

Water Quantity Enhancement Activity – WQT07 – Regional weather networks for irrigation scheduling

Enhancement Description

Crop evapotranspiration (crop ET) information from a regional weather network is utilized as a part of the irrigation water management plan for irrigation scheduling. Water use is planned and adjustments in application rates and timing are made using the regional weather network data.

Land Use Applicability

Cropland, Pastureland

Benefits

The use of data from regional weather networks can improve a farmer’s estimate of evapotranspiration from irrigated crops. This information combined with local rainfall data and monitoring of soil moisture can significantly improve the accuracy of irrigation timing and application rates. Benefits include reduced aquifer depletion, and reduced runoff and deep percolation, both of which reduce movement of agrichemicals from farm fields to aquifers, lakes, and streams.

Conditions Where Enhancement Applies

This enhancement applies to irrigated cropland or pastureland where regional weather data is not currently used to schedule irrigation events.

Criteria

This enhancement requires:

1. A subscription to a regional weather network that supplies crop ET values for irrigation scheduling.
2. The crop ET information from the network must be used as part of the irrigation water management plan to match water application rates and timing to the needs of the crops and soils.

Adoption Requirements

This enhancement is considered adopted when the applicant has a valid subscription to a regional weather service, has developed an irrigation water management plan based on the ET data from

United States Department of Agriculture
Natural Resources Conservation Service

2012 Ranking Period 1

the regional weather network and has a record of irrigation events based on the ET data from the regional weather network.

Documentation Requirements

1. Documentation of subscription to a regional weather network.
2. An irrigation water management plan showing the use of the crop ET data from a weather network in irrigation scheduling.
3. A record of actual irrigation events based on the ET data from the weather network.

Michigan Supplement

WQT 07

The Michigan Agricultural Weather Network (MAWN) calculates hourly PET at each station in Michigan and publishes the daily total value for irrigation scheduling use. The website for MAWN is <http://www.agweather.geo.msu.edu/mawn/irrigation>. Additional crop ET data can be found at <http://www.enviro-weather.msu.edu>. Both websites generate reports which may be submitted to NRCS as documentation of use of a regional subscription service.
