

Animal Enhancement Activity – ANM19 – Wildlife corridors

Enhancement Description

Wildlife corridors are linear strips of vegetation that connect two or more patches of suitable wildlife habitat. Participants will establish vegetative corridors as described below.

Land Use Applicability: Cropland, pastureland, rangeland and forestland.

Benefits

Corridors connect habitats providing additional life requisites (e.g., feeding, nesting, roosting, escape cover, etc.) as well as interaction among local populations for reproduction or other social behaviors. Fragmentation of habitat with resultant loss of connectivity threatens the continued existence of fish and wildlife populations.

Criteria

1. Continuity –corridors must be uninterrupted strips (i.e., no paved roads (unpaved farm roads no wider than 20 feet are acceptable), vegetative or physical barriers, etc.) connecting 2 or more patches of suitable habitat. Wildlife friendly fencing is not considered a barrier. Suitable habitat may consist of grasslands, rangelands, forests, wetlands, shrubby areas, or natural substrates suitable for use by wildlife species adapted to the landscape and site conditions and conforming to the composition and quality criteria below.
2. Composition - corridor vegetation must be suited to natural site conditions, consistent with the larger natural landscape context, and appropriate for the kinds of wildlife present, hence native vegetation is highly preferred. Vegetation in the “patches of suitable habitat” (above) must also meet these criteria.
3. Where habitat already exists but wildlife is prevented from moving by man-made barriers, the installation or modification of structures to allow wildlife movement will be acceptable under this enhancement. Examples include rangeland and the installation of wildlife friendly fencing, wetlands or riparian areas and the installation of aquatic organism passages and other types of habitat that are cutoff by paved roads and the installation of wildlife passages under the roads. The dimensions defined in #5 below do not apply to this criterion. Base sizing on the target species.
4. Quality – invasive exotic vegetation must be controlled
5. Dimension –the average width must be ≥ 30 feet with no section < 20 feet wide. Since context is so important no one size fits all conditions, however wider corridors are better and irregular boundaries (or borders) are preferred over straight.

United States Department of Agriculture
Natural Resources Conservation Service

2010 Ranking Period 2

Operation and Maintenance

Management activities must be conducted as necessary to ensure the corridor functions as the planned habitat.

Documentation Requirements

1. Map showing location of wildlife corridors connecting suitable habitats with required dimensions
2. Brief descriptions of the habitats to be connected
3. Description of the vegetation composition

Natural Resources Conservation Service

IDAHO ADDENDUM 2010

Animal Enhancement Activity – ANM19 – *Wildlife Corridors*

Additional guidance for wildlife corridors:

Wildlife Friendly Species

Wildlife friendly grass, forb, shrub and tree species include all native perennial plant species typically represented by a diverse mixture as described in the representative ecological site description. Native grass species typically include bluebunch wheatgrass, Idaho fescue, Sandberg bluegrass, big bluegrass, Thurber needlegrass, slender wheatgrass, thickspike wheatgrass, western wheatgrass, and basin wildrye. On sandy sites, consider sand dropseed and Indian ricegrass. Consider native forbs and legumes such as western yarrow, arrowleaf balsamroot, buckwheat, flax, milkvetch, lupine, American vetch, penstemon and tapertip hawksbeard. Introduced grass species could include redtop, orchardgrass, meadow brome, creeping foxtail, meadow foxtail, intermediate wheatgrass, pubescent wheatgrass, tall wheatgrass, and Russian wildrye. Introduced forbs and legumes include alfalfa, small burnet, clover (multiple species), sainfoin, cicer mikvetch and yellow sweetclover. Native shrubs include chokecherry, golden current, shrubby cinquefoil, juniper, serviceberry, woods rose, silver buffaloberry, redosier dogwood, and native willows (multiple species). Native trees include cottonwood, water birch, quaking aspen, Douglas and black hawthorn, and tree willows. Introduced woody species include Nanking cherry, cotoneaster and Siberian peashrub.

Wildlife Friendly Fence

Wildlife-friendly fence will have the following characteristics:

- Top wire/rail a maximum of 42” above ground.
- At least 12” between top two wires.
- Bottom wire/rail a minimum of 16” above ground.
- Smooth wire on the bottom.
- Posts at 16.5 foot intervals.
- No vertical stays.
