

Structure

Soil structure is the way in which the individual particles (sand, silt, and clay) are arranged into larger distinct aggregates. These aggregates are called peds and can usually be separated easily, particularly in dry soil.

Listed below are the different types of soil structure. Fill in the characteristics of each soil structure next to the name of the structure.

GRANULAR _____

PLATY _____

BLOCKY _____

PRISMATIC _____

COLUMNAR _____

Categories with no visible structure

MASSIVE _____

SINGLE GRAIN _____
