Renewable Energy Definition

Renewable energy is naturally replenished energy generated from natural resources such as sunlight, wind, rain, tides, biomass, and geothermal heat.
What is Wind?

- Wind is a byproduct of solar energy resulting from uneven heating and cooling of the earth.
  - This creates atmospheric pressure gradients
  - Gradients force air movement from areas of high pressure to low pressure
- Approximately 2% of solar energy reaching the earth is converted to wind.
Wind or Solar

**Wind Energy**
- No nearby wind breaks
- Tower 75 – 200 feet tall
- 24-hour production?
- Wind speed range
- Geographical variations
- 17 – 38% availability
- 20 – 40% conversion efficiency
- 20-year life span

**Solar Energy**
- Unobstructed southern view
- Array perpendicular to sun
- Production 9 am to 3 pm
- Seasonal variations
- Geographical variations
- 10 – 25% availability
- 10 – 15% conversion efficiency
- 25-year life span
Applicable Conservation Practice Standards

• Pumping Plant (533)
• Watering Facility (614)
• Pipeline (516)
• Water Well (642)
Wind Energy Basics

- Site assessment
- Windmills (mechanical)
- Turbines (electrical)
  - Small-scale (< 1 kW)
  - Residential-scale (< 10 kW)
  - Utility-scale (> 10 kW)
Wind Energy (continued)

Wind Power Classification

Wind Energy Distribution
Wind Resources

• For accurate assessment of complicated sites, wind speed and direction is typically monitored for 2-3 years at 10 and 50 meters (32 to 160 feet).
• Costs range from $3,000 - $10,000.
Wind Mills

Meopham Green, Kent 1820.
Wind Turbines

Small (≤10 kW)
- Farms
- Remote Applications
  (e.g. water pumping, telecom sites, ice making)

Intermediate (10-250 kW)
- Village Power
- Hybrid Systems
- Distributed Power

Large (250 kW - 2+MW)
- Central Station Wind Farms
- Distributed Power

Siting and Sizing Considerations

- Power Needs (energy audit)
- Wind Resources:
  - Speed and direction
  - Turbulence
- Design Considerations
- Operation & Maintenance
- Accessibility
- Regulations
Small Farm Applications

Livestock Watering
$2,000 - $3,000

Net Metering (home)
$30,000 – $40,000
Wind Resources

Wind Turbine Site Conditions

Flow over hills and obstacles

Good Sites

- Speed up effect over smooth hills

Bad Sites

- Turbulence at top and bottom of cliffs or sharp ridges

Obstacles

- Site clear of obstacles by at least 10 x the height of the obstruction or use a very tall tower
Design Considerations

- Air Density ($\rho$)
- Rotor Efficiency ($C_p$)
- Blade Area ($A$)
- Wind Speed ($V$)

Power: $P = \frac{1}{2} \rho C_p A^2 V^3$

For a given turbine, double the wind speed and the power output increases by a factor of eight.

O&M Costs

- Annual O & M 2-3% of Installed Cost
- Vary by Site and System Age
  - Insurance
  - Land costs
  - Repairs and replacements
  - Spare parts
  - Administration
Accessibility

• How far from the needed power should you site a turbine?
• How often will maintenance be required?
• How do you access the turbine?
Regulations

- Land use
- Zoning
- Setback requirements
- Environmental laws
Environmental Considerations

• Birds, bats, other wildlife
• Aesthetics
• Noise
• Health effects(?)

United States Department of Agriculture
Natural Resources Conservation Service

USDA  NRCS
Environmental Benefits

- No SOx or NOx
- No particulates
- No mercury
- No CO2
- No water
Advantages and Disadvantages of Wind Energy

**Advantages**
- Environmentally friendly
- Economically competitive with kinds of electrical generation
- Favorable economic impacts

**Disadvantages**
- Highly variable
- Complimentary power supply often necessary
- Location specific
Installed Costs for Energy Systems
(your prices will vary)

Wind Turbine
- 400 watt - $3.00/watt
- 1,000 watt - $3.50/watt
- 10,000 watt - $3.00/watt

Solar PV
- 400 watt - $2.50/watt
- 1,000 watt - $4.00/watt
- 6,000 watt - $4.00/watt
Relative Costs of Electricity Generation Technologies
(2003 Canadian cents per kilowatt-hour)

Wind Energy Applications
A Brief Overview of Wind Power in the U.S.A.

1. Early American settlers: European technology

2. Self regulating and pivoting blades for high winds: 1857
   - Provided year round water allowed much of the Great Plains to be settled between 1870 & 1920
3. Wind power to produce electricity
   • Rural Electrification Administration ended this phase
   • 1930’s power for farmsteads

4. Today
   • Beginning in the 1970’s
   • Uses modern aerodynamics learned from the aerospace industry
Uses of Wind Power

• Pump Water
  • Mechanical Windmill

• Produce Electric Power (and then pump water with the electricity)
  • Wind Turbine
Power Requirements

• Solar-PV water pumping systems less than 1.5 kW are more likely to be used in U.S. than wind powered water pumping systems due to:
  – a better match to water demand,
  – less maintenance requirements (e.g. fewer moving parts), and
  – a larger area of land with a good solar resource than with a good wind resource.

• As power requirements increase however, a wind only or a hybrid wind/solar water pumping system is desirable until the price per Watt for solar-PV modules can be decreased significantly and/or efficiency of Solar-PV modules can be improved significantly.
Conditions for Stand-Alone Wind System

• You live in an area with average annual wind speeds of at least 9 miles per hour (4.0 meters per second).
• A grid connection is not available or can only be made through an expensive extension. The cost of running a power line to a remote site to connect with the utility grid can be prohibitive, ranging from $15,000 to more than $50,000 per mile, depending on terrain.
• You acknowledge the intermittent nature of wind power and have a strategy for using intermittent resources to meet your power needs.
Solar vs. Wind
Where to draw the line?

• In general, mechanical windmills and solar pumps are best for small quantities of water and low pumping heads.

• Wind-electric systems, such as 1.5 and 10 kW units, are better for large-scale livestock watering applications, small plot irrigation, and village water supply.
Making the Decision

- Analyzing the monthly water demand requirement;
- Conducting a resource assessment;
- Deciding whether a wind or solar water pumping system would be best.

Use a reservoir (e.g. large tank) if...

- Water supply systems with a water reservoir are used where...

- for short periods, the wind energy is insufficient to run the pump
- there is a need for a back-up water source.
- As the turbine noise level increases with the wind speed, siting of the wind turbine near a residence is not recommended.
Mechanical windmills are still in production and thousands are installed every year. The amazing thing is that the design of these windmills has not changed for over a hundred years. The reason is that they were so well designed in the first place. The major U.S. manufacturers are Aermotor (San Angelo, TX) and Dempster (Beatrice, NE). We have a list of manufacturers.
• Mechanical windmills use a positive displacement pump
Payment Schedule: Pumping Plant (533) Windmill

- $5,800

**Typical Implementation Scenario**
- Complete windmill system - 12 ft fan and head to pump 2 gpm for livestock watering.
- A pumping facility installed to transfer water for a conservation need, usually for livestock watering, filling ponds, ditches or wetlands; or pumping from wells, ponds, streams and other sources.
Payment Schedule: Pumping Plant (533) Windmill with Tower

$1,022/mill-ft

Typical Implementation Scenario

- Complete windmill system with a new tower to pump livestock water, 30-foot tower (does not include well).
- A pumping facility installed to transfer water for a conservation need, including removing excess surface or ground water; filling ponds, ditches or wetlands; or pumping from wells, ponds, streams and other sources.
Windmills vs Turbines

- Windmills work very well at low wind speeds, so they tend to give more reliable water supply than wind-electric systems.
- The wind-electric systems are more efficient over a wide range of wind speeds, they can pump higher volumes of water, and the wind turbine can be placed far from the well.
Figure 9. Daily comparisons of wind and solar powered water pumped at the 50 m pumping depth. Minimum volume is approximately 7,000 liters per day.
• **10 kW turbine vs. 1,800 kW turbine**

1. Based on an average annual household power consumption of 12 MWhrs.
Figure 1. The 1000 W wind turbine installed on a 19.2 m tilt-up guyed pipe tower (Bushland, TX).
One example: 900 Watt Wind Turbine

• Lorentz helical pump was powered by wind energy at the USDA-ARS Conservation and Production Research Laboratory (CPRL) near Bushland, TX.
One example: 900 Watt Wind Turbine

- The wind turbine used was a Southwest Windpower (Flagstaff, AZ) Whisper 100 (2.1 m or 7 ft rotor diameter) which generated 3-phase variable voltage, variable frequency AC electricity.
- The wind powered version required an additional controller manufactured by Lorentz to rectify the electricity to DC before entering the primary controller.
Fig. 4. 3-Way Switch and Controllers Used on Wind Powered Water Pumping System. (Bushland, TX).

Fig. 5. Lorentz Helical Pump and Motor with Pump Shaft on Right (Bushland, TX).
One example: 900 Watt Wind Turbine

• For the Bushland, TX site, the wind powered helical pump system demonstrated the ability to pump enough water to meet the daily requirements of:
  • 120 beef cattle at 50 m (164 ft) pumping depth
  • 60 beef cattle at a 100 m (328 ft) pumping depth.
Bushland, TX (1995-6 Wind Distribution, HH=18.5m)

Fig. 12. Daily Water Volume of Lorentz HR07-2 Helical Pump Powered by SWWP Whisper 100.
Payment Schedule: Renewable Energy Production (716) Wind Turbine < 50 kW

$1,875/kW

Typical Implementation Scenario

• Wind turbine, < 50kW capacity, consisting of blades, rotor, generator, over-speed control mechanism, tower, and electrical control system

• A facility for producing energy from renewable resources
Summary

• In general, mechanical windmills and solar pumps are best for small quantities of water and low pumping heads.

• Wind-electric systems, such as 1.5 and 10 kW units, are better for large-scale livestock watering applications, small plot irrigation, and village water supply.
