

# Terrain Attribute Soil Mapping for Functional Property Maps

Zamir Libohova <sup>1, 2</sup>

Phillip R. Owens <sup>1</sup>

Edwin H. Winzeler <sup>1</sup>

Travis Neely <sup>2</sup>

John Hempel <sup>3</sup>

<sup>1</sup> Purdue University, West Lafayette, Indiana

<sup>2</sup> State Soil Scientist/MO Leader, USDA-NRCS-Soil Survey Program, Indianapolis, Indiana

<sup>3</sup> USDA-NRCS-NGDC, Morgan Town, West Virginia

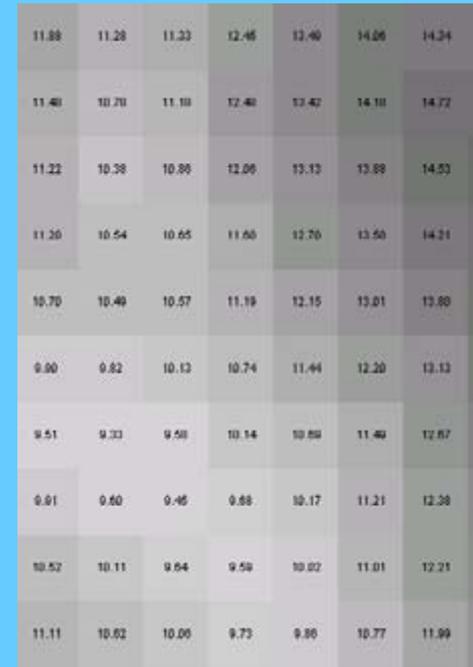

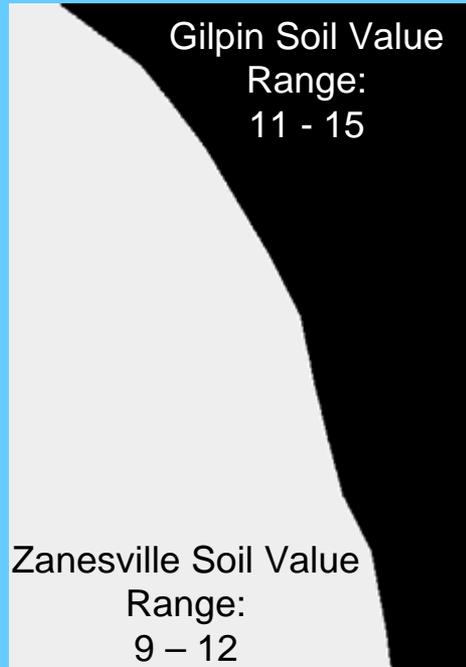

# Cooperators

- Purdue University, Department of Agronomy
- USDA-NRCS, Soil Survey Program, Indiana
  - Kevin Norwood;
  - Stephen Norm
  - John Allen;
- USDA-ARS, National Soil Erosion Laboratory
  - Diane Stott

# Rationale and Background

- The completion of the initial Soil Survey for the United States is projected around 2010;
- The launching of Web Soil Survey (WSS) and other on-line soil information;
- New high resolution spatial data and spatial analysis software.

# Polygon vs. Raster

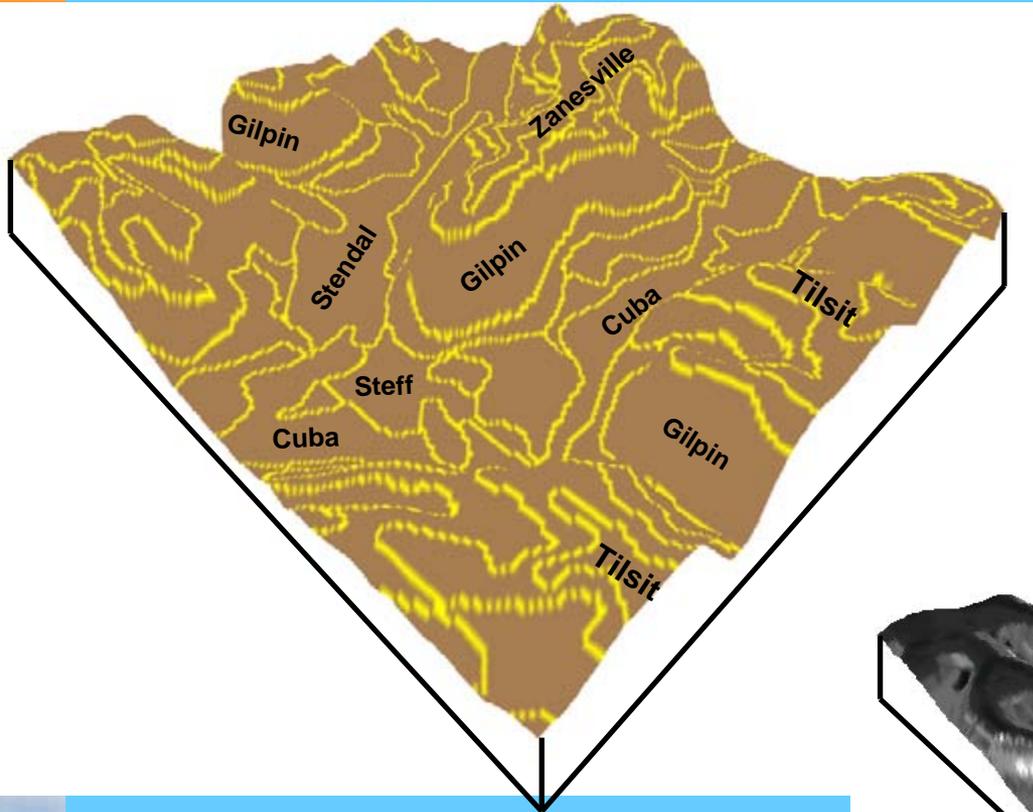

## • Polygons

- Discreet boundaries
- Broken interconnectedness
- Vague predictions (value ranges)
- Incompatibility with raster-based models
- Simplicity of representation, complexity of interpretation

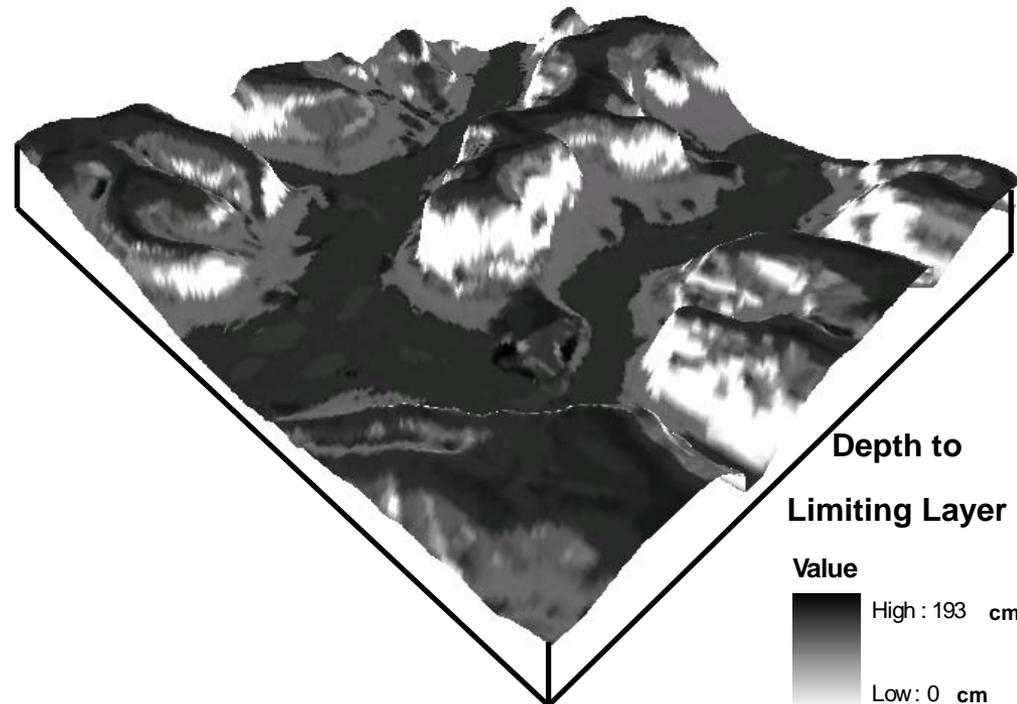

## • Rasters

- Fuzzy boundaries
- High degree of interconnectedness
- Specific predictions at specific geographic intervals
- High compatibility with raster models
- Complexity of representation, simplicity of interpretation

## Soil-Water Relationships

# TASM Principle

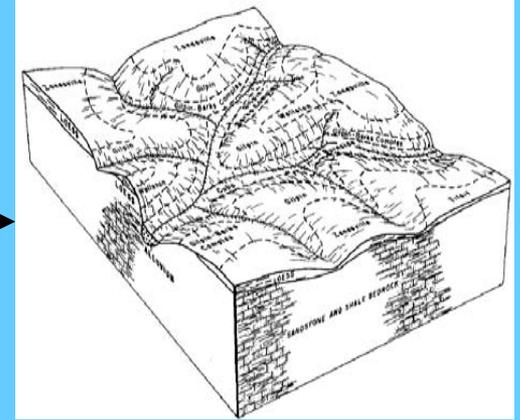

From Qualitative to Numerical Soil-Landscape relationships via Terrain Attributes

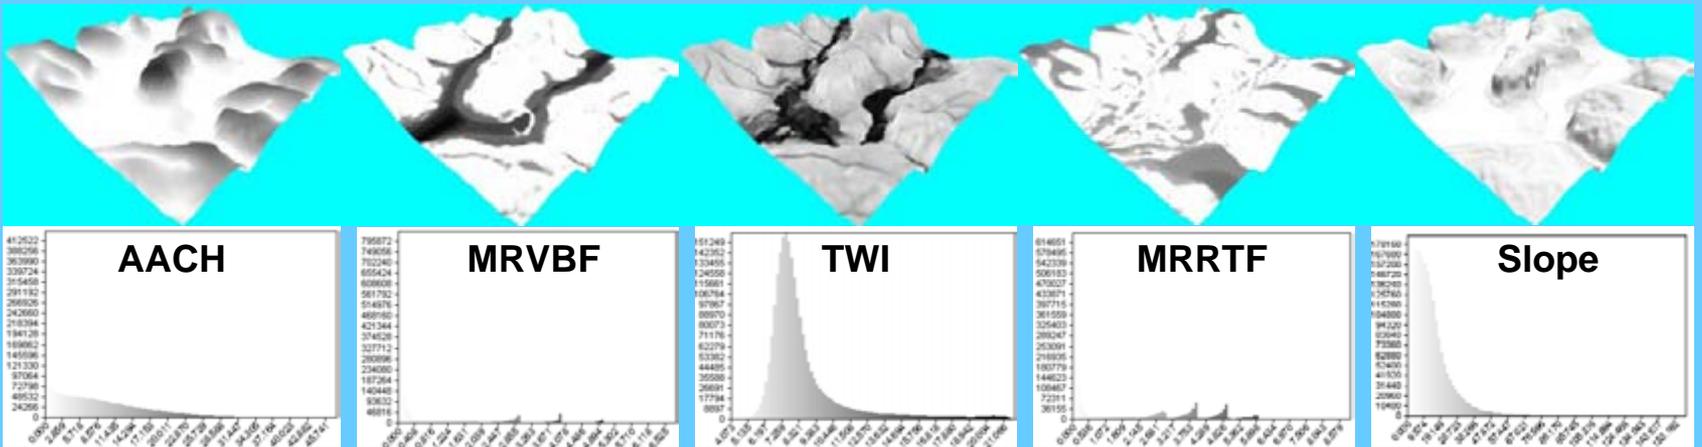

Expert/Tacit Knowledge

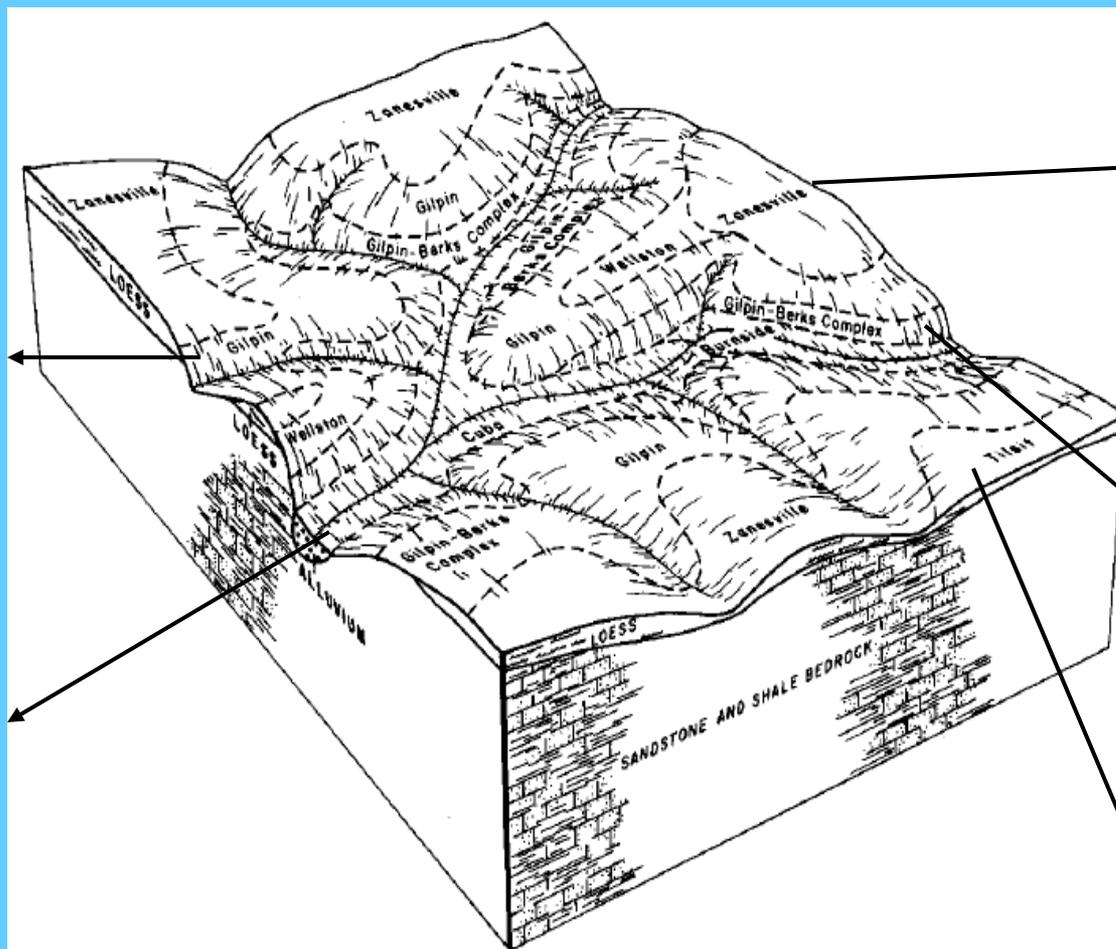

- Expert gains knowledge
- Expert examines landscapes
- Expert applies knowledge to new landscapes
- Knowledge communicated via the soil map

Block Diagrams/Qualitative Soil-Landscape relationships

# Terrain Attributes Soil Relationships

## Gilpin

MRRTF < 2.4  
MRVBF < 2.9  
Slope 12-18 %

## Cuba

MRRTF < 2.4  
MRVBF < 2.9  
Slope 0-2 %  
AACH >0.09  
TWI <12

## Zanesville

MRRTF > 2.4  
MRVBF < 2.9  
Slope 6-12 %

## Gilpin-Berks complex

MRRTF < 2.4  
MRVBF < 2.9  
Slope 18-50 %  
AACH 0.5-2.0

## Tilsit

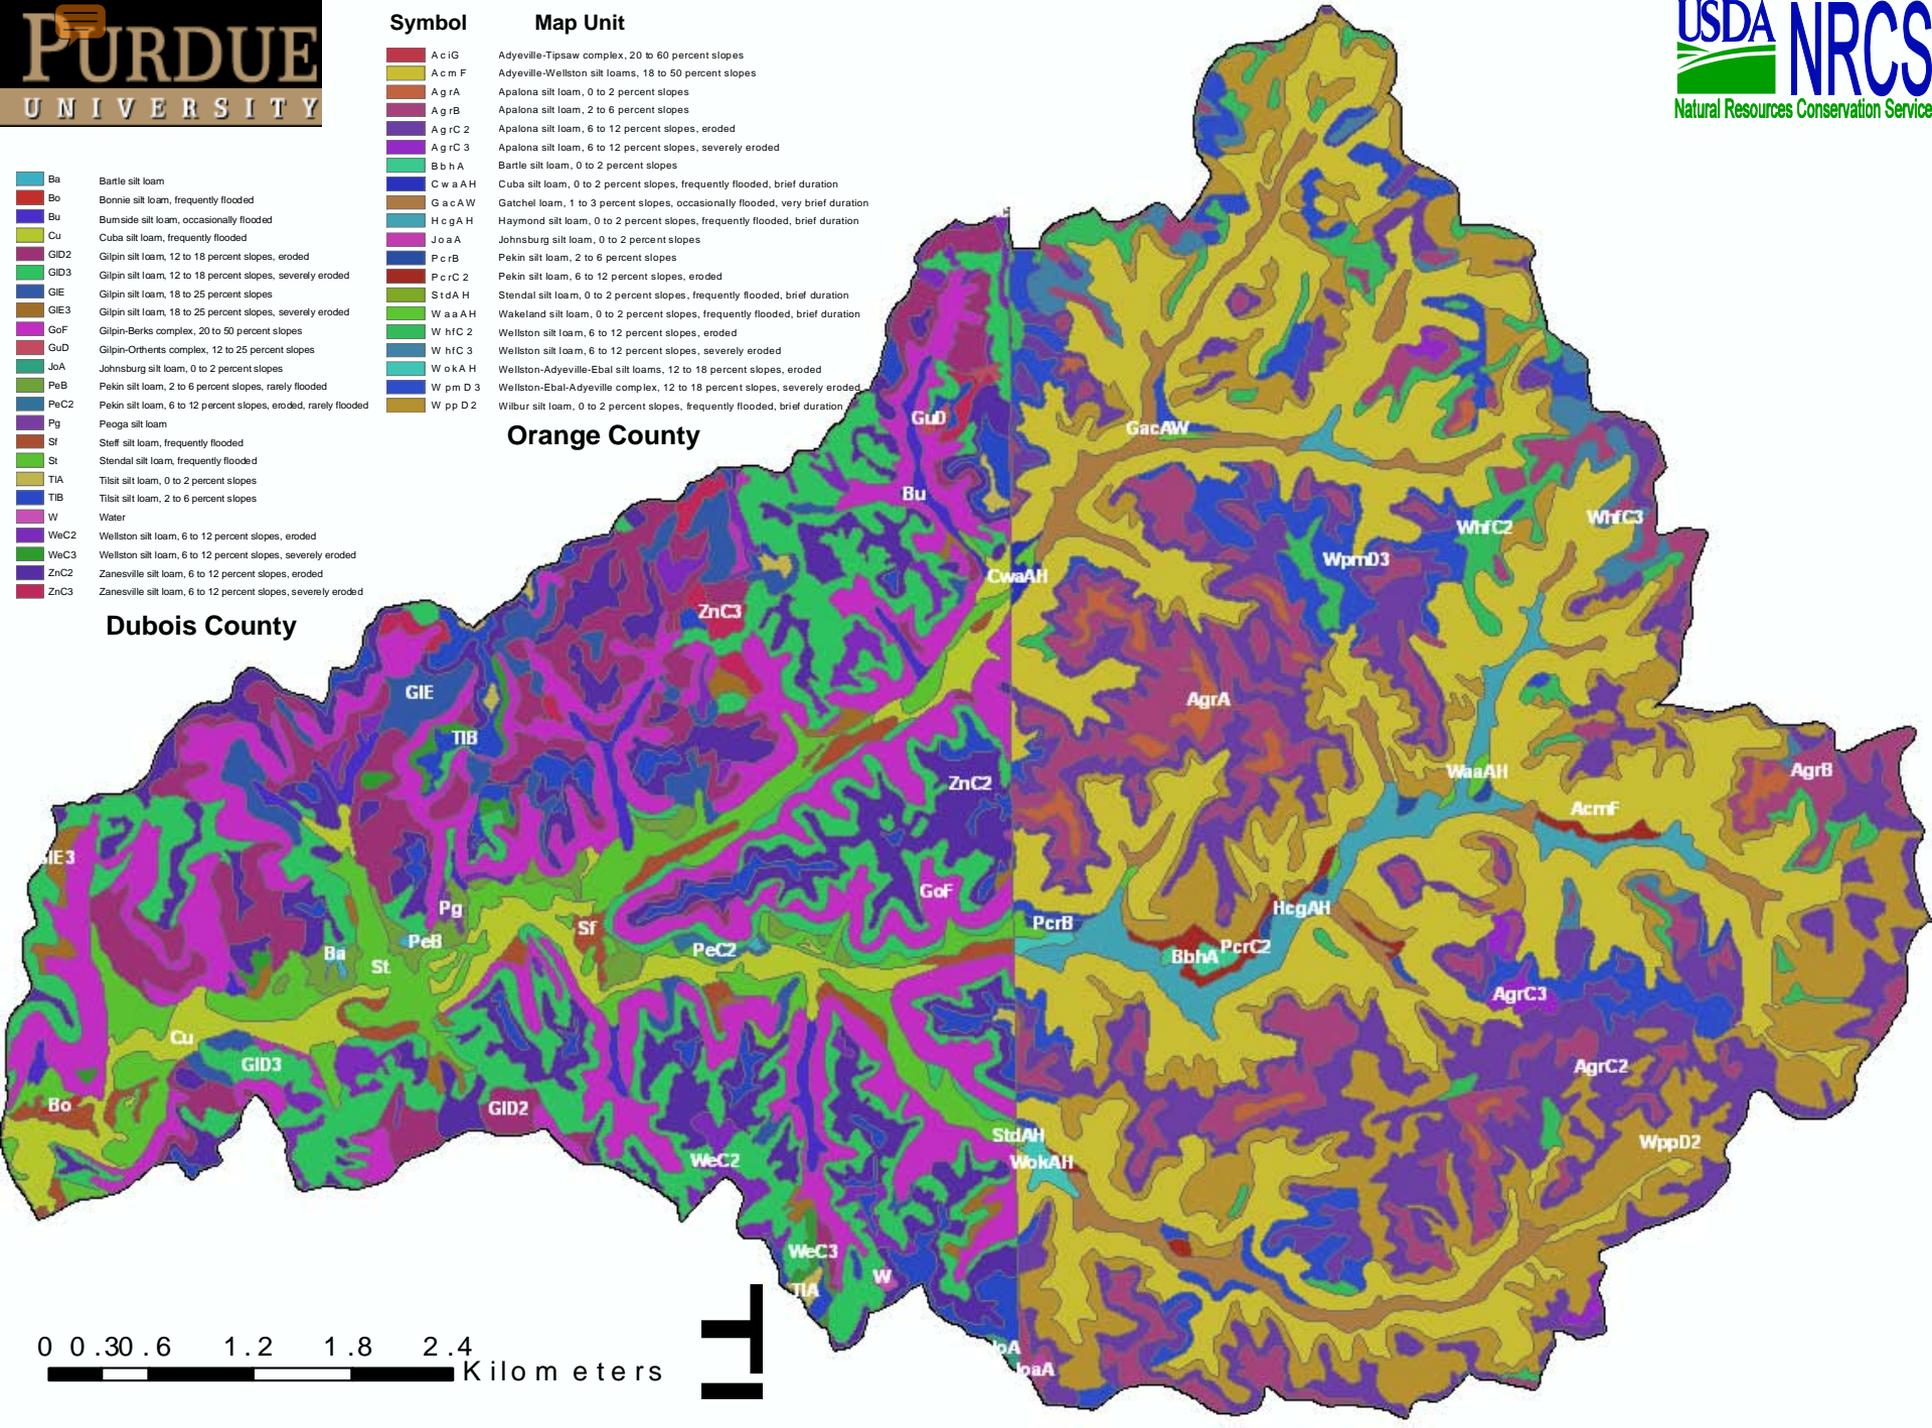

MRRTF > 2.4  
MRVBF < 2.9  
Slope < 2%

Symbol	Map Unit
AcIG	Adyeville-Tipsaw complex, 20 to 60 percent slopes
AcMF	Adyeville-Wellston silt loams, 18 to 50 percent slopes
AgRA	Apalona silt loam, 0 to 2 percent slopes
AgRB	Apalona silt loam, 2 to 6 percent slopes
AgRC2	Apalona silt loam, 6 to 12 percent slopes, eroded
AgRC3	Apalona silt loam, 6 to 12 percent slopes, severely eroded
BbhA	Bartle silt loam, 0 to 2 percent slopes
CwaAH	Cuba silt loam, 0 to 2 percent slopes, frequently flooded, brief duration
GacAW	Gatchel loam, 1 to 3 percent slopes, occasionally flooded, very brief duration
HcgAH	Haymond silt loam, 0 to 2 percent slopes, frequently flooded, brief duration
JoA	Johnsburg silt loam, 0 to 2 percent slopes
PcrB	Pekin silt loam, 2 to 6 percent slopes
PcrC2	Pekin silt loam, 6 to 12 percent slopes, eroded
StdAH	Stendal silt loam, 0 to 2 percent slopes, frequently flooded, brief duration
WaaAH	Wakeland silt loam, 0 to 2 percent slopes, frequently flooded, brief duration
Whc2	Wellston silt loam, 6 to 12 percent slopes, eroded
Whc3	Wellston silt loam, 6 to 12 percent slopes, severely eroded
WokAH	Wellston-Adyeville-Ebal silt loams, 12 to 18 percent slopes, eroded
WpmD3	Wellston-Ebal-Adyeville complex, 12 to 18 percent slopes, severely eroded
WppD2	Wilbur silt loam, 0 to 2 percent slopes, frequently flooded, brief duration

Ba	Bartle silt loam
Bo	Bonnie silt loam, frequently flooded
Bu	Burnside silt loam, occasionally flooded
Cu	Cuba silt loam, frequently flooded
GID2	Gilpin silt loam, 12 to 18 percent slopes, eroded
GID3	Gilpin silt loam, 12 to 18 percent slopes, severely eroded
GIE	Gilpin silt loam, 18 to 25 percent slopes
GIE3	Gilpin silt loam, 18 to 25 percent slopes, severely eroded
GoF	Gilpin-Berks complex, 20 to 50 percent slopes
GuD	Gilpin-Orthens complex, 12 to 25 percent slopes
JoA	Johnsburg silt loam, 0 to 2 percent slopes
PeB	Pekin silt loam, 2 to 6 percent slopes, rarely flooded
PeC2	Pekin silt loam, 6 to 12 percent slopes, eroded, rarely flooded
Pg	Peoga silt loam
Sf	Steff silt loam, frequently flooded
St	Stendal silt loam, frequently flooded
TIA	Tiltsit silt loam, 0 to 2 percent slopes
TIB	Tiltsit silt loam, 2 to 6 percent slopes
W	Water
WeC2	Wellston silt loam, 6 to 12 percent slopes, eroded
WeC3	Wellston silt loam, 6 to 12 percent slopes, severely eroded
ZnC2	Zanesville silt loam, 6 to 12 percent slopes, eroded
ZnC3	Zanesville silt loam, 6 to 12 percent slopes, severely eroded

# Validation

## Analysis of Variance Results

Source of Variability	F Value	P Value	Statistical Differences
Landscape position (LP)	19.6	< 0.0001	Significant
Method (TASM vs. Measured)	4.22	0.04	Marginal
LP*Method	1.72	0.18	Not significant

- BmA Blount silt loam, 0 to 2 percent slopes
- BmB2 Blount silt loam, 2 to 4 percent slopes, eroded
- Bs Brookston silty clay loam
- Ca Crosby silt loam, 0 to 2 percent slopes
- CsA Crosby silt loam, 2 to 4 percent slopes, eroded
- CsB2 Crosby/Miami silt loams, 2 to 6 percent slopes, eroded
- CyB2 Fincastle silt loam
- Fc Fox silt loam, 0 to 2 percent slopes
- FoA Fox silt loam, 2 to 6 percent slopes, eroded
- FoB2 Fox silt loam, 6 to 12 percent slopes, severely eroded
- FSc3 Genesee silt loam
- Gh Gravel pits
- Gp Hennepin loam, 25 to 60 percent slopes
- HeE Houghton muck, drained, 0 to 1 percent slopes
- Kk Kokomo silt loam, overwash
- Ko Kokomo silty clay loam
- Lw Made land
- Ma Miami clay loam, 12 to 18 percent slopes, severely eroded
- MIB2 Miami clay loam, 2 to 6 percent slopes, severely eroded
- MIC2 Miami clay loam, 6 to 12 percent slopes, severely eroded
- MmB3 Miami silt loam, 2 to 6 percent slopes, eroded
- MmC3 Miami silt loam, 6 to 12 percent slopes, eroded
- MmD3 Morley silt loam, 2 to 6 percent slopes, eroded
- MrB2 Morley silty clay loam, 2 to 6 percent slopes, severely eroded
- MsB3 Morley silty clay loam, 6 to 12 percent slopes, severely eroded
- MsC3 Ockley silt loam, 0 to 2 percent slopes
- OcA Ockley silt loam, 2 to 6 percent slopes, eroded
- OcB2 Ockley silt loam, loamy substratum, 0 to 2 percent slopes
- OKA Ockley silt loam, loamy substratum, 2 to 6 percent slopes, eroded
- OKB2 Palms muck, drained, 0 to 1 percent slopes
- Pa Patton silty clay loam, loamy substratum
- Pc Patton silty clay loam, occasionally flooded
- Pe Pewamo silty clay loam
- Qu Quarries
- RuA Russell silt loam, 0 to 2 percent slopes
- RuB2 Russell silt loam, 2 to 6 percent slopes, eroded
- Sh Shoals silt loam
- W Water

# The Accuracy assessment results of validation between TASM (Producer) and SSURGO (User), for the main soil series

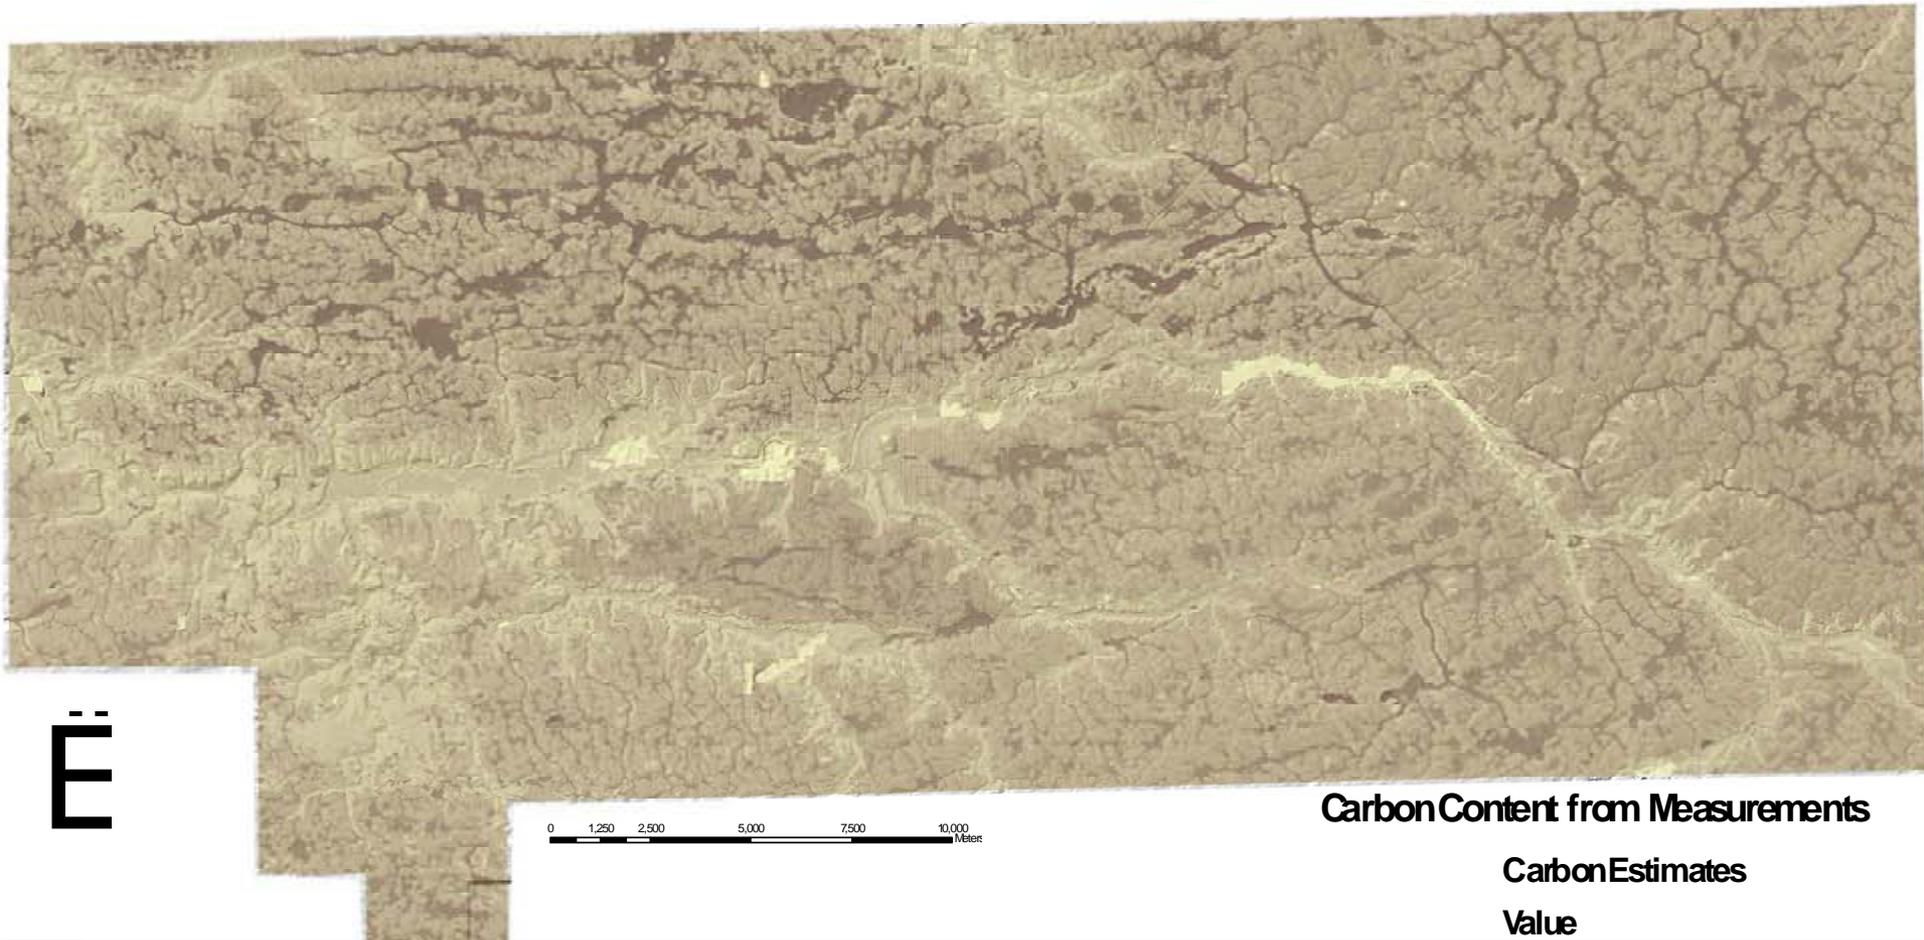

Soil Series	Accuracy (%)	
	Producer	User
Fincastle	0.87	0.92
Brookston	0.90	0.77
Crosby	0.90	0.78
Blount	0.68	0.84
Powamo	0.61	0.36
Shoals	0.21	0.37
Morley	0.20	1
Patton	1	1
Miami	1	0.09
<b>Overall Accuracy (%)</b>	<b>0.77</b>	

Validation based on 460 geo-referenced points

The kappa coefficient was 0.74 suggesting that the substantial agreement between TASM and SSURGO was not random

<u>kappa</u>	<u>Interpretation</u>
< 0 —	No agreement
0.0 — 0.20	Slight agreement
0.21 — 0.40	Fair agreement
0.41 — 0.60	Moderate agreement
0.61 — 0.80	Substantial agreement
0.81 — 1.00	Almost perfect agreement

# Spatial Distribution of Total C

# Discussion

---

- There are no fixed rules about the relationship between terrain attributes and predicted soils. (e.g. TWI and Cuba relationship – specific values – will not necessarily hold in multiple watersheds)
- Fuzzy membership maps are not a substitute for established NRCS soil maps, however as an additional product will provide tremendous value.
- Fuzzy membership maps can aid interpretation and prediction of specific soil properties.
- Soil mapping is STILL “an art and a science.”

# Conclusions

---

- We have the tools to map gradations of soil variability;
- Terrain attributes are useful for estimating soil properties;
- Structural heterogeneity of soils can be simplified for hydrological response predictions because of functional homogeneity of soil properties.
