

Water Quality Enhancement Activity – WQL11 – Precision application technology to apply nutrients

Enhancement Description

The use of precision agriculture technologies to apply nutrients to fit variations in site-specific conditions found within fields.

Land Use Applicability

Cropland and pastureland.

Benefits

Precision agriculture methods are used to collect information needed to more precisely evaluate production input factors, accurately predict crop yields, and precisely apply

variable rates of nutrients. The primary benefit of precision agriculture techniques is the use of accurate information about within field variability to minimize nutrient losses and optimize inputs. Done properly this helps to protect surface and ground water resources while maximizing net production.

Criteria

Implementation of this enhancement requires the use of nutrient management techniques. This enhancement requires:

1. The use of the following precision agriculture practices:
 - a. Variable rate technologies (VRT) for nutrient application- Computer-controlled equipment that adjusts fertilizer applications based on soil maps, vegetative indexes, or yield maps, etc. used to create management zones. Nitrogen, phosphorus and potassium fertilizer will be applied according to Land Grant University recommendations in the management zones.
 - b. Yield monitoring systems - Yields in the field are measured using combine-mounted sensors or volume meters. A GPS receiver mounted on the combine is required to correlate field location with yield to create a yield map.
2. Soil samples for nutrient analysis are taken based on soil management zones or on a maximum of a five acre grid
3. Base nitrogen application rates on a real time analysis of crop nitrogen needs. Examples include in season aerial photography and in field equipment based chlorophyll sensors.
4. Producer must have current soil tests for P and K (and Nitrogen where applicable) that are no more than 3 years old

United States Department of Agriculture
Natural Resources Conservation Service

2011 Ranking Period 1

5. Nutrient application rates must be within the “Land Grant University (LGU) recommendations based on soil testing and established yield goals and considering all nutrient sources.

Documentation Requirements

Documentation for each Treatment area (field) and year of this enhancement describing these items:

1. A map showing where the activities are applied.
2. Treatment acres
3. Crop grown in each treatment area
4. Soil sampling protocol (grid or zone) for each treatment area
5. Number of soil samples taken per treatment area
6. Soil test results
7. Calibration of fertilizer application equipment
8. Nutrient application rates/amounts and application dates for each treatment area
9. When using NDVI, provide an as-applied digital map of nutrients applied
