

## Show Photo Thumbnails in Map

### Abstract

This guide details how you can view a pop-up tooltip of the image thumbnail when hovering over a shown photo location.

### Details

1. With geo-tagged photos loaded into ArcPhoto, **click** the **Show ArcPhoto Locations** button. This adds a temporary layer to the ArcMap table of contents with green arrow markers as the symbol. Also, the **Show Photo Tooltips** button is now active.
2. **Click** the **Show Photo Tooltips** button.
3. While the **Show Photo Tooltips** button remains active, hover the mouse cursor over any of the arrows from the *ArcPhoto Quick View* layer that was activated in step #1.
4. A thumbnail render of the photo at that location will appear. In some cases, if you had to rotate the original photo in Windows Picture Viewer when you originally transferred the file, the thumbnails will remain rotated and distorted.
