Minnesota Supplement for:

Practice Standard 798 – Seasonal High Tunnel System for Crops

Supplemental Criteria

1. **To be eligible for payment, the entire structure must be constructed including the installation of the plastic covering. Planning considerations should be made to avoid construction late (or after) the growing season.**
2. **This practice may only be funded in the National Seasonal High Tunnel Initiative, the FY2013 Organic Transition or the FY2013 Certified Organic funding pools.**
3. The practice must be sited on cropland.
4. Crops grown within the tunnel must be planted directly into the natural soil profile – raised beds of natural soil can be used but the use of tables, benches, growing racks, portable pots or hydroponics is not eligible.
5. Electrical, heating and/or mechanical ventilation systems are allowed, but are not part of the least cost alternative and must be installed at the expense of the participant. Likewise, any additional structural costs required to support such systems are not included in the payment rate.
6. Participants must purchase, plan, design, and construct the tunnel structure in accordance with the commercial manufacturer's recommendations.
7. As a minimum, the structure must make use of 6-mil greenhouse-grade UV resistant polyethylene cover.
8. These are intended to be “seasonal” structures which are not designed to sustain a snow load. The participant will be responsible to decide if the plastic will be removed at the end of the growing season.
9. **High tunnels must be maintained for a minimum of four years. Participants are responsible to repair and/or replace any materials damaged by wind, snow and other weather conditions for the entire four year period.**
10. Per National policy the maximum payment for this practice is capped at **2,178 square feet per agricultural operation**. The payment cap for MN is $\$2.83 \times 2178 = \6163 or HU cap at $\$3.39 \times 2178 = \7383 per agricultural operation.

Scenarios

Contiguous US – Snow

Used for contiguous US states in areas with high snowfall. A gothic-style (peaked) manufactured frame of tubular steel covered with 4-year 6mil plastic. Costs are based on purchase of manufactured kit and landowner installing the structure. Structure must be installed to manufacturer's specifications.
