

FNMP\$ - Feed Nutrient Management Planning Economics

Software can be used to evaluate the diet, manure nutrient excretion, application costs, and land required for manure application. It helps to determine the overall cost and benefit of manure application including the impact that animal feed program will have.

Estimates:

- 1) excreted and crop available manure nutrients in manure
- 2) land requirements for agronomic utilization of the manure
- 3) labor and land application equipment time requirements
- 4) the costs associated with land application and
- 5) costs associated with feed changes.

FNMP\$ software is free and will be available at
