

Coastal Zone Soil Survey of Little Narragansett Bay

Moorings

-  Deadweight Anchor - Not Limited
-  Mushroom Anchor - Not Limited
-  Not Rated

This map indicates the suitability for either mushroom or deadweight style anchors for mooring. Mushroom anchors work best in silt or mud – high n-value soil surface layers or soft bottom types of material. Deadweight anchors are the best choice for rock, gravel, or coarse sand – low n-value soil surface layers or hard bottom types of material. Navigational channels are not rated because boats cannot anchor in a channel unless circumstances require the boat to anchor, such as being broken down.
