Part 365, Endangered Species Protection, "a person shall not take, possess, transport, …fish, plants, and wildlife indigenous to the state and determined to be endangered or threatened," unless first receiving an Endangered Species Permit from the Michigan Department of Natural Resources (MDNR), Wildlife Division. Responsibility to protect endangered and threatened species is not limited to the lists below. Other species may be present that have not been recorded in the database.

Several at-risk species and/or natural communities have been documented within 1 mile of the project location and it is possible that adverse impacts will occur. This response reflects a desktop review of the database and MNFI cannot fully evaluate this project without visiting the area. MNFI offers several levels of Rare Species Reviews, including field surveys which I would be happy to discuss with you.

Sincerely,

Michael Sanders

Michael Sanders
Environmental Review Specialist/Zoologist

MSU is an affirmative-action, equal-opportunity employer.

Comments for Rare Species Review #3507:
It is important to note that it is the applicant's responsibility to comply with both state and federal threatened and endangered species legislation. Therefore, if a state listed species occurs at a project site, and you think you need an endangered species permit please contact: Casey Reitz, DNR-Wildlife Division, 517-284-6210, or ReitzC@michigan.gov. If a federally listed species is involved and, you think a permit is needed, please contact Jessica Pruden, U.S. Fish and Wildlife Service, East Lansing office, 517-351-8316, or Jessica_Pruden@fws.gov.

NOTE: special concern species and natural communities are not protected under endangered species legislation, but efforts should be taken to minimize any or all impacts. Please consult MNFI's Rare Species Explorer for additional information on Michigan's rare plants and animals.

NOTE: Michigan rivers and streams have been grouped according to existing information of mussel distribution and individual species conservation status. The Mussel Protocol Stream Groups are designed to document the **potential** presence or absence of state or federally listed mussel species. The layer was created by modeling the habitat suitability for each mussel species and may not correspond directly with a documented location for a listed mussel. A segment may be predicted as suitable for a number of mussel species, so the stream group number was assigned to the most restrictive of the potential mussel species present.

This stretch of the **Grand River** is designated a Group 3 mussel stream which means that federally threatened and endangered mussel species may occur here and that certain surveys and possibly relocation procedures apply. I encourage you to read the ***Michigan Freshwater Mussel Survey Protocols and Relocation Procedures*** publication if in-stream work and/or land clearing activities occur that result in streambed disturbance and erosion and sedimentation into the river. A copy of the publication is being provided to you in this mailing.

	tuberculata	wartyback							

Comments for Table 1:

River redhorse (*Moxostoma carinatum*)

Habitat

Known to occur in the Grand River, river redhorse prefer medium to large rocky rivers with moderate to strong currents. They are most often associated with long, deep run habitats between 0.3 and 3 m deep. This species requires clear, unpolluted waters and is intolerant of silt and turbidity.

Management Recommendations

Maintaining or establishing vegetated riparian buffers will help protect this species habitat. These are wide-ranging species, hence maintaining or establishing river connectivity is also important to this species, especially for spawning migrations.

For more information, see the *Moxostoma carinatum* species page on the MNFI website.

Black sandshell (*Ligumia recta*)

Habitat

Known to occur in the Grand River, the black sandshell most commonly occupies rivers with strong currents and lakes with a firm substrate of gravel or sand (Watters et al. 2009).

Management Recommendations

Maintaining healthy populations of black sandshell's host fish species and open water conditions to facilitate their movement, will benefit this species. As all unionid species are vulnerable to pollutants and heavy metals, reducing point and non-point source water pollution is a priority. Black sandshell in particular has shown extreme sensitivity to copper and cadmium (Pip 1995), which is commonly introduced to aquatic systems through pesticide/herbicide applications, industrial waste, urban runoff, and mine drainage (Grabarkiewicz and Davis 2008). Alteration of habitat through river impoundment, dredging, bridge construction, and dam removal pose a threat to all native mussels, and monitoring and mitigation measures should be planned for prior to such activities taking place. Efforts to control the spread of zebra mussels, such as cleaning boat hulls, trailers, and scuba and fishing gear before traveling between bodies of water, are necessary for the conservation of this species.

For more information, see the *Ligumia recta* species page on the MNFI website.

Scaleshell (*Leptodea leptodon*)

Habitat

Known to occur in the Grand River, the scaleshell occurs in riffle areas of clean, clear medium to large rivers. They are associated with strong currents and substrates of mud and sand, or mixtures of gravel, cobble, and boulder.

Management Recommendations

The species is severely impacted by alteration and inundation of channels, siltation from agriculture and clear-cutting, chemical and organic pollution. Habitat loss caused by degradation from construction activities and intensive land use also threatens the scaleshell mussel. Also impacted by exotic zebra mussels. Maintenance or establishment of vegetated riparian buffers can help protect mussel habitats from many of their threats. Control of zebra mussels is critical to preserving native mussels. And as with all mussels, protection of their hosts habitat is also crucial.

For more information, see the *Leptodea leptodon* species page on the MNFI website.

Snuffbox (*Epioblasma triquetra*)

Habitat

Known to occur in the Grand River, the snuffbox inhabits sand, gravel, or cobble substrates in swift small and medium-sized rivers. Individuals are often buried deep in the sediment.

Management Recommendations

The Snuffbox mussel is sensitive to river impoundment, siltation and disturbance, due to its requirement for clean, swift current and relative immobility as an adult. In order to maintain the current populations in Michigan, rivers need to be protected to reduce silt loading and run-off. Maintaining or establishing vegetated riparian buffers can aid in controlling many of the threats to mussels. Control of zebra mussels is critical to preserving native mussels. And as with all mussels, protection of their hosts habitat is also crucial. Because the life cycle of the snuffbox is inherently linked with that of the logperch in Michigan, conservation and management of this fish species is needed to insure that of the Snuffbox.

For more information, see the *Epioblasma triquetra* species page on the MNFI website.

Purple wartyback (*Cyclonaias tuberculata*)

Habitat

Known to occur in the Grand River, the Purple wartyback is found in medium to large rivers with gravel or mixed sand and gravel substrates.

Management Recommendations

Like other mussels, threats are varied and include: habitat degradation, poor water quality, flow alterations, water temperature changes, heavy metals, organic pollution, sedimentation, and siltation. Maintenance or establishment of vegetated riparian buffers can help protect mussel habitats from many of these threats. Control of zebra mussels is critical to preserving native mussels. As with all mussels, fish host requirements also need to be considered.

For more information, see the *Cyclonaias tuberculata* species page on the MNFI website.

Slippershell (*Alasmidonta viridis*)

Habitat

Known to occur in the Grand River, the slippershell typically occurs in creeks and headwaters of rivers in sand or gravel substrates. Occasionally, they occur in larger rivers and lakes and in mud substrates.

Management Recommendations

The slippershell requires clear, clean water and substrates for survival. Like other mussels, threats include: siltation, poor water quality, point and non-point source pollution, and alteration of natural flow regimes. Maintenance or establishment of vegetated riparian buffers can help protect mussel habitats from these threats. Additionally, zebra mussels and other exotic species are a major threat to all mussels. Hence, control and management of exotic species also help protect native mussel species. And as with all mussels, protection of their hosts habitat is also crucial.

For more information, see the *Alasmidonta viridis* species page on the MNFI website.

Table 2: Occurrences of Special Concern Species within 1 mile of Project Site

Animal	*Moxostoma duquesnei*	Black Redhorse		SC	G5	S2	E	2007-06	2018-07-10

Comments for Table 2:

Black redhorse (*Moxostoma duquesnei*)

Habitat

Known to occur in the Grand River, the black redhorse inhabits swift flowing areas in medium- to large-sized rivers with clear water and sand, gravel, and rock substrates. Black redhorse is less tolerant of turbid water, low gradient rivers, and siltation than golden redhorse. Young black redhorse feed in schools near emergent aquatic vegetation by the edge of pools. Adults typically feed in schools just upstream or downstream of riffles. This fish eats microcrustaceans, aquatic insects, detritus, and algae. Eggs are buried in a substrate of fine rubble, sand, and gravel in water 15 to 60 cm deep, typically at the upstream or downstream end of a riffle. Black redhorse spawn when water temperatures reach 13 to 17°C (55-62°F).

Management Recommendations

Maintaining and creating riparian buffers along rivers is an important method of mitigating non-point source impacts such as excessive sedimentation and turbidity. Black redhorse are very sensitive to these impacts because many species of microcrustaceans and aquatic insects they rely on for food require clean water and substrates. Avoiding impacts to headwater streams and wetlands benefits all downstream habitats and species like black redhorse that rely on clear water and river substrates. Black redhorse populations are particularly vulnerable to the loss of habitat used by young-of-the-year fish, given current levels of habitat availability. The blockage of migratory routes by dams and reservoirs with degraded tailwater habitats have contributed to the decline of black redhorse populations in the U.S. Remove barriers to fish migration such as dams that are no longer functioning and/or are not economically viable, and restore natural river flow to impounded areas.

For more information, see the *Moxostoma duquesnei* species page on the MNFI website.

Elktoe (*Alasmidonta marginata*)

Habitat

Known to occur in the Grand River, the Elktoe is found in small to large sized streams and small to medium rivers. It is a riffle species, preferring swifter currents over packed sand and gravel substrates. The Elktoe is typically only found in clean, clear water (Cummings and Mayer 1992).

Management Recommendations

The elktoe needs clean, fast-flowing water to survive. Therefore, changes to its habitat, such as river impoundment, siltation and channel disturbances, including dredging, negatively affect this species. Pollution from point (industrial and residential discharge) and non-point (siltation, herbicide and surface run-off) sources is also a threat to mussels and should be limited and monitored to insure compliance with the Clean Water Act. Control of zebra mussels is critical to preserving native mussels. It is essential to

protect not only the habitat of the elktoe, but also the white sucker, northern hog sucker, shorthead redhorse, rockbass and warmouth, as they serve as hosts for the glochidia.

For more information, see the *Alasmidonta marginata* species page on the MNFI website.

Codes to accompany table

State Protection Status Code Definitions (SPROT)
E = Endangered
T = Threatened
SC = Special concern

Federal Protection Status Code Definitions (USESA)
LE = listed endangered
LT = listed threatened
LELT = partly listed endangered and partly listed threatened
PDL = proposed delist
E(S/A) = endangered based on similarities/appearance
PS = partial status (federally listed in only part of its range)
C = species being considered for federal status

Global Heritage Status Rank Definitions (GRANK)
The priority assigned by NatureServe's national office for data collection and protection based upon the element's status throughout its entire world-wide range. Criteria not based only on number of occurrences; other critical factors also apply. Note that ranks are frequently combined.
G1 = critically imperiled globally because of extreme rarity (5 or fewer occurrences range-wide or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extinction.
G2 = imperiled globally because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extinction throughout its range.
G3 = Either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range (e.g. a single western state, a physiographic region in the East) or because of other factor(s) making it vulnerable to extinction throughout its range; in terms of occurrences, in the range of 21 to 100.
G4 = Apparently secure globally, though it may be quite rare in parts of its range, especially at the periphery.
G5 = Demonstrably secure globally, though it may be quite rare in parts of its range, especially at the periphery.
Q = Taxonomy uncertain

State Heritage Status Rank Definitions (SRANK)
The priority assigned by the Michigan Natural Features Inventory for data collection and protection based upon the element's status within the state. Criteria not based only on number of occurrences; other critical factors also apply. Note that ranks are frequently combined.
S1 = Critically imperiled in the state because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extirpation in the state.
S2 = Imperiled in state because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extirpation from the state.
S3 = Rare or uncommon in state (on the order of 21 to 100 occurrences). S4 = apparently secure in state, with many occurrences.
S5 = demonstrably secure in state and essentially ineradicable under present conditions.
SX = apparently extirpated from state.

EO Rank Codes

Element Occurrence (EO) ranks refer to the viability or ecological integrity of the occurrence; they provide an assessment of the likelihood that if current conditions prevail the EO will persist for a defined period of time, typically 20-100 years.

A - Excellent estimated viability/ecological integrity
A? - Possibly excellent estimated viability/ecological integrity
AB - Excellent or good estimated viability/ecological integrity
AC - Excellent, good, or fair estimated viability/ecological integrity
B - Good estimated viability/ecological integrity
B? - Possibly good estimated viability/ecological integrity
BC - Good or fair estimated viability/ecological integrity
BD - Good, fair, or poor estimated viability/ecological integrity
C - Fair estimated viability/ecological integrity
C? - Possibly fair estimated viability/ecological integrity
CD - Fair or poor estimated viability/ecological integrity
D - Poor estimated viability/ecological integrity
D? - Possibly poor estimated viability/ecological integrity
E - Verified extant (viability/ecological integrity not assessed)
F - Failed to find
F? - Possibly failed to find
H - Historical
H? - Possibly historical
X - Extirpated
X? - Possibly extirpated
U - Unrankable
NR - Not ranked

CALL 811 FOR MISS DIG

FOR PROTECTION OF UNDERGROUND UTILITIES AND IN CONFORMANCE WITH PUBLIC ACT 53, 1974, THE CONTRACTOR SHALL CALL 811 A MINIMUM OF THREE (3) FULL WORKING DAYS (EXCLUDING SATURDAYS, SUNDAYS AND HOLIDAYS) PRIOR TO EXCAVATING IN THE VICINITY OF UTILITY LINES. ALL "MISS DIG" PARTICIPATING MEMBERS WILL THUS BE ROUTINELY NOTIFIED. THIS DOES NOT RELIEVE THE CONTRACTOR OF THE RESPONSIBILITY OF NOTIFYING UTILITY OWNERS WHO MAY NOT BE A PART OF THE "MISS DIG" ALERT SYSTEM.

GENERAL NOTES

1. MATERIALS AND WORKMANSHIP SHALL BE IN ACCORDANCE WITH THE 1993 EDITION OF THE CITY OF GRAND RAPIDS STANDARD CONSTRUCTION SPECIFICATIONS, EXCEPT AS OTHERWISE INDICATED ON THESE PLANS OR IN THE SUPPLEMENTAL SPECIAL SPECIFICATIONS.
2. IF A WATER SERVICE (COPPER, LEAD OR OTHERWISE) IS DISTURBED, DAMAGED, RELOCATED OR REPLACED FROM THE WATER MAIN TO THE CURB STOP, WHETHER PLANNED OR UNINTENTIONAL, THE CONTRACTOR IS TO HAVE THE SERVICE MATERIAL VERIFIED FROM THE MAIN TO THE METER. IF ANY PORTION IS FOUND TO BE LEAD, THEN THE CONTRACTOR MUST HAVE THE LEAD REPLACED WITH A COPPER WATER SERVICE. ALL WATER SERVICE REPLACEMENTS MUST BE COMPLETED BY A REGISTERED UNDERGROUND CONTRACTOR. IF THE REPLACEMENT INVOLVES WORK ON PRIVATE PROPERTY, THE CONTRACTOR IS TO CONTACT THE ENGINEER IMMEDIATELY TO OBTAIN PERMISSIONS FOR THE SERVICE TO BE REPLACED BY CITY OF GRAND RAPIDS UNDERGROUND CONTRACTORS ON TERM CONTRACT FOR LEAD SERVICE REPLACEMENT. THE CONTRACTOR WILL REIMBURSE THE CITY FOR THIS COST.

GPF No. 5315

Sheet No. 5 of 32 G04

MICHIGAN UNIFIED KEYING SYSTEM SOIL EROSION & SEDIMENTATION CONTROL MEASURES

✳ INDICATES APPLICABILITY OF A SPECIFIC CONTROL MEASURE TO ONE OR MORE OF THE SEVEN PROBLEM AREAS

KEY	DETAIL	CHARACTERISTICS	SLOPES A	STREAMS AND WATERWAYS B	SURFACE DRAINAGEWAYS C	ENCLOSED DRAINAGE (Inlet & Outlet Control) D	LARGE FLAT SURFACE AREAS E	BORROW AND STOCKPILE AREAS F	ADJACENT PROPERTIES G
1	Dust Control – No Detail –	DUST CONTROL APPLICATIONS CAN INCLUDE WATERING, CHEMICAL DUST SUPPRESSION, GRAVEL OR ASPHALT SURFACING, TEMPORARY AGGREGATE COVER AND HAUL TRUCK COVERS	✳				✳	✳	
2	Selective Grading & Shaping	WATER CAN BE DIVERTED TO MINIMIZE EROSION FLATTER SLOPES EASE EROSION PROBLEMS	✳				✳	✳	✳
3	Grubbing Omitted	SAVES COST OF GRUBBING, PROVIDES NEW SPROUTS RETAINS EXISTING ROOT MAT SYSTEM, REDUCES WIND FALL AT NEW FOREST EDGE. DISCOURAGES EQUIPMENT ENTRANCE	✳				✳		✳
4	Vegetative Stabilization	MAY UTILIZE A VARIETY OF PLANT MATERIAL STABILIZES SOIL SLOWS RUNOFF VELOCITY FILTERS SEDIMENT FROM RUNOFF	✳	✳	✳		✳	✳	✳
5	AVAILABLE DETAIL								
6	Sodding with Mesh Blanket and/or Matting	FACILITATES ESTABLISHMENT OF VEGETATIVE COVER EFFECTIVE FOR DRAINAGEWAYS WITH LOW VELOCITY EASILY PLACED IN SMALL QUANTITIES BY INEXPERIENCED PERSONNEL SHOULD INCLUDE PREPARED TOPSOIL BED	✳		✳			✳	✳
7	AVAILABLE DETAIL								
8	Sodding	PROVIDES IMMEDIATE PROTECTION CAN BE USED ON STEEP SLOPES WHERE SEED MAY BE DIFFICULT TO ESTABLISH. EASY TO PLACE, MAY BE REPAIRED IF DAMAGED SHOULD INCLUDE PREPARED TOPSOIL BED	✳		✳		✳	✳	✳
9	Vegetative Buffer Strip	SLOWS RUNOFF VELOCITY FILTERS SEDIMENT FROM RUNOFF REDUCES VOLUME OF RUNOFF ON SLOPES	✳	✳					✳
10	Mulching	USED ALONE TO PROTECT EXPOSED AREAS FOR SHORT PERIODS PROTECTS SOIL FROM IMPACT OF FALLING RAIN PRESERVES SOIL MOISTURE AND PROTECTS GERMINATING SEED FROM TEMPERATURE EXTREMES	✳				✳	✳	
11	Roughened Surface	REDUCES VELOCITY AND INCREASES INFILTRATION RATES COLLECTS SEDIMENT HOLDS WATER, SAND AND MULCH BETTER THAN SMOOTH SURFACES	✳				✳		
12	AVAILABLE DETAIL								
13	Riprap, Rubble, Gabions	USED WHERE VEGETATION IS NOT EASILY ESTABLISHED EFFECTIVE FOR HIGH VELOCITIES OR IRON CONCENTRATIONS PERMITS RUNOFF TO INFILTRATE SOIL DISSIPATES ENERGY FLOW AT SYSTEM OUTLETS	✳	✳	✳				
14	AVAILABLE DETAIL								
15	AVAILABLE DETAIL								
16	AVAILABLE DETAIL								
17	Benches	REDUCES RUNOFF VELOCITY BY REDUCING EFFECTIVE SLOPE LENGTH COLLECTS SEDIMENT. PROVIDES ACCESS TO SLOPES FOR SEEDING, MULCHING AND MAINTENANCE	✳					✳	
18	Earth Diversion Berm	DIVERTS WATER FROM VULNERABLE AREAS COLLECTS AND DIRECTS WATER TO PREPARED DRAINAGEWAYS MAY BE PLACED AS PART OF NORMAL CONSTRUCTION OPERATION	✳					✳	✳
18A	Earth Diversion Berm With Stone Outlet at Inlet	DIVERTS WATER FROM VULNERABLE AREAS COLLECTS AND DIRECTS WATER TO PREPARED DRAINAGEWAYS MAY BE PLACED AS PART OF NORMAL CONSTRUCTION OPERATION	✳					✳	✳
19	Diversion Ditch	COLLECTS AND DIVERTS WATER TO REDUCE EROSION POTENTIAL MAY BE INCORPORATED IN PERMANENT PROJECT DRAINAGE SYSTEMS	✳					✳	✳
20	Diversion Berm & Ditch	DIVERTS WATER TO A PREPARED DRAINAGEWAY MAY BE USED AT INTERVALS ACROSS SLOPE FACE TO REDUCE EFFECTIVE SLOPE LENGTH	✳					✳	✳
21	Stone Filter Berm	CONSTRUCTED OF GRAVEL OR STONE INTERCEPTS AND DIVERTS RUNOFF TO STABILIZED AREAS OR PREPARED DRAINAGE SYSTEMS SLOWS RUNOFF AND COLLECTS SEDIMENT	✳	✳					✳
21A	Stone Filter Berm with Silt Fence	CONSTRUCTED OF GRAVEL OR STONE INTERCEPTS AND DIVERTS RUNOFF TO STABILIZED AREAS OR PREPARED DRAINAGE SYSTEMS SLOWS RUNOFF AND COLLECTS SEDIMENT – SILT FENCE PREVENTS EROSION AROUND SPILLWAY	✳	✳					✳
22	AVAILABLE DETAIL								
23	AVAILABLE DETAIL								
24	Grassed Waterway	MUCH MORE STABLE FORM OF DRAINAGEWAY THAN BARE CHANNEL GRASS TENDS TO SLOW RUNOFF AND FILTER OUT SEDIMENT USED WHERE BARE CHANNEL WOULD BE ERODED			✳				
25	Slope Drain (Surface Pipe)	PREVENTS EROSION ON SLOPES WHEN RUNOFF CANNOT BE DIVERTED TO EDGES OF SLOPE AREA. USUALLY TEMPORARY CAN BE CONSTRUCTED OR EXTENDED AS GRADING PROGRESSES	✳						✳
26	Slope Drain – Paved Chute/Flume	PREVENTS EROSION ON SLOPES WHEN RUNOFF CANNOT BE DIVERTED TO EDGE OF SLOPE AREA. USUALLY PERMANENT CAN BE CONSTRUCTED OR EXTENDED AS GRADING PROGRESSES	✳						✳
27	Slope Drain (Subsurface Pipe)	PREVENTS EROSION ON SLOPES WHEN RUNOFF CANNOT BE DIVERTED TO EDGE OF SLOPE AREA. USUALLY PERMANENT CAN BE CONSTRUCTED AS GRADING PROGRESSES	✳						✳
28	Drop Spillway	SLOWS VELOCITY OF FLOW, REDUCING EROSIVE CAPACITY		✳	✳				
29	Pipe Drop	REDUCES RUNOFF VELOCITY REMOVES SEDIMENT AND TURBIDITY CAN BE DESIGNED TO HANDLE LARGE VOLUMES OF FLOW			✳				
30	Pipe Spillway	REMOVES SEDIMENT AND TURBIDITY FROM RUNOFF MAY BE PART OF PERMANENT EROSION CONTROL PLAN			✳				
31	Energy Dissipator	SLOWS RUNOFF VELOCITY TO NON-EROSIVE LEVEL PERMITS SEDIMENT COLLECTION FROM RUNOFF	✳		✳	✳			
32	Level Spreader	CONVERTS COLLECTED CHANNEL OR PIPE FLOW BACK TO SHEET FLOW AVOIDS CHANNEL EASEMENTS AND CONSTRUCTION OFF PROJECT SITE SIMPLE TO CONSTRUCT			✳				
33	Sediment Trap	MAY BE CONSTRUCTED OF A VARIETY OF MATERIALS TRAPS SEDIMENT AND REDUCES VELOCITY OF FLOW CAN BE CLEANED AND EXPANDED AS NEEDED			✳				
34	Sediment Basin	TRAPS SEDIMENT RELEASES RUNOFF AT NON-EROSIVE RATES CONTROLS RUNOFF AT SYSTEM OUTLETS CAN BE VISUAL AMENITIES			✳	✳			
35	AVAILABLE DETAIL								
36	Catch Basin Inlet Protection	COLLECTS HIGH VELOCITY CONCENTRATED RUNOFF MAY USE FILTER CLOTH OVER INLET					✳		✳

✳ INDICATES APPLICABILITY OF A SPECIFIC CONTROL MEASURE TO ONE OR MORE OF THE SEVEN PROBLEM AREAS

KEY	DETAIL	CHARACTERISTICS	SLOPES A	STREAMS AND WATERWAYS B	SURFACE DRAINAGEWAYS C	ENCLOSED DRAINAGE (Inlet & Outlet Control) D	LARGE FLAT SURFACE AREAS E	BORROW AND STOCKPILE AREAS F	ADJACENT PROPERTIES G
37	Sod Filter	INEXPENSIVE AND EASY TO CONSTRUCT PROVIDES IMMEDIATE PROTECTION PROTECTS AREAS AROUND INLETS FROM EROSION				✳			
38	AVAILABLE DETAIL								
39	Fabric Filter Curb Inlet Protection	CAN UTILIZE MATERIAL FOUND ON SITE EASY TO CONSTRUCT FILTERS SEDIMENT FROM RUNOFF				✳			✳
40	Inlet Sediment Trap	EASY TO SHAPE COLLECTS SEDIMENT MAY BE CLEANED AND EXPANDED AS NEEDED				✳			
41	Stone and Rock Ford Crossing	MAY BE ROCK OR CLEAN RUBBLE MINIMIZES STREAM TURBIDITY INEXPENSIVE MAY ALSO SERVE AS DITCH CHECK OR SEDIMENT TRAP		✳					
42	Temporary Culvert	ELIMINATES STREAM TURBULENCE AND TURBIDITY PROVIDES UNOBSTRUCTED PASSAGE FOR FISH AND OTHER WATER LIFE CAPACITY FOR NORMAL FLOW CAN BE PROVIDED WITH STORM WATER FLOWING OVER ROADWAY		✳					
43	Culvert Sediment Trap	EASY TO INSTALL AT INLET KEEPS CULVERT CLEAN AND FREE FLOWING MAY BE CONSTRUCTED OF LUMBER OR LOGS		✳					✳
44	AVAILABLE DETAIL								
45	Temporary Stream Channel Change	NEW CHANNEL KEEPS NORMAL FLOWS AWAY FROM CONSTRUCTION REQUIRES STATE PERMIT		✳					
46	AVAILABLE DETAIL								
47	Cofferdam	WORK CAN BE CONTINUED DURING MOST ANTICIPATED STREAM CONDITIONS CLEAR WATER CAN BE PUMPED DIRECTLY BACK INTO STREAM		✳					
48	AVAILABLE DETAIL								
49	Check Dam	REDUCES FLOW VELOCITY CATCHES SEDIMENT CAN BE CONSTRUCTED OF LOGS, STRAW, HAY, ROCK, LUMBER, MASONRY, OR SAND BAGS		✳	✳				
50	AVAILABLE DETAIL								
51	Retaining Wall	REDUCES GRADIENT WHERE SLOPES ARE EXTREMELY STEEP PERMITS RETENTION OF EXISTING VEGETATION, KEEPING SOIL STABLE IN CRITICAL AREAS, MINIMIZES MAINTENANCE	✳						✳
52	AVAILABLE DETAIL								
53	Windbreak	MINIMIZES WIND EROSION MAY BE SNOW FENCE					✳		
54	Silt Fence	USES GEOTEXTILE FABRIC AND POSTS OR POLES EASY TO CONSTRUCT AND LOCATE AS NECESSARY	✳		✳		✳		✳
55	Stone Filter–Before Paving	STONE FILTER TO PROVIDE INEXPENSIVE AND EASILY CONSTRUCTED SEDIMENT CONTROL PRIOR TO PAVING SEE DETAIL AT LEFT			✳	✳			
55A	Stone Filter–After Paving	STONE FILTER TO PROVIDE INEXPENSIVE AND EASILY CONSTRUCTED SEDIMENT CONTROL AFTER PAVING SEE DETAIL AT LEFT			✳	✳			
55B	Catch Basin, Filter Bag	MANUFACTURED FILTER BAG INSERTED UNDER CASTING. COLLECTS SEDIMENT AT CATCH BASIN INLET SEE DETAIL AT LEFT			✳	✳			
56	Turbidity Curtain	A TURBIDITY CURTAIN IS USED WHEN SLACK WATER AREA IS NECESSARY TO ISOLATE CONSTRUCTION ACTIVITIES FROM THE WATERCOURSE. THE STILL WATER AREA CONTAINS THE SEDIMENT WITHIN THE CONSTRUCTION LIMITS		✳					
57	Stream – Liner	MAY BE 6A TYPE STONE, SMALL ROCKS OR SIMILAR–SIZED CLEAN CONCRETE–MASONRY RUBBLE, MINIMIZES STREAM TURBIDITY RELATIVELY INEXPENSIVE MAY BE USED AS DITCH CHECK OR SEDIMENT TRAP			✳				
58	Sediment Sump	CONTROLS SEDIMENTATION IN LARGE STREAMS, CONSIST OF OVER EXCAVATING THE DRAIN BY ONE TO TWO FEET, THE SUMP WILL BE AT LEAST 200 FEET LONG, SEDIMENTS ACCUMULATED DURING CONSTRUCTION WILL BE REMOVED UPON PROJECT COMPLETION			✳				
59	AVAILABLE DETAIL								
60	Temporary Construction Entrance	ASSISTS IN REMOVING SOIL FROM THE TIRES OF CONSTRUCTION VEHICLES AND VEHICLES WHEN EXITING THE CONSTRUCTION SITE. THIS REDUCES TRACKING EXCESSIVE SEDIMENT/SOIL ONTO THE ADJACENT ROAD							✳

SOIL EROSION & SEDIMENTATION CONTROL NOTES

1. CONTRACTOR SHALL PLACE ALL SOIL EROSION & SEDIMENTATION CONTROL MEASURES AS SHOWN IN THE PLANS, OR AS DIRECTED BY THE ENGINEER IN ACCORDANCE WITH THE MICHIGAN UNIFIED KEYING SYSTEM.
2. CONSTRUCTION OPERATIONS SHALL BE SCHEDULED AND PERFORMED SO THAT PREVENTATIVE EROSION CONTROL MEASURES ARE IN PLACE PRIOR TO EXCAVATION; TEMPORARY STABILIZATION MEASURES ARE IN PLACE IMMEDIATELY FOLLOWING BACK FILLING AND/OR GRADING OPERATIONS.
3. SPECIAL PRECAUTIONS WILL BE TAKEN IN THE USE OF CONSTRUCTION EQUIPMENT TO PREVENT SITUATIONS THAT PROMOTE EROSION.
4. CLEANUP WILL BE DONE IN A MANNER TO ENSURE THAT EROSION CONTROL MEASURES ARE NOT DISTURBED.
5. THE PROJECT WILL BE INSPECTED DAILY FOR SOIL EROSION AND SEDIMENTATION CONTROL COMPLIANCE BY CERTIFIED STORM WATER OPERATOR PROVIDED BY CONTRACTOR. DEFICIENCIES WILL BE CORRECTED BY THE CONTRACTOR WITHIN 24 HOURS.
6. TEMPORARY EROSION CONTROL MEASURES SHALL BE COMPLETELY REMOVED BY THE CONTRACTOR UPON ESTABLISHMENT OF PERMANENT CONTROL MEASURES, WITH PRIOR APPROVAL OF OWNER, ENGINEER, AND/OR AGENCY HAVING JURISDICTION.
7. CONSTRUCTION WILL DISTURB LESS THAN 5 ACRES, THUS AN NPDES STORM WATER DISCHARGE PERMIT WILL NOT BE REQUIRED. CONTRACTOR SHALL MEET THE PERMIT–BY–RULE (RULE 323.2190) HOWEVER FOR AREAS BETWEEN 1 ACRE AND 5 ACRES.
8. ALL ROADS WITHIN THE INFLUENCE OF THE PROJECT MUST REMAIN CLEAN AT ALL TIMES. CONTRACTOR SHALL SWEEP ROADS AS DIRECTED BY THE ENGINEER.
9. BEST MANAGEMENT PRACTICES FOR SOIL EROSION AND SEDIMENTATION CONTROL MEASURES SHALL BE USED ON THIS PROJECT AS SHOWN ON THE PLANS AND AS DEFINED BY THE ENGINEER.
10. ALL EROSION CONTROL MEASURES SHALL BE CONSTRUCTED AND MAINTAINED IN ACCORDANCE WITH THE CITY OF GRAND RAPIDS AND THE OFFICE OF THE KENT COUNTY DRAIN COMMISSIONER REQUIREMENTS AND PROJECT SPECIFICATIONS
11. ANY EROSION OR SEDIMENT FROM WORK ON THIS SITE SHALL BE CONTAINED ON THE SITE AND NOT ALLOW3ED TO COLLECT ON ANY OFF SITE AREAS OR IN WATERWAYS: WATERWAYS INCLUDE BOTH NATURAL AND MAN–MADE OPEN DITCHES, STREAMS, STORM DRAINS, LAKES AND PONDS.
12. WORK TO BE PERFORMED WITHIN THE GRAND RIVER FOR 2,756 FEET BETWEEN I–196 AND FULTON STREET AND ALONG THE GRAND RIVER FOR 900 FEET IN AH–NAB–AWEN PARK. STAGING AREAS 0 FEET AWAY FROM RIVER AT AH–NAB–AWEN PARK AND 25 FEET AWAY AT MONROE LOT.
13. THE SOIL TYPE WITHIN THE PROJECT IS IDENTIFIED AS URBAN LAND BY THE UNITED STATES DEPARTMENT OF AGRICULTURE NATURAL RESOURCES CONSERVATION SERVICE
14. PROVIDE TRAFFIC CONTROL BARRICADES, SIGNS, LIGHTS, ETC. IN ACCORDANCE WITH THE LATEST EDITION OF THE MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES AS NECESSARY FOR THE PROTECTION AND SAFETY OF THE PUBLIC. MAINTAIN THESE DEVICES AT ALL TIMES DURING CONSTRUCTION.
15. PROTECT TREES NOT SHOWN FOR REMOVAL FROM DAMAGE DURING CONSTRUCTION IN ACCORDANCE WITH THE CONTRACT DOCUMENTS.
16. ALL REMOVED MATERIALS ARE THE PROPERTY OF THE CONTRACTOR. CLEANUP AND DISPOSE OF ALL EXCESS MATERIALS OFF SITE AT A LOCATION DESIGNATED FOR THIS USE AND IN ACCORDANCE WITH LOCAL REGULATIONS OR AT N ON SITE LOCATION DESIGNATED BY THE OWNER, UNLESS OTHERWISE NOTED.
17. USE (2) TWO BENCH MARKS FOR VERIFICATION OF ALL CONSTRUCTION ELEVATIONS. SET ADDITIONAL BENCH MARKS TO COMPLY WITH THIS REQUIREMENT.
18. RESTORE ALL STREET SURFACES, DRIVEWAYS, CULVERTS, ROADSIDE DRAINAGE DITCHES, AND OTHER PUBLIC OR PRIVATE STRUCTURES THAT ARE DISTURBED OR DAMAGED AS A RESULT OF CONSTRUCTION ACTIVITIES TO A CONDITIONS EQUAL TO OR BETTER THAN EXISTING CONDITIONS AND TO THE SATISFACTION OF THOSE HAVING JURISDICTION, UNLESS NOTED OTHERWISE IN THE PLANS.

CONSTRUCTION SEQUENCE

1. IMPLEMENTATION OF TEMPORARY EROSION CONTROL MEASURES; SELECTIVE GRADING, DIVERSIONS AS REQUIRED IN FIELD, PROTECTION OF STORM SEWER FACILITIES
2. EXCAVATION AND STOCKPILING OF SOIL.
3. PERIODIC MAINTENANCE OF AFFECTED EROSION CONTROL MEASURES.
4. PERMANENT MEASURES; FINAL GRADING, SEEDING AND MULCHING.

SEE UNIFIED KEYING SYSTEM FOR EROSION CONTROL KEY NUMBERS

TO BE COMPLETED BY CONTRACTOR FOR PERMIT

PERMANENT SEEDING GUIDE

RECOMMENDED PLANTING SEASON

EGLE STREAM CROSSING NOTES

1. CONSTRUCTION OF STREAM CROSSING SHALL BE SUBJECT TO THE SPECIFICATIONS FOR PROTECTION OF NATURAL RESOURCES AT UTILITY CROSSING AS GIVEN IN THE ADMINISTRATIVE RULES PART NO. 301 OF PUBLIC ACT 451, AS AMENDED, 1994.
2. A SILTATION BARRIER SHALL BE CONSTRUCTED IMMEDIATELY DOWNSTREAM OF THE CONSTRUCTION SITE PRIOR TO THE COMMENCEMENT OF ANY CONSTRUCTION ACTIVITIES. (SEE MICHIGAN UNIFIED KEYING SYSTEM FOR SPECIFIED BARRIER) THE SILTATION BARRIER SHALL BE MAINTAINED IN GOOD WORKING ORDER THROUGHOUT THE DURATION OF THE PROJECT.
3. BACKFILL SHALL CONSIST OF INERT MATERIALS WHICH WILL NOT CAUSE SILTATION NOR CONTAIN SOLUBLE CHEMICALS OR ORGANIC MATTER WHICH IS BIODEGRADABLE. ALL FILL SHALL BE CONTAINED IN SUCH MANNER SO AS NOT TO ERODE INTO ANY WATERCOURSE.
4. ALL RAW BANKS SHALL BE STABILIZED WITH RIPRAP TO THREE FEET ABOVE ORDINARY HIGH WATER MARK, THEN SEEDED, FERTILIZED AND MULCHED, OR SODDED TO PREVENT EROSION
5. UPON PROJECT COMPLETION THE EXCESS SPOILS SHALL BE REMOVED AND DISPOSED IN AN APPROPRIATE UPLAND SITE.
6. SILTATION BARRIER MAY BE REMOVED UPON PLACEMENT OF PERMANENT EROSION CONTROL BARRIERS.

5. BE PREPARED TO UN-ISOLATE WORK AREA AND ALLOW FLOW ON BOTH SIDES OF CHANNEL UPON SHORT NOTICE IF OWNER'S REPRESENTATIVE DETERMINES BED SCOUR NEAR BRIDGE PIERS, FLOODWALLS, OR OTHER INFRASTRUCTURE SHOULD BE INSPECTED.
6. CONTRACTOR SHALL MAINTAIN AND MONITOR ALL EXISTING UTILITY OUTFALLS TO FUNCTION OR DRAIN PROPERLY THROUGHOUT CONSTRUCTION; INCLUDING BOTH MARKED AND UNMARKED UTILITIES.
7. ACCESS CAUSEWAYS, WORK ISOLATION MEASURES, AND TEMPORARY GRADE CONTROLS SHALL BE INSTALLED IN THE FLOWING RIVER. REFER TO THE TECHNICAL SPECIFICATIONS FOR FLOW RATE AND DEPTH INFORMATION. CONTRACTOR SHALL SUBMIT PLAN TO PERFORM WORK IN THE FLOWING RIVER WITH MAXIMUM DEPTHS TO PERFORM WORK.
8. SURFACES FOR ALL TEMPORARY CAUSEWAYS AND COFFERDAMS CAN BE PROVIDED TO CONTRACTOR

CONSTRUCTION SEQUECNING NOTES:

1) CAUSEWAYS MUST BE INSTALLED BEFORE REMOVAL OF DAMS OR CONSTRUCTION OF PROPOSED IMPROVEMENTS CAN BEGIN AT ANY GIVEN LOCATION.
2) PROPOSED IMPROVEMENTS AT DAM 3 SHALL BE HELD UNTIL AFTER COFFERDAM AT DAM 2 HAS BEEN REMOVED.
3) PROPOSED IMPROVEMENTS AT DAM 4 SHALL BE HELD UNTIL AFTER COMPLETION OF PROPOSED IMPROVEMENTS AT DAM 2.

MUSSEL RELOCATION NOTES:

1) MUSSEL RELOCATION IS ANTICIPATED TO OCCUR BY OTHERS, PRIOR TO IN-CHANNEL CONSTRUCTION ACTIVITIES BEGINNING WITH THE EXCEPTION OF NOTE 3 BELOW.
2) LOCATIONS UNABLE TO BE ACCESSED FOR MUSSEL RELOCATION WOULD BE RELOCATED DURING CONSTRUCTION, IF FLOW CONDITIONS ALLOW AND RELOCATION IS ABLE TO BE COMPLETED AHEAD OF CONSTRUCTION ACTIVITIES.
3) THE AREA WITHIN THE WORK ISOLATION AT DAM 2 WOULD BE RELOCATED PRIOR TO WORK COMMENCING IN THAT AREA. RELOCATION ACTIVITIES HERE WOULD HAVE UP TO 10 DAYS TO CLEAR THE AREA.

THE UNDERGROUND LOCATIONS SHOWN FOR BEDROCK, NATURAL GAS (GAS), TELEPHONE (TEL), ELECTRICAL POWER (PWR), CABLE TV (CTV) AND FIBER OPTIC LINES (FIBER) ARE APPROXIMATE. THE CITY OF GRAND RAPIDS ASSUMES NO RESPONSIBILITY FOR THEIR ACCURATE REPRESENTATION IN THIS DRAWING. MISS DIG MUST BE CONTACTED PRIOR TO CONSTRUCTION TO LOCATE THESE UTILITIES.

T07

NOTES:

1. ESTABLISH STABILIZED CONSTRUCTION ENTRANCE PRIOR TO THE INITIATION OF SITE CONSTRUCTION ACTIVITIES IN LOCATON SHOWN ON THE PLANS OR AS DIRECTED BY THE ENGINEER.
2. REMOVE ALL VEGETATION, TOPSOIL, AND OTHER OBJECTIONABLE MATERIAL FROM THE FOUNDATION AREA.
3. GRADE FOUNDATION AND CROWN FOR POSITIVE DRAINAGE AWAY FROM PUBLIC ROAD IF POSSIBLE. IF THE SLOPE OF THE CONSTRUCTION ENTRANCE IS TOWARD A PUBLIC ROAD AND EXCEEDS TWO PERCENT, CONSTRUCT AN EIGHT INCH HIGH DIVERSION RIDGE WITH A RATIO OF 3–TO–1 SIDE SLOPES ACROSS THE FOUNDATION AREA ABOUT 15 FEET FROM THE ENTRANCE TO DIVERT RUNOFF AWAY FROM THE ROAD.
4. INSTALL A CULVERT PIPE UNDER THE PAD IF NEEDED TO MAINTAIN PROPER PUBLIC ROAD DRAINAGE.
5. PLACE AGGREGATE TO THE DIMENSIONS AND GRADE SHOWN IN THE CONSTRUCTION PLANS, LEAVING THE SURFACE SMOOTH AND SLOPED FOR DRAINAGE.
6. DIVERT ALL STORM WATER RUNOFF AND DRAINAGE FROM THE INGRESS,/EGRESS PAD TO A SEDIMENT TRAP OR BASIN.
7. INSPECT DAILY.
8. RESHAPE PAD AS NEEDED FOR DRAINAGE AND RUNOFF CONTROL.
9. TOP DRESS WITH CLEAN AGGREGATE AS NEEDED.
10. IMMEDIATELY REMOVE MUD AND SEDIMENT TRACKED OR WASHED ONTO PUBLIC ROADS.
11. FLUSHING SHOULD ONLY BE USED IF THE WATER CAN BE CONVEYED INTO A SEDIMENT TRAP OR BASIN.

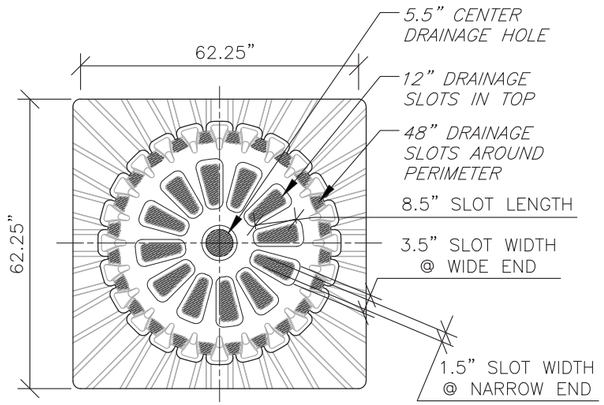
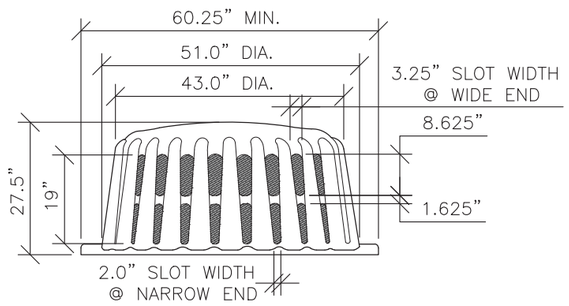
ISOMETRIC VIEW

SHOWN WITH ROADWAY PROJECTS FILTER HAT



PLAN VIEW



ELEVATION VIEW

Model #S–200A
REPLACEMENT FILTERS: MODEL #S–240

FILTER OPTIONS

FILTER HAT IS AVAILABLE IN THREE OPTIONS:
1) ALL HIGH–FLOW MATERIAL
2) ALL HIGH–EFFICIENCY MATERIAL
3) HIGH–FLOW MATERIAL ON TOP HALF OF HAT, HIGH–EFFICIENCY MATERIAL ON BOTTOM HALF (THIS FILTER COVER IS RECOMMENDED FOR ALL ROADWAY PROJECTS.)

IT IS THE PURCHASERS RESPONSIBILITY TO PURCHASE APPROPRIATE FILTER HAT. PURCHASER SHALL PROVIDE ROCK FOR FILTER POCKETS.

FILTER HAT INSTALLATION

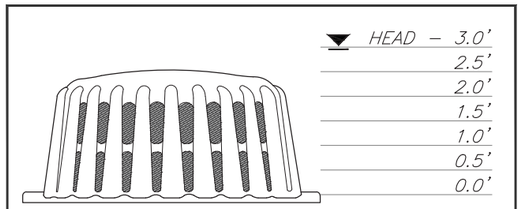
FILTER HAT SLIDES DIRECTLY OVER FILTER FRAME. TO KEEP FILTER FRAME IN PLACE OVER STORM STRUCTURE, ROCK POCKETS ARE SEWN DIRECTLY INTO FILTER HAT MATERIAL. EVERY FILTER HAT COMES IN ONE PIECE FOR EASY INSTALLATION.

MAINTENANCE

ALL TEMPORARY EROSION, SEDIMENTATION, & POLLUTION CONTROL PRACTICES SHOULD BE INSPECTED DAILY. CONTRACTOR SHALL REMOVE SEDIMENT AND DISPOSE OF IN A PROPER MANNER. INSPECT S–200A DAILY FOR CUTS, ABRASIONS, AND PROPER INSTALLATION. REPLACE OR REPOSITION AS NECESSARY.

SPECIFICATIONS

FILTER FABRIC SILT–SAVER HAT SHALL BE BASED ON DESIGN PROFESSIONAL'S SPECIFICATIONS.



FRAME & FILTER DISCHARGE ANALYSIS

HEAD (FT)	EQUATION USED	OPENING AREA (SF)	FRAME FLOW (CFS)	FILTER AREA (SF)	FILTERED FLOW (CFS)
0.5	O	2.1	7	6	2
1.0	O	3.9	19	12	3
1.5	O	7.0	41	18	5
2.0	O	8.0	54	24	7
2.5	O	9.2	70	30	9
3.0	O	9.2	77	—	77

DUE TO NARROW SLOT, A TRANSITION WILL OCCUR BETWEEN WEIR AND ORIFICE CONDITIONS. ORIFICE FLOW WILL PROVIDE A MORE CONSERVATIVE ESTIMATE OF FLOW, THEREFORE THE LESSER OF THE ORIFICE AND WEIR FLOWS WILL BE USED FOR EACH STAGE CALCULATION.

FILTER MATERIAL ALLOWS 129 gpm/SF OR 0.29cfs/SF
ORIFICE EQUATION (O) = Q=0.6A(2gh)^0.5
P = FEET PERIMETER
h = HEAD IN FEET
Q = CAPACITY IN cfs
A = FREE OPEN AREA OF FRAME
g = 32.2 FEET-PER-SECOND/SECOND

FRAME MATERIAL: BLACK 0.25" HMWPE

FILTER FABRIC MATERIAL: REFER TO SPEC

1.0 INTRODUCTION

The concrete 6th Street Dam in the Grand River at Grand Rapids, MI has been assumed to be an effective barrier to upstream migration of the invasive sea lamprey (*Petromyzon marinus*) (Great Lakes Fishery Commission (GLFC), 2018). Proposed modifications to the Grand River associated with the Grand River Revitalization Lower Reach Project include the demolition of four low-head dams and construction of naturalized instream restoration features between Bridge Street and Fulton Street. Hydraulic conditions at the 6th Street Dam under post-project conditions have been modeled to show that the hydraulics of 6th Street Dam will not be impacted to result in reduced effectiveness in blocking sea lamprey as compared to corrected effective conditions. This evaluation and corresponding hydraulic modeling results are reported in this memorandum.

Hydraulic comparisons are made to channel conditions prior to recent instream work conducted by Michigan Department of Transportation (MDOT). This is referred to as the Existing Conditions Configuration herein.

2.0 MODELING RESULTS EVALUATION OF EXISTING AND PROPOSED CONDITIONS

Flow rates below bankfull flow of 13,000 cfs, were evaluated in SRH-2D and comparisons were made between existing and proposed conditions. Flood flows, greater than bankfull flow, were evaluated and compared using the effective HEC-RAS FEMA flood model.

Tailwater elevations were taken from both models directly downstream of 6th Street Dam, at River Station 2160+20.2; Table 1 compares the calculated rating curves. The crest of 6th Street Dam is submerged by tailwater at the 5-year flood (26,000 cfs). Proposed Conditions tailwater elevations were modeled to remain at or at or below Existing Conditions, within modeling error, for all flow rates evaluated. An 18" vertical separation between tailwater and crest was maintained for similar flow rates as existing conditions.

Table 1: Comparison of modeled tailwater elevations at 6th Street Dam

Flowrate (cfs)	Existing Conditions (ft)	Proposed Conditions (ft)	Modeled Change in Tailwater (ft)	Modeling Results
1,200	595.92	595.62	-0.30	SRH-2D
2,500	596.64	596.33	-0.31	
3,900	597.26	596.93	-0.33

7,500	598.5	598.19	-0.31	
10,000 (1-year)	599.2	598.96	-0.24	
13,000 (Bankfull)	599.9	599.88	-0.02	HEC-RAS
18,000 (2-year)	601.84	601.86	0.02	
26,000 (5-year)	604.34 (1)	604.32 (1)	-0.02	
31,000 (10-year)	605.98 (1)	605.93 (1)	-0.05	
38,000 (25-year)	608.17 (1)	608.04 (1)	-0.13	
44,000 (50-year)	610.26 (1)	610.11 (1)	-0.15	
50,000 (100-year)	612.92 (1)	612.72 (1)	-0.20	

(1) Less than 18" vertical separation between tailwater and crest of dam

3.0 WATER TEMPERATURE

Water temperature plays a major role in predicting when sea lampreys may be migrating upriver. The following information is included to corelate flow rates and water temperature to various times of year. The project will not have an impact on these correlations. Sea lampreys typically spawn in the Grand River in the late winter through spring months (February through June) (USFWS, *personal communication*). Table 2 provides the calculated mean-monthly flow rates and corresponding average temperatures. For the flow data. forty-years of discharge data were obtained from USGS Gage 04119000 and a mean-monthly flow rate was calculated from the mean-daily rate. For water temperatures, 10°C has been identified as a target, with migration beginning as temperatures sustain above 10°C. The annual hydrograph is summarized along with water temperature in Figure 1.

Table 2: Mean monthly flow rates for active spawning months

Month	Mean daily flow	Mean monthly water temp.
-	ft^3/s	^oC
February	4,878	2
March	7,725	4
April	7,387	10
May	5,696	15
June	4,024	21

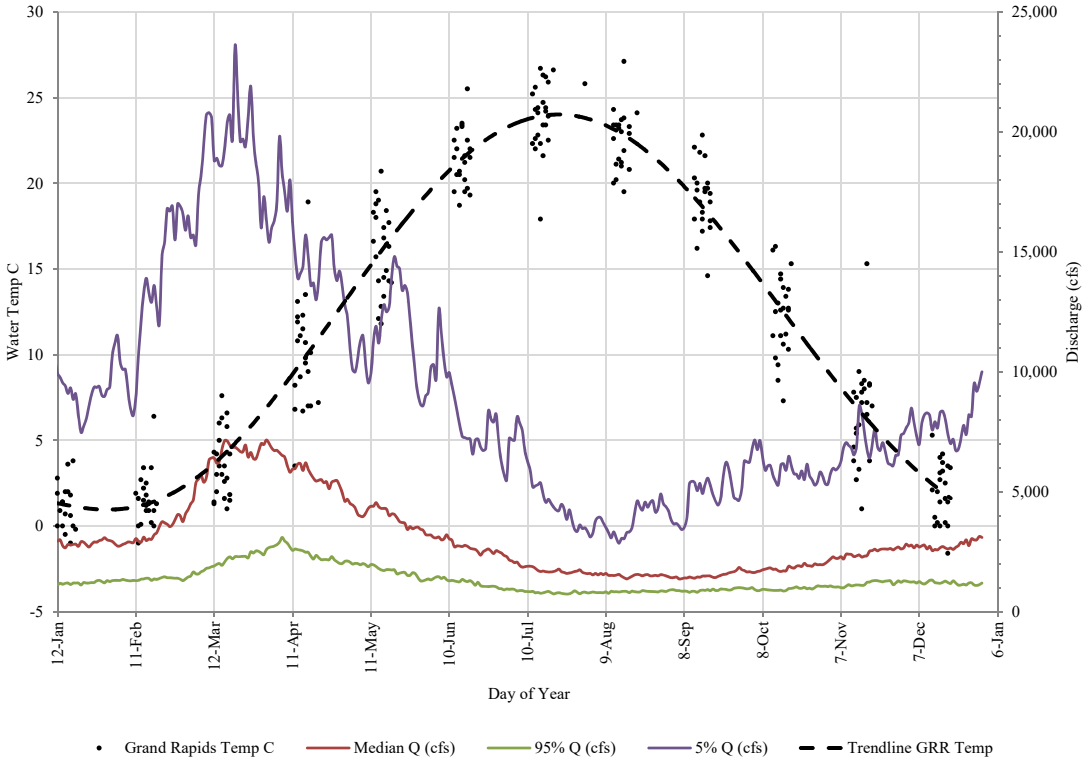

Figure 1: Annual hydrograph with water temperature

4.0 CONCLUSION

The hydraulic function of 6th Street Dam as a barrier to sea lampreys is not anticipated to be negatively affected by the Lower Reach project. The systemic processes of the river and hydraulic characteristics of the dam that contribute to blockage of sea lampreys is not explicitly understood and blockage is likely a combination of various components, including water temperature, vertical free over-fall from tailwater to crest, as well as velocity of flow over and through the dam.

The project would have no effect on water temperatures or on the dam structure itself.

Modeling results indicate that tailwater elevations would remain at or below existing conditions, within modeling error. Based on this evaluation, the function of 6th Street Dam as a barrier to sea lampreys is anticipated to remain as effective as the existing condition.

DRAFT

1.0 INTRODUCTION

The concrete 6th Street Dam in the Grand River at Grand Rapids, MI has been assumed to be an effective barrier to upstream migration of the invasive sea lamprey (*Petromyzon marinus*) (Great Lakes Fishery Commission (GLFC), 2017). Proposed modifications to the Grand River associated with the Grand River Revitalization Lower Reach Project (project) include the demolition of four low-head dams and construction of naturalized instream restoration features, located between Bridge Street and Fulton Street. Hydraulic conditions at the 6th Street Dam under permanent project actions for the project have been modeled to show that the hydraulics of 6th Street Dam will not be impacted to result in reduced effectiveness in blocking sea lamprey as compared to existing conditions (see Report J1a). Temporary conditions during construction have also been modeled to evaluate impacts to tailwater conditions at 6th Street Dam. The evaluation of hydraulics during temporary construction conditions and corresponding hydraulic modeling results are reported in this report.

Hydraulic comparisons are made to channel conditions prior to recent instream work conducted by Michigan Department of Transportation (MDOT). This is referred to as the Existing Condition herein.

2.0 MODELING RESULTS EVALUATION OF EXISTING AND TEMPORARY CONSTRUCTION CONDITIONS

The project is proposed to be constructed by access provided from a staging area in Ah-Nab-Awen Park and in-channel causeways accessing each work area from the park. At Dam 2, the west half of the proposed improvements would be constructed within isolation conditions after installing a cofferdam around the work area and diverting flow to the east side of the channel. Construction activities will be limited by flow depths in the river are anticipated to be performed during flow rates less than approximately 4,000 cfs. Above this flow, depths would likely exceed those for safe and efficient construction in the flowing water and would begin to overtop the cofferdam at the Dam 2 location. Additionally, because construction would only occur during the lower flow periods, the temporary structures (causeways and cofferdam) are proposed to remain in the river during periods of higher flows when construction is unable to occur. Removing temporary structures prior to 4,000 cfs being exceeded would not provide for feasible construction of the project.

The proposed hydraulic feature at the Dam 2 location replaces the grade control function of Dam 3 and part of Dam 4. In order to maintain stable grade control within the reach until the completion of the proposed new hydraulic feature, the removal of Dams 3 and 4 is proposed to be done after the completion of the feature at Dam 2.

Refer to the construction sequencing discussion in Report D1 and the temporary care of water sheets (T Sheets) in permit drawings for reference.

Three temporary conditions models have been evaluated for potential impacts to tailwater at 6th Street Dam:

- Temporary Conditions Model 1 assumes that causeways to Dams 1 and 2, as well as causeways to all work downstream of Pearl Street have bene installed and all dams remain in place.
- Temporary Conditions Model 2 assumes that the cofferdam at the Dam 2 location has been installed in addition to all causeways as described in model 1. All dams remain in place

- Temporary Conditions Model 3 assumes that the cofferdam has been removed and all proposed improvements have been completed, but all causeways still need to be removed from the channel.

These temporary conditions models make conservative assumptions as to what all would potentially be in the river at one time. This is to provide the contractor flexibility to perform the work as efficiently as possible, while still adhering to the sequencing detailed in Report D1.

Modeling results for tailwater at 6th Street Dam are compared and discussed for each temporary condition below. Low flows, which include flow rates below bankfull flow of 13,000 cfs, were evaluated in SRH-2D and comparisons were made between existing and temporary conditions. High flows, which includes flow rates greater than bankfull flow, were evaluated and compared using the effective HEC-RAS FEMA flood model. Tailwater elevations were taken from both models directly downstream of 6th Street Dam, at River Station 2160+20.2.

2.1 *Temporary Conditions Model 1*

Table 1 compares the calculated rating curves for Existing Conditions and Temporary Conditions; the crest of 6th Street Dam is submerged by tailwater at the 5-year flood (26,000 cfs). Modeling results indicate potential for increased tailwater elevations of up to 0.37 feet and an 18" vertical separation from tailwater to dam crest being maintained for flow rates below 18,000 cfs.

Table 1: Comparison of modeled tailwater elevations at 6th Street Dam for Temporary Conditions Model 1

Flowrate (cfs)	Existing Conditions (ft)	Temporary Conditions (ft)	Modeled Change in Tailwater (ft)	Modeling Results
1,200	595.92	596.25	0.33	SRH-2D
2,500	596.64	596.96	0.32	
3,900	597.26	597.58	0.32	
5,000	597.67	598.00	0.33	
7,500	598.5	598.83	0.33	
10,000 (1-year)	599.2	599.57	0.37	
13,000 (Bankfull)	599.9	600.13	0.23	HEC-RAS
18,000 (2-year)	601.84	602.04 (1)	0.2	
26,000 (5-year)	604.34 (1)	604.52 (1)	0.18	
31,000 (10-year)	605.98 (1)	606.14 (1)	0.16	
38,000 (25-year)	608.17 (1)	608.29 (1)	0.12	
44,000 (50-year)	610.26 (1)	610.36 (1)	0.1	
50,000 (100-year)	612.92 (1)	612.98 (1)	0.06	

(1) Less than 18" vertical separation between tailwater and crest of dam

2.2 Temporary Conditions Model 2

Table 2 compares the calculated rating curves for Existing Conditions and Temporary Conditions. Modeling results indicate potential for increased tailwater elevations of up to 0.33 feet and an 18" vertical separation from tailwater to dam crest being maintained for flow rates below 18,000 cfs.

Table 2: Comparison of modeled tailwater elevations at 6th Street Dam for Temporary Conditions Model 2

Flowrate (cfs)	Existing Conditions (ft)	Temporary Conditions (ft)	Modeled Change in Tailwater (ft)	Modeling Results
1,200	595.92	596.23	0.31	SRH-2D
2,500	596.64	596.94	0.3	
3,900	597.26	597.55	0.29	
5,000	597.67	597.97	0.3

DRAFT

3.0 WATER TEMPERATURE

Water temperature plays a major role in predicting when sea lampreys may be migrating upriver. The following information is included to corelate flow rates and water temperature to various times of year. The project will not have an impact on these correlations. Sea lampreys typically spawn in the Grand River in the late winter through spring months (February through June) (USFWS, *personal communication*). Table 4 provides the calculated mean-monthly flow rates and corresponding average temperatures. For the flow data. forty-years of discharge data were obtained from USGS Gage 04119000 and a mean-monthly flow rate was calculated from the mean-daily rate. For water temperatures, 10°C has been identified as a target, with migration beginning as temperatures sustain above 10°C. The annual hydrograph is summarized along with water temperature in Figure 1.

Table 4. Mean monthly flow rates for active spawning months

Month -	Mean daily flow ft^3/s	Mean monthly water temperature ^oC
February	4,878	2
March	7,725	4
April	7,387	10
May	5,696	15
June	4,024	21

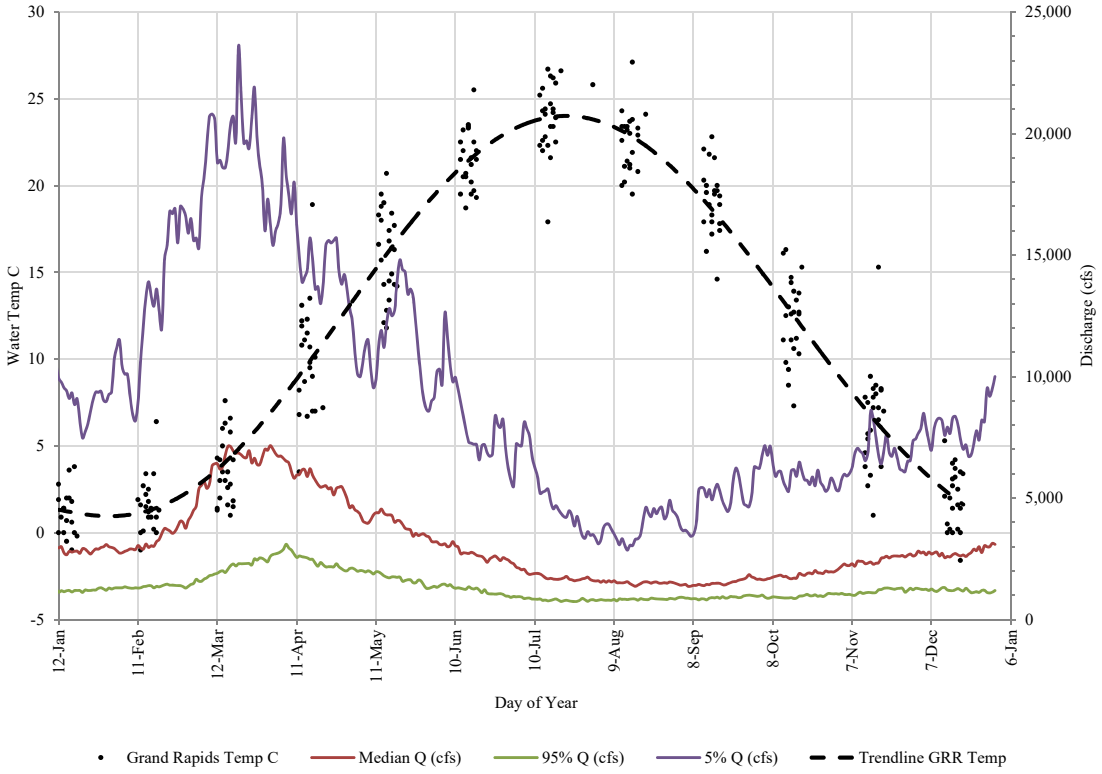

Figure 1: Annual hydrograph with water temperature

4.0 CONCLUSION

The systemic processes of the river and hydraulic characteristics of the 6th Street Dam that contribute to blockage of sea lampreys is not explicitly understood and blockage is likely a combination of various components, including water temperature, vertical free over-fall from crest to tailwater, as well as velocity of flow over and through the dam.

The removal of Dams 3 and 4 would be sequenced after the completion of the proposed feature at Dam 2 as means to maintain stable grade control within the reach through construction. The addition of obstruction associated with the temporary causeways and cofferdam resulted in small, modeled increases in tailwater at 6th Street Dam. For this reason, installation of temporary structures would begin immediately following sea lamprey migration season (July 1st) if flow conditions allow. If flows are low enough before sea lamprey migration season ends, isolation measures would be installed if approved after coordination with the USFWS Sea Lamprey Control Program.

Construction is anticipated to be potentially completed in one season but will be dependent on flow conditions throughout the season. If conditions do not allow for full completion of work in one season, some temporary causeway material may be left in the channel over winter (along with all constructed proposed improvements). Potential increases in modeled tailwater elevations that may result if this is the case have been minimized by prioritizing the removal of Dams 3 and 4 immediately following the completion of the feature at Dam 2. Potential modeled impacts to tailwater over winter are represented by temporary conditions models 2 and 3; condition 2 assumes Dams 3 and 4 remain in place and condition 3 assumes they've been removed, which would be the more likely scenario given the anticipated construction schedule.

ACKNOWLEDGEMENTS

This Fish Passage Assessment was completed under contract to Grand Rapids Whitewater (GRWW) as part of the efforts to restore and revitalize the Grand River in Grand Rapids. Mr. Matt Chapman (GRWW), Mr. Michael Staal (City of Grand Rapids [CGR]), and Mr. Scott Prins (River Restoration [RRO]) provided project details. Mr. Patrick Ertel, Dr. Tammy Newcomb, Mr. Jay Wesley (Michigan Department of Natural Resources [MDNR]), and Luke Trumble and Amy Lounds (Michigan Department of Environment, Great Lakes, and Energy [EGLE]) provided advice throughout the informal consultation process. Dr. Ted Castro-Santos (United States Geological Survey), Ms. Susan Wells (United States Fish and Wildlife Service), and Dr. Robert McLaughlin (Michigan State University) provided critique of the fish passage analysis methodology.

1.0 INTRODUCTION

The City of Grand Rapids is pursuing to improve aquatic habitat in the Lower Grand River where it flows through downtown Grand Rapids, Kent County, Michigan (GVMC, 2011). Goals of the project include developing a river design that is aesthetically and functionally natural as possible, within the constraints of a large urban river, and to achieve fish passage and aquatic habitat enhancement targets as determined by the Michigan Department of Natural Resources (MDNR) and the project team. The lower reach of the Grand River Revitalization project is located on the Grand River mainstem in the City of Grand Rapids, Michigan from approximately 40 meters (131 ft) upstream of Bridge Street to Fulton Street (Figure 1-1).

1.1 Purpose of the Document

The purpose of the fish passage report is to review the design plans for the Grand River Revitalization project and evaluate the passage of desirable fish species in the lower reach project area. A fish passage report was previously submitted in 2020 (ESC 2020), for a permit application that was withdrawn in March 2023. Following the withdrawal, a new design (proposed design) was developed during focused and frequent consultation between Grand Rapids WhiteWater (GRWW), the City of Grand Rapids (CGR), Michigan Department of Environment, Great Lakes and Energy (EGLE) and MDNR. One of the primary objectives for the proposed design was to maximize fish passage and aquatic habitat while minimizing impacts. This evaluation report focuses on the proposed design where habitat elements were removed while others were added.

1.2 Proposed Action

The stated purpose of revitalizing the rapids in Grand Rapids is described in the Biological Assessment (Dunn 2024) as, "To restore the rapids, improve public safety, restore aquatic habitat diversity and suitability for native Great lakes fish and mussel species, and enhance river access and use." This action includes removing the four low head dams which are barriers to several species of fish, and to construct habitat features known to successfully pass fish. The proposed features of the action include riffles, boulder drop structures, bank vane structures,

and emergent habitat boulders that are found in many nature-like fishway designs and the historic condition of the rapids. In fall of 2023, the design was modified to avoid and minimize impacts to freshwater mussel and fish species. Appendix A (modified from Dunn 2024) shows the current design that was coordinated with EGLE and MDNR and evaluated in this report. The current design has reduced the construction and permanent impacts from the previous while incorporating elements that have successfully been used to pass fish in Michigan. Changes that were incorporated into the current design are described as follows (Dunn 2024):

Between Blue Bridge and Fulton Street

- The boulder wave structure on the west side of the channel was replaced with an augmented boulder vane structure with a reduced footprint and surrounding scattered boulders.
- The previous design included a recovery pool downstream of the wave that has been removed from the design. A small scour pool is included directly downstream of the vane structure, similar to other Michigan projects that have implemented weir or Aadland (2010) rock arch designs.

Between Pearl and Blue Bridge

- The hydraulic feature in this area, which included a boulder wave structure on the west connected to a constructed riffle structure on the east, has been replaced with scattered boulder and a series of bank vane structures to provide slack water near designated access points on the bank.
- The recovery pool of the previous design has been removed.

Between Gillett and Pearl Street (Location of Dam 1)

- The hydraulic feature at Dam 1, which included a boulder wave structure on the west side connected to a constructed riffle structure on the east, has been replaced with a single constructed riffle with emergent habitat boulders and moved downstream to have more overlap with the Dam 1 removal footprint.
- The recovery pool of the previous design has been removed.

Between Bridge St and Gillet (Location of Dam 2)

- The hydraulic feature at Dam 2, which included a boulder wave structure on the west connected to a constructed riffle structure on the east, has been replaced with a hydraulic feature that combines constructed riffles on either side of the river with a series of boulder drop structures in the center of the channel. The new hydraulic feature has a reduced footprint.
- The recovery pool of the previous design has been removed. Small scour pools are included directly downstream of the boulder drop structures, similar to other Michigan projects that have implemented W-weir or Aadland rock arch designs.

Between Bridge St and Gillet (Location of dam 3)

- The dam removal limits have been expanded, based on coordination with EGLE, to include a re-grading of the channel upstream of Dam 3
- Scattered habitat boulders are proposed to be placed within the dam removal footprint.

Location of Dam 4

- The dam removal limits have been expanded, based on coordination with EGLE, to include re-grading of the channel upstream of Dam 4.

2.0 AFFECTED ENVIRONMENT AND BIOLOGICAL RESOURCES

2.1 Lower Grand River Fishery

The project area provides an important and diverse recreational fishery for resident fish species including walleye (*Sander vitreus*), sucker spp., channel catfish (*Ictalurus punctatus*) and smallmouth bass (*Micropterus dolomieu*). Seasonal opportunities exist for migrating fish and include walleye and steelhead (*Oncorynchus mykiss*) in the Spring, and Chinook salmon (*Oncorynchus tshawytscha*) in the Fall. Maintaining, and maximizing, these fishing opportunities is important to all partners involved in the revitalization project. The fish community in the project area is highly diverse, includes many tolerant species, and has changed from its historic condition because of the reduction in rapid and riffle habitat. Many of the fish species in the project area are ubiquitous throughout the mainstem and not associated with swift water habitats. For an extensive review of the Grand River fishery see Hanshue and Harrington (2017).

Two State Threatened fish species are found in the project area. There is a small lake sturgeon (*Acipencer fulvescens*) population that persists in the project area and is only suspected to spawn near Plaster Creek (~1.25 mi. downstream of Fulton Street) and in the project area downstream of 6th Street dam. The Grand River population has been placed into the 'small declining' category based on a low suspected adult population size and declining population trajectory (Hayes and Caroffino 2012). The 6th Street dam is a barrier to historic spawning grounds of lake sturgeon (Hanshue and Harrington 2017) and incidental catch by fisherman occurs each spring. Lake sturgeon recruitment has been documented during two years of a five-year study that has occurred below the project area by a locally-based team of researchers during fall assessments (Grand Rapids Public Museum 2024). The river redhorse (*Moxostoma carinatum*) is a large-bodied sucker species found in the Grand River. There have been recent obseravations in the project area during their spring spawning period (S. Hanshue, MDNR personal communication).

3.0 FISH PASSAGE EVALUATION CONSIDERATIONS

The following sections describe criteria that were developed for the fish passage evaluation, the areas where analysis occurred, methods used for hydraulic model development, and details of fish passage evaluation procedures and results.

3.1.1 General Considerations

The proposed design uses design and construction criteria, that when achieved, will improve fish passage conditions in the Grand River for the diverse fish community. The proposed action includes rock arch rapids, boulder clusters, and small hooks which are design aspects found in nature-like fishways (Aadland 2010). Nature-like design principles have been published by many sources including MDNR, Aadland (2010), Newbury (2013, 2010) and have been successful in meeting fish passage objectives. Fundamental to the design of nature-like fishways is that they pass a broad range of species, emulate habitats found in natural systems, are resilient to a range of flows, and are stable through extreme conditions.

During consultation with MDNR specific design targets were developed and consistent with nature-like fishways, that if met, would result in environmental conditions that are within the swimming abilities of desirable fish species and should accommodate passage of the broader fish community. Specific design targets included and met in the proposed action:

- **Headloss per weir of ≤0.24 m (0.8 ft):** The proposed design, when not submerged by tailwater, would have a maximum headloss of 0.61 m (2 ft) with an average headloss of ~0.54 m (~1.8 ft). The dam 1 riffle starts to see reduced headloss of tailwater levels around 5000 cfs and the dam 2 feature around 7,500-10,000k cfs.
- **Boulder weir gap width between 0.15 – 91 m (0.5 – 3 ft):** Gaps between raised boulders on the crest of the boulder drops have a minimum spacing of 0.61 m (2 ft) with a maximum of 3.66 to 4.57 m (12 to 15 ft) where flow paths are desirable for boat passage.
- **Mild downslopes at riffles:** Constructed riffles have a target slope of 50:1 and the grading will not be steeper than ~45:1 over the riffles.
- **Center depth in deep pools at ≥1.68 m (5.5 ft):** Maximum pools depths are designed at 2.1 m (7 ft) while active and not submerged with an average depth (3,900 cfs) of 1.68 m (5.5 ft).
- **Minimum pool depth of 0.91 m (3 ft):** Minimum pools depths are designed at 1.07 m (3.5 ft).

The fish passage analysis provides a quantitative tool to assess if the design will meet fish passage objectives. Two species were identified as indicator species to use in the analysis because they are both important members of the native fish community, have considerable public interest, and represent different fish swimming groups and swimming performance abilities. For instance, the river redhorse has the same fatigue equation to walleye in the model used for analysis. This allows for evaluating walleye passage along with river redhorse and a suite of other species in the model. The decision was made to evaluate the two species during a range of hydraulic conditions and design features (riffles, weir features, etc.). **Important to this analysis is that fish passage was evaluated at the more extreme modeled conditions** assuming that if passage was achieved at locations and conditions of "worst case scenario" that passage would also be achieved at other locations with less challenging hydraulic conditions.

3.1.2 Fish Groupings Considered in Passage Evaluation

Walleye and lake sturgeon were the target fish species selected based upon a series of criteria, including 1) consultation with management agencies, 2) conservation status, 3) availability of peer-reviewed, locally applicable habitat use and swimming capabilities, and 4) known movement and/or migratory behavior.

3.1.3 Hydraulic Modelling

For modelling of flow velocity and flow depth, SRH-2D models were used. Calculations were based upon depth-averaged velocity and near-bottom velocity. SRH-2D solves two-dimensional dynamic wave equations to resolve depth-averaged hydraulics for a variety of scales and applications. The software has been widely implemented and validated. Applied to the Grand River, the model resolves hydraulic parameters (e.g. depth, velocity at a resolution of 0.15 m (0.5 ft) across the spatial domain of the river system.

Hydraulic conditions used in evaluation:
2,500 CFS: 75% exceeded average daily flow rate and a common summertime flow
3,900 CFS: 50% exceeded average daily flow rate
5,000 CFS: Near 25% exceeded average daily flow rate and within range of spring spawning flow
7,000 CFS: Near 10% exceeded average daily flow rate and mid- to higher range of spring spawning flow

The flows were selected in consultation with MDNR to account for temporal and environmental variability and to represent expected seasonal conditions encountered in the Grand River. Hydraulic model outputs for the project reach at the four evaluated discharges are presented in Appendix B.

3.1.4 Velocity

Two velocity values were computed; 1) depth-averaged velocity, and 2) near-bed velocity. Both velocity estimators have advantages and limitations but together provide utility for evaluating fish passage. Depth-averaged velocity is widely used for evaluating fish passage and assessing whether current velocity would pose a burst or exhaustive swim barrier. Its use here seems appropriate to characterize the variable local hydraulic conditions (i.e. velocity and depth), found across the project river channel. In some cases, near-bed velocity will also be presented using methodology developed by Vacher (2005) and with spreadsheets developed by EGLE and MDNR to calculate velocity at 80% depth using average velocity and average depth estimates. The velocity reduction in near-bed flows has been shown to provide significant benefit to fish when it is fully accessible (Jensen 2014). The use of near-bed velocity is only appropriate when a fish has adequate “headroom” or available depth to effectively use the reduced velocity near-bed layer. Therefore, near-bed velocity will be used in cases where adequate headroom exists and during times where average velocity may show a fish passage barrier. The average depth

calculations will be the primary velocity metric because it represents a more challenging passage scenario for fish than the near-bed velocity parameter.

3.1.5 Depth

Desired conditions for fish passage are maintained when deeper relative depths are available for a range of fish body sizes and life-stages. As body size increases for fish, so does the need for greater relative depths. Minimum depth design targets from comparable fish passage projects typically ranged from 0.23 to 0.31 m (0.75 to 1 ft) depth. The Little Rapids (Chippewa County, MI) project targeted a minimum of 0.31 m (1 ft) depth to accommodate spawning walleye (USDOC 2014) and the River Raisin (Monroe County, MI) project targeted minimum depths of ≥0.23 m (9 in) in the roughened boulder areas to accommodate walleye, lake sturgeon, and other target species (Cardno-JF New 2013). A minimum depth criterion of 0.31 m (1 ft) was suggested for spawning sturgeon by Threader et al. (1998). For this analysis the depth target was accordingly set at 0.31 m (1 ft) in the roughened boulder areas during springtime flows (approximately 5,000-7,500 cfs) to accommodate lake sturgeon movement during spawning.

4.0 ANALYSIS BACKGROUND

Prior to completing the fish passage analysis methodology, MDNR hosted a meeting with Encompass Socio-ecological Consulting (ESC), CGR and GRWW to discuss the methodology with a panel of fish passage experts from across North America. The purpose was to determine if the model was precautionary in its predictions and to gather recommendations for improvements. Following the meeting, the model was finalized, and data were analyzed using the procedure.

To evaluate the impact of the proposed design on fish passage, fifteen swimpaths were established across four reaches of the project area (Appendix C). Each swimpath was placed to begin downstream of a habitat feature and extend upstream until the hydraulic influence of the feature was passed. The project features were collaboratively evaluated by MDNR and ESC by reviewing heat maps across several discharges (2,500 – 7,500 cfs) with the intent of selecting difficult swimpath routes that were often the 'worst case scenario'. Accordingly, the difficult routes were assessed based on velocity and depth, and varied between site, channel feature and discharge. Locations were also selected to evaluate different types of channel features found in the project design. For example, in all project reaches are laterally positioned boulder clusters intended to provide conditions for successful fish passage and by evaluating one representative boulder cluster we could effectively extrapolate to other analogous features within the design.

The fifteen swimpaths were distributed across four project reaches in a downstream to upstream numbering (Appendix C):

Fulton Street to Blue Bridge: Swimpaths 11-15.

Analysis performed at 2,500 cfs because of relatively shallow depths and higher flow velocities. Evaluated features included boulder clusters, a mid-channel riffle, and nearshore riffles.

Grand Rapids Public Museum to Pearl Street: Swimpaths 7-10.

Analysis performed at 3,900 CFS because of relatively shallow depths and higher flow velocities on the rivers north side. Evaluated features included two small j-hooks and mid-channel/near-shore riffles.

Pearl Street to Gillett Bridge: Swimpaths 4-6.
Analysis performed at 5,000 cfs because of relatively shallow depths and higher velocities on the rivers west side. The 7,500 cfs condition was similar hydraulically but not selected because of deeper depths that would provide more headroom for fish to exploit near-bed velocities. Evaluated features included a mid-channel boulder cluster and riffles on the rivers west side.

Above Gillett Bridge: Swimpaths 1-3.
Analysis performed at 5,000 cfs because the conditions represent those during spawning migrations for walleye, salmon and sturgeon. The 7,500 cfs condition functioned similarly hydraulically but not selected because of deeper depths that would provide more headroom for fish to exploit near-bed velocities. Evaluated features included a modified W-weir with resting pool habitat, a mid-channel riffle, and a boulder cluster on the east side of the river.

To identify barriers to fish passage along swimpath routes an Excel model was developed (RiverRestoration and ESC) based on swimming performance curves from Katopodis and Gervais (2016). The code identified locations at which a fish shifted from passive to prolonged swimming mode based on stream velocity. Once the mode shift occurred a hydraulic barrier was identified, and an energetic function was applied that calculated the distance a fish was capable of swimming at prolonged or burst mode at a given velocity. Between each 0.5 m (1.64 ft) increment along the swim path the amount of energy expended, and a cumulative distance function calculated the percent of total distance remaining that a fish could travel. When the energy budget was expended over the hydraulic pathway, a complete barrier was identified.

To calculate the 0.5 m (1.64 ft) incremental distance, velocity/distance curves were fit using the fish swimming performance database "Icthyomechanics" from Katopodis and Gervais (2016) and validated these data with other relevant sources (Peake et al. 2011, Scruton et al. 1998, Castro-Santos 2005, Threader et al. 1998). The swimming performance variables used in the model included swimming speed (Body Lengths per Second) and time to fatigue statistics. The Ichthyomechanics database calculates swimming performance data by using taxonomic classifications to group fish species of similar swimming modes and swimming performances. Combining species into groups was found to improve the statistical analysis especially in cases of inadequate data and where inconsistent sampling methodologies occurred between studies. To evaluate walleye (and salmon) passage, distance curves were fit with total lengths of 0.38 m, 0.43 m and 0.51 m (15 in, 17 in, and 20 in) to be representative of spawning size fish. For the sturgeon group, two lengths were fit at 1.5 m and 1.86 m (60 in and 72 in). For each swimpath, the likelihood that 50% of a total length group would pass was used. The likelihood percentage was developed from the average distance a fish could travel at a velocity value and incorporated the

associated confidence bounds from Katopodis and Gervais (2016). The relationship between water velocity and estimated distance of travel for the walleye group and the sturgeon group is presented in Figure 4-1 for reference.

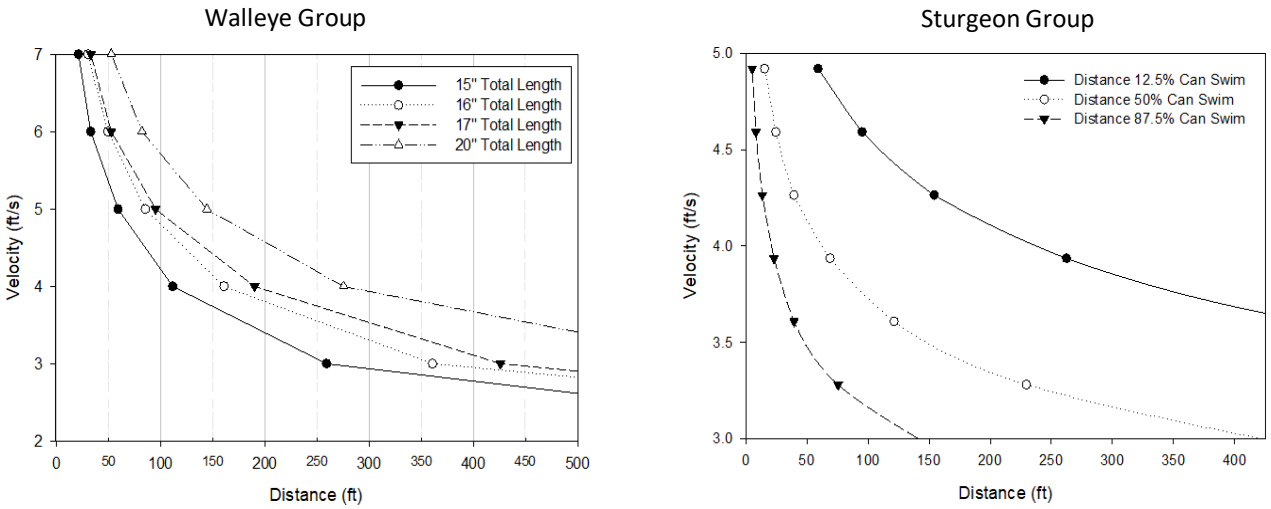

Figure 4-1. Relationship between water velocity (ft/s) and distance of travel (ft) for Salmon and Walleye group and Sturgeon.

5.0 RESULTS

5.1 Walleye Group Passage

A total of 15 swimpaths were analyzed using the model described above. Appendix C provides a depiction of each swimpath, velocity and depth values along the route, and a determination of passability based on the proportion of distance that a fish expended during upstream travel at 0.5 meter increments. Overall, the model predicted full passage at 10 of the 15 swimpaths for all three walleye length groups (Table 5-1).

Table 5-1. Estimated passage success for three length groups of walleye using average velocity at difficult swimpaths. A 'Y' designation indicates at least 50% of the population would pass.

			Total Length Groups		
Location	CFS	Swimpath #	0.38 m TL (15 in)	0.43 m TL (17 in)	0.51 m TL (20in)
Fulton Street to Blue Bridge	5,000	1	Y	Y	Y
		2	N	N	N
		3	Y	Y	Y
Grand Rapids Public Museum to Pearl Street	5,000	4	Y	Y	Y
		5	N	N	Y
		6	Y	Y	Y
Pearl Street to Gillet Bridge	3,900	7	Y	Y	Y
		8	N	N	Y
		9	Y	Y	Y
		10	Y	Y	Y
Fulton Street to Blue Bridge	2,500	11	N	N	Y
		12	N	N	N
		13	Y	Y	Y
		14	Y	Y	Y
		15	Y	Y	Y

The boulder cluster swimpaths (3, 6, and 14) were passable at each location for all walleye lengths. The backwater effect from the boulders, and decreased local flow where fish can rest, were discernable in the line graphs and showed a benefit to the modelled energy expended along the swimpaths. The depth along all swimpaths was >0.4 m except for Swimpath 6 when the path approached boulders, although deeper depths could be easily accessed by a fish if it's the path was altered slightly. Boulder clusters are a common design feature in each of the four reaches. Accordingly, passage of walleye and other similar species would be predicted to pass at each of the boulder cluster structures that were not analyzed.

Riffle feature swimpaths were placed at nine locations (Swimpaths 2, 4, 5, 8, 9, 11-13, 15) and at varying discharge conditions (Appendix C). Four of the eight swimpaths were estimated to have complete passage for all length groups of walleye, while two other swimpaths allowed passage of the largest length group. In Swimpath 2, a barrier to all length groups was due to a long travel distance at velocities near 1.5 m/s. For passage, fish would need to alter their route to exploit the lower sustained velocities near the riffle margins, use adjacent boulder areas, or exploit near-bed flows. In Swimpath 12, the barrier was largely produced by 2 m/s velocities at the crest of the weir structure, although fish could pass by accessing the margins of the crest where lower velocities exist. Even during low-flow conditions (2,500 cfs) the swimpaths maintained depths >0.4 m and would allow for fish to exploit reduced velocity near-bed flows.
Two swimpaths (7, 10) were positioned at near shore (margin) areas and used to evaluate small, j-hook structures in the design. The features are adjacent to the Grand Rapids Public Museum and just below the JW Marriott hotel. Both features produced conditions to pass walleye from all length groups. Below the proposed j-hook adjacent to the Grand Rapids Public Museum is a similar structure 83 m downstream where passage would also be expected.

A unique feature of the design is a modified W-weir (rock arch) design located between boulder clusters and constructed riffle features above the Gillett Bridge. Swimpath 1 was routed through the W-weir at the highest velocity and shallowest depth and passed over three-grade structures and three pools. The feature was passable for all length groups evaluated with a maximum of ≤50% energy reserves used during the swimpath. Over the middle weir feature the peak velocity reached 2 m/s, however because of the short distance, the fish could burst over the feature and into the recovery pool with little energy expenditure. This finding was consistent with how constructed rock arch structures are designed to function by providing hydraulic drop and resistance while allowing for a fish to pass with efficient bursts and recover in an upstream pool.

Although average velocity was the primary evaluation tool during the fish passage analysis, there were minimum depths along most of the swimpaths which exceeded 0.5 m. This amount of depth would allow adequate headroom for walleye to exploit a 0.15 m to 0.28 m (6 in to 11 in) near-bed area where reduced flows could be found. When near-bed velocities were placed into the model all 15 of the swimpaths were passable for all three size groups. The impact of near-bed flows on fish passage success is displayed for Swimpath 5 in Figure 5-1. In this example, using

average velocity calculations only the largest body sized fish was predicted to pass. However, when the near-bed velocity reduction was applied, all three body sizes were able to pass with only a small percentage of their ability to complete the swimpath used.

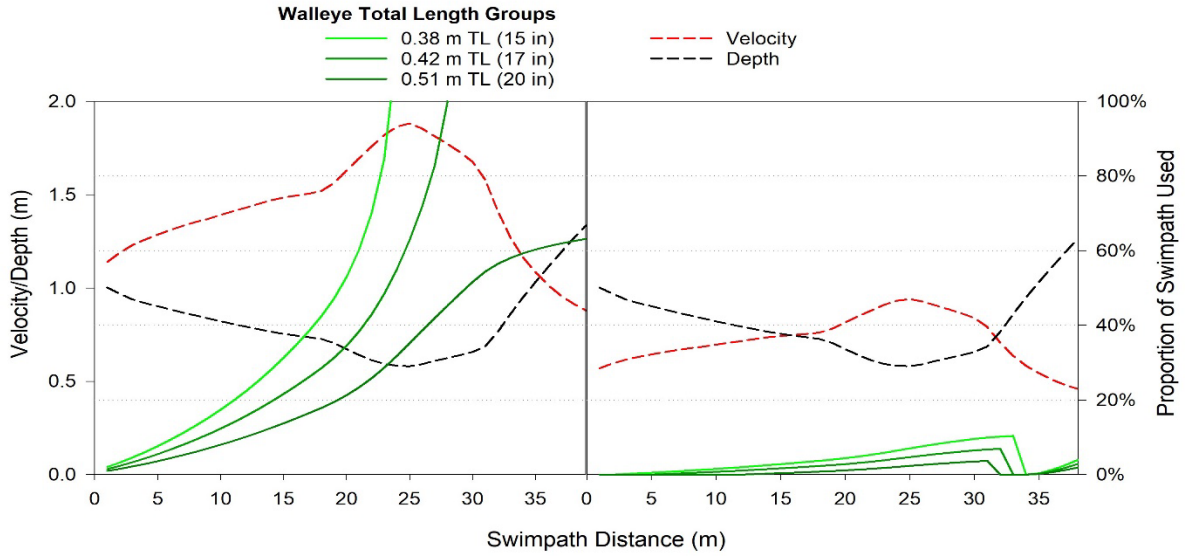

Figure 5-1. Comparison of fish passage success between depth averaged and near-bed velocities. Y-axis represents the amount of swimpath used and if 100% is reached a barrier to passage exists.

Based on these findings the proposed design is expected to function effectively to pass walleye and similar species at all habitat features. If a velocity barrier exists, near-bed velocities and less challenging routes are available.

5.2 Sturgeon Group Passage

Passage of lake sturgeon was evaluated at a boulder cluster and the W-weir. The model predicted full passage for both length groups at the boulder cluster swimpath (Swimpath 6) when using depth averaged flow velocity (5-2). As with the walleye group, the boulders provided discernable flow refugia in the line graphs by producing abrupt velocity reductions and an obvious benefit to the modelled energy expended along the route. The depth along the swimpath was greater than >0.5 m except when approaching a boulder. Deeper depths could be used by a sturgeon by altering its course slightly. The boulder cluster is a common design feature and found throughout the project area. Accordingly, passage of sturgeon would be likely at most analogous boulder features and provide upstream passage.

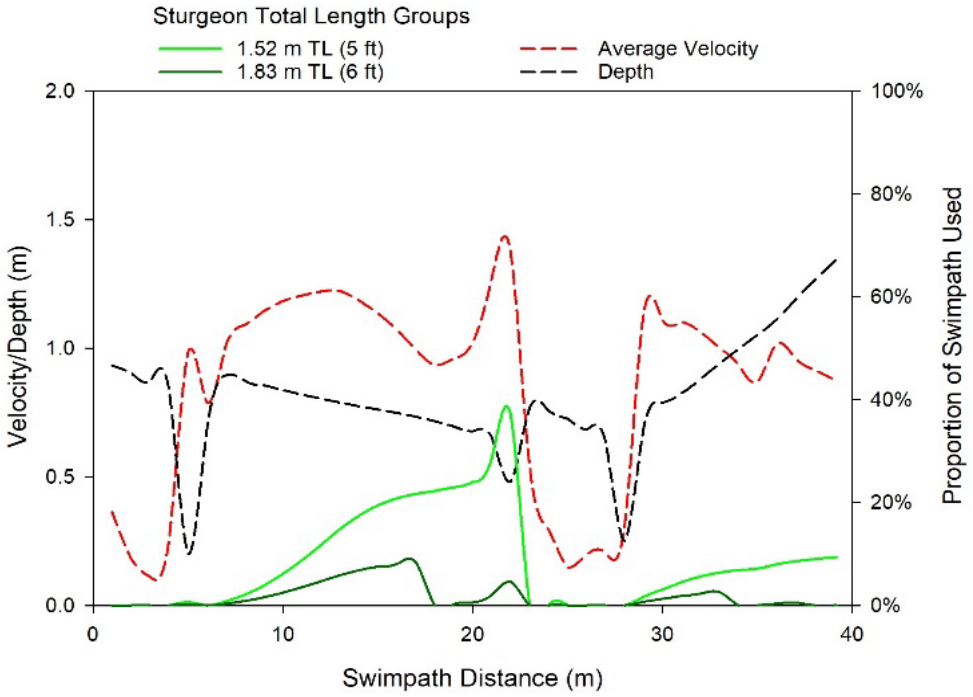

Figure 5-2. Fish passage success of lake sturgeon at boulder cluster (Swimpath 6). Y-axis represents amount of swimpath used – if 100% is reached a barrier to passage exists.

The Swimpath 1 route was used to evaluate W-weir passage and was found to be a barrier when using average velocity (Figure 5-3). The barrier was due to velocity over the middle weir crest briefly spiking to >2 m/s. Therefore, if using average velocity values, sturgeon would need to alter their route to the lower velocity areas found near the weir edges or the adjacent boulder clusters. However, using near bed velocity is an appropriate estimator for lake sturgeon if adequate depth is available for the large-bodied fish. The most challenging area along the swimpath is found at the middle weir crest with an average depth of 1.1 m (47.2 in) across a 3 m path where headroom would average 0.22 - .25 m (9-10 in). Peak velocities would be around 1.1 m/s, however, large recovery pools appropriate for sturgeon would be available immediately

above and below each crest for refugia (Daugherty et al. 2009). Sturgeon would be proficient at using the near bed conditions as they moved upstream by touching, or being close to, the river bottom where they would navigate their direction through subtle adjustments of their body in the current, and use small bursts to ascend barriers to an upstream recovery pool (Auer 2013). When using near bed velocity in the model both size groups were predicted to ascend the barrier with little energy expended (Figure 5-3). Other areas of the W-weir contain lower average and near-bed velocities with deeper depths and should provide passage at most locations.

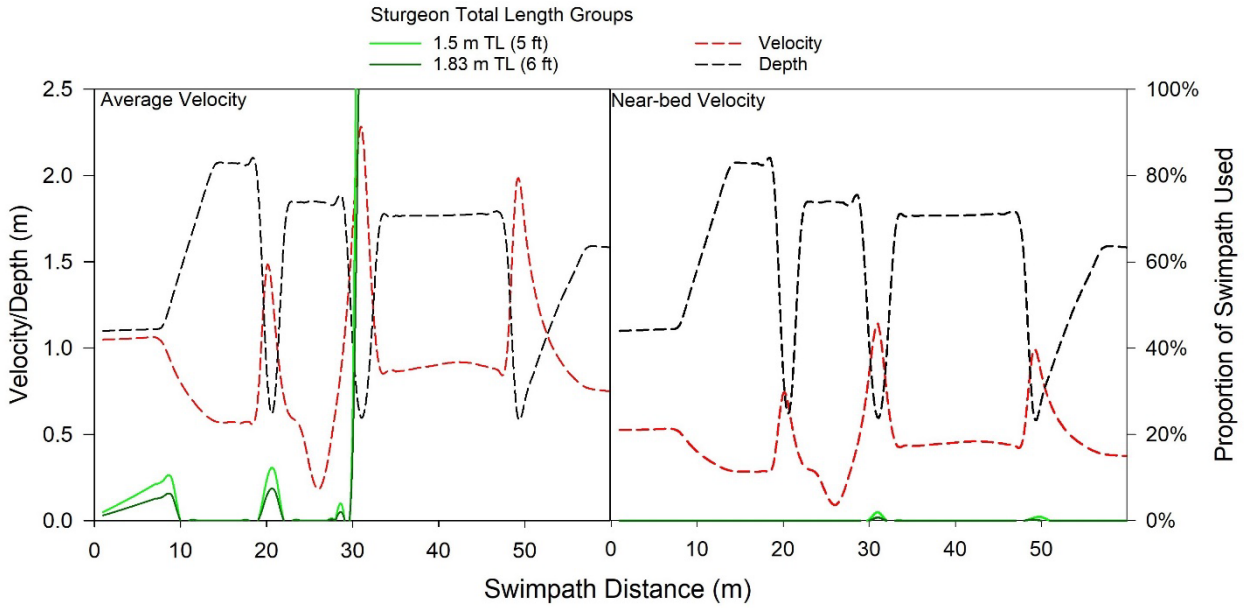

Figure 5-3. Comparison of fish passage success between depth averaged and near-bed velocities. Y-axis represents the amount of swimpath used and if 100% is reached a barrier to passage exists.

6.0 SUMMARY AND CONCLUSION

The findings of this report reinforce how the proposed design facilitates fish passage and that the naturalized design will function as predicted. Within the model used, fish passage was predicted to occur at most difficult hydraulic scenarios and for each of the design elements – boulder clusters, W-weir, and riffles. These findings also suggest that the design will allow a suite of other species to pass that have similar or greater swimming performance including the State Threatened river redhorse, other sucker species, and salmon. The current low-head dams provide a significant barrier to migration up to the 6th Street dam. The proposed design offers hydraulic conditions that facilitate fish passage for a broad group of species and at a wide range of flow conditions and incorporates natural features within the constraints of an urbanized channel.

Appendix G. Cumulative Impacts Analysis memo

OFFICE OF
CITY
ENGINEER

CITY OF GRAND RAPIDS

March 7, 2024

To: Michigan Department of Environment, Great Lakes, and Energy

RE: Cumulative Impacts Analysis
City of Grand Rapids Projects along the Grand River

To whom it may concern:

At EGLE's request, in connection with its review of the City's application for permits under Parts 301, 303, and 31 of the Natural Resources and Environmental Protection Act ("NREPA") for the Grand River Revitalization Project (the "Project"), the City of Grand Rapids compiled a list of projects planned along the Grand River on City-owned property or where the City may be the State permit applicant. EGLE also specifically asked the City to include the River for All projects on this list. The City has included the River for All (RFA) projects, though these projects are only in the City's Parks and Recreation 2022 Strategic Master Plan, and the specific design and schedule for implementation for most of them are currently unknown. The narrative of the projects and impacts shown below for the River for All projects are based on conceptual graphics, and future projects may be significantly different. Some of these projects may not receive funding and would not be built.

The following changes have been made since the previous version was submitted on October 13, 2023:

1. 201 Market Ave from Fulton St. to Wealthy St. has been updated to match the permit application submission.
2. Canal Park Project and Leonard St. to Ann St. Trail – RFA #1 statuses were updated to be "Construction" after receiving permits in 2024.
3. Lower Reach status was updated to be "Active Design".
4. Other minor formatting and grammatical changes

Maps and Figures showing the location of the projects and approximate project extents are attached as Appendix A; a table of the projects and simplified activity information is attached as Appendix B; a narrative describing the projects and anticipated impacts from the projects is attached as Appendix C; and available design drawings are attached as Appendix D.

The projects on the list vary in status from purely conceptual renderings to permit-level design. Project status has been labeled as either "Master Plan only", "concept design", "active design" or "permitting". Definitions of each status are included in Appendix B. Only projects in the active design or permitting phases have progressed enough to be able to calculate any regulated activity. Impacts related to the Master Plan and concept design projects have been estimated based on current renderings or concept plans; these estimates are denoted in the green cells of Appendix B and are likely to change as design

progresses. For projects in the active design phase, the City has included the estimated work in wetlands, bottomlands, and floodplains, but these estimates are subject to change prior to submittal of the permit application. The projects in the permitting phase have the State's permit application number included in the table so those project files may be easily referenced. All other projects have a page number listed to indicate which page the drawing or set of drawings is in Appendix D.

Sincerely,

Tim Burkman, P.E.
City Engineer
City of Grand Rapids

Appendix C
Narrative of Anticipated Impacts from Grand River projects

This document describes the cumulative impacts on regulated aquatic resources which may result from other projects in the vicinity of the Lower Reach Project. All impacts discussed or quantified herein are based on information currently available at the time of permit submission. Impacts for projects not at permitting level were estimated based on assumptions. Impacts have been identified which may occur from projects the City of Grand Rapids has in permitting, active design, concept design, or in the Master Plan only. Potential impacts to aquatic resources discussed here include:

- Impacts on the Public's right to Navigate, Fish, and Fowl on the Grand River;
- Impacts on Bed Mobility, Downstream Turbidity, and Sediment Transport;
- Impacts on Wildlife and Habitat, including Threatened and Endangered Species;
- Impacts to Wetlands;
- Impact on Stream Function;
- Impacts on Modeled Flood Risk;
- Temporary Construction Impacts

Summary Project Narratives

Lower Reach Project (Active Design):
This project is undergoing a refined concept design. The new design will result in improved aquatic habitat and enhanced recreational opportunities; removal of the safety risks caused by the four existing low-head dams; improved mussel habitat area; improved fish passage hydraulics over existing conditions; and enhanced public access to the river. Thus, once constructed, the Project will have positive impacts on regulated resources.

In terms of adverse impacts to a regulated resource, the Project has been designed to have limited, temporary impacts. Specifically, construction of the Project will necessitate the following temporary adverse impacts: (i) the public's ability to navigate and recreate on the Grand River will be temporarily limited in certain areas due to temporary restrictions on river access during construction; (ii) there may be a temporary increase in bed mobility and downstream turbidity and sediment transport during construction; and (iii) there will be temporary adverse impacts on aquatic wildlife.

Corps Project including RFA#2 (Concept Design):
The Great Lakes Fishery Commission has contracted with the U.S. Army Corps of Engineers (Corps) to conduct an Environmental Impact Statement (EIS) for the Corps project. Fourteen alternatives have been identified and will be considered for the project. Upon completion of the formal EIS process, the Great Lakes Fishery Commission will select the preferred alternative and issue a Record of Decision.

For the purpose of this analysis, the City and GRWW have analyzed the potential cumulative impacts for the City's preferred alternative, which is to remove the 6th Street Dam, construct an adjustable hydraulic structure (AHS), and install diversified hydraulic features in the Grand River.

The proposed AHS would incorporate a portage route connecting the upstream and downstream sides of the barrier for navigation. Similar to the Lower Reach Project, once constructed, the Corps Project alternative evaluated here is anticipated to have positive impacts on regulated resources.

The proposed site of the AHS, as evaluated for this application, is adjacent to the River for All (RFA) Site #2, the decommissioned Water Department Storage Yard. River for All Site #2 will be decommissioned as a storage yard for the City of Grand Rapids Water Department and is re-envisioned as a riverfront park. Currently, this site is being considered for access and staging for the construction of the proposed AHS. The existing site is primarily a compacted gravel parking lot/storage yard with ancillary structures for water main and storm water pumping stations. The former railroad bed serves as the top of the flood protection system, but the flood protection is envisioned to be relocated and increased as part of the project. When completed, river access will dramatically increase and transform this site into a regional recreation hub. Concept Design plans for RFA Site #2 call for:

1. An elevated canopy trail to connect pedestrians to the forested canopy above and protect wetland habitat below.
2. A lodge for year-round educational and cultural events.
3. Increase the flood protection system to 100-year base flood elevation plus 3 feet.
4. Potential repurposing of the water storage tank providing a unique space for large events and daily use.
5. A logjam inspired nature playground.
6. A dedicated drop-off area to accommodate large group access and circulating river traffic.
7. River terraces provide additional access to the water's edge
8. 600 lineal feet of new shared use trail.
9. Removal of railroad berm and terraced site to allow access into and out of the river as well as creating a naturalized edge and additional flood storage.
10. River landing provides a safe and accessible public river access space.
11. A large universally accessible walk provides river recreation opportunities to the north and south of the AHS.
12. Stormwater terraces treat onsite runoff and provide ecological interest and support habitat restoration.

Lyon Edge Project (Construction, HP8-8RNS-2WDK2):
This project will include removal of stairs and amphitheater to create a passive and active recreational area, connection of existing routes, and pedestrian safety improvements related to vehicular traffic in Lyon Square.

East River Edge Project (Campau) (Construction, HP8-PWB2-465KA):
This river edge sidewalk has been undercut by river flows, and the area is not currently open to the public as it presents public health and safety concerns. This project will restore the stability and safety of the trail and improve safe access to the river edge from the proposed paved multi-use trail.

Grand Rapids Public Museum Riverfront Improvements (Construction, HPD-8EMK-1EGF2):

This project will remove existing sidewalk and install a new trail down to the river's edge to improve access. The project will also add a new access to the east side of the museum and will include a dual-purpose step/seating area and outdoor classroom. The improvements will allow unrestricted access for all people and add native vegetation to improve aesthetics, and create aquatic and wildlife habitat

Leonard St. to Ann St. Trail (Construction, WRP040128 v. 1):
This project has been refined to be an upper non-motorized pathway on the top of a flood protection berm. This project is proposing to provide freeboard to reach FEMA's NFIP accreditation levels above the 100-year base flood elevation.

Coldbrook Water Pump Stations – RFA #3 (Master Plan only):
The project seeks to transform a property with mostly surface parking lots and storage buildings, which drain directly to the Grand River, into a prominent public recreation and outdoor education amenity. This existing site has a concrete floodwall limiting access to the river.

The new site layout will be an opportunity to provide education on the importance of best management practices related to stormwater and the positive changes happening along the Grand River and its tributaries. This site will be a critical hub for river and trail access. Envisioned improvements include the following:

1. Removal of approximately 150 lineal feet of concrete floodwall allowing access into and out of the river as well as creating a naturalized edge and additional flood storage.
2. Interpretation of Coldbrook Creek to demonstrate the channel's historic alignment and educate the public on the other hidden streams in the area.
3. Flexible plaza spaces adjacent to the building provide areas for outdoor learning, events, and cultural activities, such as canoe building with the Anishinaabe and programmed outdoor recreation activities could be pursued here.
4. Mixed use redevelopment above the 100-year floodplain is anticipated at the corner of Leonard Street and North Monroe Avenue with plazas oriented towards the river.
5. A large multipurpose lawn provides flexible space with an option for future bus drop off
6. ADA and small parking lot is located onsite.
7. An emergency access boat ramp.

Fish Ladder Park – RFA #5 (Master Plan only):
Fish Ladder Park has been identified as an important community gathering spot and the fish ladder structure is an iconic piece of functional art. The park would continue to serve these purposes and the project seeks to enhance and improve the site to function with any future changes to the river. If or when the 6th Street Dam is removed, the Fish Ladder structure would be modified to continue to provide fish passage, and improvements would be implemented within the surrounding park, which would continue to be a primary hub for fishing access. Envisioned improvements include the following:

1. Viewing deck located north of the Fish Ladder.
2. Existing fish ladder structure will remain for rapids viewing and fish observation.
3. Increase the flood protection system to 100-year base flood elevation plus 3 feet.
4. Changing room, restroom, and fish cleaning station.

5. Flexible plaza and adjacent parking area to accommodate small events.
6. Sloped event lawn next to new trees, planted on the high point of the existing berm to provide shade
7. Emergency access boat ramp.
8. Upper viewing perches on the embankment link to Scribner with Fish Ladder Park, provide small lounging pockets and expand spectator areas.
9. Approximately 800 lineal feet shared use trail.
10. Angling and wading access steps link the river trail to the bank.
11. Stormwater terraces treat onsite runoff and provide ecological interest and support habitat restoration.

Wealthy St. Access (Concept Design):
Wealthy St. Access is situated at the southern end of the downtown river corridor and a vital connector for residents within the Roosevelt Park and Black Hills Neighborhoods. The eastern edge is a City-owned parking lot with minimal use. The western edge is a small City-owned parking lot that is also minimally used, with dilapidated stairs that provide access about halfway down to the river. The stairs were originally installed for City workers to access an outfall that is now abandoned. The envisioned improvements will provide equitable river access in an area that currently consists of 15-foot tall concrete flood walls and a neglected river edge with some trees. Please note only one of the river edges is anticipated to be improved in this project, but both potential improvements are shown in the figure in Appendix D. At this time, it is unknown which side of the river the project would occur on. Envisioned improvements include the following:

1. Approximately 250 lineal feet of elevated boardwalk/ramps providing access from the existing parking lot to the river
2. Reconfiguration of the existing parking lot with improved drop-off location
3. Site amenities including pedestrian-scale lighting, benches, litter, and interpretive signage
4. Vegetated rip rap

201 Market Ave. (Permitting, HPZ-0BP4-6TQCH):
The existing river's edge on the east side of the Grand River between Fulton Street and Wealthy Street is approximately 2/3 of a mile. The current parcel contains buildings used to store the City's public works equipment. The river edge condition is a combination of cast in place concrete wall and steel sheet piling. Dependent upon the water level, portions of the river's edge include a sloped bank at the base of the walls. The entire length is populated with a combination of mature large trees and dense scrub-shrub underbrush providing screening of views for the current industrial and commercial uses.

The conceptual designs for the river's edge propose removal of the existing floodwall to provide better access to a more natural shoreline while adding freeboard to the flood control system in order to reach the 3 feet above the 100-year base flood elevation. Flood control will be maintained by utilizing a variety of design features rising to the flood control level with gentler slopes, naturally terraced dolomitic limestone and native plantings combined with walking running and biking trails paralleling the river and joining the properties along the Grand River. The proposed trail will be connected to river access points and public right of ways using universal design guidelines, creating universal access for all to enjoy the Grand River. This

development will coincide with changes in the adjacent parcels in the industrial use to commercial use, public green space, and potentially residential use.

Canal Park (Construction, WRP040025 V.1):
Project proposes to remove and replace approximately 3,810 LF of sidewalk and pathways in Canal Park. The new sidewalk and pathways will be 14-foot wide shared-use trail and raised to meet FEMA's NFIP accreditation requirements. A river terrace area and seat wall is proposed along river's edge. In addition, an event pavilion and plaza are also proposed. A river overlook decks is proposed to provide safe and unobstructed view of the river. A barrier-free floating kayak launch is also proposed. Proposed work activities have been designed to minimize impacts below the OHWM to the greatest extent possible. Furthermore, design meets the 100-year BFE plus required freeboard. Design to the 100-year flood plus required freeboard will provide sufficient flood protection within park area and protect infrastructure and park amenities. The barrier-free floatable kayak launch is the only proposed work past water's edge.

6th St. Park (Concept Design):
This park currently consists of a north/south linear trail, a restroom, fish cleaning station, small pavilion, public parking lot, and a concrete floodwall that spans the entire length of the park from I-196 to 6th Street with only one (1) point of access (which is not universally accessible) to the river located at the 6th Street Dam. Due to the concrete floodwall, there is minimal to no biodiversity along the river's edge. Additionally, there are several storm sewers that discharge into the river through the existing concrete floodwall. The southern half of the park consists of an electrical substation and remnant surface parking lots. The City acquired the parking lot parcels through a Michigan Natural Resources Trust Fund acquisition grant and has been temporarily activating the site. Permanent improvements will not proceed for several years as this is one of the anticipated staging and access sites for the Corps Project. This site will provide an opportunity to transform how the City and its citizens engage with its most valuable natural resource in one of its most prominent downtown locations. Envisioned improvements include the following:

1. 1,800 lineal feet of new shared use trail.
2. Increase the flood protection system to 100-year base flood elevation plus 3 feet.
3. Removal of approximately 740 lineal feet of concrete floodwall allowing access into and out of the river as well as creating a naturalized edge and additional flood storage.
4. River landing providing a safe and accessible public river access space.
5. A large universally accessible walk for river access.
6. Daylighted stormwater outfall and stormwater marsh provide resilient, natural stormwater treatment and re-establish a healthy river edge.
7. Stepped seating terraces at the river edge to provide an expanded, resilient rapids viewing area.
8. A shaded seating edge expands park access, even during high water events.
9. An event pavilion to accommodate concessions, restrooms, and services to support recreation.
10. An event lawn sized for markets, concerts, and a number of other uses.
11. Stormwater terraces treat onsite runoff and provide ecological interest and support habitat restoration.
12. A flexible mid-level terrace can host seasonal events and recreation.
13. A skate park in the area near I-196.

14. Non-motorized watercraft takeout point

Riverside Park (Master Plan only):
Riverside Park is Grand Rapid's largest and most prominent park for active and passive recreation users. The 182-acre park with approximately 2,000 lineal feet of river frontage lies almost entirely within the 100-year flood limit with a few exceptions along Monroe Avenue. The river edge is primarily naturalized with the exception of some armored locations and 3 public boat launch facilities. The park also has an interior lagoon with two heavily vegetated islands. Numerous smaller improvements have been made within the park over the last 20 years, but the last major investments were implemented in the late 1990's. Due to the park's popularity, use, and location within a highly fluctuating floodplain, most of the built assets are nearing the end of their functional life cycle. Roads, bridges, trails, and other structures are in need of repair, replacement. or removal. Additionally, over 100 acres of the park consists of maintained turf. This practice, along with the surface runoff from interior roads and parking, and siltation from seasonal flooding have contributed to poor water quality within the park's lagoon. The park is also situated at the downstream end of several large storm outfall pipes. These pipes collect stormwater from an approximately 1,800-acre watershed to the east and discharge directly into the Grand River. The City's master plan contains a broad list of ambitious and exciting changes for the park that focus on the following community priorities:

1. Remove, replace, and expand non-motorized trails network within the park
2. Daylight existing stormwater low-flow and route through new bio-swales, rain gardens, constructed wetlands to collect, cleanse and infiltrate water prior to reaching the lagoon and/or Grand River.
3. Reduce road and parking impervious surfaces
4. Increase native wetland, wet meadow, and upland plantings, especially along areas receiving surface runoff.
5. Renovate existing restrooms and maintenance facility.
6. Provide multi-purpose community waterfront center with restrooms, concessions, large event area, accessible watercraft launch, and river amphitheater.
7. Improve existing active recreation programs including sport fields, cross country course and disc golf.
8. Improve accessibility to the lagoon and river's edge as well as increase edge resiliency through use of bio-engineering techniques.
9. New dog park dedicated as off-leash area
10. Improve all 3 existing boat launches
11. Renovate existing play areas and incorporate nature-based play elements

Ah-Nab-Awen Park - South (Active Design)
Ah-Nab-Awen Park is on the west side of the Grand River between Pearl and Bridge Streets and a vital outdoor event space, trail connector, and cultural site for guests and residents in the heart of downtown. The proposed design for the south end of the park between Gillett Bridge and Pearl Street includes removal of the representative burial mounds, aging restroom and improvements to sidewalks that are not ADA compliant, and cultural interpretation. Special attention was also given to transform the "Fake Mounds", as they are referred to by the Grand River Band of Ottawa Indians who helped shape the proposed improvements from an under-utilized and misrepresented historical area to a space for healing, celebration, and a welcoming environment for both tribal members and the general public.

Impacts on the Public's right to Navigate, Fish, and Fowl on the Grand River

Lower Reach Project (Active Design):
Removal of the four low-head dams is anticipated to make the Grand River in this reach more accessible, and therefore, improve the public's right to navigate, fish, and fowl.

Corps Project including RFA#2 (Concept Design):
Due to the proposed portage route around the AHS structure that currently does not exist, this project is expected to have a significant positive impact on the public's right to navigate, fish, and fowl on the Grand River. The site improvements related to RFA #2 will also improve access to and from the river, also positively impacting the public's right to navigate, fish, and fowl on the Grand River.

During construction of the project, it may be necessary to temporarily restrict or prohibit use of a portion of the river for public safety.

Lyon Edge Project (Construction, HP8-8RNS-2WDK2):
This project is expected to have a positive impact on the public's right to navigate, fish, and fowl on the Grand River by enhancing the riverfront to provide a gathering space for the public along the river's edge. The stairs down to the river in this area will be removed, but two access points to the river are nearby along the Devos Place Convention Center and across Pearl St. No adverse impacts are anticipated on the Public's right to fish, fowl, and navigate the Grand River from this project.

East River Edge Project (Campau) (Construction, HP8-PWB2-465KA):
The East River Edge sidewalk improvements will have a positive impact on the Public's right to navigate, fish, and fowl on the Grand River by rehabilitating and improving access along the river. No adverse impacts are anticipated on the Public's right to fish, fowl, and navigate the Grand River from this project. This public walkway is currently closed due to a public safety hazard and will not reopen until this project occurs. Severe erosion has substantially undercut the sidewalk creating a public safety hazard.

Grand Rapids Public Museum Riverfront Improvements (Construction, HPD-8EMK-1EGF2):
The Grand Rapids Public Museum is reimagining their riverfront and are proposing to remove the large riprap and scrub-shrub vegetation and install a concrete sidewalk with foundation along a portion of their property. This change is expected to have a positive impact on the Public's right to navigate, fish, and fowl as it is creating two access points with universal access design principles to the river's edge that do not currently exist. No adverse impacts are anticipated on the Public's right to fish, fowl, and navigate the Grand River from this project.

Leonard St. to Ann St. Trail (Construction, WRP040128 v. 1):
The walkway will provide better access along the river's edge. No adverse impacts are anticipated on the Public's right to fish and fowl the Grand River from this project either.

Coldbrook Water Pump Stations – RFA #3 (Master Plan only):
This site is anticipated to have a positive impact on the Public's right to navigate, fish, and fowl on the Grand River. By removing approximately 150 lineal feet of concrete floodwall to allow access into and out of the river and adding a naturalized river edge with universal design concepts, access to the river will improve allowing anyone to fish or fowl on the Grand River. With improved access, this will positively impact the public's river to navigate the river. There are no anticipated improvements that would adversely affect the public's right to navigate, fish, or fowl on the Grand River.

Fish Ladder Park – RFA #5 (Master Plan only):
This project is anticipated to have positive impacts on the public's right to fish, fowl, and navigate the Grand River. One of the main goals of this project is to provide universal access to the riverfront for all people to enjoy. The proposed improvements of adding more access and associated support facilities (i.e., changing rooms, restrooms, fish cleaning stations) are all added to support the public's use of the river. No adverse impacts are anticipated on the Public's right to fish, fowl, and navigate the Grand River from this project.

Wealthy St. Access (Concept Design):
This project is anticipated to have positive impacts on the public's right to fish, fowl, and navigate the Grand River. This project would add access to a site where minimal facilities currently exist to improve the public's right to fish, fowl, and navigate the Grand River. There are no anticipated adverse impacts on the public's right to fish, fowl, and navigate the Grand River.

201 Market Ave. (Permitting HPZ-0BP4-6TQCH):
One of the main goals of this potential project is to provide universal access to the riverfront for all people to enjoy. The proposed amenities, including the river edge and bridges, will be designed to add access to aid in the Public's abilities to fish, fowl, and navigate the river. Therefore, this project would have a positive impact on the Public's right to fish, fowl, and navigate the Grand River.

Canal Park (Construction, WRP040025 V.1):
One of the main goals of this potential project is to provide universal access to the riverfront for all people to enjoy. With the removal of the concrete retaining wall, and the addition of a large universally accessible walk, this will positively impact the public's right to fish, fowl, and navigate the Grand River. There are no anticipated adverse impacts to the public's right to fish, fowl, and navigate the Grand Rapids associated with this project.

6th St. Park (Concept Design):
One of the main goals of this potential project is to provide universal access to the riverfront for all people to enjoy. The current river access is limited in its ability to provide sufficient access to all people. With the removal of the concrete retaining wall, and the addition of a large universally accessible walk and stepped terrace seating, this will positively impact the public's right to fish, fowl, and navigate the Grand River by creating more universally accessible space at the edge of the Grand River. There are no anticipated adverse impacts to the public's right to fish, fowl, and navigate the Grand Rapids associated with this project.

Riverside Park (Master Plan only):

Riverside Park currently offers a wide variety of options for people to access the Grand River. With this project, the options would be to further enhance those to provide universal access and boating access or to renew the current assets. Therefore, positive impacts for the public's right to fish, fowl, and navigate the Grand River are anticipated. No adverse impacts for the public's right to fish, fowl, and navigate the Grand River are anticipated.

Ah-Nab-Awen Park - South (Active Design)
Ah-Nab-Awen Park currently offers for people to access the Grand River. With this project, the options would be to further enhance those to provide universally accessible walks to the existing main path leading down to the river. Therefore, positive impacts for the public's right to fish, fowl, and navigate the Grand River are anticipated. No adverse impacts for the public's right to fish, fowl, and navigate the Grand River are anticipated.

Impacts on the Bed Mobility, Downstream Turbidity, and Sediment Transport

Lower Reach Project (Active Design):
This project is not anticipated to have any adverse permanent impacts on bed mobility, downstream turbidity, and sediment transport. Temporary increases in downstream turbidity may occur during construction, but proper best management practices will be utilized to minimize impacts.

Corps Project including RFA#2 (Concept Design):

The Corps Project, as being analyzed in this document, is not expected to have adverse impacts on bed mobility, turbidity, or sediment transport. The hydraulic gradient over the dam would be distributed over the proposed AHS and several hydraulic features, each designed with a 2x factor of safety against mobility. In this way, the hydraulic features and AHS would function to maintain grade control throughout the reach. Additionally, modeling and design of features would verify that any increases in the scour potential over existing riverbed would not exceed threshold mobility for existing substrate. Similar to the Lower Reach Project, care will be taken through design and modeling to verify that ongoing accumulation of fine sediment within the project reach is avoided and minimized.

Temporary turbidity during construction would be managed with industry standards and assumed to be performed in a similar fashion to means and methods proposed in the Lower Reach Project.

Lyon Edge Project (Construction, HP8-8RNS-2WDK2):
The Lyon Edge project is not expected to have any impacts to bed mobility, sediment transport, or downstream turbidity as all project work is occurring above the ordinary high water mark (OHWM) or behind the floodwall.

East River Edge Project (Campau) (Construction, HP8-PWB2-465KA):
The East River Edge sidewalk improvements is anticipated to have a positive impact to bed mobility, downstream turbidity, and sediment transport. Since 1990, the project area has experienced lateral erosion of 1.7 to 2.8 feet of material along the 439-foot length of river edge that has been transported downstream. This demonstrates the project area has eroding and transporting to downstream areas in the past and may be continuing to this day. The project will stabilize the river edge using slabbed pieces of dolomitic limestone and vegetative plugs, resulting in reduced downstream turbidity and substrate mobility. Temporary turbidity during construction would be managed utilizing appropriate best management practices.

Grand Rapids Public Museum Riverfront Improvements (Construction, HPD-8EMK-1EGF2):
The Grand Rapids Public Museum Riverfront Improvements is expected to have no net adverse impact on the bed mobility, downstream turbidity, or sediment transport. Minimal work would be conducted within the flowing channel and any temporary turbidity during construction would be managed with appropriate best management practices.

Leonard St. to Ann St. Trail (Construction, WRP040128 v. 1):
This project is not expected to adversely impact bed mobility, downstream turbidity, and sediment transport as the work is above the OHWM.

Coldbrook Water Pump Stations – RFA #3 (Master Plan only):
This site is anticipated to have no adverse impact on the bed mobility, downstream turbidity, and sediment transport. There is no in-river work planned with this project. The intent of the design is to soften some of the concrete edges through the use of naturalized material. It is anticipated that softening of the river edge and providing more flood storage will not adversely impact the bed mobility, downstream turbidity, and sediment transport.

Some temporary impacts to turbidity may occur during construction, but appropriate best management practices will be taken and/or installed during construction.

Fish Ladder Park – RFA #5 (Master Plan only):
There is no anticipated adverse impact on bed mobility, downstream turbidity, and sediment transport as the proposed work is not significantly changing the cross-section at this park and the material will be designed to be stable. There may be temporary adverse impacts during construction, but these will be managed by appropriate best management practices.

Wealthy St. Access (Concept Design):
There is no anticipated adverse impact on bed mobility, downstream turbidity, and sediment transport as any change in the cross-section or any protrusions into the flow that increase shear stresses will be minimal. There may be a slight positive impact on these aspects as an increase in native vegetation may help reduce turbidity in the river. There may be temporary negative impacts during construction, but these will be managed by appropriate best management practices.

201 Market Ave. (Permitting HPZ-0BP4-6TQCH):
There is no anticipated adverse impact on bed mobility, downstream turbidity, and sediment transport. The intent of the design is to soften the concrete edges through the use of naturalized material. It is anticipated that softening of the river edge and providing more flood storage will not adversely impact the bed mobility, downstream turbidity, and sediment transport. There may be a marginal positive impact in downstream turbidity for higher flow events given the additional space in the floodplain. There may be temporary negative impacts during construction, but these will be managed by appropriate best management practices.

Canal Park (Construction, WRP040025 V.1):
There are no anticipated adverse impacts on bed mobility, downstream turbidity, and sediment transport as the intent of the design is to soften the concrete edges through the use of naturalized material. It is anticipated that softening of the river edge and providing more flood storage will not adversely impact the bed mobility, downstream turbidity, and sediment transport. There may be a slight positive impact on these aspects as an increase in native vegetation may help reduce turbidity in the river. There may be temporary negative impacts during construction, but these will be managed by appropriate best management practices.

6th St. Park (Concept Design):
There is no anticipated adverse impact on bed mobility, downstream turbidity, and sediment transport. The intent of the design is to soften the concrete edges through the use of naturalized material. It is anticipated that softening of the river edge and providing more flood storage will not adversely impact the bed mobility, downstream turbidity, and sediment transport. There may be temporary negative impacts during construction, but these will be managed by appropriate best management practices.

Riverside Park (Master Plan only):
With the intent of project to improve the stormwater management, water quality of the stormwater, and the lagoons in the park, work below the OHWM is expected, but it would likely be within the park itself, not on the river edge. Given that the intent of the system is to improve water quality, it is anticipated there will be no adverse impacts to the Grand River related to bed mobility, downstream turbidity, and sediment transport. There may be temporary negative impacts during construction, but these will be managed by appropriate best management practices.

Ah-Nab-Awen Park - South (Active Design)
This project is not expected to adversely impact bed mobility, downstream turbidity, and sediment transport as the work is above the OHWM.

Impacts on Wildlife and Habitat, including Threatened and Endangered Species

Threatened and Endangered Mussel impact was calculated using an estimated polygon of work area compared to extents of the Grand River at 890 cfs. This 890 cfs line is the low water level (7Q10) used to assess changes in the wetted area available for aquatic organisms under low flow conditions as detailed in the [TOC 26] Revised Biological Assessment. Where the areas overlapped was assumed to be possible area of mussel impact for the sake of this exercise.

The density of the mussel habitat in the Grand River in the City of Grand Rapids varies based on reach. Based on quantitative samples, in 2013, 2015, and 2016, an average mussel density has been assumed for the following reaches. Impacts to mussels have been estimated based on these densities.

Reach	*Mussel Density (unionids/m^2)*
Proposed AHS to 6th St. bridge	*3.0*
6th St. bridge to 6th St. dam	*1.7*
6th St dam to Fulton St.	*0.3*
Fulton St. to Plaster Creek	*0.1*

It is important to note that these are approximate estimations, based on 30% preliminary design for the in-channel improvements, and include conservative assumptions for construction means and methods which have yet to be determined.

Lower Reach Project (Active Design):
This project is anticipated to pursue a Biological Opinion from the United State Fish and Wildlife Service. All impacts to mussels will be avoided and minimized.

Corps Project including RFA#2 (Concept Design):
The Corps Project is expected to have a positive impact on wildlife and habitat. Aquatic wildlife would have a more diverse range of habitat types which are more representative of a naturally functioning river. Added habitat types would include pools, riffles, runs, and glides, all of which are not as prevalent under existing conditions. The macroinvertebrate community is categorized as poor in the Lower Grand River because “stable habitat necessary for a diverse macroinvertebrate community” is lacking and riffle habitat has not formed (DEQ 2016b). The macroinvertebrate community is anticipated to benefit and respond with a higher species richness and diversity after construction. The addition of coarse substrate riffle habitat is expected to provide an important habitat type for aquatic macroinvertebrates and produce benefits to the habitat of the reach as a whole (Vinson and Hawkins 1998).

While there will be temporary impacts associated with the proposed removal of 6th Street Dam and construction of the proposed AHS and hydraulic features, the project is expected to provide access to approximately 80 acres of aquatic habitat for non-jumping fish species, including Lake Sturgeon spawning habitat currently blocked by the 6th Street Dam. The project, with the 16 acres of permanent streambed change as analyzed in this document, is also expected to create 240% more preferred hydrophysical habitat for mussels than existing conditions. There may be

temporary impacts on the aquatic wildlife, but the project team will continue to consult with the United State Fish and Wildlife Service (USFWS) and Michigan Department of Natural Resources (MDNR) on ways to avoid, minimize, and mitigate any potential impacts.

Construction access to the proposed AHS site will be most likely through the Water Dept. Storage Yard and access to 6th Street Dam most likely through Fish Ladder Park and 6th Street Park. For this reason, these river edge improvements would likely be constructed following the in-river work for the Corps Project. Since all projects are still in concept design phase and any timeline for construction at the time of this submittal is unknown, the mussels impact from projects were shown separately to provide a conservative estimate.

The species discussed below could experience some potential impacts from the Corps project. These impacts can likely be further mitigated during the design/development process and using best management practices during construction.

Unionids (Mussels):
Construction of the AHS will affect approximately 18,500 m^2 of riverbed. Unionid density in this area is approximately 3.0 unionids/m^2. Approximately 150 *E. triquetra*, 5,300 Michigan TES species, and 51,000 other unionids could be affected by construction of the AHS. However, approximately 80% of those unionids could be translocated before construction: 120 *E. triquetra*, 4,200 Michigan TES species, and 41,000 other unionids. Unionids that would not be translocated include approximately 30 *E. triquetra*, 1,100 Michigan TES species, and 10,200 other unionids.

The area between the 6th Street Bridge and the 6th Street Dam would also be directly impacted during construction, approximately 42,000 m^2. Unionid density in this area averaged 1.7 unionids/m^2, A total of approximately 200 *E. triquetra*, 6,800 Michigan TES species, and 66,000 other unionids could occur in this area. Collecting and translocating unionids from this area would be limited to those within work isolation areas due to the dangerous diving conditions this close to the 6th Street dam. For the purposes of this assessment, unionids were assumed to be collected from one third of the area, as some of the area may require work in wet and some of the area may be covered with isolation measures before unionids can be collected. An estimated 80% of the unionids in one third of the area could be translocated under isolated conditions; 50 *E. triquetra*, 1,800 Michigan TES species, and 17,600 other unionids. Unionids that would not be translocated and affected by the Upstream Project above the dam include 144 *E. triquetra*, 5,000 Michigan TES species, and 48,400 other unionids.

Most of the area between the 6th Street Dam and the Lower Reach project will also be directly impacted by construction below the dam; 107,400 m^2. Freshwater mussels occur at a low density (0.3/m^2) between the 6th Street Dam and the Lower Reach project. Approximately 290 *E. triquetra*, 4,300 Michigan TES species, and 27,700 other unionid species may reside in this direct impact area. Diving conditions below the dam are also dangerous due to the high current velocities. Conservatively, unionids could be collected from within work isolation areas, approximately one third of the area. Approximately 80% of the unionids within the cofferdams would be translocated; 80 *E. triquetra*, 1,150 Michigan TES species, and 7,400 other unionids. Unionids that would not be translocated and assumed to be directly impacted by the Upstream Project below the 6th Street Dam include 215 *E. triquetra*, 3,150 Michigan TES species, and 20,300 other unionids.

The total number of unionids affected after translocation in all 3 areas is approximately 400 *E. triquetra*, 9,200 Michigan TES species, and 79,000 other unionids.

Hydraulic changes to flow depths and velocities would occur between the AHS and channel reconfiguration areas (indirect affect areas). The indirect affects area is approximately 232,000 m^2, with a mussel density of 1.7/m^2. Approximately 400,000 mussels may be indirectly affected, including 1,100 *E. triquetra* and 37,000 other Michigan TES species.

Measures that could be used to mitigate impacts include translocating mussels from the AHS construction area to a suitable recipient site. Collection and translocation of unionids directly affected by the project may be limited to slower flowing areas near the banks and within cofferdams.

The loss of mussels could also be mitigated by the improvement in habitat conditions within the Corps Project area. The area above the 6th Street Dam is now a slow flowing pool. An increased velocity with the removal of the 6th Street Dam should improve habitat conditions for unionid mussels and their host fish. A preliminary Preferred Hydraulic Habitat (PHH) model was developed based on hydraulic conditions within the highest density areas within the sampled area between the AHS and the 6th Street Dam. The model included an index of substrate stability (shear stress/critical shear stress) ≤1.2 under high flow conditions (stable substrate under high flow), velocity under low flow conditions between 0.15 m/sec and 0.036 m/sec (low enough velocity to allow juvenile settlement but some flow during low flow conditions), and areas with ≤10% bed slope. Bedrock areas and areas that would not be inundated under 7Q10 (low flow conditions) were excluded from the model. Under existing conditions, approximately 32,700 m^2 of PHH occurs above the 6th Street Dam and 2,800 m^2 of PHH occurs between the 6th Street Dam and Dam 2. This should increase to approximately 86,000 m^2 of PHH or a 240% increase after the project is completed.

Myotis septentrionalis (Northern Long-eared Bat)

Northern long-eared bats could be affected if they used any of the trees in the area for roosting if roost trees were removed as part of construction activities. However, few *M. septentrionalis* appear to spend the summer in the southern portion of Michigan. Additionally, the Project is within an urban setting, not likely to harbor this species of bat. A few trees would likely need to be removed from construction/staging areas for the proposed AHS on the east bank but none of these trees appear to be suitable roost trees. As a precaution, trees should be removed from construction/staging areas in winter months to avoid effects on roosting bats. Northern long-eared bats are unlikely to be affected by this Project.

Myotis sodalis (Indiana bat)

Although summering *M. sodalis* occur throughout the southern portion of Michigan, including Kent County, it is not likely to be affected by the Project. Impacts to bats would primarily include removal of roost trees as part of construction activities. A few trees would likely need to be removed from construction/staging areas for the AHS (Upstream Reach) on the east bank. This area is already heavily urbanized and trees that are to be removed are unlikely to be roost trees. As a precaution, trees should be removed from construction/staging areas in winter months to avoid effects on roosting bats or evaluated for bat habitat prior to removal. Indiana bats are unlikely to be affected by this Project.

Lycaeides melissa samuelis (Karner blue butterfly)
This species primarily occurs in oak savannas and pine barrens with sandy soil. It is dependent upon wild lupine (*Lupinus perennis*), as larvae feed exclusively on this plant species. Although *L. m. samuelis* is known to occur in Kent County, no suitable habitat exists in the Project Area. This species would not be affected by the Project.

Acipenser fulvescens (Lake Sturgeon) - Threatened
A small *A. fulvescens* population is known to occur in the mainstem of the lower Grand River and the mouth of the Grand River, but within the project area**,** it has not been found upstream of the 6th Street Dam (Figure 3-8, Hanshue and Harrington, 2011). The 6th Street Dam is a barrier to spawning grounds of several Lake Michigan fish species, including *A. fulvescens* (Hanshue and Harrington, 2011). As a result, *A. fulvescens* populations are restricted to the Grand River downstream of this structure. Annual spawning numbers of *A. fulvescens* are believed to be between 66 and 130 fish of primarily older adults (Hanshue and Harrington, 2011). Juvenile Lake Sturgeon have not been documented in the project area. Allowing Lake Sturgeon upstream of the 6th Street Dam and diversifying habitat in the Downstream Reach would improve conditions for A. fulvescens in the Grand River.

Moxostoma carinatum (river redhorse) – Threatened
Adults spawn each year, at temperatures between 18˚C and 24˚C (Mongeau et al., 1992; Jenkins and Burkhead, 1993), which occurs between mid-May through July in the Grand River.
Moxostoma carinatum occurs throughout the entire lower segment of the Grand River, from downstream of the Maple River near Lyons to Grand Haven near the mouth of Lake Michigan (Hanshue and Harrington, 2011). Small numbers of River Redhorse have been found in the project area during summer electrofishing surveys (Holtgren, personal communication). River Redhorse are known to occupy areas with deep runs, swift currents, and larger substrates during Winter and Spring months and then shift to lower velocities and finer substrates during Summer and Fall months. The diversity of habitat, with coarser substrate and a wider variability of localized flow velocities, will increase and subsequently provide a habitat mosaic with improved conditions for River Redhorse.

Lyon Edge Project (Construction, HP8-8RNS-2WDK2):
This project is not anticipated to have any impacts on wildlife and habitat. All project work is occurring above the ordinary high water mark (OHWM) or behind the floodwall. No work or construction access will occur within the Grand River and a debris net will be installed under work area to prevent debris from adversely impacting aquatic wildlife, including aquatic macroinvertebrate habitat, fish passage, or fish habitat. USFWS Consistency letter dated May 4, 2022 indicates “no effect” for federally protected Snuffbox Mussel *(Epioblasma triquetra).*

Review of Michigan Natural Features Inventory (MNFI) notes the following state protected aquatic wildlife exist within 1.5 miles of the project area: Snuff box *(Epioblasma triquetra),* Purple wartyback *(Cyclonaias)*, River redhorse *(Moxostoma carinatum)*, Slippershell *(Alasmidonta viridis)*, Black sandshell *(Ligumia recta)*, Fawnsfoot *(Truncilla donaciformis)*. Proposed work activities will not impact these species as no work is proposed within the Grand River.

East River Edge Project (Campau) (Construction, HP8-PWB2-465KA):
The East River Edge sidewalk improvement project is expected to have a positive impact on wildlife. The project is proposed to install slabs of dolomitic limestone and native vegetative plugs along the river edge to reduce streambank erosion and create streamside habitat foraging, resting, and breeding areas. The project will reduce streambank erosion which will also benefit the aquatic wildlife downstream of the project area. Proposed work extends 2.75 feet waterward of the OHWM and will be conducted entirely from upland area using a turbidity curtain.

Review of Michigan Natural Features Inventory (MNFI) notes the following state protected aquatic wildlife exist within 1.5 miles of the project area: Snuff box *(Epioblasma triquetra),* Purple wartyback *(Cyclonaias)*, River redhorse *(Moxostoma carinatum)*, Slippershell *(Alasmidonta viridis)*, Black sandshell *(Ligumia recta)*, Fawnsfoot *(Truncilla donaciformis)*. It is anticipated that work activities will likely not impact these species as their presence was not identified in the 2020 mussel survey conducted by EcoAnalysts. USFWS Consistency letter dated April 8, 2021 indicates “no effect” for federally protected Snuffbox Mussel.

USFWS has also indicated the 2020 mussel survey conducted by EcoAnalysts would be acceptable for this project and was submitted with the permit application. EcoAnalysts confirmed that common mussels were found in the project area (email correspondence attached). Early coordination with MDNR Biologist notes 2 state protected mussels (Snuffbox and Black sandshell) species may be in the project reach. As requested by EGLE, further coordination with MDNR and the City to address potential impacts to protected aquatic species has been requested, has not occurred, and will be handled during permit review process.

This project is not anticipated to have an adverse impact on fish passage. The dolomitic limestone and native vegetative plugs will provide a stable natural river edge which will have a positive impact on macroinvertebrates and fish habitat due to reduced sediment load from erosion. Streamside vegetation will provide safe harbor areas and cooler water temperatures for aquatic species, including macroinvertebrates and larval and juvenile fish species. Furthermore, the proposed work is not installing structures that would typically interfere with fish passage (e.g., weir, dam, etc.)

Grand Rapids Public Museum Riverfront Improvements (Construction, HPD-8EMK-1EGF2):
The Grand Rapids Public Museum riverfront project is expected to have no adverse impacts on wildlife. The current large riprap offers little habitat value. Replacing the existing riprap with either natural field stone or dolomitic limestone would not change that habitat value, and the disturbance on the stream bottom is 0.01 acre.

Native plantings along channel banks will work to improve streamside foraging, resting, and breeding areas for terrestrial wildlife. Work will be conducted from upland areas and steel sheeting cofferdam will be used to protect existing undergrade structures during the construction process, so no tracking in the river is currently proposed. Work is anticipated to extend approximately 0.5-1.0 feet past the water’s edge but would not extend into the limits of the 890 cfs line. Therefore, this project would result in no impacts to mussel habitat areas. The dolomitic limestone and native vegetative plugs will provide a stable natural river edge that will have a positive impact on macroinvertebrates and fish habitat due to reduced sediment load from erosion. Streamside vegetation will provide resting areas and refugia, and cooler water

temperatures which will benefit aquatic species. Furthermore, proposed work is not installing structures that would significantly modify conditions that would interfere with fish passage (e.g., weir, dam, etc.)

USFWS Consistency letter dated November 16, 2021 (attached) indicates “no effect” for federally protected Snuffbox Mussel). Review of Michigan Natural Features Inventory (MNFI) (attached) notes the following state protected aquatic wildlife exist within 1.5 miles of the project area: Snuff box *(Epioblasma triquetra),* Purple wartyback *(Cyclonaias)*, River redhorse *(Moxostoma carinatum)*, Slippershell *(Alasmidonta viridis)*, Black sandshell *(Ligumia recta)*, Fawnsfoot *(Truncilla donaciformis)*. Impacts from proposed work activities will be negligible given work extends minimally (1 foot) into the water.

Leonard St. to Ann St. Trail (Construction, WRP040128 v. 1):
Inquiry to MNFI (attached) notes 3 state Threatened Species (Purple Wartyback, Slippershell and River Red Horse), and 2 state Endangered Species (Black Sand Shell and Peregrine Falcon), may exist within 1 mile of the project area. No adverse impact to Peregrine Falcon or River Red Horse is expected to occur as a result of proposed activities. Peregrine Falcon preferred habitat (inland or coastal cliffs, open woodlands near water, and potentially high city buildings) generally does not exist in the project area. River Red Horse habitat is associated with long deep runs (1-10 feet) in rivers, and proposed work activities will not extend into these areas of the Grand River. Mussels and/or their habitat will not be impacted as proposed activities do not impact the channel bed.

Evaluation of federally protected species was conducted using USFWS IPaC determination key for the following species: Whooping Crane, Snuffbox Mussel, Karner Blue and Monarch Butterfly, Eastern Massasauga, and Indiana, Northern Long Eared and Tricolored bats. Based on absence of suitable habitat, urbanized area, and existing site conditions, it was determined no impacts to these species would occur as a result of proposed work activities. There is reasonable assumption no impact to mussels will occur as all work will occur from upland area and no activities will impact the riverbed.

Furthermore, all work activities will occur outside the 890 CFS line and not impact mussels or their habitat. Mussel studies for the Grand River note the 890 CFS is the breakpoint line for where mussels live and thrive, therefore no adverse impact to either federal or state protected mussels is anticipated to occur.

Coldbrook Water Pump Stations – RFA #3 (Master Plan only):
This site is currently a parking lot and storage buildings with a concrete floodwall along the river edge. No threatened and endangered species would be anticipated in the upland portion of this project. Threatened and endangered mussels could possibly be in the river near this area.

There is an assumed possible 0.03 acre of permanent streambed impact for the emergency access boat ramp. This would reduce the potential habitat for mussels in the river. A temporary streambed impact of 0.06 acres (243 m^2) was assumed to be needed for construction, including the 0.03 acre area mentioned above. The anticipated population of mussel in this area, assuming a mussel density of 1.7/m^2, would be approximately 420 mussels in this area. Assuming approximately 80% of the unionids would be translocated; the estimated take for this project is

85 mussels based on the current concept design. Measures that would be used to mitigate impacts include translocating mussels from the construction area to a suitable recipient site.

Fish Ladder Park – RFA #5 (Master Plan only):
This site is currently a park along the river edge. No threatened and endangered species would be anticipated in the upland portion of this project. Threatened and endangered mussels could possibly be in the river near this area.

This park may be one access point for the Corps project. Any river edge work included in this plan may be in conjunction with that project. This project is estimated to have up to 0.45 acre (1820 m^2) in areas of the river that could be occupied by mussels. Total permanent streambed impact area is estimated to be 0.08 acres. Assuming the higher 1.7/m^2 density of mussels upstream of 6th St. dam (rather than 0.3/m^2 downstream of the dam) in order to be conservative, the streambed impacts could include approximately 3,100 mussels. Therefore, assuming 80% of the mussels can be translocated, the take is assumed to be 620 mussels. The total impact to the mussels may be duplicated since both the Corps Project and the Fish Ladder Park project may account for the same riverbed area in the impact assessment.

There are some trees in this park, which could potentially be bat habitat, although it is unlikely as the area is already heavily urbanized. As a precaution, trees should be removed from construction/staging areas in winter months to avoid effects on roosting bats or evaluated for bat habitat prior to removal. No threatened and endangered species would be anticipated in the upland portion of this project.

Wealthy St. Access (Concept Design):
The parcels along the river edge are currently underutilized parking areas with minimal facilities to the river. There are some trees in the area, but any potential impacts to threatened or endangered bats would be avoided or minimized. No threatened and endangered species would be anticipated in the upland portion of this project.

Threatened and endangered mussels could possibly be in the river near this area. A mussel survey has not been completed for this area. Within the 0.30 acre (1215 m^2) of temporary streambed impact and no permanent streambed impact area, the anticipated population of mussels, using mussel density of 0.1/m^2, there would be approximately 120 mussels in this area. Approximately 80% of the unionids within the cofferdams would be translocated; therefore, take estimates for mussels associated with his project have been calculated to be approximately 25 mussels.

Measures that would be used to mitigate impacts include translocating mussels from the construction area to a suitable recipient site.

201 Market Ave. (Permitting HPZ-0BP4-6TQCH):
The June 6, 2023 inquiry to MNFI for the Canal Park and Ah-Nab-Awen projects was determined appropriate to use for this project, given the project site is within close proximity to the two other sites and has similar work activities being proposed. MNFI notes 3 state Threatened Species (Purple Wartyback, Slippershell and River Red Horse), and 2 state Endangered Species (Black Sand Shell and Peregrine Falcon), may exist within 1 mile of the project area. No adverse impact to Peregrine Falcon is expected to occur as a result of proposed activities. Peregrine Falcon

preferred habitat (inland or coastal cliffs, open woodlands near water, and potentially high city buildings) generally does not exist in the project area. River Red Horse habitat is associated with long deep runs (1-10 feet) in rivers, and proposed work activities will not extend into these areas of the Grand River. Lastly, protected mussels and/or their habitat will not be impacted as proposed activities do not impact the channel bed, and work will be conducted from upland area.

Evaluation of federally protected species was conducted using USFWS IPaC determination key for the following species: Whooping Crane, Snuffbox Mussel, Karner Blue and Monarch Butterfly, Eastern Massasauga (EMR), and Indiana, Northern Long Eared (NLB) and Tricolored bats. USFWS Consistency letter dated November 20, 2023 notes no effect for all species except EMR and NLB, which have a not likely to adversely affect (NLAA) designation. Based on absence of suitable habitat, urbanized area, existing site conditions, and construction methodology, it was determined no adverse impacts to these species would occur as a result of proposed work activities.

Furthermore, all work activities will occur outside the 890 CFS line and not impact mussels or their habitat. Mussel studies for the Grand River Revitalization project (HNV-A018-7X9N3) note the 890 CFS is the breakpoint line for where mussels live and thrive, therefore no adverse impact to either federal or state protected mussels is anticipated to occur. Tree removals will occur during the migrating season (October to March 30) to ensure no adverse impact to federally protected bats.

Fishbeck has determined there is reasonable certainty of no take for Snuffbox or Northern Long Eared bat for the following reasons:

- All work will occur from upland area and no equipment will enter the water.
- All work will occur outside the 890 CFS lines, which is breakpoint line for where mussels live and thrive.
- Turbidity curtain will be used in areas where work occurs below the OHWM to prevent off-site siltation to the greatest extent possible. Curtains will be installed from upland area or by wading out into the river.
- Silt fence or coir logs will be used to prevent off-site siltation in work areas above the OHWM.
- All SESC measures will be inspected and maintained daily throughout construction and any deficiencies observed will be repaired prior to commencement of daily activities.
- No work will impact the river bed.
- Tree removals will occur during the migratory season.

Canal Park (Construction, WRP040025 V.1):
Inquiry to MNFI (attached) notes 3 state Threatened Species (Purple Wartyback, Slippershell and River Red Horse), and 2 state Endangered Species (Black Sand Shell and Peregrine Falcon), may exist within 1 mile of the project area. No adverse impact to Peregrine Falcon or River Red Horse is expected to occur as a result of proposed activities. Peregrine Falcon preferred habitat (inland or coastal cliffs, open woodlands near water, and potentially high city buildings) generally does not exist in the project area. River Red Horse habitat is associated with long deep runs (1-10 feet) in rivers, and proposed work activities will not extend into these

areas of the Grand River. Mussels and/or their habitat will not be impacted as proposed activities do not impact the channel bed.

Evaluation of federally protected species was conducted using USFWS IPaC determination key for the following species: Whooping Crane, Snuffbox Mussel, Karner Blue and Monarch Butterfly, Eastern Massasauga, and Indiana, Northern Long Eared and Tricolored bats. Based on absence of suitable habitat, urbanized area, and existing site conditions, it was determined no impacts to these species would occur as a result of proposed work activities. There is reasonable assumption no impact to mussels will occur as all work will occur from upland area and no activities will impact the riverbed.

Furthermore, all work activities will occur outside the 890 CFS line and not impact mussels or their habitat. Mussel studies for the Grand River note the 890 CFS is the breakpoint line for where mussels live and thrive, therefore no adverse impact to either federal or state protected mussels is anticipated to occur.

6th St. Park (Concept Design):
This project is anticipated to not adversely impact wildlife and habitat. This park may be one of the access points for the Corps project. Any river edge work included in this plan may be in conjunction with that project. This project is estimated to have up to 1 acre (4046 m^2) in streambed impacts, which would include approximately 7,000 mussels assuming a 1.7/m^2 density, but the mussels could be translocated. Assuming 80% of the mussels would be translocated, the take is estimated to be 1,400 mussels. The total impact to the mussels in this assessment may be duplicated since the Corps project include the same riverbed area in the impact assessment.

Since the park as it exists today is a dilapidated parking lot, and the proposed improvements will include increased vegetation, it is anticipated to have positive impacts on wildlife and habitat.

There are some trees in this park, which could potentially be bat habitat, although it is unlikely as the area is already heavily urbanized. As a precaution, trees should be removed from construction/staging areas in winter months to avoid effects on roosting bats or evaluated for bat habitat prior to removal. No threatened and endangered species would be anticipated in the upland portion of this project.

Riverside Park (Master Plan only):
This park provides a variety of habitat for wildlife, including some common aquatic wildlife. Envisioned work will be assumed to improve water quality of the lagoons and stormwater runoff and increase wetlands, wet meadows, and upland plantings. For the purpose of this assessment, it was assumed there would be 1.0 acres (4046 m^2) of temporary riverbed impact area that impacted mussels, including 0.5 acres of permanent streambed impact. Assuming a 3.0/m^2 density, this project would impact approximately 12,200 mussels. The mussels would be translocated. Assuming 80% of the mussels would be translocated, the take is estimated to be 2,440 mussels.

Habitat assessments for the northern long-eared bat, Indiana bat, and the karner blue butterfly may be necessary at the time design starts. As a precaution, trees should be removed from

construction/staging areas in winter months to avoid effects on roosting bats or evaluated for bat habitat prior to removal. No threatened and endangered species would be anticipated in the upland portion of this project.

Given the current wide variety and habitat, and the goal of adding other natural features, it is anticipated that any impacts to wildlife will be temporary from construction, and the long term impacts is anticipated to be positive. No permanent adverse impacts are anticipated.

Ah-Nab-Awen Park - South (Active Design)
There are no impacts on wildlife and habitat, including threatened and endangered species.

Impacts on Wetlands

Lower Reach Project (Active Design):
The Lower Reach Project may have direct impact on wetlands, but the impacts are likely to be temporary and minimal. In 2019, approximately 0.25 acres of wetlands were delineated in this reach.

Corps Project including RFA#2 (Concept Design):
The Corps project may have a direct impact on 0.21 acres of wetlands, as determined from the 2014 Golder Wetland Delineation [TOC No. 23], which identified a total of 3.09 acres of wetlands along the Grand River from approximately Ann St. to Fulton St. This area of wetland impact includes the area of the elevated boardwalk included in RFA #2, the Water Department Storage Yard. More recent delineation data from the 2019 Fishbeck report [TOC No. 24] was also referenced but does not extend upstream of 6th Street Dam. Wetland impact associated with the Corps project could potentially be reduced based on updated wetlands delineation, further discussion on construction methodology, and/or further design development from the 30% design state.

The changes in water levels relative to existing conditions are expected to have indirect impacts to existing wetlands and other riparian areas within the project reach. Water levels in areas downstream of 6th Street Dam would increase, while water levels in areas between the dam and the AHS would decrease. These changes in water levels would alter the frequency of inundation of existing wetlands and are anticipated to result in some changes to long-term wetland boundaries. Much of the vegetation within the delineated wetlands are well-established non-emergent species [TOC No. 23]; these portions of wetlands would continue to be periodically inundated and remain vegetated similar to existing conditions. Since non-emergent species of wetland vegetation do not rely as much on specific water levels in the river, much of the existing vegetation is expected to survive and/or adjust to the new water level. Specific estimation of indirect impacts to wetlands resulting from the proposed changes to water levels are unable to be approximated at this time. Based on [TOC No. 23], there appears to be some emergent wetland vegetation within the 1.7 acre delineated wetland on the east bank directly upstream of Leonard Street. These emergent species of vegetation are anticipated to be impacted by lower water levels; however, the new inundation patterns of post-project conditions would likely establish new, and potentially expanded areas of emergent wetlands.

Lyon Edge Project (Construction, HP8-8RNS-2WDK2):
There are no anticipated wetlands impacts for the Lyon Edge Project. All work is upland above the OHWM.

East River Edge Project (Campau) (Construction, HP8-PWB2-465KA):
There are no anticipated wetland impacts for the East River Edge sidewalk improvement project. There are no wetlands in this project area.

Grand Rapids Public Museum Riverfront Improvements (Construction, HPD-8EMK-1EGF2):
There are no anticipated wetland impacts from the Grand Rapids Public Museum Riverfront project. There are no wetlands in this project area.

Leonard St. to Ann St. Trail (Construction, WRP040128 v. 1):
No wetlands are anticipated to be impacted by this project.

Coldbrook Water Pump Stations – RFA #3 (Master Plan only):
There are no known adverse impacts to wetlands in this project. This area was not included in any of the project wetland delineations, and the State's online wetland mapper shows no wetland in this area. River for All conceptual plans for the Coldbrook Decommissioned Water Pumping Station Site imagines a stormwater outfall water quality treatment area, which could be beneficial to wetlands.

Fish Ladder Park – RFA #5 (Master Plan only):
River for All plans for the Fish Ladder Park redevelopment could result in temporary disturbance of portions of the 0.25 acres of wetland along the RDB between the 6th Street Dam and I-196 as identified in [TOC No. 23] 2014 Golder wetland delineation report. Permanent impacts are not anticipated based on this delineation. The wetlands delineations would be updated prior to any future design, and any impacts would be avoided, minimized, or mitigated to the extent possible.

Wealthy St. Access (Concept Design):
We are not currently aware of any detailed wetland delineation on this site, so the State of Michigan's online wetland mapper was utilized. From this mapper, it appears a forested wetland up to approximately 0.15 acres is on the eastern river edge site. A wetland delineation would have to be performed on this concept prior to future design. Any impacts to the wetland would be avoided, minimized, or mitigated.

201 Market Ave. (Permitting HPZ-0BP4-6TQCH):
A wetlands delineation was performed in July 2023. The wetland in the project area consisted of ten segments with an approximate total area of 0.95-acre. Diminimus impacts to wetlands area, totaling 0.09 acres, will result from the proposed work. This project will result in improved ecological resources along the river's edge due to the naturalization of the shoreline. Proposed native vegetation will improve water quality and facilitate streamside aquatic habitat and foraging areas to do not currently exist.

Canal Park (Construction, WRP040025 V.1):
There are no anticipated wetlands impacts for the Canal Park Project. There are no wetlands in this project area.

6th St. Park (Concept Design): From the [TOC No. 23] 2014 Golder Wetland Delineation, there was 0.05 acres of wetland just north of 6th St. dam. These wetlands may be temporarily impacted by construction, but proper best management practices to protect, avoid, or minimize the impacts would be utilized. River for All conceptual plans for portions of this site along the left descending bank just north of the I-196 westbound bridge include the creation of two small marsh-type wetland features, which would lead to a beneficial impact.

Riverside Park (Master Plan only):
A wetland delineation has not yet been performed for this site. Based on the State's online wetland mapper, there could be 50-60 acres of wetland in the park, including the area of the lagoons. The goals of the project include to improve the lagoons, wetlands, wet meadows, and upland plantings. To achieve this goal, it may be necessary to impact wetlands in the park, but

these adverse impacts are assumed to be temporary, and permanent impacts would be positive. No permanent adverse impacts to the wetlands are anticipated. A wetland delineation will be performed prior to finalizing design. Temporary impacts due to construction may occur, but proper best management practices may be installed.

Ah-Nab-Awen Park - South (Active Design)
There are no anticipated wetlands impacts for this project. There are no wetlands in this project area.

Impacts on Stream Function

Lower Reach Project (Active Design):
This project proposes to remove four low-head dams from the reach, so changes to the existing stream function can be expected.

Corps Project including RFA#2 (Concept Design):
Similar to the Lower Reach Project, the Corps project proposes significant changes to the existing stream function of the Grand River through the project reach. The proposed removal of 6th Street Dam and installation of the proposed in-river features seeks to replace a very uniformly flowing and hydraulically disconnected reach with a more dynamic and diverse hydraulic environment that more-closely emulates a natural river The stream gradient distributed at the dam would be spread-out over the project reach, both over the proposed features and over the existing channel bed. Average flow velocities throughout the reach would generally increase. Water levels would increase, when compared to existing conditions, downstream of the dam and decrease between the dam and the proposed AHS, establishing a more-gradual hydraulic gradient throughout the reach. More diversity in flow depths and velocities, as well as substrate, would result from the project and riffles, glides, pools, and runs would exist that do not under existing conditions.

Lyon Edge Project (Construction, HP8-8RNS-2WDK2):
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

East River Edge Project (Campau) (Construction, HP8-PWB2-465KA):
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

Grand Rapids Public Museum Riverfront Improvements (Construction, HPD-8EMK-1EGF2):
This project is not anticipated to have discernable impacts to the stream function of the Grand River

Leonard St. to Ann St. Trail (Construction, WRP040128 v. 1):
This project is not anticipated to have discernable adverse impacts to the stream function of the Grand River.

Coldbrook Water Pump Stations – RFA #3 (Master Plan only):
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

Fish Ladder Park – RFA #5 (Master Plan only):
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

Wealthy St. Access (Concept Design):
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

201 Market Ave. (Permitting HPZ-0BP4-6TQCH):
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

Canal Park (Construction, WRP040025 V.1):
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

6th St. Park (Concept Design):
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

Riverside Park (Master Plan only):
If the lagoons are improved and wetlands are improved or added, there could be a positive impact on the stream function of the Grand River. None of the other improvements to this project would have discernable impacts to the stream function of the Grand River.

Ah-Nab-Awen Park - South (Active Design)
This project is not anticipated to have discernable impacts to the stream function of the Grand River.

Impacts on Modeled Flood Risk

Lower Reach Project (Active Design):
This project will be hydraulically modelled and will be required to maintain the City's freeboard deficient certification from FEMA. Localized increases in flood stages may occur, but no harmful interference is expected to result.

Corps Project including RFA#2 (Concept Design):
The Corps Project has been added to the cumulative impacts model for the Lower Reach Project as requested by EGLE. The model calculates a no-rise condition during the 100-yr flood based on the 30% design of the proposed improvements. Localized increases in flood stages are modeled to occur at some locations within the project reach; however, all increases would be contained within the flood protections system and would not result in harmful interference. The HEC-RAS model has been included as [TOC No. 11 Revised July 2022]. Refer to the Hydraulics Report [TOC No. 12 Revised July 2022] for further discussion.

Lyon Edge Project (Construction, HP8-8RNS-2WDK2):
Per the request from EGLE prior to Correction Request #3, all ancillary bank projects have been added to the HEC-RAS model for the Lower Reach Project; this includes the addition of the Lyon Edge Project. Model results indicate that no increases in modeled flood levels would occur from adding this project to the HEC-RAS model for the Project. The HEC-RAS model has been included as [TOC No. 11 Revised July 2022]. Refer to the Hydraulics Report [TOC No. 12 Revised July 2022] for further discussion.

East River Edge Project (Campau) (Construction, HP8-PWB2-465KA):
Per the request from EGLE prior to Correction Request #3, all ancillary bank projects have been added to the HEC-RAS model for the Lower Reach Project; this includes the addition of the East River Edge Project. Model results indicate that no increases in modeled flood levels would occur from adding this project to the HEC-RAS model for the Project. The HEC-RAS model has been included as [TOC No. 11 Revised July 2022]. Refer to the Hydraulics Report [TOC No. 12 Revised July 2022] for further discussion.

Grand Rapids Public Museum Riverfront Improvements (Construction, HPD-8EMK-1EGF2):
Per the request from EGLE prior to Correction Request #3, all ancillary bank projects have been added to the HEC-RAS model for the Lower Reach Project; this includes the addition of the Grand Rapids Public Museum Riverfront Improvements Project. Model results indicate that no increases in modeled flood levels would occur from adding this project to the HEC-RAS model for the Project. The HEC-RAS model has been included as [TOC No. 11 Revised August 2022]. Refer to the Hydraulics Report [TOC No. 12 Revised August 2022] for further discussion.

Leonard St. to Ann St. Trail (Construction, WRP040128 v. 1):
This project has a net fill of 100 CY in the floodplain with no fill proposed to be under the OHWM. No changes to the modelled flood risk are anticipated.

Coldbrook Water Pump Stations – RFA #3 (Master Plan only):
This project has not progressed design far enough to have developed a hydraulic model to incorporate into the cumulative impacts HEC-RAS model for the Lower Reach Project. Based

on the current estimate of earthwork quantities shown in Appendix B, this project would have a net cut within the floodplain; therefore, no adverse impacts to modeled flood risk are anticipated.

Fish Ladder Park – RFA #5 (Master Plan only):
This project has not progressed design far enough to have developed a hydraulic model to incorporate into the cumulative impacts HEC-RAS model for the Lower Reach Project. Based on the current estimate of earthwork quantities shown in Appendix B, this project would have a net cut below the OHWM and in the floodplain; therefore, no adverse impacts to modeled flood risk are anticipated.

Wealthy St. Access (Concept Design):
This project has not progressed design far enough to have developed a hydraulic model to incorporate into the cumulative impacts HEC-RAS model for the Lower Reach Project. Portions of this project may be designed to be within a conveyance shadow of the Wealthy St. bridge abutment and would be designed to have no impact on the base flood elevation. No adverse impacts to modelled flood risk are anticipated.

201 Market Ave. (Permitting HPZ-0BP4-6TQCH):
A hydraulic model for this project was created in HEC-RAS version 4.1. The project result in a slight decrease in Energy Grade Line or Hydraulic Grade Line throughout the project reach. Therefore, it is concluded the proposed project does not result in harmful interference.

Canal Park (Construction, WRP040025 V.1):
Based on the current estimate of earthwork quantities shown in Appendix B, this project would have a net cut below the OHWM and in the floodplain; therefore, no adverse impacts to modeled flood risk are anticipated.

6th St. Park (Concept Design):
This project has not progressed design far enough to have developed a hydraulic model to incorporate into the cumulative impacts HEC-RAS model for the Lower Reach Project. Based on the current estimate of earthwork quantities shown in Appendix B, this project would have a net cut below the OHWM and in the floodplain; therefore, no adverse impacts to modeled flood risk are anticipated.

Riverside Park (Master Plan only):
This project has not progressed design far enough to have developed a hydraulic model to incorporate into the cumulative impacts HEC-RAS model for the Lower Reach Project. The task of the design team is to build the project without causing an increase in the modeled flood levels.

Ah-Nab-Awen Park - South (Active Design)
This project has a dredge of 56 CY and fill of 128 CY which results in a net fill of 72 CY in the floodplain with no fill proposed to be under the OHWM. No changes to the modelled flood risk are anticipated.

Temporary Construction Impacts

Lower Reach Project (Active Design):
This project will evaluate construction means and methods to avoid and minimize construction impact to the environment. Disturbance from construction equipment (noise, equipment, traffic, vibration) may temporarily cause aquatic wildlife to flee from the nearshore area. However, it is anticipated species will return when construction is complete. Temporary turbidity during construction would be managed with industry standards and assumed to be performed.

Corps Project including RFA#2 (Concept Design):
Similar to the discussion of construction means and methods for the Lower Reach Project, included in Section 9.7 of the revised Basis of Design Report [TOC No. 6 Revised July 2022], temporary impacts during construction for this project would also evaluate alternative means and methods for construction to minimize and avoid impacts to aquatic resources. A discussion of temporary construction impacts to aquatic wildlife and threatened and endangered species for the Corps project has been included in the earlier section on Impacts to Wildlife and Habitat. Assumed construction impact was included in the assessments of the mussels. Temporary construction impacts to fish passage are minimal and would be similar to that of the Lower Reach project (Section 9.7.1 of Basis of Design [TOC No. 6 Revised July 2022]). It is worth noting that because the 6th St dam is currently a barrier to many species of fish in the Grand River, temporary adverse impacts to fish passage (relative to existing conditions) would be minimal. Disturbance from construction equipment (noise, equipment, traffic, vibration) may temporarily cause aquatic wildlife to flee from the nearshore area. However, it is anticipated species will return when construction is complete. Temporary turbidity during construction would be managed with industry standards and assumed to be performed in a similar fashion to means and methods proposed in the Lower Reach Project.

Lyon Edge Project (Construction, HP8-8RNS-2WDK2):
There are no construction impacts to the riverbed, shoreline or other water features as no work is proposed within the river and floodwall exists throughout entire project area. All work will occur from upland areas and no equipment will enter the river. Approximately 200 lineal feet of temporary construction debris net will be stretched under the work platform to ensure no construction debris enters the river. It is not anticipated that shade from the debris net will adversely impact aquatic resources. Proposed work activities will permanently reduce cover over bottom land by 367 square feet. It is anticipated that aquatic biota and insects will not be adversely impacted by temporary construction netting or increased sunlight. Disturbance from construction equipment (noise, equipment, traffic, vibration) may temporarily cause aquatic wildlife to flee from the nearshore area. However, it is anticipated species will return when construction is complete.

East River Edge Project (Campau) (Construction, HP8-PWB2-465KA):
All construction activities will occur from upland area and no heavy equipment will enter the water. A turbidity curtain will be placed sufficient to cover the entire project area during construction. Construction activities will permanently impact 360 lineal feet of shoreline. Approximately 288 square feet of riverbed will be impacted. Riverbed impacts will extend no greater than 2.75 lineal feet into water from edge of shoreline. Disturbance from construction equipment (noise, equipment, traffic, vibration) may temporarily cause aquatic wildlife to flee

from the nearshore area. However, it is anticipated species will return when construction is complete.

Grand Rapids Public Museum Riverfront Improvements (Construction, HPD-8EMK-1EGF2):
The majority of construction activities will occur from upland areas and no heavy equipment will enter the water. 500 lineal feet of temporary sheet piling will be installed approximately +/-1 foot east of water's edge at 3500 CFS. Approximately 500 square feet of riverbed will be impacted. Temporary sheeting is necessary to protect existing channel bank and undergrade structures during the construction process. Impacts to the riverbed, aquatic wildlife and organisms during construction will be negligible. Disturbances from construction equipment (noise, equipment, traffic, vibration, etc.) may temporarily cause aquatic wildlife to flee from the nearshore area, however, it is anticipated species will return when construction is complete.

Leonard St. to Ann St. Trail (Construction, WRP040128 v. 1):
Temporary construction impacts are anticipated to be minimal. All work will occur upland and will not be performed during high flow events. Disturbances from construction equipment (noise, equipment, traffic, vibration, etc.) may temporarily cause wildlife to flee from the area, however, it is anticipated species will return when construction is complete.

Coldbrook Water Pump Stations – RFA #3 (Master Plan only):
Since this project is only at conceptual design stage, the project design still needs significant development prior to developing a construction plan. For the sake of this cumulative impact assessment, several assumptions will be made to satisfy EGLE's request. However, these assumptions will be refined as the project develops.

The assumptions are discussed in the sections on impact to wildlife and habitat and turbidity above. The assumed impacts would be minimized using best management practices. There are no other anticipated constructions impacts at this time.

Fish Ladder Park – RFA #5 (Master Plan only):
Since this project is only at conceptual design stage, the project design still needs significant development prior to developing a construction plan. For the sake of this cumulative impact assessment, several assumptions will be made to satisfy EGLE's request. However, these assumptions will be refined as the project develops.

The assumptions are discussed in the sections on impact to wildlife and habitat and turbidity above. The assumed impacts would be minimized using best management practices. There are no other anticipated constructions impacts at this time.

Wealthy St. Access (Concept Design):
Since this project is only at conceptual design stage, the project design still needs significant development prior to developing a construction plan. For the sake of this cumulative impact assessment, several assumptions will be made to satisfy EGLE's request. However, these assumptions will be refined as the project develops.

The assumptions are discussed in the sections on impact to wildlife and habitat and turbidity above. The assumed temporary impacts would be minimized using best management practices. There are no other anticipated constructions impacts at this time.

201 Market Ave. (Permitting HPZ-0BP4-6TQCH):
Most of the construction of this project will take place in upland areas. Some work below the OHWM is needed in order to construction the base of the retaining wall or sea wall as well as to remove existing debris and plant vegetation. Prior to any work occurring, appropriate best management practices such as a turbidity curtain would be installed to limit any potential turbidity that arose from the project. The project will also schedule the work under the OHWM during periods of typical low flows on the Grand River.

Canal Park (Construction, WRP040025 V.1):
The construction is assumed to take place from the river edge and no work will occur from the riverbed. Appropriate best management practices such as turbidity curtain would be installed to limit any potential turbidity that arose from the project.

6th St. Park (Concept Design):
Since this project is only at conceptual design stage, the project design still needs significant development prior to developing a construction plan. For the sake of this cumulative impact assessment, several assumptions will be made to satisfy EGLE's request. However, these assumptions will be refined as the project develops.

The assumptions are discussed in the sections on impact to wildlife and habitat and turbidity above. The assumed impacts would be minimized using best management practices. There are no other anticipated constructions impacts at this time.

Riverside Park (Master Plan only):
Since this project is only at conceptual design stage, the project design still needs significant development prior to developing a construction plan. For the sake of this cumulative impact assessment, several assumptions will be made to satisfy EGLE's request. However, these assumptions will be refined as the project develops.

Any work along the river edge would take place from land. Appropriate best management practices such as turbidity curtain would be installed to limit any potential turbidity that arose from the project.

Ah-Nab-Awen Park - South (Active Design)
There are no construction impacts to the riverbed, shoreline or other water features as no work is proposed within the river or below the OHWM. All work will occur from upland areas and will not be any closer than 80' from the river's edge. Between the proposed work and river includes existing lawn and landscape beds. A silt fence barrier will be placed and maintained throughout the duration of construction to prevent any silt from entering the river.

APPENDIX D
Drawings

APPENDIX E

Other Supporting Information

Amendment to Biological Assessment June 2024

Biological Assessment 2024: Impacts to federal and state threatened and endangered species from rehabilitation of the Grand River between Bridge and Fulton Streets in Grand Rapids, Kent County, Michigan
Revision 1- *Amendment June 13, 2024*

RE: addition of temporary scour protection around Gillett Bridge piers during period of Dam 2 removal and construction isolation.

This increases the Direct Impact Area by 1,970 m^2 (170 m^2<=2 ft/sec; 1,800 >2ft/sec), decreases to Construction Indirect Impact Area by 1,970 m^2, and increases the number of mussels impacted by 592 animals. This includes:
5 E. triquetra
3 P. sintoxia
17 C. tuberculata
17 L. recta
3 P. alatus
10 T. truncata
4 A. marginata
24 L. costata

Temporary scour protection was verified by modeling to have no impact on modeled tailwater elevations

Modifications to the BA.
Executive Summary- Increase construction area from 45,445 m^2 to 47,415 m^2 Direct Impacts
Change from 11 Acres to 11.7 acres

1.0 Introduction
1.2.1 NRCS Action

Page 3, paragraph 3, change 45,445 m2 and 11 acres to 47,415 m2 and 11.7 acres

Informal consultation with U.S. Fish and Wildlife Service (USFWS) was initiated in October 2023 (Table 1-1). A series of meeting between NRCS, GRWW, City, USFWS, MDNR, and EGLE have been held to discuss the design and to further avoid, minimize, and mitigate impacts to the river, fish, and unionid mussels. Of the 127,600 m^2 (31.5 acres) Construction Area, 47,415 m^2 (11.7 acres) would be directly impacted during construction (direct impact area) of this project. This is approximately a 50% reduction in impact area from the previous design, 89,195 m^2 (22 acres).

Figure 1-1 modified to add the Gillett pier access and scour protection to the direct impact area.

2.0 Project description
2.1.1 Project location

Page 7, last paragraph, change area to 47,415 m^2 and 11.7 acres (direct impact area) and indirect construction impact area from 82,155 to 80,185 ,m^2 and 19.8 acres.

The Construction Area is within the wetted channel of the Grand River between Bridge and Fulton Street bridges in Grand Rapids, Kent County, Michigan. Of the 127,600 m^2 (31.5

acres) Construction Area, 47,415 m^2 (11.7 acres) would be directly impacted during construction (direct impact area) (Table 2-1). This is approximately a 50% reduction in construction impact area from the previous design, 89,195 m^2 (22 acres). The river bottom would not be physically modified in approximately 80,185 m^2 (19.8 acres) of the Construction Area (construction indirect impact area), but could be affected by turbidity and changes in local hydraulic conditions. Staging and access areas would primarily be from Ah-Nab-Awen Park (park).

2.1.2 Evaluation metrics

Page 8, second paragraph. Add to the definition of direct impact areas-

Area affected by construction (direct impact areas) considered all areas that would be impacted by causeways constructed to access and work in construction areas in the dam removal and riffle construction areas, and tracking in the river needed for placement of emergent habitat boulder fields, diversified boulder arches, and rock pile vanes downstream of Pearl Street. The direct impact area also includes the area needed to access and place temporary scour protection around the Gillett Bridge piers.

Modified construction sheets are attached.

Page 8, third paragraph-

Permanent impact area includes a sum of all structures that would not be available to freshwater mussels post-construction. This includes boulders and rock used for riffles, diversified boulder arches, emergent habitat boulder fields, rock vanes, and transient sand. Scour protection would be removed when the Dam 2 construction area is no longer isolated. This area is not considered a permanent impact area.

2.1.4 NRCS project

Page 14, first paragraph add scour protection-

Limiting construction to lower flows allows construction to occur in the wet, negating the need for most of the isolation measures previously proposed. Causeways of imported clean coarse aggregate would be installed along the west bank to access the Dam 1, 3, and 4 construction areas, as well as the bank vane structures and the emergent habitat boulder fields downstream of Pearl Street. The Dam 2 construction area would be accessed directly from the staging area. A low causeway (<0.6 m) may also be needed to access Gillett Bridge piers. However, if river levels permit, piers could be accessed by tracking on the river bottom. Construction equipment would be equipped with Global Positioning Systems (GPS) to ensure all construction and in river tracking is within the direct impact areas outlined in this BA.

Page 14, paragraph 4 add paragraph between paragraphs 3 and 4

Flow velocity may increase when the Dam 2 cofferdam is in place, potentially increasing scour around the Gillett Bridge piers. Therefore, a low causeway (<0.6 m) may be installed to access these piers to place temporary scour protection. The causeway would extend from the causeway along the west bank. Scour protection would extend around the three eastern most piers to twice the pier width (4.4 m; 14.4 ft). Scour protection would be installed before the Dam 2 area is isolated in July/August (after *P. marinus* spawning season). The temporary causeway and scour protection would be removed before the end of the construction season at the latest (not left in over winter). The additional material

in the river has been modeled to have no impact on tailwater elevation at 6th Street Dam and would not be in the river during *P. marinus* spawning season.

2.1.5 NRCS Project Impacts

Page 17- second paragraph in this section- Add temporary scour protection to the second sentence.

Project elements that could directly affect TES mussels include any actions that would affect freshwater unionid mussels and/or their habitat. TES would be harmed (killed or injured) by construction of temporary causeways, temporary scour protection, a cofferdam structure, substrate placement, grading, and equipment tracking within the river channel.

Page 17-Fourth paragraph in this section- Change 45,445 m^2 (11 acres) to 47,415 m^2 and 11.7 acres. Also add scour protection and update species numbers.

The area that would be affected by project construction includes the area from 91 m (300 ft) upstream of Bridge Street to the upstream face of Fulton Street, an area of 127,600 m^2 (31.5 acres) (Table 2-1). Of this, 47,415 m^2 (11.7 acres) would be directly impacted during dam removal, temporary scour protection placement, and causeway and feature creation. If unionid mussels are evenly scattered throughout the direct impact areas, approximately 128 *E. triquetra*, 1,878 additional Michigan TES, and 12,219 other unionid species could be impacted during construction (Table 2-1 updated). Unionids not relocated from direct impact areas could be crushed by construction activities. As many unionids as practicable would be translocated from direct impact areas before construction to minimize these impacts. However, unsafe diving/collection conditions may prevent some unionids from being removed (see Grand Rapids/GRWW relocation project, Section 2.2). Those not relocated would be considered Take and mitigated through a mitigation fund (see Section 2.3).

Updated Table 2-1

Page 18- top of the page- change area and animal numbers

The area of indirect impact within the construction area is approximately 80,185 m^2 (19.8 acres). Approximately 216 *E. triquetra*, 3,175 additional Michigan TES , and 20,664 other unionids could be affected by increases in turbidity and slight changes in local hydraulics (Table 2-1).

2.1.6 Conservation Measures

Page 20, first bullet point- update areas

The project has changed from most of the Project Area being isolated and impacted directly (89,195 m^2 direct impact Area; EcoAnalysts, 2020) to direct impact area of only 47,415 m^2, a 50% reduction in area affected by the project. Rather than the river being constrained by isolation measures during construction, construction would occur in the flowing river. Only a small area (3,285 m^2) at Dam 2 would be isolated during construction (Table 2-9), and the area would not be isolated during *P. marinus* migration season.

2.2 Grand Rapids/GRWW Relocation Project

Page 22, update areas and no. of animals

The Grand Rapids/GRWW Relocation Project would consist of collecting as many mussels as possible from the NRCS Project direct impact areas with USFWS assistance (Figure 1-1) and translocating them to three recipient sites (Figure 1-4). The area that would be affected by project construction includes the area from 91 m (300 ft) upstream of Bridge

Street to the upstream face of Fulton Street, an area of 127,600 m^2 (31.5 acres) (Table 2-1). Of this, 47,415 m^2 (11.7 acres) would be directly impacted during dam removal, and scour protection, causeway and feature creation. If unionid mussels are evenly scattered throughout the direct impact areas, approximately 128 *E. triquetra*, 1,878 other Michigan TES, and 12,219 other unionid species could be impacted during construction (Table 2-1). Unionids not relocated from direct impact areas could be crushed by construction activities. As many unionids as practicable would be translocated from direct impact areas before construction in 2024 to minimize these impacts. However, unsafe diving/collection conditions may prevent some unionids from being removed.

2.2.1 Recipient sites

Page 22, first paragraph, change no. of animals

A survey was conducted in 2015 to identify suitable recipient sites for mussels that would be translocated from NRCS Project impact areas (ESI, 2016). Five potential sites were identified; Ionia, Saranac, Chief Hazy Cloud, Ada, and Site 7. Of these, Ada is the largest (23,480 m^2 [5.8 acres]) site, and most of the TES were found at this site (Tables 2-7 and 2-8). The best habitat within the Ada bed is 3,400 m^2 (0.8 acres) mid channel (Figure 2-5). As many 10 m x 10 m areas as needed to accommodate TES would be established using corner markers driven into the substrate and either PVC pipe or ropes between the corner markers within this section of the site for the placement of TES. TES would be hand placed 1 unionid/m^2 into the 10 x 10 areas. A PVC grid with 1 m^2 cells would be used to delineate positions within the 10 x 10 area. The remainder of the site would be used to place common species. Density within this site averaged 2.8 unionids/m^2. If density is increased no more than 50%, the site can accommodate 4,760 TES individuals and 21,000 common individuals (Table 2-8). If mussels could be collected from all of the direct impact areas with no mortality, approximately 128 *E. triquetra*, 1,878 other Michigan TES, and 12,218 common individuals could be moved (Table 2-9). Landowners near the site would be contacted before any work is conducted.

Table 2-9 updated

2.2.2 Collection and Translocation Safety Limitations and Timing

Update Figure 2-8

2.2.3 Collection and Translocation Methods

No changes to text

Updated Table 2-11 and 2-12

2.2.4 Monitoring

No changes

2.3 Mitigation Fund

As many mussels as possible would be collected from direct impact areas and translocated to one of the three recipient sites under the Grand Rapids/GRWW project (see Section 2.2). The estimated area of direct impacts is 47,415 m^2. Using an average unionid density of 0.3 unionids/m^2, approximately 14,224 unionids occur within direct impact areas (Table 2-9). Mussels would at least be collected and translocated from within the isolated area. Up to 15% of those mussels may be missed during collection, and up to 5% might die due to handling. Minimum number of mussels that would be translocated would be 830 mussels, with mortality of 13,394 mussels (Table 2-12). If mussel collection in all of the direct impact area can be safely done, then

with 15% of the mussels missed and 5% mortality due to handling, the maximum number of mussels that would be relocated would be 11,485.

A mitigation fund would be established to offset the take for the mussels that were unable to be translocated under the Grand Rapids/GRWW Project. The maximum mitigation fund contribution would be based on $34.10/mussel (2020 BA $28.50/mussel escalated for inflation) and would not exceed $456,743 (Table 2-13 updated). This fund would be reduced by the amount of mussels that are translocated multiplied by the cost per mussel as stated above. The objective of the mitigation fund would be to fund projects that provide a direct benefit to mussels to achieve the USFWS "no net loss" policy and offset any potential impacts from mussels that were unable to be translocated. The work performed through the mitigation fund would help inform future conservation and habitat restoration efforts.

2.4 Project schedule – no changes

3.0 Environmental Setting and Biological Resources- no changes

4.0 Species Considered- no changes

5.0 Effects of Proposed Action

Tables 5-1, 5-2, 5-3, 5-4 and 5-5 updated

First paragraph- change areas

The construction area for the NRCS project spans from 91 m (300 ft) upstream of Bridge Street to Fulton Street, 127,600 m^2 (31.5 acres). Of this 47,415 m^2 (11.7 acres) would be directly impacted during construction, and the areas between direct impact areas (80,185 m^2; 19.8 acres) would be indirectly impacted by temporary increases in turbidity and changes in flow patterns associated with causeways and features constructed in the river. Scouring of the existing riverbed outside of direct impact areas is not anticipated during construction. Upstream indirect impacts during construction (38,420 m^2; 9.5 acres) would be limited to slight changes in depth and velocity depending on what construction and project features are in the river. Construction sequencing has been developed to ensure increases in modeled tailwater levels are avoided and minimized during *P. marinus* migration. Barrier criteria for *P. marinus* would be maintained through construction and post-construction, and Great Lakes Fish Commission (GLFC) who monitors the Grand River for *P. marinus*, have been notified of the project.

Third paragraph-change areas and mussel numbers

The Project would be constructed from causeways constructed in the river or with equipment tracking on the river bottom. One small area within the Dam 2 direct impact area would be isolated from the flow of the river for construction. All unionids, and any fish that do not leave the direct impact areas, outside the isolation area may be crushed under causeways or by tracking equipment, excavation, grading, and placement of rock. To minimize mortality of unionid mussels, mussels would be collected and translocated from as much area as practicable within direct impact areas under the Grand Rapids/GRWW project. If an equal mussel density of 0.3 unionids/m^2 is assumed throughout the direct impact areas (47,415 m^2), approximately 128 *E. triquetra*, 1,878 additional Michigan TES, and 12,219 other mussels occur in direct impact areas (Table 5-1). If mussels can be translocated from all of the direct impact area (best case), with a collection efficiency of 85% and 5% mortality due to handling, mortality would only be from

translocation and is expected to include 20 *E. triquetra*, 296 Michigan TES, and 1,924 common species (Table 5-2). This would be the minimum Take (Table 5-4).

Fourth paragraph- change areas and mussel numbers

Under worst case conditions (maximum Take), mussels would at least be translocated from within the small, isolated area (3,285 m^2). The construction team would need to wait for fish and unionids to be moved from within the isolated area before construction. A maximum of 10 days of mussel translocation is allocated for this effort. Approximately 9 *E. triquetra*, 130 TES, and 847 common species occur in the isolated area (Table 5-1). Collection efficiency in this area is expected to be 85%; however, up to 5% mortality could occur from handling. Mortality from the translocation effort is expected to include 1 *E. triquetra*, 21 TES, and 133 common species (Table 5-2). Worst case, mussels would only be collected from the isolated area, mussels in other parts of the direct impact area would be negatively impacted. Mortality from direct impact areas where mussels are not translocated would include 119 *E. triquetra*, 1,748 additional Michigan TES, and 11,372 common species (Table 5-3). Total mortality (uncollected direct impact areas + translocation mortality) would include 120 E. *triquetra*, 1,768 additional Michigan TES, and 11,505 other mussels (Table 5-4).

Fifth paragraph- change areas and mussel numbers

The most likely scenario is if river conditions permit, mussels should be translocated from the isolated area and all areas with ≤0.6 m/sec (2 ft/sec) velocity. The estimated number of mussels in low velocities areas and the isolated area combined includes 32 *E. triquetra*, 462 additional Michigan TES, and 3,010 other individuals. Translocation mortality would include 4 *E. triquetra*, 60 additional Michigan TES, and 388 other individuals (Table 5-2). An additional 93 *E. triquetra*, 1,369 additional Michigan TES, and 8,909 other mussels would be killed in areas where collection could not occur due to unsafe conditions (Table 5-3). Total mortality under this scenario (direct impact areas >0.6 m/sec [not translocated] + translocation take) would be 97 *E. triquetra*, 1,429 additional Michigan TES, and 9,297 common mussels (Table 5-4).

Sixth paragraph-- change areas and mussel numbers

Mussels may also be temporarily affected by increased turbidity and changes in local hydraulic conditions in Construction Area indirect impact areas. No scour holes are expected to develop during construction outside of direct impact areas. Host fish activity in these areas may be altered. Turbidity would be monitored and adaptively managed to minimize these effects. The area of construction indirect impact area is approximately 80,185 m^2 (Table 5-5). Approximately 24,056 mussels, including 216 *E. triquetra* and 3,175 additional Michigan TES could occur in the Construction Area indirect impact area (Table 5-5). These mussels could be temporarily stressed during construction or host fish may not be available during glochidial release, and a few year classes may be lost.

7.0 Conclusions and determination of effects

7.1 Federal Endangered Species- E. triquetra; change numbers

The NRCS Project may affect and is likely to adversely affect *E. triquetra*, but would not jeopardize the continued existence of this species. *Epioblasma triquetra* occur at a low frequency (0.9%) within the Project Area. An estimated 128 *E. triquetra* occur in the direct impact area (Table 5-1). The Grand Rapids/GRWW relocation project would translocate 85% of *E. triquetra* from within at least the isolated area to minimize harm and 5% mortality is expected during translocation (Table 5-2). At a minimum, 20 *E. triquetra* would be directly harmed during translocation if all unionids in direct impact areas are translocated (Table 5-4). If only mussels in the isolated area are translocated, 120 *E.*

triquetra could be directly harmed (Table 5-4). An additional 27 could be harmed by OMRRR activities (Tables 5-6). OMRRR take would be reduced by translocation if practical. Approximately 104 *E. triquetra* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *E. triquetra*. Approximately 216 *E. triquetra* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. Based on relative abundance at the I-196 bridge, approximately 55 *Epioblasma triquetra* may occur downstream of Fulton Street and could be indirectly affected by any downstream increased turbidity.

7.2 Michigan Endangered Species

Toxolasma parvum (Lilliput)- no changes

7.3 Michigan Threatened Species- change numbers

Cyclonaias tuberculata (Purple Wartyback)

The NRCS Project would result in take of *C. tuberculata*. *Cyclonaias tuberculata* occur at a frequency of 2.9% within the Project Area. An estimated 407 *C. tuberculata* occur in the direct impact area (Table 5-1). The Grand Rapids/GRWW relocation project would translocate 85% of *C. tuberculata* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 64 *C. tuberculata* could be negatively impacted during translocation (Table 5-4). If only mussels in the isolated area are translocated, 383 *C. tuberculata* could be negatively impacted (Table 5-4). An additional 86 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 330 *C. tuberculata* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *C. tuberculata*. Approximately 688 *C. tuberculata* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Cyclonaias tuberculata* has been collected downstream of Fulton Street and an estimated five could be indirectly affected by any downstream increased turbidity (Table 5-5).

Ligumia recta (Black Sandshell)

The NRCS Project would result in take of *L. recta*. *Ligumia recta* occur at a frequency of 2.9% within the Project Area. An estimated 411 *L. recta* occur in the direct impact area (Table 5-1). The Grand Rapids/GRWW relocation project would translocate 85% of *L. recta* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). At a minimum, 65 *L. recta* would be directly impacted during translocation if all unionids in direct impact areas are translocated (Table 5-4). If only mussels in the isolated area are translocated, 387 *L. recta* could be directly impacted (Table 5-4). An additional 87 could be directly impacted by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 333 *L. recta* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *L. recta*. Approximately 695 *L. recta* could occur in the Construction Area indirect impact area and could be

temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Ligumia recta* has been collected downstream of Fulton Street and an estimated 255 could be indirectly affected by any downstream increased turbidity.

Alasmidonta viridis (Slippershell)-no change

Acipenser fulvescens (Lake Sturgeon)-no change

Moxostoma carinatum (River Redhorse)-no change

7.4 Michigan Species of Special Concern

Pleurobema sintoxia (Round Pigtoe)-update numbers

The NRCS Project would result in take of *P. sintoxia*. *Pleurobema sintoxia* occur at a frequency of 0.4% within the Project Area. An estimated 61 *P. sintoxia* occur in the direct impact area (Table 5-1). The Grand Rapids/GRWW relocation project would translocate 85% of *P. sintoxia* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 10 *P. sintoxia* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 58 *P. sintoxia* could be directly affected (Table 5-4). An additional 13 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 50 *P. sintoxia* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *P. sintoxia*. Approximately 103 *P. sintoxia* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Pleurobema sintoxia* has not been collected downstream of Fulton Street, but may occur there and a few could be indirectly affected by any downstream increased turbidity.

Potamilus alatus (Pink Heelsplitter)- update numbers

The NRCS Project would result in take of *P. alatus*. *Potamilus alatus* occur at a frequency of 0.5% within the Project Area. An estimated 77 *P. alatus* occur in the direct impact area (Table 5-1). The Grand Rapids/GRWW relocation project would translocate 85% of *P. alatus* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 12 *P. alatus* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 72 *P. alatus* could be directly affected (Table 5-4). An additional 16 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 62 *P. alatus* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *P. alatus*. Approximately 130 *P. alatus* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used

during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Potamilus alatus* was collected downstream of Fulton Street, approximately 705 could be indirectly affected by any downstream increased turbidity.

Truncilla truncata (Deertoe)- update numbers

The NRCS Project would result in take of *T. truncata*. *Truncilla truncata* occur at a frequency of 1.7% within the Project Area. An estimated 240 *T. truncata* occur in the direct impact area (Table 5-1).The Grand Rapids/GRWW relocation project would translocate 85% of *T. truncata* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 38 *T. truncata* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 226 *T. truncata* could be directly affected (Table 5-4). An additional 51 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 195 *T. truncata* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *T. truncata*. Approximately 407 *T. truncata* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Truncilla truncata* has been collected downstream of Fulton Street and an estimated 8,530 could be indirectly affected by any downstream increased turbidity.

Venustaconcha ellipsiformis (Ellipse)-update numbers

The NRCS Project would result in take of *V. ellipsiformis*. *Venustaconcha ellipsiformis* occur at a frequency of 0.06% within the Project Area. An estimated 9 *V. ellipsiformis* occur in the direct impact area (Table 5-1). The Grand Rapids/GRWW relocation project would translocate 85% of *V. ellipsiformis* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 1 *V. ellipsiformis* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 8 *V. ellipsiformis* could be directly affected (Table 5-4). An additional 2 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 7 *V. ellipsiformis* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *V. ellipsiformis*. Approximately 14 *V. ellipsiformis* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Venustaconcha ellipsiformis* has not been collected downstream of Fulton Street, but may occur there and a few could be indirectly affected by any downstream increased turbidity.

Alasmidonta marginata (Elktoe)-update numbers

The NRCS Project would result in take of *A. marginata*. *Alasmidonta marginata* occur at a frequency of 0.7% within the Project Area. An estimated 102 *A. marginata* occur in the direct impact area (Table 5-1). The Grand Rapids/GRWW relocation project would translocate 85% of *A. marginata* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 16 *A.*

marginata would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 96 *A. marginata* could be directly affected (Table 5-4). An additional 22 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 83 *A. marginata* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *A. marginata*. Approximately 173 *A. marginata* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. A few *A. marginata* were collected downstream of Fulton Street at the I-196 bridge, and a few could be indirectly affected by any downstream increased turbidity.

Lasmigona compressa (Creek Heelsplitter)-no changes

Lasmigona costata (Flutedshell)- update numbers

The NRCS Project would result in take of *L. costata*. *Lasmigona costata* occur at a frequency of 4.0% within the Project Area. An estimated 566 *L. costata* occur in the direct impact area (Table 5-1). The Grand Rapids/GRWW relocation project would translocate 85% of *L. costata* from within at least the isolated area to minimize effects and 5% mortality is expected during translocation (Table 5-2). If unionids are collected from all direct impact areas, 89 *L. costata* would be directly affected during translocation (Table 5-4). If only mussels in the isolated area are translocated, 533 *L. costata* could be directly affected (Table 5-4). An additional 119 could be affected by OMRRR activities (Tables 5-6). OMRRR effects would be reduced by translocation if practical. Approximately 459 *L. costata* could occur in the upstream indirect impact area (Table 5-5). Hydraulic changes to this reach would be minor and are not expected to adversely affect *L. costata*. Approximately 957 *L. costata* could occur in the Construction Area indirect impact area and could be temporarily affected by sporadic increases in turbidity (Table 5-5). Increases in turbidity could affect feeding and reproduction depending on the magnitude and duration of turbidity plumes. BMPs would be used during construction to minimize turbidity, and turbidity would be monitored and adaptively managed to minimize effects. *Lasmigona costata* has not been collected downstream of Fulton Street, but may occur there and a few could be indirectly affected by any downstream increased turbidity.

Utterbackia imbecillis (Paper Pondshell) – no changes

Table 2-1 updated. Existing and Current Project areas and impacts to unionid mussels.

	Existing	2024 Project
Total wetted area at 890 CFS (m2)	167,353	166,020
Permanent impact area	643	4,638
Area available for mussel colonization[1]	166,710	161,382
Estimated no. of mussels in available area	50,013	48,415
Modeled Hydrophysical Habitat[2]	6,080	7,565
Construction Area		127,600
Direct Impact Area	0	47,415
Epioblasma triquetra	-	128
Michigan TES	-	1,878
Other unionid species	-	12,219
Indirect Impact Area		80,185
Epioblasma triquetra	-	216
Michigan TES	-	3,175
Other unionid species	-	20,664
OMRRR mussel area[3]		10,000
Epioblasma triquetra	-	27
Michigan TES	-	396
Other unionid species	-	2,577
Upstream Indirect Impact Area[4]		38,420
Epioblasma triquetra	-	104
Michigan TES	-	1,521
Other unionid species	-	9,901
Downstream Indirect Impact Area[5]		282,600
Epioblasma triquetra	-	?
Michigan TES	-	?
Other unionid species	-	28,260

[1]890 wetted area minus dams, boulders, transient sand, and rock or structures that mussels cannot occupy

[2] Areas with current velocity under 1,200 CFS conditions between 0.12 and 0.50 ft/sec; this defines areas with some flow under low flow, but not scouring flow.
Shear stress at 3,900 CFS >0.01 lb/sf to prevent sand deposition

[3] OMRRR (operation, maintenance, repair, rehabilitation, and replacement)

[4] 6th Street Dam to Construction Area

[5] Fulton St. to Plaster Creek - live E. triquetra have been found downstream of Fulton, insufficient data on E. triquetra and Michigan TES species to evaluate

Table 2-2. Coordinates[1] for sites within the Action Area.

Site	Easting	Northing
Upstream Indirect Impact Area		
Upstream west	608009	4758821
Upstream east	608158	4758823
Downstream west	608003	4758480

Yellow shading indicates conditions when the distance from the crest to tailwater level is <18"

[1]See Appendix D for methods and data

[2]WSE = wetted surface elevation (mean sea level; ft)

[3]Change = Existing - Post-construction or Construction conditions

[4]Assumes casueways to Dams 1 and 2, and causeways downstream of Pearl Street have been installed and all dams remain in place

[5]Assumes that the coffers at Dam 2 have been installed in addition to all causeways and scour protection as described in model 1 and all dams remain in place

[6]Assumes the cofferdam has been removed and all proposed improvements are completed, but all causeways are still present

Table 2-4. Water surface elevation (WSE) at the base of the fish ladder.[1]

							Difference to invert[3]				
			Construction					Construction			
Flowrate CFS	Fish Ladder Invert	Existing[2]	Temp. model condtions 1[4]	Temp. model condtions 2[5]	Temp. model condtions 3[6]	Post constr.	Existing[2]	Temp. model condtions 1	Temp. model condtions 2	Temp. model condtions 3	Post constr.

[1] Habitat for Cyprinidae (Minnows, Shiners)

[2] Habitat for *Lepomis* sp. (Sunfish), juvenile fish, *Catostoma commersoni* (White Sucker)

[3] Habitat for Ictaluridae (Catfish), *Micropterus* sp. (Bass); slow flowing, at least 1 m (3 ft) at 2500 CFS

[4] Habitat for *Percina caprodes* (Logperch), juvenile Ictaluridae (Catfish), juvenile Catostomidae (Suckers)

[5] Habitat for *Moxostoma* sp. (Redhorse), *Hypentelium nigricans* (N. Hogsuckers)

[6] Habitat for *Aplodinotis grunniens* (Freshwater Drum)

Table 2-6. Estimated fish passage success for three length groups of walleye at challenging swim

Location	CFS	Swim path #	50% of Population Would Pass 15" TL	17" TL	20" TL
Upper Ah-Nab-Awen Park (W-Weir/Riffle)	5,000	1	Y	Y	Y
		2	N	N	N
		3	Y	Y	Y
Lower Ah-Nab-Awen (Riffle Structure)	5,000	4	Y	Y	Y
		5	N	N	Y
		6	Y	Y	Y
Museum/JW Marriott	3,900	7	Y	Y	Y
		8	N	N	Y
		9	Y	Y	Y
		10	Y	Y	Y
Downstream of Blue Bridge	2,500	11	N	N	Y
		12	N	N	N
		13	Y	Y	Y
		14	Y	Y	Y
		15	Y	Y	Y

Modified from Holtgren (2024), see Appendix E for fish swimpaths

Y indicates at least 50% of the population would pass, N indicates they would not pass

Table 2-7. Unionid species collected within the lower Grand River, 2013 to 2020.

Nomenclature follows FMCS (2023)

FD = Freshly dead shell, WD = Weathered dead shell, SF = Subfossil

[1]FE = federally endangered (USFWS, 2024); ME = Michigan endangered, MT = Michigan threatened, MSC = Michigan species of special concern (https://mnfi.anr.msu.edu/species/animals; accessed February 2024)

[2]ESI (2016); [3]ESI (2017a); EcoAnalysts (2018); [4] ESI (2014) quantitative samples only

[5]Number collected based on combination of quantitative and qualitative samples in 2013 (ESI, 2014);

species found in other studies (JFNew, 2013a, b, c, d; Cardno, 2017) or years (ESI, 2017a; ESI, 2018; EcoAnalysts, 2018, 2019, 2020) are indicate with an L (live)

[6]EcoAnalysts (2021); Species collected by EcoAnalysts (2019) are indicted with an L (live)

[7]Includes Sites 13 and 14 (ESI, 2016; ESI, 2018) and Site I196S (JFNew, 2013b; GEI, 2023); see Figure 3-1

[8]Based on quantitative samples only; [9]Samples were not distributed throughout the Project Area, samples were biased toward higher density areas

Table 2-8. Recipient site areas available for placing TES.[1]

	Ionia	Saranac	Peace Park	Chief Hazy Cloud	Ada	Site 7	Riverside Park[2]	Plaster Creek[2]	Total
Area (m^2)	9,421	5,650	6,749	1,991	23,480	6,675	8,650	286	62,902
Density	2.4	3.4	4.5	4.0	2.8	0.7	1.6	-	
Mussel estimate	22,610	19,210	30,371	7,964	65,744	4,673	13,840	-	164,411
TES Grid Area	-	-	-	-	3,400	-	8,650	286	12,050
No. of TES unionids[1]	-	-	-	-	4,760	-	6,920	-	11,680
Non-TES Area	9,421	5,650	6,749	1,991	15,000	6,675	-	-	45,486
No. mussels[2]	11,305	9,605	15,185	3,982	21,000	2,336	-	-	63,414

[1] No. of mussels that could be placed in the area, assuming density increase will be no more than 50% of resident density

[2]Very few *T. parvum, U. imbecillis, T. truncata* , or *P. alatus* are expected to be placed at these sites

Table 2-9. Estimated number of mussels, including TES within Direct Impact Areas that could translocatec

	Total[1]	≤2ft/sec[2]	Isolated Area[3]
Area (m^2)	47,415	9,560	3,285
No. unionids (0.3/m^2)	14,224	2,868	986
No. *E. triquetra* (0.90%)	128	26	9
No. Michigan TES (13.20%)	1,878	379	130
No. common species (85.90%)	12,218	2,464	847

Relative abundance of species based on Table 1-2

[1]Total direct impact area and estimated number of unionid mussels within direct impact areas

[2]Area within direct impact areas with current velocity ≤2ft/sec under 2500 CFS conditions and considered safe for collecting (excludes isolated area)

[3]Isolated area that would be dewatered and safe for collecting unionid mussels

Table 2-10. Construction and mussel translocation flow rate exceedance probability chart.

Week of	Percent Chance of Exceedance (10 year record)					
	1,500 cfs	2,500 cfs	3,000 cfs	3,500 cfs	5,000 cfs	7,500 cfs

24-Dec	100%	96%	88%	79%	32%	10%

Table 2-11. Estimated collection effort in Direct Impact areas ≤2 ft/sec under 2,500 CFS conditions.

Construction Area	Total Area (m^2)	Estimated person days[1]	Area (m^2) ≤2 ft/sec[2]	Estimated person days[1]
Dam 2 [3]	6,925	58	810	7
Dam 1	9,045	75	2,470	21
Dam 3 and 4	14,950	125	5,815	48
Down of Pearl	11,240	94	295	2
Isolated area	3,285	27	3,285	27
Scour protection	1,970	16	170	1
Total	47,415	395	12,845	107

[1] Assumes 3 min/m^2, with 1 diver/snorkeler, 6 hours of active collecting/day (see methods in text)

[2] Excludes areas within 10 m of the lowhead dams (see Figure 2-8)

[3] Excluding isolated area

Table 2-12. Potential mussel mortality.

	Isolated area only collected (Maximum mortality)					Area ≤2 ft/sec^2 and isolated area (most likely)					All Direct Impact Areas collected (Minimum mortality)			
	Mortality of mussels outside the isolated area	Mussels within the isolated area	15% not collected	5% mortality	Total Mortality	Mortality of mussels outside the collection area	Est. no. of unionids	15% not collected	5% mortality	Total	Est. no. of unionids	15% not collected	5% mortality	Total
Area (m^2)	44,130	3,285				34,570	9,560				47,415			
No. unionids (0.3/m^2)	13,239	986	148	7	13,394	10,371	2,868	430	18	10,819	14,225	2,134	107	2,240
No. *E. triquetra* (0.90%)	119	9	1	0	121	93	26	4	0	97	128	19	1	20
No. Michigan TES (13.20%)	1,748	130	20	1	1,768	1,369	379	57	3	1,429	1,878	282	14	296
No. common species (85.80%)	11,372	847	127	6	11,506	8,909	2,464	370	18	9,297	12,219	1,833	92	1,924

Table 2-13. Potential unionid mortality and resulting mitigation fund.

	Potential Unionid Mortality[1]			Mitigation Fund[2]		
	All Direct Impact Areas translocated	Isolated and ≤2ft/sec areas translocated	Only isolated area translocated	All Direct Impact Areas translocated	Isolated area and ≤2ft/sec areas translocated	Only isolated area translocated
Area (m^2)	47,415	9,560	44,130			
No. unionids (0.3/m^2)	2,240	10,819	13,394	$76,396.23	$368,934.72	$456,742.77
No. *E. triquetra* (0.90%)	20	97	121			
No. Michigan TES (13.20%)	296	1,429	1,768			
No. common species (85.80%)	1,924	9,297	11,506			

[1] 15% not relocated within collected area and 5% not surviving relocation

[2]Mitigation fund based on mortality x $34.10; $28.50 used in the 2020 BA adjusted for inflation between 2020 and 2024.

Table 2-14. Anticipated permitting and construction schedule.

Task/Milestone	Schedule[1]
Final Biological Assessment Submitted to NRCS	February 2024
NRCS Submittal of Biological Assessment (BA) to USFWS	February 2024
USFWS Formal Consultation of BA	February to May 2024
Biological Opinion	June/July 2024
Endangered species permits issued by MDNR	April 2024
MDNR scientific collecting permit	May-24
Mussel translocation[2]	August to October 2024
Publish Draft EA for Public Review	April 2024
Prepare Draft Final EA	May 2024
EGLE Permit Submission	March 2024
Final EA	June 2024
EGLE Review	90 days
EGLE permit receipt	June 2024
Construction Mobilization	April to May 2025
Construction	June 2025 to October 2026

[1] Dates are tentative

[2] Some translocation may occur in 2025

Table 5-1. Estimated number of unionid mussels in the Direct Impact areas.

		Direct Impact Area (m^2)			
	Relative Abundance (%)[1]	Isolated Area[2]	≤2ft/sec[3]	Other Direct Impact Areas[4]	Total
