NRCS Announces National Water Quality Initiative in Southeast New Hampshire for 2013

Agricultural Producers located in priority watersheds will be able to participate

Durham, New Hampshire, Updated April 26, 2013 — State Conservationist Richard Ellsmore announced that there will be National Water Quality Initiative application ranking cut-off dates in June and July for the 2013 program. USDA's Natural Resources Conservation Service (NRCS) will manage the initiative by making funds available to farmers, ranchers and forest landowners in three designated watersheds in southeast New Hampshire.

While applications are accepted throughout the year, people are encouraged to submit their application by **May 17th** to allow time to clear eligibility requirements by the ranking deadlines. All eligible applications for technical and financial assistance to install conservation practices to protect water quality in these watersheds, that are complete by the ranking deadlines, will be ranked and considered for current funding.

“The Water Quality Initiative will further NRCS’s partnership efforts to improve water quality using voluntary actions on private lands,” Ellsmore said. “This initiative is a focused approach in areas facing significant natural resource challenges. It bolsters the positive results of landscape conservation initiatives NRCS and its partners already have underway.”

Through this effort, eligible producers in the Oyster River, Lower Lamprey River, and the Squamscott River Watersheds will invest in voluntary conservation actions to help provide cleaner water for their neighbors and communities. The selected watersheds all empty into the Great Bay and were identified with help from state agencies, partners, and the NRCS State Technical Committee.

Using funds from the Environmental Quality Incentives Program (EQIP), NRCS will provide technical and financial assistance to producers to install conservation practices such as cover crops and filter strips, and to make changes in management strategies to minimize

NEWS RELEASE

nutrients and sediment entering surface waters. This federal investment can make a difference to improve water quality in these small watersheds, as well as the Great Bay. In addition to practice installation and management changes, there will be a water quality monitoring component to help measure success allowing NRCS to transfer this information to water quality projects in other areas.

Located in southeast New Hampshire, the three selected watersheds encompass 46,360 acres. The initiative targets nutrients and sediment impairments. Watersheds, like these, with existing management plans and water quality monitoring programs are highly desirable as they will allow NRCS to demonstrate the impact of the initiative. EQIP funding will be used to accelerate efforts to improve water quality in the targeted waters.

Remember to check with your local NRCS office to see if you are located in a selected watershed. This summer, NRCS will notify all applicants of the results and begin developing contracts with selected applicants.

Since 1935, NRCS’s nationwide conservation delivery system works with private landowners to put conservation on the ground based on specific, local conservation needs, while accommodating state and national interests.
