Acorus calamus

Sweet Flag

Preferred Water Depth and Inundation Tolerance
Prefers 6-20 inches (Max: 24”/ Min: 0”). Species tolerates seasonal inundation, but may be killed by inundation of 1 foot or more of water for prolonged periods.

Wildlife Value
Provides waterfowl habitat. Muskrats will eat rhizomes. Wood ducks eat seeds. Medicinal plant with antibacterial compounds.

Application/Zone
Used in lower shoreline zones and vegetated swales. Rhizomes and roots form a mat in upper 4-8 inches of soil.

Availability, Establishment, and Maintenance
- Transplants, rhizomes and seeds are common and available from commercial vendors.
- Seeds may have dormancy requirement. About 90% germination is achieved by exposing freshly harvested seeds to cold, moist stratification for 60-90 days but seeds can be stored from 9 months to 2 years. Fall sowing provides better germination than spring by providing this cold treatment naturally.
- Rhizomes and transplants are generally more successful than seeds.
- Rhizomes are planted 2-5 inches deep. Root systems should be well-placed at a shoot base in the soil.
- Avoid flooding of newly established plants. Species requires drawdown until plants are established.
- For seed, some report 13 days are needed to germinate in a greenhouse without cold treatment. Survival rate in the field is 100%.
- Moderate rate of spread by rhizome, so use spacing of 1-3 foot centers.
Sweet Flag

Alisma subcordatum  
Common Water Plantain

Preferred Water Depth and Inundation Tolerance
Prefers 0-6 inches, shallow marsh (Max: 20”/Min: 0”). Species tolerates periodic inundation of short duration. Found in mudflat and shoreline areas that dry up by the end of the season.

Wildlife Value
Achenes are eaten by waterfowl, songbirds, pheasants and rodents. Plants provide shade for fish. Leaves are sometimes eaten by rabbits and deer.

Application/Zone
Used in upper and lower shoreline zones, for streambank stabilization, and in vegetated swales.

Availability, Establishment, and Maintenance
• Achenes, transplants, and rootstocks are available from commercial vendors. Abundant achene production, approximately 144,000 per plant.
• Achenes require scarification to break dormancy which can be done with sandpaper. May require oscillating temperatures in moist (underwater) conditions and/or light for germination.
• Good plant establishment occurs when fresh achenes are broadcast in wet mudflats or around shorelines in the fall as this provides these treatments naturally.
• Achenes retain viability when stored in water under cold temperatures for 6 months.
• Rootstocks and transplants may be planted 2-5 inches deep in soil at a spacing determined by project design.
• This species is present and viable in the seedbank found in many hydric (wetland) soils.

**Seeding Rate**  
.06 - .5 lbs/acre
**Andropogon gerardii**  
**Big Bluestem**

**Preferred Water Depth and Inundation Tolerance**  
Prefers moist soil. Mesic prairie species that survives in wet prairies and fens. Species is not tolerant of flooding, but is drought tolerant.

**Wildlife Value**  
Provides a food source for Delaware skipper and forage for deer and livestock. Also provides cover for wildlife.

**Application/Zone**  
Used to stabilize soil and slow surface runoff. Used for upland slope buffer stabilization.

**Availability, Establishment, and Maintenance**  
- Propagation is easy by seed. Fall planted seed germinates in April.  
- If not fall planted, plant in late April to June.  
- In mixed grass plantings for tall grass, use up to 75% Big Bluestem along with Indian Grass on dry to mesic sites.  
- Grass seed should not be more than 40% of total prairie mix by weight.
**Big Bluestem**

*Andropogon gerardii*

**Aster laevis**  
**Smooth Blue Aster**

**Preferred Water Depth and Inundation Tolerance**  
Can tolerate wet-mesic conditions for short durations and seasonal inundation. Species prefers dry upland areas.

**Wildlife Value**  
Attracts orange sulphur butterflies.

**Application/Zone**  
Used to slow stormwater runoff and provide upland slope buffer stabilization.

**Availability, Establishment, and Maintenance**  
- Easily propagated from seed. No germination treatments are needed.
- Seeds can be stored dry.
- Cuttings may be rooted.
**Smooth Blue Aster**

* Aster laevis *

**Mature Height**
3-5 feet

**Aster lanceolatus**  
(A. simplex)  

**Preferred Water Depth and Inundation Tolerance**  
Prefers moist to saturated soil. Germinating seedlings are killed by 2 days of inundation. Mature plants can tolerate short periods of shallow flooding. Panicled Aster is more tolerant of inundation than New England Aster.

**Wildlife Value**  
Provides waterfowl cover.

**Application/Zone**  
Used in upper shoreline zone and as upland slope buffer stabilization. Also used in vegetated swales.

**Availability, Establishment, and Maintenance**  
- Transplants, achenes, and rootstocks are available from several commercial vendors.
- Moist stratification benefits germination of achenes, but this cold treatment may not be required.
- Drill or broadcast achenes in the fall and cover them lightly with soil.
- Mature plants may be divided in the late fall or early spring.
- Most Asters studied germinate readily at 70° F.
- Can be very weedy and aggressive.
Panicled Aster

**Aster novae-angliae**  
**New England Aster**

**Preferred Water Depth and Inundation Tolerance**
Prefers moist soil to wet-mesic conditions. Species has limited inundation tolerance. Germinating seedlings are killed by 2 days of inundation. Mature plants appear to tolerate short periods of shallow flooding in natural areas but not in reconstructed wet areas.

**Wildlife Value**
Provides waterfowl cover. Attracts butterflies and honeybees.

**Application/Zone**
Used on moderate side slopes in prairie matrix. Used in upper shoreline zones and for upland slope buffer stabilization.

**Availability, Establishment, and Maintenance**
- Transplants, achenes, and rootstocks are available from several commercial vendors.
- Fresh achenes or achenes stored dry produce 95-100% germination in 3-8 days. Moist stratification of fresh achenes benefits germination. Drill or broadcast achenes in the fall and cover them lightly with soil for natural stratification.
- Mature plants may be divided in late fall or early spring. Pinching back young growth before July will cause plants to bush out. Spring cuttings of 1.5-2 inches may be rooted in sand.
- An April-May drawdown stimulates seed germination and plant growth. New England Aster can be aggressive and form monocultures.
New England Aster

Bidens cernua

Nodding Bur Marigold

Preferred Water Depth and Inundation Tolerance
Prefers saturated soil. Species tolerates seasonally flooded conditions for short durations.

Wildlife Value
Provides wildlife cover. Waterfowl, shorebirds, songbirds, and small mammals consume achenes.

Application/Zone
Used in upper shoreline zones and in vegetated swales. A good pioneer species.

Availability, Establishment, and Maintenance
- Plants and achenes are available from commercial vendors.
- Achenes should be broadcast on wet mudflats or shorelines and raked into the soil.
- Achenes require cold (34-36° F) moist stratification for several months before being exposed to warm temperatures for optimum germination.
- Achenes may be fall planted after drawdown on mudflats or shorelines to allow winter exposure. Drawdown in early summer will cause explosive growth from fall planted achenes.
- Early summer shallow flooding followed by drawdown promotes best seed production from established plants.
Nodding Beggarsticks
Bidens cernua

**Bidens frondosa**  
**Common Beggarsticks**

**Preferred Water Depth and Inundation Tolerance**
Prefers moist soil. Growth is favored by a 75-90% soil moisture content. Young plants have no tolerance for submergence and should not be flooded for more than 2 or 3 days in 1-2 inches of water. Mature plants have some tolerance for water level fluctuation. This species shares the same zone with *Aster lanceolatus*.

**Wildlife Value**
Provides cover and food. Achenes are eaten by mallard ducks and ruffed grouse. Plants are eaten by muskrats.

**Application/Zone**
Used in upper shoreline zones, upland slope buffers, and in vegetated swales.

**Availability, Establishment, and Maintenance**
- Achenes are available from commercial vendors.
- Achenes have a high rate of germination after cold, moist stratification at 32-34°F for several months and spring planting.
- Fresh achenes may also be fall planted by broadcasting and raking into soil for natural stratification.
- Mid to late season drawdown (May -July) stimulates seed production from mature plants.

.125 lbs/acre
**Bouteloua curtipendula**  
*Side-Oats Grama*

**Preferred Water Depth and Inundation Tolerance**  
Mesic to dry prairie and savanna species. Species has no inundation tolerance.

**Wildlife Value**  
Provides nutritious grass for grazing and is tolerant to limited grazing. Attracts birds and provides cover for grassland birds.

**Application/Zone**  
Used for upland slope buffers. Dense rhizomatous root system works well on steep slopes to prevent erosion.

**Availability, Establishment, and Maintenance**  
- For warm season planting, seed or divisions work well.  
- Germinates easily from seed in most cases.
**Side-Oats Grama**

*Bouteloua curtipendula*

**Seeding Rate**
5 lbs/acre
**Calamagrostis canadensis**  
**Blue Joint Grass**

**Preferred Water Depth and Inundation Tolerance**  
Prefers saturated soil. Tolerates temporary spring flooding up to a depth of 6 inches early in the season. Species does not tolerate permanent flooding.

**Wildlife Value**  
Waterfowl eat seeds. Young plants are grazed by deer and muskrats.

**Application/Zone**  
Used in upper shoreline zones and in vegetated swales.

**Availability, Establishment, and Maintenance**
- Locally, plugs have been most successful. These should be planted on 0.5-1.5 foot centers because of their slow spread by rhizomes.
- Soil should be moist to saturated, but not inundated during planting.
- Established stands may be mowed in alternate years for maintenance.
- *C. canadensis* rarely produces seed and even when it does, the seed is rarely viable.
- Can spread aggressively by rhizome under optimal conditions.

Calamagrostis canadensis
Carex comosa          Bristly Sedge

Preferred Water Depth and Inundation Tolerance
Prefers 0 - 12 inches. Species tolerates early seasonal flooding.

Wildlife Value
Fruits are eaten by waterfowl. Also provides food for sora and yellow rails, swamp
and tree sparrows, snipe and other song birds.

Application/Zone
Used in upper shoreline zones. Marsh species that forms clumps.

Availability, Establishment, and Maintenance
• Plugs seem to work best. Plant on 0.5-1.5 foot centers because of slow rate of
  spread.
• There are some known cases of seed germination in restored wet areas.
• Cold, moist stratification may be needed for seeds.

Carex granularis  
Pale Sedge

Preferred Water Depth and Inundation Tolerance
Prefers moist soil. Species tolerates 1 inch of standing water for short durations. *C. granularis* is a flatwood and fen species.

Wildlife Value
Not available.

Application/Zone
Used in partially shaded upper shoreline zones.

Availability, Establishment, and Maintenance
- Has been observed recovering from soil seed bank.
- Germination is best from fresh seed.
- Store seed dry (14% moisture) cold, overwinter, and sow the following spring.
**Pale Sedge**

**Carex vulpinoidea**

**Fox Sedge**

**Brown Fox Sedge**

**Preferred Water Depth and Inundation Tolerance**
Prefers water depth of 6 inches or less. Species does not tolerate extended inundation but does tolerate some fluctuation. Tolerates standing water in the spring and early summer.

**Wildlife Value**
Provides food for sora and yellow rails, swamp and tree sparrow, snipe and other songbirds.

**Application/Zone**
Used in upper shoreline zones, for streambank stabilization, and in vegetated swales.

**Availability, Establishment, and Maintenance**
- Seeds, rootstock, and whole plants are available.
- Readily established by seed. Seeds can be stratified by either late fall planting for overwintering or cold, dry storage.
- Seed should remain close to the soil surface because they need light for germination.
- Transplants or small clumps should be planted from early spring to June 15.
- Transplants should be planted on 0.5-1.5 foot centers because of slow rate of spread.

Celtis occidentalis  
Hackberry

**Preferred Water Depth and Inundation Tolerance**
This is a floodplain forest and flatwoods species (1st terrace). Seedlings cannot tolerate submergence, but mature trees can survive spring flooding.

**Wildlife Value**
Fruits are eaten by birds and small mammals. Serves as an exclusive food source of the hackberry and snout butterflies.

**Application/Zone**
Used in upper shoreline zones, for streambank stabilization, and upland slope buffers.

**Availability, Establishment, and Maintenance**
- Easily transplanted bareroot as small tree or balled and burlapped as a larger tree.
- Seeds should be stratified for 60-90 days at 41° F in a moist medium.
- Growth rate is medium, 22-30 inches per year.

Cephalanthus occidentalis  Common Buttonbush

**Preferred Water Depth and Inundation Tolerance**
Preferred water depth is 2-3 feet. Species tolerates permanently to semi-permanently flooded conditions. Ten inch tall seedlings can survive complete submergence for up to 45 days.

**Wildlife Value**
Seeds are eaten by waterfowl. Seed also provides food for insects, beaver, and muskrats. Plants provide nectar source and habitat for insects. Also provides nesting habitat for birds. Browsed by deer, muskrats, and beaver. Provides reptile habitat.

**Application/Zone**
Used in upper and lower shoreline zones and for streambank stabilization.

**Availability, Establishment, and Maintenance**
- Transplants and seed have limited availability from vendors. Collect seed in August-September and store in fresh water at 34°F.
- Seed can be planted in wet mudflats or shorelines and requires light for germination.
- Plants establish easily from cuttings, but cuttings should be rooted before flooding.
- Rooted cuttings survive well. Small plants or seedlings may be transplanted directly on the site at 5 feet on center density.
- Growth rate is medium, 1-2 feet per year.
- This species can form monocultures.

Coreopsis tripteris  

Tall Coreopsis

Preferred Water Depth and Inundation Tolerance
Wet and mesic prairie and savanna species. Survives 1 inch inundation for short periods.

Wildlife Value
Serves as a good nectar source. Attracts butterflies.

Application/Zone
Used for upland slope buffer stabilization.

Availability, Establishment, and Maintenance
- Readily available from vendors.
- No pretreatment is needed for seeds.
- Establishes readily and spreads quickly from seed.
- In some cases, can be aggressive.

Cornus racemosa       Gray Dogwood

Preferred Water Depth and Inundation Tolerance
Prefers moist to saturated soil. Inundation of 2-4 inches is tolerated for short durations.

Wildlife Value
Fruits are eaten by birds. Provides browse and food for deer, beaver, pheasant, rabbit, woodchuck, raccoon, and squirrel. Also provides cover for American woodcock.

Application/Zone
Used in upper shoreline zones, for streambank stabilization, and for upland slope buffers.

Availability, Establishment, and Maintenance
• Seed germinates easily only after scarification.
• Shrub spreads by underground stems to form round 8-12 feet wide colonies.
• Easily rooted from cuttings.
• Has a fast growth rate. Shoots grow 3 to 6 feet in one season. This species can become too aggressive.

**Cornus sericea**  
*(C. stolonifera)*

**Red Osier Dogwood**

**Preferred Water Depth and Inundation Tolerance**
Prefers saturated soil. Species tolerates periodic inundation of 0-12 inches early in the season for short durations. During growing season, this species will tolerate constant inundation for less than 30 days.

**Wildlife Value**
Berries are eaten by many songbirds and ruffed grouse. Deer and rabbits browse twigs and buds. Thickets provide cover and nesting habitat. Provides excellent warbler habitat. Also provides food for raccoon, woodchuck, and beaver.

**Application/Zone**
Used in upper shoreline zones, for streambank stabilization, and upland slope buffers.

**Availability, Establishment, and Maintenance**
- Excellent seedling establishment. Very easy to propagate.
- Widely available as bare root or balled and burlapped.
- Can root from cuttings.
- Spreads by stolons. Fast growth rate, more than 2 feet per year.

Cyperus esculentus

Field Nut Sedge
Yellow Nut Sedge; Chufa

Preferred Water Depth and Inundation Tolerance
Tolerates seasonal or occasional flooding, up to 1 foot deep.

Wildlife Value
Seeds are eaten by waterfowl and other wildlife. Also provides cover for reptiles, amphibians, and small mammals. Waterfowl also eat rhizomes.

Application/Zone
Used in lower and upper shoreline zones where water levels fluctuate.

Availability, Establishment, and Maintenance
- Available as seed, rootstock (tuber), or transplants.
- Grows readily from seed on moist soil (mudflats).
- Draw-down stimulates new growth from tubers.
- A common plant of farmed wet areas.

**Eleocharis smallii**  
**Creeping Spike Rush**  
**Marsh Spike Rush**

**Preferred Water Depth and Inundation Tolerance**
Mudflat species. This species needs saturated soil.

**Wildlife Value**
Achenes are eaten by waterfowl.

**Application/Zone**
Extensive creeping rhizomes can stabilize upper shoreline zones and streambanks.

**Availability, Establishment, and Maintenance**
- Perennial, spreads by seed where competition is reduced.
- Sow fresh seed on mudflats (under drawdown condition).
Creeping Spike Rush  
*Eleocharis smallii*

**Mature Height**
12-18 inches

**Plant Type**
Perennial herb

**Indicator Status**
Obligate

**Nutrient Load Tolerance**
Low

**Salt Tolerance**
Moderate

**Siltation Tolerance**
Low

**Flowering Color and Time**
Brown  
June to September

**Light Preference**
Full sun

**Seeding Rate**
.02 - .4 lbs/acre
**Elymus canadensis**  
**Nodding Wild Rye**  
Canada Wild Rye

**Preferred Water Depth and Inundation Tolerance**
Mesic species. Prefers moderately well to poorly drained soil. Minimal inundation tolerance.

**Wildlife Value**
Provides habitat for small mammals. Vegetative parts are palatable to grazing species.

**Application/Zone**
Fibrous, wide spreading root system can stabilize upper shoreline zones, streambanks, upland slope buffers, and vegetated swales. Also a good pioneer species.

**Availability, Establishment, and Maintenance**
- Seed is widely available from commercial vendors.
- Seeding is recommended. Seed germination is better if seeds are stratified for one month at 32°F. Best germination of seed occurs if they are drilled into soil to a depth of 1-1.5 inches.
- Rangeland drill or hopper type seed broadcaster may be used to plant seeds. If broadcasting, seeds must be covered lightly with soil. Mixing seed with sand and other grass and forb species dispersed with a hand hopper or cyclone spreader facilitates establishment of prairie species in small areas.
- One source recommends planting at 0.5 to 1.0 lbs/acre because the species is too short-lived and expensive to plant at a heavier rate. A complete stand will result in two to three years if planted at this rate.
- Spreads quickly from seed but dies back after a few years.
Nodding Wild Rye
Canada Wild Rye

**Mature Height**
3-6 feet

**Plant Type**
Perennial grass

**Indicator Status**
Facultative (-)

**pH**
Wide range

**Nutrient Load Tolerance**

July to October

**Light Preference**
Partial to full sun

**Seeding Rate**
.02 - 2 lbs/acre

Elymus canadensis
**Elymus virginicus**  
**Virginia Wild Rye**

**Preferred Water Depth and Inundation Tolerance**
Prefers moist soil. Species tolerates inundation up to a depth of 6 inches. Can also tolerate dry soils.

**Wildlife Value**
Palatable to grazing species.

**Application/Zone**
Used in upper shoreline zones, for streambank stabilization, for upland slope buffers, and in vegetated swales.

**Availability, Establishment, and Maintenance**
- Fall and spring seeding is successful.
- Can become aggressive if seeded too heavily.
Virginia Wild Rye

_Elymus virginicus_

**Mature Height**
Up to 3 feet

**Plant Type**
Perennial grass

**Indicator Status**
Facultative Wet (-)

**Seeding Rate**
.06 - 1.0 lbs/acre
**Eupatorium maculatum**  
**Spotted Joe Pye Weed**

**Preferred Water Depth and Inundation Tolerance**
Prefers moist soil. Tolerates inundation up to a depth of 6 inches early in the season, as in damp meadows, open marshes, and fens. Tolerates flooding for short periods in the spring.

**Wildlife Value**
Attracts butterflies, bumblebees, and many other insects. Provides cover for small mammals, amphibians, and reptiles. Seeds are eaten by swamp sparrow.

**Application/Zone**
Used in upper shoreline zones and in vegetated swales.

**Availability, Establishment, and Maintenance**
- Seed works best and is readily available from commercial vendors.
- Seed has spotty germination. No treatment is necessary. Sow seed in the fall or early spring when ground is cool.
- Seed is very fine and should be planted on the soil surface.
- Division of plants, if desired, should be done in the spring but only every 2 to 4 years.
Spotted Joe Pye Weed

.06 - 2.0 lbs/acre
**Eupatorium perfoliatum**  Common Boneset

**Preferred Water Depth and Inundation Tolerance**
Prefers moist soil. Tolerates inundation to a depth of 6 inches early in the season, as found in wet meadows, marsh edges, fens, and prairie swales.

**Wildlife Value**
Achenes are eaten by waterfowl, turkey, and swamp sparrow. Mallards and grouse eat leaves. Attracts butterflies. Also provides cover for small mammals, reptiles, and amphibians.

**Application/Zone**
Used in upper shoreline zones and in vegetated swales. Fibrous root system binds soil and resists erosion. Provides good ground cover.

**Availability, Establishment, and Maintenance**
- Seed is best. Sow fine seed on soil surface in the fall or spring. No germination treatment is necessary.
- Can also be propagated by division of rootstock in the fall or spring.

**Seeding Rate**
.125 lbs/acre
Fraxinus pennsylvanica
(F. pennsylvanica subintegerrima)

Preferred Water Depth and Inundation Tolerance
Natural floodplain species. Species tolerates periodic inundation of 0-24 inches for short durations.

Wildlife Value
Twigs and seeds provide forage for mammals, such as deer, beaver, and mice. Birds eat seeds and the tree provides nesting habitat. Fallen logs provide amphibian and reptile habitat. Also provides habitat for many insects.

Application/Zone
Used for streambank and upland slope buffer stabilization.

Availability, Establishment, and Maintenance
• Transplants readily and establishes itself well.
• Best seed germination has been seen after dry storage at 40°F followed by 70°F.
• Tolerates drought and sterile soils. Has fast growth rate, 2.5-3 feet per year.
• Spreads quickly by seed.
**Green Ash**

*Fraxinus pennsylvanica*

*(F. pennsylvanica subintegerrima)*

**Mature Height**
Up to 60 feet

**Plant Type**
Deciduous tree

**Indicator Status**

**Seeding Rate**
Not applicable
Glyceria striata  
Fowl Manna Grass

**Preferred Water Depth and Inundation Tolerance**
Prefers moist to saturated areas.

**Wildlife Value**
Provides food for waterfowl, especially ducks, and for muskrat and deer.

**Application/Zone**
Good pioneer species in upper shoreline zones, for streambank stabilization, and in vegetated swales.

**Availability, Establishment, and Maintenance**
- Good availability, but may not be a northeastern Illinois ecotype.
- Good establishment from seed, but less competitive against reed canary grass.
- Cold, moist stratification helps break dormancy of seed. Cold storage in water for three months or fall planting to allow overwintering provides good germination.
- Mixing seed with sand facilitates hand broadcasting and results in more even planting.
- Transplants are best planted in the spring.
- Requires light for seed germination.

Helenium autumnale  
Common Sneeze Weed

Preferred Water Depth and Inundation Tolerance
Prefers moist to saturated soil. Tolerates brief, shallow inundation like that found in wet prairies, fens, and sedge meadows.

Wildlife Value
Attracts butterflies and provides cover.

Application/Zone
Fibrous root system can help stabilize upper shoreline zones, streambanks, and vegetated swales.

Availability, Establishment, and Maintenance
• Propagate by divisions or seed in the spring.
• Seed is widely available from commercial vendors.
• Excellent germination of seed occurs within 4 weeks.
**Common Sneeze Weed**

**Seeding Rate**  
.12-.5 lbs/acre
**Helianthus grosseserratus**  Sawtooth Sunflower

**Preferred Water Depth and Inundation Tolerance**
Prefers moist to saturated soil. Species tolerates seasonal inundation like that found in sedge meadows and wet prairies.

**Wildlife Value**
Provides nectar and pollen for bees and other insects. Achenes are eaten by insects, birds, and small mammals. Also provides reproduction and foraging habitat for Gorgone checkerspot butterfly.

**Application/Zone**
Used for soil stabilization in upper shoreline zones and vegetated swales. Also a good pioneer species.

**Availability, Establishment, and Maintenance**
- Achenes may benefit from cold stratification.
- Plants may be subdivided in the fall and planted in a new site. Stem cuttings may be taken in the spring and rooted for transplanting.
- Achenes may be sown with a rangeland drill or a hopper style planter. Hand seeding with a small hopper may be used in small areas.
- Fall seeding works with fresh seed.
- This species has a quickly spreading growth habit and can become weedy.
