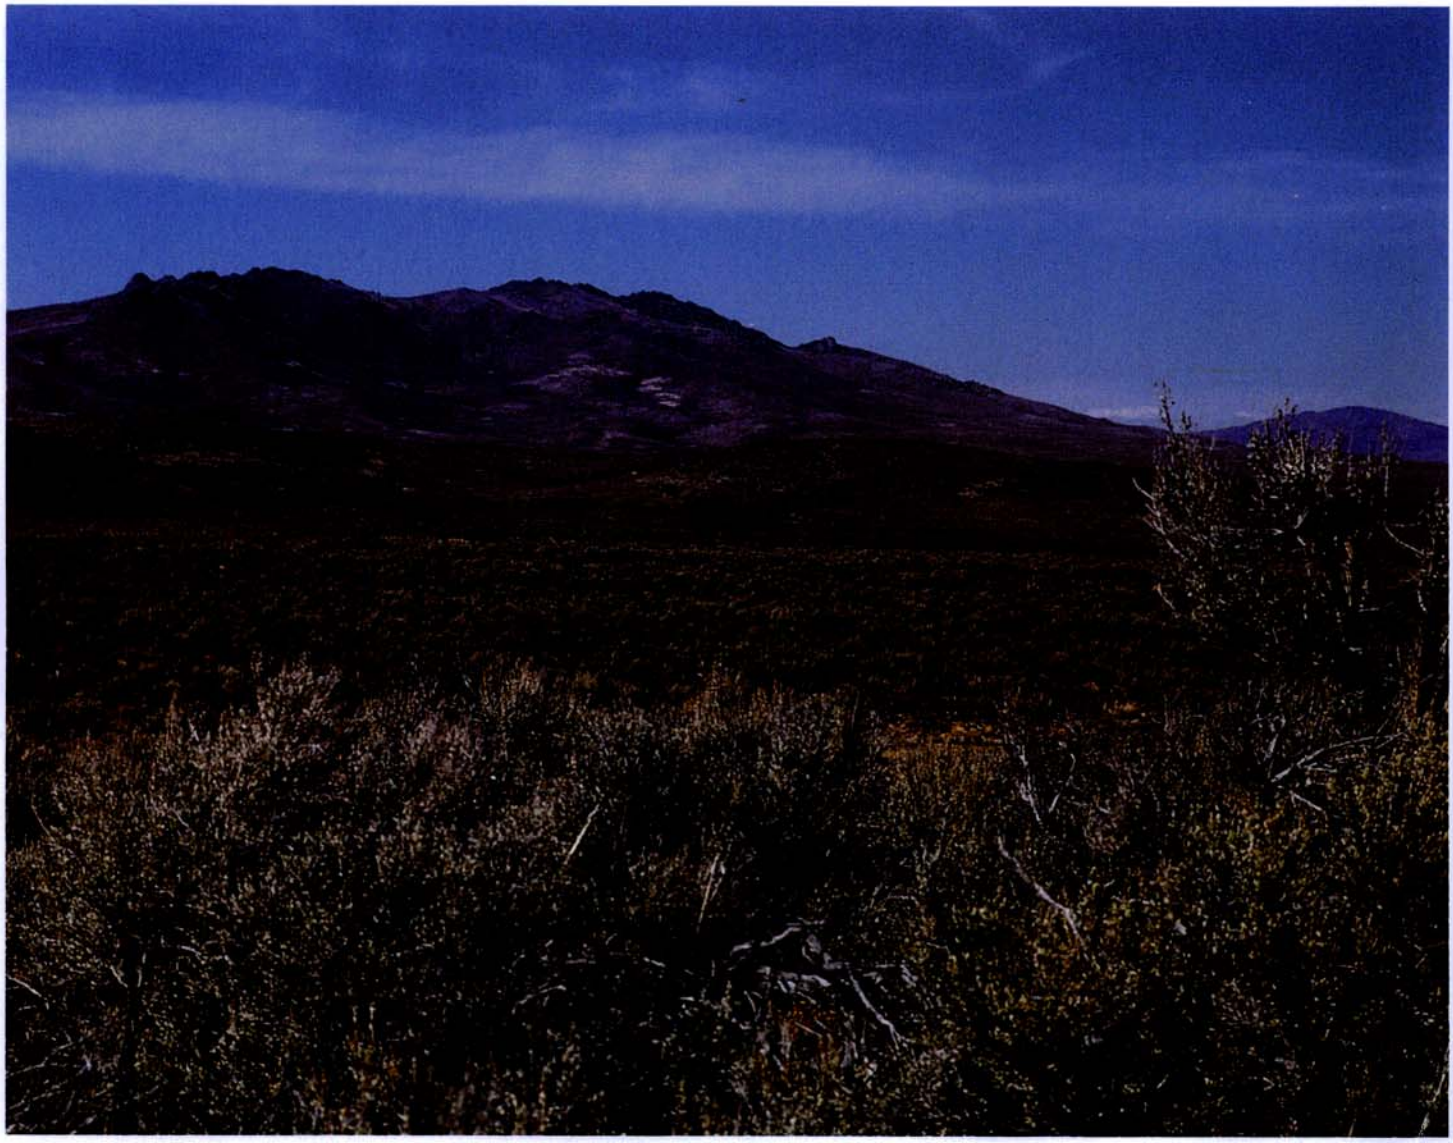
USDA United States Department of Agriculture

Natural Resources Conservation Service

In cooperation with United States Department of the Interior, Bureau of Land Management, and University of Nevada, Agricultural Experiment Station

Soil Survey of Elko County, Nevada, Central Part

Volume 1



How To Use This Soil Survey

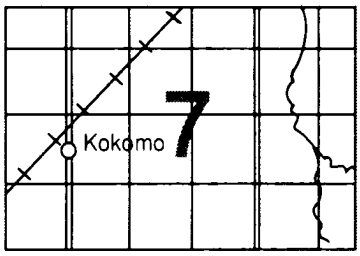
General Soil Map

The general soil map, which is the color map preceding the detailed soil maps, shows the survey area divided into groups of associated soils called general soil map units. This map is useful in planning the use and management of large areas.

To find information about your area of interest, locate that area on the map, identify the name of the map unit in the area on the color-coded map legend, then refer to the section **General Soil Map Units** for a general description of the soils in your area.

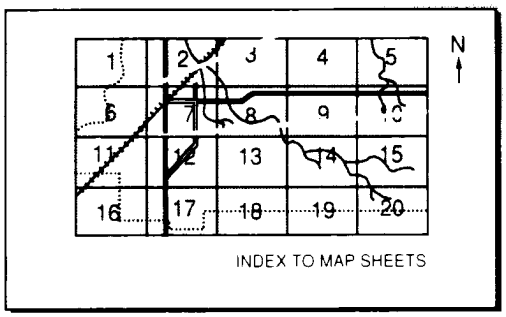
Detailed Soil Maps

The detailed soil maps follow the general soil map. These maps can be useful in planning the use and management of small areas.



MAP SHEET

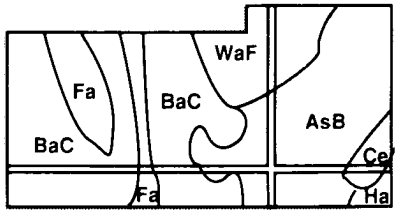
To find information about your area of interest, locate that area on the **Index to Map Sheets**, which precedes the soil maps. Note the number of the map sheet, and turn to that sheet.



INDEX TO MAP SHEETS

Locate your area of interest on the map sheet. Note the map unit symbols that are in that area. Turn to the **Index to Map Units** (see Contents), which lists the map units by symbol and name and shows the page where each map unit is described.

MAP SHEET



AREA OF INTEREST

NOTE: Map unit symbols in a soil survey may consist only of numbers or letters, or they may be a combination of numbers and letters.

The **Summary of Tables** shows which table has data on a specific land use for each detailed soil map unit. See **Contents** for sections of this publication that may address your specific needs.

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (formerly the Soil Conservation Service) has leadership for the Federal part of the National Cooperative Soil Survey.

Major fieldwork for this soil survey was completed in 1984. Soil names and descriptions were approved in 1986. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 1984. This survey was made cooperatively by the Natural Resources Conservation Service; the United States Department of the Interior, Bureau of Land Management; and the University of Nevada, Agricultural Experiment Station. The survey is part of the technical assistance furnished to the Jiggs, Lamoille, Northeast Elko, Owyhee, and Starr Valley Conservation Districts.

Soil maps in this survey may be copied without permission. Enlargement of these maps, however, could cause misunderstanding of the detail of mapping. If enlarged, maps do not show the small areas of contrasting soils that could have been shown at a larger scale.

All programs and services of the Natural Resources Conservation Service are offered on a nondiscriminatory basis, without regard to race, color, national origin, religion, sex, age, marital status, or handicap.

Cover: Lone Mountain, southwest aspect. Stampede soils are in the foreground, and Donna and Stampede soils are in the middle of the picture. These soils are on fan piedmont remnants.

Engineering index properties (table 5) 932

Classification of the soils (table 6) 1076

Foreword

This soil survey contains information that can be used in land-planning programs in the survey area. It contains predictions of soil behavior for selected land uses. The survey also highlights limitations and hazards inherent in the soil, improvements needed to overcome the limitations, and the impact of selected land uses on the environment.

This soil survey is designed for many different users. Farmers, ranchers, foresters, and agronomists can use it to evaluate the suitability of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the survey to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the survey to help them understand, protect, and enhance the environment.

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are shallow to bedrock. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. Broad areas of soils are shown on the general soil map. The location of each soil is shown on the detailed soil maps. Each soil in the survey area is described. Information on specific uses is given for each soil. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

Soil Survey of Elko County, Nevada, Central Part

By Paul W. Blackburn, Natural Resources Conservation Service
United States Department of Agriculture, Natural Resources Conservation Service,
in cooperation with
United States Department of the Interior, Bureau of Land Management, and University of Nevada, Agricultural Experiment Station

Fieldwork by Paul W. Blackburn, Terry S. Bowerman, Roderick Douglas, Deborah L. Kaiser, Michael J. Neubeiser, Robert Smith, Alan R. Wasner, and Dennis W. Worrel, Natural Resources Conservation Service, and by Earth Environmental Consultants, Inc., under contract with the United States Department of the Interior, Bureau of Land Management

This survey area is in the northeastern part of Nevada (fig. 1). It comprises most of the southwestern and central parts of Elko County. It has a total area of 2,623,895 acres, or nearly 4,100 square miles. The incorporated town of Elko is in the central part of the survey area.

The survey area is at the northern fringe of the Basin and Range province. Its position is transitional to the Snake River Plains along the Idaho State line.

The survey area is made up of mountain ranges trending north-south and intermontane valleys. Tributaries of the Humboldt River drain the survey area. The northern part of the survey area is a transitional area to high volcanic plateaus. The survey area rises in elevation from about 5,000 feet in the valleys to about 8,700 feet in the Pinyon Range.

The survey area is sparsely populated. Its economy is based on ranching and mining. Scattered irrigated lands are throughout the area, mostly on the flood plains along the Humboldt River and its tributaries. Native meadow, used as either hayland or pasture, makes up much of the irrigated land.

The descriptions, names, and boundaries of the soils in this survey area do not in all instances match those on the soil maps of adjacent survey areas. Differences are the result of a better knowledge of the soils, changes in series concepts, or variations in the intensity of mapping or in the extent of the soils within the survey areas.

General Nature of the Survey Area

This section gives general information about the survey area. It describes history, water supply, industries and transportation, drainage, soil landscapes, geology, and climate.

History

The original inhabitants of the survey area were the Shoshone Indians. French trappers and fur traders arrived in 1828. A wagon trail established in 1843 along the Humboldt River was utilized for 27 years. Ranching began in 1859, after cattle had wintered on the flood plain along the Humboldt River.

In 1868, the Central Pacific Railroad Company laid tracks along the Humboldt River. In December of that year, the town of Elko was planned. A month later, the first lots were put up for sale. In 1869, mines were started in the northern part of the survey area and the Idaho-Elko Toll Road was opened.

Because of its location, the town of Elko became the main trade center for the area. It is still the hub for the area's trade, transportation, and recreational activities.

Water Supply

The main sources of water in the survey area are the Humboldt River and its tributaries. Some of its tributaries are the North and South Forks of the

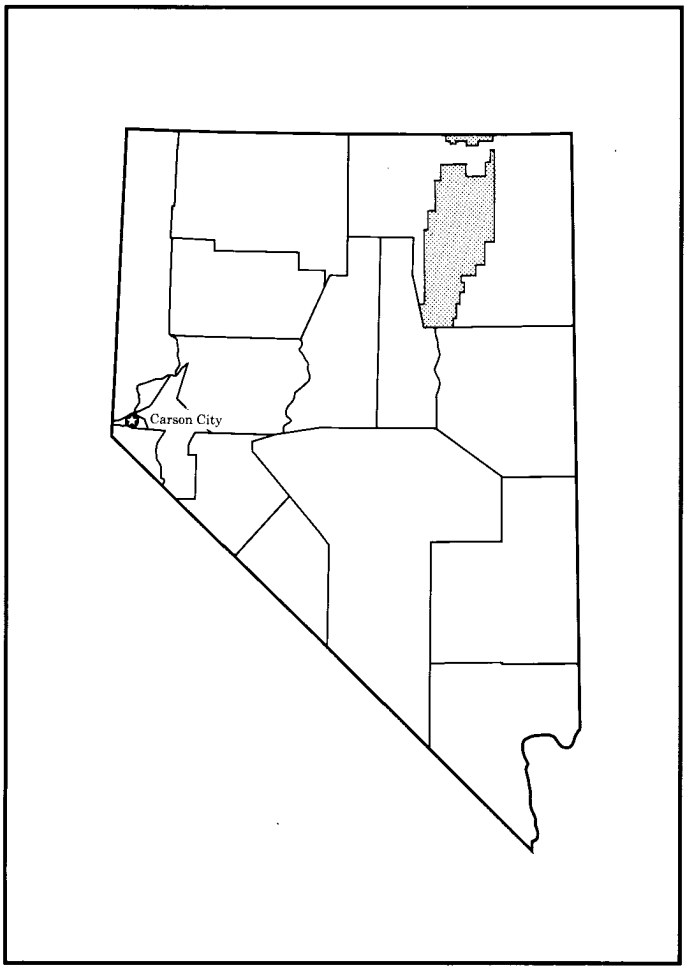

Figure 1.—Location of Elko County, Central Part, in Nevada.

Humboldt River, Huntington Creek, and the Marys River. The water is used mainly for irrigation. In a few scattered areas, water for irrigation is drawn from drilled wells or springs.

At the lower elevations, water for livestock and wildlife is provided by the Humboldt River and its tributaries. At the higher elevations, water is provided by numerous small springs and seeps and several small perennial streams.

Domestic wells are the main source of water for the town of Elko and the outlying rural areas. Springs provide water for some of the communities and ranches near the foot of mountain ranges.

Industries and Transportation

The main industries in the survey area are ranching and mining. The ranches are dominantly cow-calf operations. The weaners and yearlings are generally sold in the fall. A few herds of sheep are in the area.

An open pit gold mine north of Elko began operating in 1980. After a mill was completed in 1981, the mine became the second largest gold producer in the United States. Exploration for oil has taken place southwest of Jiggs and north of Ryndon. Geothermal ground water has been developed and is used by local small industries.

Rail service to the area is provided by the Southern Pacific and Union Pacific Railroads. Amtrak and a commercial airline provide service to and from the town of Elko on a daily basis. Chartered flight service is available at the Elko Municipal Airport.

Interstate 80 runs from east to southwest through the south-central part of the survey area. State Route 225, which is the main paved road, runs north-south from the town of Elko through Mountain City. Route 226, a paved road south of Elko, runs through Jiggs, where it becomes an unpaved county road. State Route 229 leaves I-80 at Halleck and runs southeast through Ruby and Secret Valley. A scenic loop can be taken on Route 230 by exiting I-80 at Deeth and heading southeast through Starr Valley and returning to I-80 at Welcome.

Drainage

The survey area is drained principally by the Humboldt River. This river enters the survey area east of Deeth and flows in a southwesterly direction through Elko, leaving the survey area near Carlin.

The southern part of the survey area is drained mainly by Huntington Creek. This creek enters the South Fork of the Humboldt River north of Jiggs.

The central part of the survey area is drained by two major tributaries of the Humboldt River. The west-central part is drained by the North Fork of the Humboldt River, which flows dominantly south and enters the Humboldt River directly east of Ryndon. The east-central part is drained by the Marys River, which flows south and enters the Humboldt River near Deeth.

The northwestern and northeastern parts of the survey area, which are near Idaho, each have major drainages. The Bruneau River drains the northwestern part. It flows north into Idaho and enters the Snake River. The Jarbidge River drains the northeastern part. It flows north into Idaho and enters the North Fork of the Bruneau River.

Soil Landscapes

In this survey area the mapped areas generally represent associations of two or three major soil components as well as included soils of limited extent.

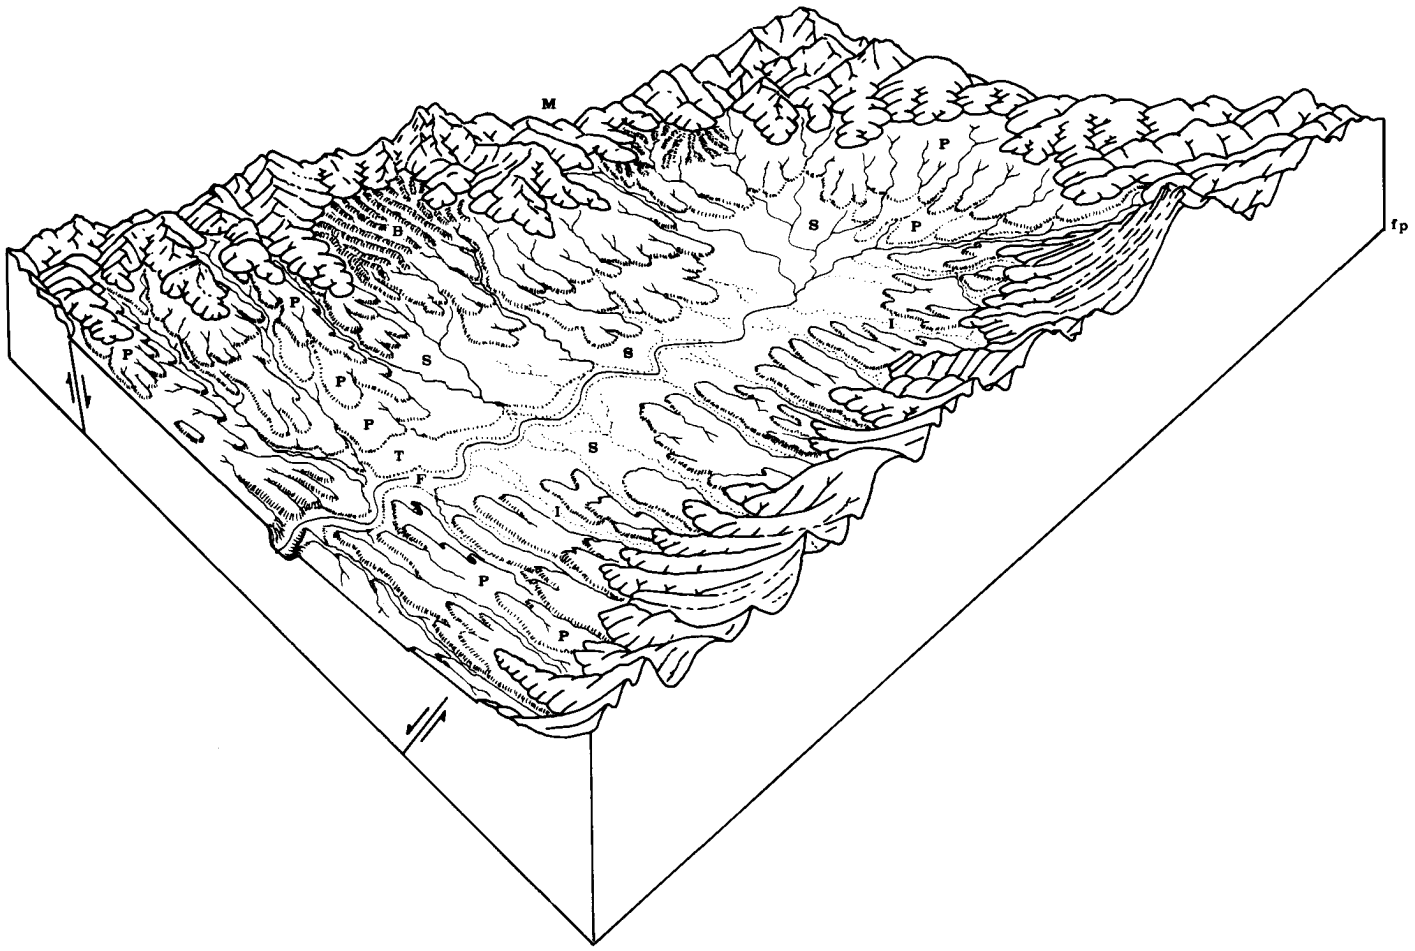

Figure 2.—A semibolson that displays the effects of several cycles of dissection and deposition. The major landforms are ballenas (B); fan piedmonts (P), comprising several levels, or ages, of fan remnants; fan skirts (S); an axial stream terrace (T); and an axial stream flood plain (F). Alluvial fans are not distinguished from fan piedmonts. Inset fans (I) are between fan remnants. The basin is bounded on two sides by mountains (M).

Soil patterns commonly coincide with landforms and physiographic positions. In the section "Detailed Soil Map Units," descriptive terms are used to identify the location of individual soil components on the landscape. Although landforms and soils are related, they are not mutually exclusive. Individual soil series commonly occur on more than one component landform.

In this survey area the landforms are classified and defined according to a system developed by Frederick F Peterson *(16)*. The landform elements are described and defined in a manner precise enough to indicate where soils occur in relation to each other. The intent of this section is not to define all of the landform terms but to define briefly the main geomorphic surfaces in the survey area. All landform terms are defined in the Glossary.

The landforms of the intermontane basins are first grouped in two general classes—bolson and semibolson (fig. 2). Bolsons are not described in this report because they do not occur within the survey area. Semibolsons have three identifiable major physiographic parts in the Basin and Range province (fig. 3). These are the bounding mountains, the piedmont slope, and the basin floor. The bounding mountains rise more than 1,000 feet above the surrounding boundaries. The piedmont slope and basin floor are gross topographic forms that slope from the bounding mountains down to a flood plain.

The shapes, genetic relationships, and geographic scales of the topography observed in the field are used to classify the landforms. The semibolson landform is successively divided into smaller and genetically more

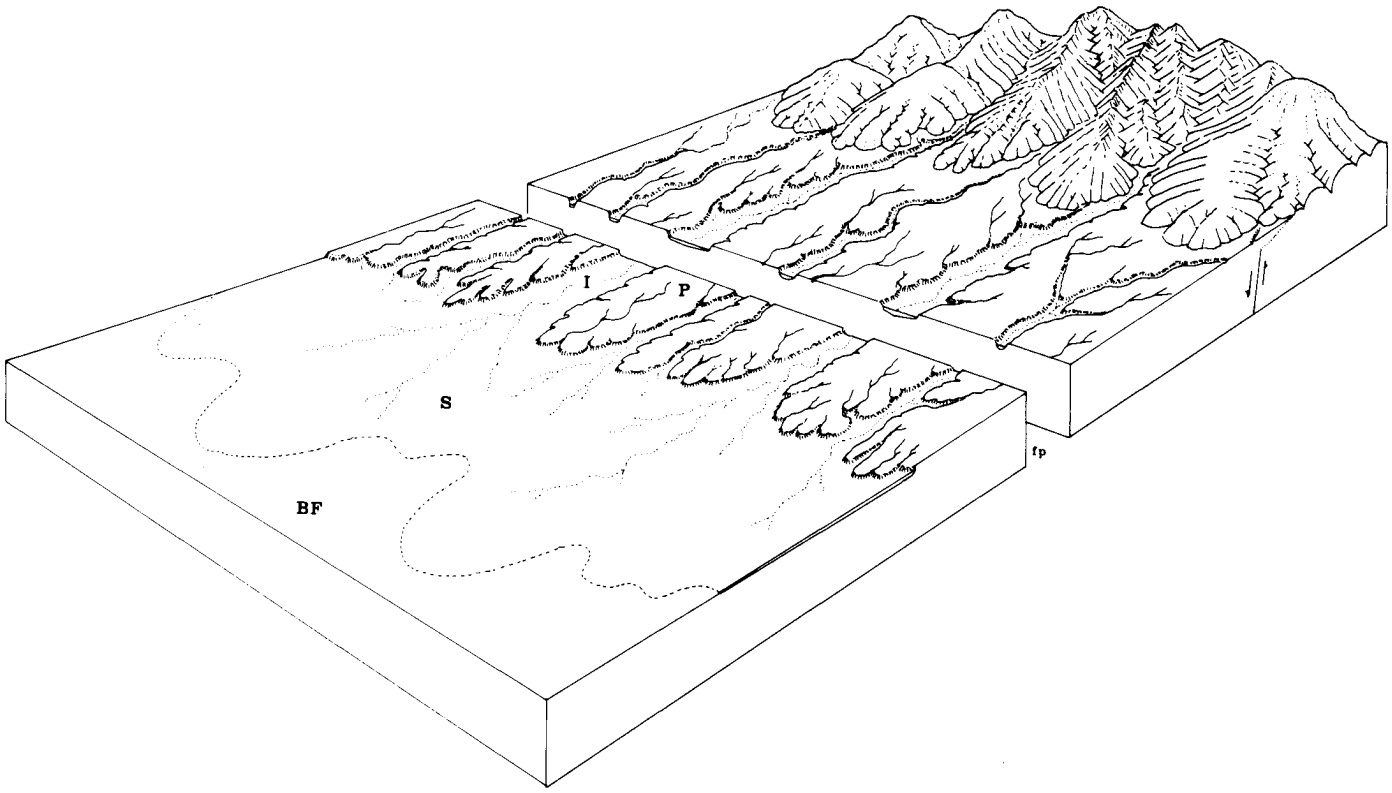

Figure 3.—A fan skirt (S) that merges along its lower boundary with a basin floor (BF) and that was formed by coalescing alluvial fans originating at gullies cut in a dissected fan piedmont (P) and by debauching inset fans (I) of the fan piedmont. The erosional fan piedmont remnants and mouths of the inset fans form the upper boundary of the fan skirt. The skirt is the same age surface as the inset fans but is younger than the relict summits of the fan remnants. It may be the same age or younger than the basin floor surface, but as shown here it is younger because its alluvium overlaps the basin floor surface.

homogeneous classes, as shown in the chart "Classification of Semibolson Landforms." The broadest class is major physiographic parts, each of which is made up of several genetically related major landforms. These landforms in turn may be comprised of several genetically related component landforms. The component landforms are the smallest single units that one would consider in combined terms of their form, constituent materials, and genetic history. Some component landforms, such as fan piedmont remnants, have distinctive topographic parts with quite different geomorphic histories. These parts are called landform elements. The landform elements that are erosional surfaces are subdivided into slope components.

In the section "General Soil Map Units," landscape positions are given for each major component. These positions generally are major physiographic parts, major landforms, or component landforms. In the section "Detailed Soil Map Units," broad landscape positions are specified for each map unit. These positions apply to the entire unit. They are major physiographic parts or major landforms. More detailed landscape positions are given for each major component and contrasting inclusion in the map unit. These generally are component landforms, landform elements, or slope components.

Geology

Lower Paleozoic Ordovician rocks are the oldest rocks in the survey area *(8)*. These rocks formed in material laid down in a broad, shallow sea, part of a wide strait extending eastward into central Utah. The rocks are in areas south of Taylor Canyon, in the north end of the Adobe Range, and in the Double Mountain area. They include the Valmy Formation and the Vinini Formation.

Mid-Paleozoic rocks of dominantly Devonian age

CLASSIFICATION OF SEMIBOLSON LANDFORMS

Landforms			Parts of landforms	
I Major physiographic part	II Major landform	III Component landform	IV Landform element	V Slope component
Bounding mountains				
Piedmont slope	Ballena			Crest Shoulder slope Back slope Foot slope

underlie the Pinyon Range, the Adobe Range, and the Elko hills *(8)*. These rocks consist of shale, siltstone, sandstone, and chert pebble conglomerate. Typically, Sumine, Cleavage, Chen, Hapgood, and Loncan soils overlie these rocks.

Local areas of Devonian dolomite and limestone are throughout the survey area, but they are mainly in the Pinyon Range and in the northern Sulfur Spring Range. Typically, Hopeka and Cavehill soils overlie these rocks.

Limestone of lower Pennsylvanian to upper Permian age is in the Buckskin Mountains, the Grindstone Mountains, and the Cedar Ridge area *(8)*. Typically, Izod, Samor, and Nirac soils overlie these rocks.

Tertiary volcanic extrusives and shallow igneous rocks underlie most of the uplands in the north-central part of the survey area and in the Robinson Mountain area *(8)*. These rocks consist chiefly of rhyolitic flows and welded and nonwelded silicic ash flow tuff. These flows now conceal the older rocks in much of the northern part of the survey area. Typically, Cotant, Akler, Lerrow, Linkup, and Shively soils overlie these rocks.

Normal faulting of the Tertiary and Pleistocene orogeny is responsible for many of the topographic features in the survey area. This faulting, which has been continuous to the present, began before the Humboldt Formation was deposited. The Humboldt Formation was deposited during relatively quiet intervals between major epochs of volcanism *(17, 18)*. It now makes up the majority of the intermontane basins in the survey area. It consists of lakebeds, ash, tuff, and clastic deposits laid down by streams. Typically, Donna,

Eboda, Stampede, Hunnton, Wieland, and Puett soils overlie this material.

Recent alluvium is the youngest material in the survey area. It is on the flood plains adjacent to the Humboldt River and its tributaries. It is stratified clay, silt, sand, and gravel. Typically, Devilsgait, Woofus, Sonoma, Ocala, Welch, and Crooked Creek soils overlie this material.

Climate

In this survey area summers are hot, especially at the lower elevations, and winters are cold. Precipitation is normally light at the lower elevations during all months of the year. At the higher elevations, precipitation is much greater and snow accumulates to considerable depths. Much of the snowmelt irrigates crops in nearby valleys.

Table 1 gives data on temperature and precipitation for the survey area as recorded at Carlin, Elko, Jiggs, Owyhee, Tuscarora, and Wells, Nevada, for a period somewhere between 1939 and 1978. Table 2 shows probable dates of the first freeze in fall and the last freeze in spring. Table 3 provides data on length of the growing season.

In winter the average temperature is 27 degrees F at Carlin, Elko, and Jiggs; 30 degrees at Owyhee; 28 degrees at Tuscarora; and 25 degrees at Wells. The average daily minimum temperature in winter is 20 degrees at Carlin and Owyhee, 15 degrees at Elko, 13 degrees at Jiggs and Wells, and 18 degrees at Tuscarora. The lowest temperature on record, which occurred at Elko on January 21, 1937, is -43 degrees. In summer the average temperature is 68 degrees at Carlin, 66 degrees at Elko, 63 degrees at Jiggs, 65 degrees at Owyhee and Wells, and 64 degrees at Tuscarora. The average daily maximum temperature in summer is 80 degrees at Carlin and Tuscarora; 85 degrees at Elko, Jiggs, and Wells; and 81 degrees at Owyhee. The highest recorded temperature, which occurred at Elko on August 4, 1978, is 107 degrees.

Growing degree days are shown in table 1. They are equivalent to "heat units." During the month, growing degree days accumulate by the amount that the average temperature each day exceeds a base temperature (40 degrees F). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze in spring and the first freeze in fall.

The total annual precipitation is about 15 inches at Carlin, 9 inches at Elko, 12 inches at Jiggs and Tuscarora, 14 inches at Owyhee, and 10 inches at Wells. Of these totals, 40 to 50 percent usually falls in April through September. The growing season for most crops falls within this period. In 2 years out of 10, the rainfall in April through September is less than 2 inches. The heaviest 1-day rainfall during the period of record was 4.13 inches at Elko on August 27, 1970. Thunderstorms occur on about 20 days each year.

The average seasonal snowfall is about 40 to 60 inches. The greatest snow depth at any one time during the period of record was 42 inches at Tuscarora on December 28, 1968. On an average of 20 to 30 days, at least 1 inch of snow is on the ground. The number of such days varies greatly from year to year. Every few years a blizzard with high winds and drifting snow strikes the survey area. Even at the lower elevations, snow remains on the ground for many weeks and livestock suffer.

The average relative humidity in midafternoon is about 40 percent. Humidity is higher at night, and the average at dawn is about 70 percent. The sun shines about 80 percent of the time possible in summer and 70 percent in winter. The prevailing wind is from the southwest. Average windspeed is highest, 7 miles per hour, in spring.

How This Survey Was Made

This survey was made to provide information about the soils and the miscellaneous areas in the survey area. The information includes a description of the soils and their location and a discussion of the suitability, limitations, and management of the soils for specified uses. The fieldwork in most parts of the survey area was done by soil scientists from the Natural Resources Conservation Service, but the fieldwork in the southwestern and north-central parts of the survey area was done by soil scientists from Earth Environmental Consultants, Inc., under contract with the Bureau of Land Management.

Access to the 71 Ranch was denied to the field mapping party. As a result, field mapping of this limited area was completed through photo interpretation and not by actual field observation. This procedure limits the reliability of the soil interpretations for use and management within this specific area.

Some discrepancies emerged in joining the soil surveys of the Tuscarora Mountain and Diamond Valley areas. Older published soil surveys of these areas were completed within the framework of the then existing knowledge and standards. A better understanding of soils and improved mapping techniques have been developed. Consequently, some of the soil names, map unit components, or physiographic positions may not be exactly the same as before. These differences should have little or no effect on the use of these surveys for management purposes.

During the course of this survey, soil scientists observed the steepness, length, and shape of slopes; the general pattern of drainage; the kinds of crops and native plants growing on the soils; and the kinds of bedrock. They dug many holes to study the soil profile, which is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unmodified parent material in which the soil formed. This unmodified material is devoid of roots and other living organisms and has not been changed by other biological activity.

The soils and miscellaneous areas in the survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil or miscellaneous area is associated with a particular kind of landscape or with a segment of the landscape. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landscape, a soil scientist develops a concept, or model, of how the soils were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil at a specific location on the landscape.

Individual soils on the landscape commonly merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot assure that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

General Soil Map Units

The general soil map at the back of this publication shows broad areas that have a distinctive pattern of soils, relief, and drainage. Each map unit on the general soil map is a unique natural landscape. Typically, it consists of one or more major soils or miscellaneous areas and some minor soils or miscellaneous areas. It is named for the major soils or miscellaneous areas. The soils or miscellaneous areas making up one unit can occur in other units but in a different pattern.

Figure 4 illustrates how the general soil map units relate to various broad landscapes. The map units in figure 4 are representative of those on a semibolson that is an externally drained intermontane basin.

The general soil map can be used to compare the suitability of large areas for general land uses. Areas of suitable soils or miscellaneous areas can be identified on the map. Likewise, areas that are not suitable can be identified.

Because of its small scale, the map is not suitable for planning the management of a farm or field or for selecting a site for a road, building, or other structure. The soils in any one map unit differ from place to place in slope, depth, drainage, and other characteristics that affect management.

The general soil map units in this survey area have been grouped for broad purposes. Each of the broad groups and the map units in each group are described on the following pages.

Map Unit Descriptions

Areas Dominated by Soils on Basin Floors

This group consists of three map units. Elevation is 5,000 to 6,400 feet. The mean annual precipitation is 8 to 12 inches, the mean annual temperature is 42 to 50 degrees F, and the frost-free period is 80 to 120 days.

These soils are nearly level and very deep. They are medium textured over coarse textured to fine textured. Some of the soils are young and exhibit little, if any, profile development. The rest are on the slightly older geomorphic surfaces and exhibit a minimal degree of profile development.

Most of these soils have a seasonal high water table and are subject to flooding. The rest are well drained and are subject to rare flooding. Some of the soils are saline and sodic. The rest are not affected by salt and sodium.

1. Devilsgait-Woofus-Moranch

Nearly level, very deep, very poorly drained and well drained soils; on flood plains and fan skirts

This map unit is in the central part of the survey area, which comprises the major drainage of the Humboldt River and the South Fork of the Humboldt River. The Devilsgait and Woofus soils support mainly creeping wildrye, basin wildrye, and inland saltgrass. The Moranch soils support mainly black greasewood, basin wildrye, and inland saltgrass.

This map unit makes up about 3 percent of the survey area.

The Devilsgait and similar soils are very deep and very poorly drained and are on flood plains. They are stratified and dominantly medium textured and moderately fine textured throughout. They are not saline or sodic. They are subject to frequent flooding.

The Woofus and similar soils are very deep and very poorly drained and are on flood plains. They are dominantly medium textured and moderately fine textured over coarse textured. They are not saline or sodic. They are subject to frequent flooding.

The Moranch and similar soils are very deep and well drained and are on fan skirts. They are dominantly medium textured throughout. They are slightly saline and strongly sodic. They are subject to rare flooding.

Of minor extent in this unit are the Ocala and Kelk soils. The Ocala soils are on alluvial flats. They support black greasewood, basin wildrye, and western wheatgrass. The Kelk soils are on fan skirts. They support big sagebrush and Thurber needlegrass.

This unit is used for livestock grazing, rangeland

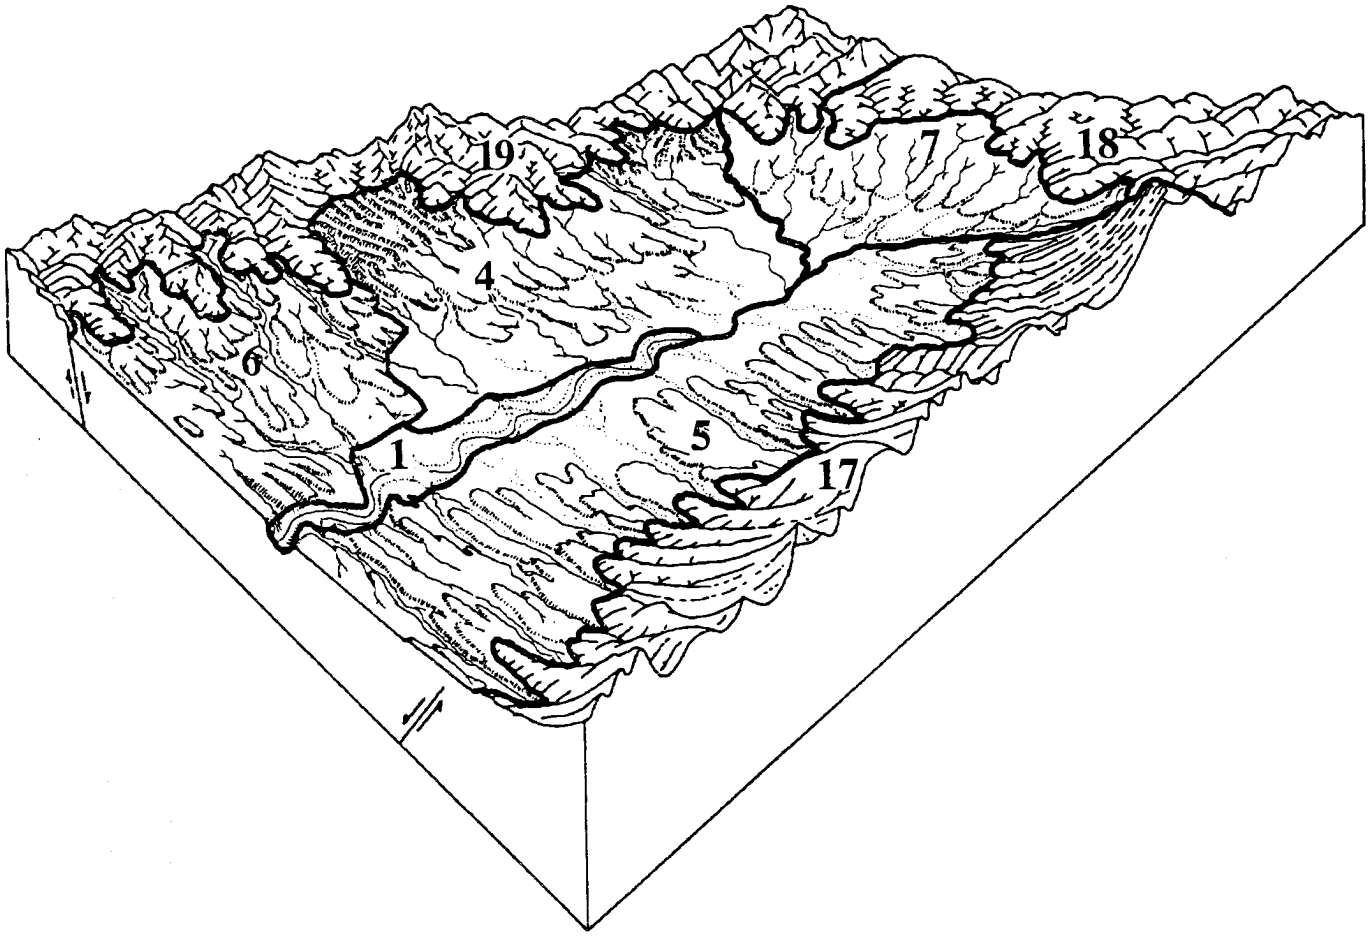

Figure 4.—General soil map units representative of those on a semibolson that is an externally drained intermontane basin. The units are as follows: 1—Devilsgait-Woofus-Moranch; 4—Orovada-Bioya-Puett; 5—Hunnton-Wieland-Bilbo; 6—McIvey-Stampede-Betra; 7—Donna-Stampede-Bilbo; 17—Cleavage-Quarz-Loncan; 18—Cotant-McIvey-Lerrow; and 19—Sumine-Cleavage-Hapgood.

wildlife habitat, and irrigated hay and pasture.

2. Sonoma-Devilsgait-Ocala

Nearly level, very deep, very poorly drained to somewhat poorly drained soils; on basin floors

This map unit is in the southern, central, and east-central parts of the survey area. The Sonoma soils support mainly creeping wildrye, basin wildrye, and mat muhly. The Devilsgait soils support mainly creeping wildrye, basin wildrye, and inland saltgrass. The Ocala soils support mainly basin wildrye, black greasewood, alkali sacaton, and inland saltgrass.

This map unit makes up about 2 percent of the survey area.

The Sonoma and similar soils are very deep and poorly drained and are on flood plains and alluvial flats. They are dominantly medium textured and moderately fine textured throughout. They are slightly saline and are slightly sodic to strongly sodic. They are subject to occasional flooding.

The Devilsgait and similar soils are very deep and very poorly drained and are on flood plains. They are stratified and dominantly medium textured and moderately fine textured throughout. They are not saline or sodic. They are subject to occasional or frequent flooding.

The Ocala and similar soils are very deep and somewhat poorly drained and are on alluvial flats and the outer margin of flood plains. They are dominantly medium textured and moderately fine textured throughout. They are slightly saline and sodic to

strongly saline and sodic. They are subject to occasional flooding.

Of minor extent in this unit are the Kelk, Moranch, Woofus, and Bloor soils. The Kelk soils are on the upper fan skirts. They support big sagebrush and Thurber needlegrass. The Moranch soils are on the lower fan skirts. They support black greasewood, basin wildrye, and inland saltgrass. The very poorly drained Woofus soils are on flood plains. They support basin big sagebrush, basin wildrye, and Nevada bluegrass. The Bloor soils are on alluvial flats. They support plants similar to those on the Ocala soils.

This unit is used for livestock grazing, irrigated hay and pasture, and rangeland wildlife habitat.

3. Crooked Creek-Hussa

Nearly level, very deep, poorly drained soils; on flood plains

This map unit is in the northwestern, northeastern, and southeastern parts of the survey area. The Crooked Creek and Hussa soils support mainly tufted hairgrass, sedge, and rush.

This map unit makes up about 1 percent of the survey area.

The Crooked Creek and similar soils are very deep and poorly drained and are on flood plains. They are dominantly fine textured throughout. They are not saline or sodic. They are subject to occasional or frequent flooding.

The Hussa and similar soils are very deep and poorly drained and are on flood plains. They are dominantly moderately fine textured throughout. They are not saline or sodic. They are subject to occasional flooding.

Of minor extent in this unit are the Alburz Variant soils in the Lamoille Valley area and near Lee. These soils support cottonwood, sedge, and bluegrass.

This unit is used for livestock grazing, irrigated hay and pasture, rangeland, and wildlife habitat.

Areas Dominated by Soils on Fan Piedmonts

This group consists of four map units. Elevation is 5,000 to 7,600 feet. The mean annual precipitation is 8 to 16 inches. the mean annual temperature is 40 to 50 degrees F, and the frost-free period is about 70 to 120 days.

These soils are gently sloping to steep. They are moderately deep to a duripan or are shallow or very deep. They are moderately coarse textured to very gravelly or very cobbly and fine textured or very fine textured. The soils are on the older geomorphic surfaces. Many of them have accumulated clay in the subsoil and cemented silica in the substratum.

The soils in this group are well drained and are not subject to flooding.

4. Orovada-Bioya-Puett

Gently sloping to steep, well drained soils that are moderately deep to a duripan or are shallow or very deep; on fan piedmont remnants, in the rock-core areas of fan piedmont remnants, and on partial ballenas

This map unit is in the White Flats and Dennis Flats areas and in the north end of the Lamoille Valley. The Orovada and Bioya soils support mainly big sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Puett soils support mainly Wyoming big sagebrush, black sagebrush, Indian ricegrass, and bottlebrush squirreltail.

This map unit makes up about 11 percent of the survey area.

The Orovada and similar soils are very deep, are gently sloping to strongly sloping, and are on fan piedmont remnants. They have a medium textured surface layer over a medium textured and moderately coarse textured substratum.

The Bioya and similar soils are gently sloping to strongly sloping. They are moderately deep to a duripan. They are on fan piedmont remnants and partial ballenas. They have a medium textured surface layer and subsoil over an indurated duripan.

The Puett and similar soils are shallow, are moderately steep and steep, and are in the rock-core areas of fan piedmont remnants and on the side slopes of partial ballenas. They are moderately coarse textured and are underlain by soft bedrock.

Of minor extent in this unit are the Wieland, Tustell, Hunnton, Hussa, Kodra, and Perwick soils along the Eureka County line. The Wieland, Tustell, Hunnton, and Kodra soils are on the summits of fan piedmont remnants. They support big sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Hussa soils are on narrow flood plains. They support creeping wildrye, basin wildrye, and inland saltgrass. The Perwick soils are in the rock-core areas of fan piedmont remnants and on the side slopes of partial ballenas. They support Utah juniper and big sagebrush.

This unit is used mainly for livestock grazing and rangeland wildlife habitat. Some areas are used for homesite development.

5. Hunnton-Wieland-Bilbo

Gently sloping to steep, well drained soils that are moderately deep to a duripan or are very deep; on fan piedmont remnants

This map unit is in valleys throughout the survey area. The Hunnton, Wieland, and Bilbo soils support

mainly big sagebrush, Thurber needlegrass, and bluebunch wheatgrass.

This map unit makes up about 29 percent of the survey area.

The Hunnton and similar soils are gently sloping to strongly sloping and are moderately deep to a duripan. They are on fan piedmont remnants. They have a medium textured surface layer and a fine textured subsoil over an indurated duripan.

The Wieland and similar soils are very deep, are gently sloping to moderately steep, and are on fan piedmont remnants. They have a gravelly, medium textured surface layer and a fine textured subsoil over a weakly cemented, gravelly, moderately fine textured substratum.

The Bilbo and similar soils are very deep and steep and are on the side slopes of fan piedmont remnants. They generally have a medium textured surface layer and a very gravelly, fine textured subsoil over an extremely gravelly, moderately coarse textured substratum.

Of minor extent in this unit are the Crooked Creek soils, drained areas of the Hussa soils, and the Puett, Kelk, and Chiara soils. The Crooked Creek soils are on narrow flood plains. They support tufted hairgrass and sedge. The drained Hussa soils are on narrow flood plains. They support basin big sagebrush and basin wildrye. The Puett soils are in rock-core areas on the side slopes of fan piedmont remnants. They support Wyoming big sagebrush, black sagebrush, and Indian ricegrass. The Kelk soils are on inset fans and fan skirts. The Chiara soils are on the summits of fan piedmont remnants. The Kelk and Chiara soils support plants similar to those on the major soils.

This unit is used mainly for livestock grazing and rangeland wildlife habitat. Some areas are used for homesite or urban development.

6. McIvey-Stampede-Betra

Gently sloping to strongly sloping, well drained soils that are moderately deep to a duripan or are very deep; on fan piedmont remnants

This map unit is in the southeastern and northwestern parts of the survey area, along the base of the Ruby Mountains, the East Humboldt Range, and the Independence Mountains. The McIvey soils support mainly mountain big sagebrush, Idaho fescue, and bluebunch wheatgrass. The Stampede soils support mainly big sagebrush, bluebunch wheatgrass, and Thurber needlegrass. The Betra soils support mainly low sagebrush, Idaho fescue, and bluebunch wheatgrass.

This map unit makes up about 3 percent of the survey area.

The McIvey and similar soils are very deep, are gently sloping to strongly sloping, and are on the summits and side slopes of fan piedmont remnants. They have a gravelly, medium textured surface layer over a very gravelly or very cobbly, fine textured subsoil.

The Stampede and similar soils are gently sloping and moderately sloping and are moderately deep to a duripan. They are on the summits of fan piedmont remnants. They have a gravelly, medium textured surface layer and a gravelly, fine textured subsoil over an indurated duripan.

The Betra and similar soils are gently sloping and moderately sloping and are moderately deep to a duripan. They are on the summits of fan piedmont remnants. They have a cobbly, medium textured surface layer and a very gravelly or very cobbly, fine textured subsoil over a strongly cemented duripan.

Of minor extent in this unit are the Short Creek, Heechee, Alburz Variant, and Hussa soils. The Short Creek soils are on the side slopes of fan piedmont remnants. They support big sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Heechee soils are on the summits of fan piedmont remnants. They support antelope bitterbrush, mountain big sagebrush, Idaho fescue, and bluebunch wheatgrass. The Alburz Variant soils are on narrow flood plains. They support cottonwood and sedge. The Hussa soils are on narrow flood plains. They support tufted hairgrass and sedge.

This unit is used mainly for livestock grazing and rangeland wildlife habitat. Some areas are used for irrigated hay and pasture.

7. Donna-Stampede-Bilbo

Gently sloping to steep, well drained soils that have a dense claypan and are moderately deep to a duripan or are very deep; on fan piedmont remnants

This map unit is northeast of the Lamoille Valley and borders part of the Independence Mountains and the Adobe Range in the lower northeast corner of the survey area. The Donna soils support mainly low sagebrush, Idaho fescue, and bluebunch wheatgrass. The Stampede and Bilbo soils support mainly big sagebrush, Thurber needlegrass, and bluebunch wheatgrass.

This map unit makes up about 9 percent of the survey area.

The Donna and similar soils are gently sloping to strongly sloping and are on the summits of fan piedmont remnants. They are moderately deep to a

duripan. They have a gravelly, medium textured surface layer and a very fine textured subsoil over an indurated duripan.

The Stampede and similar soils are gently sloping to strongly sloping and are moderately deep to a duripan. They are on the summits and side slopes of fan piedmont remnants. They have a gravelly, medium textured surface layer and a fine textured subsoil over an indurated duripan.

The Bilbo and similar soils are very deep and steep and are on the side slopes of fan piedmont remnants. They have a very gravelly, medium textured surface layer; a very gravelly, fine textured subsoil; and an extremely gravelly, moderately coarse textured substratum.

Of minor extent in this unit are the Hunnton, Tustell, Quarz, and Hussa soils. The Hunnton, Tustell, and Quarz soils are on fan piedmont remnants. They support plants similar to those on the Stampede soils. The Hussa soils are on narrow flood plains. They support tufted hairgrass and sedge.

This unit is used for livestock grazing and rangeland wildlife habitat.

Areas Dominated by Soils on Hills and Fan Piedmonts

This group consists of six map units. The soils in this group are dominantly on hills but also are on the adjacent fan piedmont remnants. Elevation is 5,000 to 7,600 feet. The mean annual precipitation is 8 to 16 inches, the mean annual temperature is 41 to 51 degrees F, and the frost-free period is about 70 to 120 days.

These soils are gently sloping to steep and are very shallow, shallow, moderately deep, or very deep or are shallow to a duripan. The soils range from moderately coarse textured to fine textured or very gravelly or very cobbly and fine textured. They are on the older geomorphic surfaces and have a layer of accumulated clay in the subsoil or cemented silica in the substratum. Some of the soils are very shallow or shallow to bedrock and are eroding nearly as rapidly as they are forming.

The soils in this group are well drained or somewhat excessively drained and are not subject to flooding.

8. Grina-Karpp-Rad

Gently sloping to steep, well drained soils that are shallow to a duripan or are shallow or very deep; on hills and fan piedmont remnants

This map unit is in the Cedar Ridge area and the Elko Hills area. The Grina and Karpp soils support mainly Utah juniper and big sagebrush. The Rad soils support mainly big sagebrush, Thurber needlegrass, and bluebunch wheatgrass.

This map unit makes up about 2 percent of the survey area.

The Grina and similar soils are shallow, are moderately steep and steep, and are on hills. They are dominantly medium textured or moderately fine textured throughout and are underlain by soft bedrock.

The Karpp and similar soils are gently sloping to strongly sloping, are shallow to a duripan, and are on the summits and side slopes of fan piedmont remnants. They have a medium textured surface layer and a very gravelly, medium textured subsoil over an indurated duripan.

The Rad and similar soils are very deep, are gently sloping to strongly sloping, and are on the side slopes of fan piedmont remnants. They are dominantly medium textured throughout.

Of minor extent in this unit are the Perwick and Bunky soils. The Perwick soils are on the side slopes of hills. They support Utah juniper and Wyoming big sagebrush. The Bunky soils are on the summits of fan piedmont remnants. They support big sagebrush, Thurber needlegrass, and bluebunch wheatgrass.

This unit is used for woodland, livestock grazing, and rangeland wildlife habitat.

9. Yuko-Tuffo

Gently sloping to steep, very shallow and shallow, somewhat excessively drained and well drained soils; on hills

This map unit is in the west-central part of the survey area. The Yuko and Tuffo soils support mainly big sagebrush, bluebunch wheatgrass, and Thurber needlegrass.

This map unit makes up about 1 percent of the survey area.

The Yuko and similar soils are shallow, well drained, and strongly sloping to steep and are on hills. They have a very gravelly, medium textured surface layer and a moderately fine textured subsoil over soft bedrock.

The Tuffo and similar soils are very shallow and shallow, somewhat excessively drained, and gently sloping to moderately steep and are on hills. They are dominantly moderately coarse textured and are underlain by soft bedrock.

Of minor extent in this unit are the Enko and Crooked Creek soils. The Enko soils are on the foot slopes of hills. They support plants similar to those on the Yuko and Tuffo soils. The poorly drained Crooked Creek soils are in narrow drainageways on hills. They support basin big sagebrush and basin wildrye.

This unit is used for livestock grazing and rangeland wildlife habitat.

10. Izod-Porrone-Chiara

Moderately sloping to steep, somewhat excessively drained and well drained soils that are shallow to a duripan or are shallow or very deep; on hills and the adjacent fan piedmont remnants

This map unit is in the north end of Dixie Flats. The Izod soils support mainly black sagebrush, Indian ricegrass, and Thurber needlegrass. The Porrone and Chiara soils support mainly big sagebrush, Thurber needlegrass, and bluebunch wheatgrass.

This map unit makes up about 1 percent of the survey area.

The Izod and similar soils are shallow, somewhat excessively drained, and moderately sloping to very steep and are on hill crests and side slopes. They are dominantly very gravelly or extremely gravelly and medium textured and are underlain by hard bedrock.

The Porrone and similar soils are very deep, well drained, and steep and are on side slopes. They are dominantly very gravelly and medium textured throughout.

The Chiara and similar soils are shallow to a duripan, well drained, and moderately sloping and strongly sloping and are on fan piedmont remnants. They are dominantly medium textured over an indurated duripan.

Of minor extent in this unit are the Gochea and Spilock soils and areas of rock outcrop. The very deep Gochea soils are on hills and fan piedmont remnants. They support plants similar to those on the Porrone and Chiara soils. The Spilock soils are on fan piedmont remnants. They support Utah juniper and big sagebrush. Rock outcrop is throughout the unit. It is barren of vegetation.

This unit is used for livestock grazing and rangeland wildlife habitat.

11. Samor-Nirac-Izod

Moderately steep and steep, shallow and moderately deep, somewhat excessively drained and well drained soils; on hills

This map unit is in the Cedar Ridge area and in the west-central part of the survey area. The Samor soils support mainly Utah juniper and big sagebrush. The Nirac soils support mainly mountain big sagebrush, Idaho fescue, and bluebunch wheatgrass. The Izod soils support mainly black sagebrush, Indian ricegrass, and Thurber needlegrass.

This map unit makes up about 1 percent of the survey area.

The Samor and similar soils are shallow, well drained, and moderately steep and steep and are on hill crests and side slopes. They have a very gravelly, medium textured surface layer and a very cobbly or very gravelly, medium textured subsoil over hard bedrock.

The Nirac and similar soils are moderately deep, well drained, and moderately steep and steep and are on the side slopes of hills. They have a gravelly, medium textured surface layer and a very gravelly, medium textured subsoil over hard bedrock.

The Izod and similar soils are shallow, somewhat excessively drained, and moderately steep and steep and are on hill crests and side slopes. They are dominantly very gravelly or extremely gravelly and medium textured throughout and are underlain by hard bedrock.

Of minor extent in this unit are the Porrone, Akler, Eboda, and Gochea soils and areas of rock outcrop. The Porrone soils are on side slopes. They support big sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Akler soils are on hill crests and side slopes. They support low sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Eboda soils are on the concave side slopes of hills. They support big sagebrush, Idaho fescue, and bluebunch wheatgrass. The Gochea soils are on the side slopes of hills. They support big sagebrush, Thurber needlegrass, and bluebunch wheatgrass. Rock outcrop is throughout the unit. It is barren of vegetation.

This unit is used for livestock grazing, woodland, and rangeland wildlife habitat.

12. Linkup-Roca

Strongly sloping to steep, shallow and moderately deep, well drained soils; on hills

This map unit is on hills throughout the survey area. The Linkup soils support mainly low sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Roca soils support mainly big sagebrush, Thurber needlegrass, and bluebunch wheatgrass.

This map unit makes up about 6 percent of the survey area.

The Linkup and similar soils are shallow, are strongly sloping to moderately steep, and are on hill crests and side slopes. They have a very cobbly, medium textured surface layer and a cobbly, fine textured subsoil over hard bedrock.

The Roca and similar soils are moderately deep, are moderately steep and steep, and are on the side slopes of hills. They have a very gravelly, medium textured surface layer and a very cobbly or very gravelly, fine textured subsoil over hard bedrock.

Of minor extent in this unit are the Izod, Akler, and

Kleckner soils and areas of rock outcrop. The Izod soils are on hill crests and side slopes. They support black sagebrush, Indian ricegrass, and Thurber needlegrass. The Akler soils are on hill crests and side slopes. They support plants similar to those on the Linkup soils. The Kleckner soils are on the side slopes of hills. They support plants similar to those on the Roca soils. Rock outcrop is throughout the unit. It is barren of vegetation.

This unit is used for livestock grazing and rangeland wildlife habitat.

13. Tweener-McIvey

Gently sloping to moderately steep, very shallow, shallow, and very deep, well drained soils; on hills and fan piedmont remnants

This map unit is in the northern part of the survey area. The Tweener soils support mainly antelope bitterbrush, Idaho fescue, and bluebunch wheatgrass. The McIvey soils support mainly mountain big sagebrush, Idaho fescue, and bluebunch wheatgrass.

This map unit makes up about 1 percent of the survey area.

The Tweener and similar soils are very shallow or shallow, are gently sloping to moderately steep, and are on hill crests and side slopes. They have a very gravelly, medium textured surface layer and a very cobbly, medium textured or moderately fine textured subsoil over hard bedrock.

The McIvey and similar soils are very deep, are gently sloping or moderately sloping, and are on fan piedmont remnants. They have a very gravelly, medium textured surface layer over a very gravelly or very cobbly, fine textured subsoil.

Of minor extent in this unit are the Cleavage soils and drained areas of the Welch soils. The Cleavage soils are on hills. They support low sagebrush, black sagebrush, and Idaho fescue. The drained Welch soils are in narrow drainageways on hills. They support basin big sagebrush and basin wildrye.

This unit is used for livestock grazing and rangeland wildlife habitat.

Areas Dominated by Soils on Plateaus

This group consists of two map units. The soils in this group are dominantly on the side slopes and summits of plateaus. Elevation is 5,000 to 7,400 feet. The mean annual precipitation is 10 to 16 inches, the mean annual temperature is 40 to 45 degrees F, and the frost-free period is 70 to 100 days.

These soils are gently sloping to very steep. They are shallow, moderately deep, or very deep or are shallow to a duripan. They have a medium textured to extremely stony, medium textured surface layer over a very gravelly, medium textured to extremely cobbly, fine textured or fine textured subsoil that in some areas overlies a duripan or bedrock. The soils are on the older geomorphic surfaces and have an organically enriched surface layer and accumulated clay in the subsoil.

These soils are well drained and are not subject to flooding.

14. Sumine-Vitale-Bullvaro

Steep and very steep, moderately deep and very deep, well drained soils; on the side slopes of plateaus

This map unit is in the extreme north part of the survey area. The Sumine soils support mainly bluebunch wheatgrass, basin wildrye, and mountain big sagebrush. The Vitale soils support mainly Idaho fescue, bluebunch wheatgrass, and big sagebrush. The Bullvaro soils support mainly Idaho fescue, bluebunch wheatgrass, and low sagebrush.

This map unit makes up about 1 percent of the survey area.

The Sumine and similar soils are moderately deep, are steep and very steep, and are on the side slopes of plateaus. They have an extremely stony, medium textured surface layer and a very gravelly or very cobbly, moderately fine textured subsoil over hard bedrock.

The Vitale and similar soils are moderately deep and are steep and very steep. They have a very gravelly, medium textured surface layer and a very gravelly, medium textured or moderately fine textured subsoil over hard bedrock.

The Bullvaro and similar soils are very deep and are steep and very steep. They have a medium textured surface layer and a very gravelly, medium textured subsoil over an extremely gravelly, moderately coarse textured substratum.

Of minor extent in this unit are the Hackwood, Gollaher, Inpendence, and Siri soils and areas of rock outcrop and rubble land. The Hackwood soils are on the side slopes of plateaus. They support quaking aspen and mountain brome. The Gollaher soils are on the side slopes of plateaus. They support Rocky Mountain juniper and big sagebrush. The Inpendence soils are on mountain side slopes. They support snowbrush ceanothus. The Siri soils are on the side slopes of plateaus. They support black sagebrush, Thurber needlegrass, and bluebunch wheatgrass. Rock outcrop and rubble land are throughout the unit. They are barren of vegetation.

This unit is used for rangeland, wildlife habitat, and livestock grazing.

15. Chen-Ebic-Manard

Gently sloping to strongly sloping, well drained soils that are moderately deep to a duripan or are shallow or moderately deep; on plateaus

This map unit is in the extreme north part of the survey area. The Chen, Ebic, and Manard soils support mainly low sagebrush, Idaho fescue, and bluebunch wheatgrass.

This map unit makes up about 2 percent of the survey area.

The Chen and similar soils are shallow, are gently sloping and moderately sloping, and are on the summits of plateaus. They have a gravelly, medium textured surface layer and a very gravelly or very cobbly, fine textured subsoil over hard bedrock.

The Ebic and similar soils are moderately deep, are gently sloping to strongly sloping, and are on plateaus. They have a gravelly, medium textured surface layer and a very cobbly or extremely cobbly, fine textured subsoil over hard bedrock.

The Manard and similar soils are moderately deep to a duripan, are gently sloping to strongly sloping, and are on plateaus. They have a medium textured surface layer, a fine textured subsoil, and an indurated duripan over hard bedrock.

Of minor extent in this unit are the Heechee, Glean, and Inpendence soils. The Heechee soils are on plateaus. They support antelope bitterbrush, bluebunch wheatgrass, and Idaho fescue. The Glean soils are on mountain side slopes. They support mountain big sagebrush, Idaho fescue, and bluebunch wheatgrass. The Inpendence soils are on the short side slopes of plateaus and on mountain side slopes. They support quaking aspen and mountain brome.

This unit is used for livestock grazing and rangeland wildlife habitat.

Areas Dominated by Soils on Mountains

This group consists of four map units. The soils in this group are dominantly on mountain crests and side slopes. Elevation is 5,600 to 8,700 feet. The mean annual precipitation is 10 to more than 16 inches, the mean annual temperature is 38 to 45 degrees F, and the frost-free period is 50 to 100 days.

These soils are moderately sloping to very steep and are very shallow to very deep. They have an extremely gravelly to cobbly, medium textured surface layer over very gravelly, moderately coarse textured to fine textured material that in some areas overlies bedrock. These soils generally are on the older geomorphic surfaces and have an organically enriched surface layer and accumulated clay in the subsoil. A few of the soils are on the younger geomorphic surfaces and are eroding nearly as rapidly as they are forming.

The soils in this group are well drained and are not subject to flooding.

16. Hopeka-Cavehill-Pernog

Moderately steep and steep, very shallow to moderately deep, well drained soils; on mountains

This map unit is in the Pinyon Range and Sulfur Spring Mountains. The Hopeka soils support mainly singleleaf pinyon, Utah juniper, and black sagebrush. The Cavehill soils support mainly singleleaf pinyon and mountain big sagebrush. The Pernog soils support mainly curlleaf mountainmahogany, bluebunch wheatgrass, and pine bluegrass.

This map unit makes up about 1 percent of the survey area.

The Hopeka and similar soils are very shallow, are moderately steep and steep, and are on the crests and side slopes of mountains. They are dominantly very gravelly and medium textured and are underlain by hard bedrock.

The Cavehill and similar soils are moderately deep, are moderately steep and steep, and are on mountain side slopes. They have a very gravelly, medium textured surface layer and a very gravelly or very cobbly, medium textured subsoil over hard bedrock.

The Pernog and similar soils are shallow, are moderately steep and steep, and are on mountain crests and side slopes. They have a stony, medium textured surface layer and a very stony, medium textured or moderately fine textured subsoil over hard bedrock.

Of minor extent in this unit are the Eboda, Hackwood, Bucan, Gando, and Izod soils and areas of rock outcrop. The Eboda soils are on the lower, concave mountain side slopes. They support big sagebrush, Idaho fescue, and bluebunch wheatgrass. The Hackwood soils are on the upper, concave mountain side slopes. They support quaking aspen and mountain brome. The Bucan soils are on the lower, convex mountain side slopes. They support low sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Gando soils are on mountain side slopes. They support singleleaf pinyon, Utah juniper, and big sagebrush. The Izod soils are on mountain crests. They support black sagebrush, needleandthread, and Indian ricegrass. Rock outcrop is throughout the unit. It is barren of vegetation.

This unit is used for woodland, livestock grazing, and rangeland wildlife habitat.

17. Cleavage-Quarz-Loncan

Moderately steep and steep, shallow and moderately deep, well drained soils; on mountains

This map unit is throughout the survey area. The Cleavage soils support mainly low sagebrush, black sagebrush, and Idaho fescue. The Quarz soils support mainly mountain big sagebrush, bluebunch wheatgrass, and basin wildrye. The Loncan soils support mainly mountain big sagebrush, Idaho fescue, and bluebunch wheatgrass.

This map unit makes up about 10 percent of the survey area.

The Cleavage and similar soils are shallow, are moderately steep and steep, and are on mountain crests and side slopes. They have an extremely gravelly, medium textured surface layer and a very gravelly, medium textured or extremely gravelly or very cobbly, moderately fine textured subsoil over hard bedrock.

The Quarz and similar soils are moderately deep, are moderately steep and steep, and are on mountain side slopes. They have a very gravelly, medium textured surface layer and a very gravelly, fine textured subsoil over hard bedrock.

The Loncan and similar soils are moderately deep, are moderately steep and steep, and are on mountain side slopes. They have a very gravelly, medium textured surface layer and a very gravelly or extremely cobbly, medium textured subsoil over hard bedrock.

Of minor extent in this unit are the Linkup, Kleckner, Welch, and Crooked Creek soils. The Linkup soils are on the lower side slopes of mountains. They support low sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Kleckner soils are on mountain side slopes. They support plants similar to those on the Loncan soils. The Welch soils are in narrow drainageways in the mountains. They support tufted hairgrass and Nevada bluegrass. The poorly drained Crooked Creek soils are in narrow drainageways in the mountains. They support basin big sagebrush and basin wildrye.

This unit is used for livestock grazing and rangeland wildlife habitat.

18. Cotant-McIvey-Lerrow

Moderately sloping to steep, shallow, moderately deep, and very deep, well drained soils; on mountains

This map unit is in the northern and northwestern parts of the survey area. The Cotant soils support mainly low sagebrush, Idaho fescue, and bluebunch wheatgrass. The McIvey soils support mainly mountain big sagebrush, Idaho fescue, and bluebunch wheatgrass. The Lerrow soils support mainly mountain big sagebrush, bluebunch wheatgrass, and basin wildrye.

This map unit makes up about 9 percent of the survey area.

The Cotant and similar soils are shallow, are moderately sloping to steep, and are on mountain crests and side slopes. They have a very cobbly, medium textured surface layer and a fine textured subsoil over soft bedrock.

The McIvey and similar soils are very deep, are moderately steep and steep, and are on mountain side slopes. They have a cobbly, medium textured surface layer over a very gravelly or very cobbly, fine textured subsoil.

The Lerrow and similar soils are moderately deep, are moderately steep and steep, and are on mountain side slopes. They have a cobbly, medium textured surface layer and a fine textured or gravelly or cobbly, fine textured subsoil over soft bedrock.

Of minor extent in this unit are the Cleavage, Loncan, Akler, Shively, Welch, and Hackwood soils and areas of rock outcrop. The Cleavage soils are on the crests and upper side slopes of mountains. They support low sagebrush, black sagebrush, and Idaho fescue. The Loncan and Shively soils are on mountain side slopes. They support plants similar to those on the McIvey soils. The Akler soils are on the lower mountain side slopes. They support low sagebrush, Thurber needlegrass, and bluebunch wheatgrass. The Welch soils are in narrow drainageways in the mountains. They support tufted hairgrass and Nevada bluegrass. The Hackwood soils are on concave mountain side slopes. They support quaking aspen and mountain brome. Rock outcrop is throughout the unit. It is barren of vegetation.

This unit is used for livestock grazing and rangeland wildlife habitat.

19. Sumine-Cleavage-Hapgood

Moderately steep to very steep, shallow to deep, well drained soils; on mountains

This map unit is in the mountains in the central and northern parts of the survey area. The Sumine soils support mainly mountain big sagebrush, bluebunch wheatgrass, and basin wildrye. The Cleavage soils support mainly low sagebrush, black sagebrush, and Idaho fescue. The Hapgood soils support mainly Idaho fescue, mountain brome, slender wheatgrass, and mountain big sagebrush.

This map unit makes up about 7 percent of the survey area.

The Sumine and similar soils are moderately deep, are moderately steep to very steep, and are on mountain side slopes. They have a very gravelly, medium textured surface layer and a very gravelly or very cobbly, moderately fine textured subsoil over hard bedrock.

The Cleavage and similar soils are shallow, are moderately steep and steep, and are on the crests and upper side slopes of mountains. They have an extremely gravelly, medium textured surface layer and a very gravelly, medium textured or extremely gravelly or very cobbly, moderately fine textured subsoil over hard bedrock.

The Hapgood and similar soils are deep and very deep, are steep and very steep, and are on mountain side slopes. They have a very gravelly, medium textured surface layer over a very gravelly, medium textured or moderately coarse textured subsoil.

Of minor extent in this unit are the Tusel, Hackwood, Inpendence, and Pernog soils and areas of rock outcrop. The Tusel soils are on mountain side slopes. They support Idaho fescue and bluebunch wheatgrass. The Hackwood soils are on concave mountain side slopes. They support quaking aspen and mountain brome. The Inpendence soils are on the upper, concave side slopes of mountains. They support quaking aspen and mountain brome. The Pernog soils are on mountain crests and side slopes. They support curlleaf mountainmahogany, bluebunch wheatgrass, and pine bluegrass. Rock outcrop is throughout the unit. It is barren of vegetation.

This unit is used for livestock grazing and rangeland wildlife habitat.

Broad Land Use Considerations

The soils in this survey area vary widely in their potential for major land uses. They are used for cropland, pasture, rangeland, wildlife habitat, and urban development. Extensive land use changes are not expected in the foreseeable future.

About 95 percent of the land area is used for rangeland and related uses. Map units 1 to 3 have the highest potential for forage production because they are near a water source. Some of the soils in these map units, however, are limited because of a seasonal high water table and accumulated salt and sodium. Map units 4 to 19 are used extensively for range. The soils in map units 4 to 7 are limited mainly by inadequate precipitation. Also, some of the soils in these units are shallow or moderately deep to a hardpan, which limits the rooting depth. The soils in map units 8, 9, 10, and 15 are limited mainly by inadequate precipitation, the slope, and the depth to bedrock or a hardpan. The soils in map units 11, 12, 13, 14, 16, 17, 18, and 19 are limited by the slope, surface rock fragments, and the depth to bedrock.

Pinyon and juniper grow on some of the soils in map units 8, 11, and 16. These woody plants are cut for fenceposts and firewood.

Almost all of the land in the survey area is used by one or more kinds of wildlife. The Humboldt River supports catfish and carp. Its tributaries support rainbow, brook, and brown trout. The most common openland wildlife species are sage grouse, chukar, Hungarian partridge, cottontail rabbit, jackrabbit, coyote, badger, and mule deer. Wildlife are attracted by the water, food, and cover available in the native meadows and pastures.

Detailed Soil Map Units

The map units delineated on the detailed maps at the back of this survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and limitations of a unit for specific uses. They also can be used to plan the management needed for those uses.

A map unit delineation on a map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils or miscellaneous areas. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils and miscellaneous areas are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some "included" areas that belong to other taxonomic classes.

The presence of included areas in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into segments that have similar use and management requirements. The delineation of such landscape segments on the map provides sufficient information for the development of resource plans, but if intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes facts about the unit and gives the principal hazards or limitations to be considered in planning for a few specific uses. Soil suitability ratings are given for selected uses, including range seeding; roadfill; topsoil; daily cover for landfill; shallow excavations; local roads and streets; pond reservoir areas; embankments, dikes, and levees; sand, and gravel. The Appendix lists the criteria used to develop these ratings.

The detailed soil map units identified within the survey area reflect the various relationships of soils with component parts of the landscape. These relationships are illustrated in figures 5 and 6. These figures indicate, in a three-dimensional representation, the soil-physiographic relationships typical of the area.

Figure 5 illustrates how some of the map unit delineations appear throughout the various segments of the landscape. Each map unit has one or more major soil components and generally has several contrasting inclusions. Figure 6 shows the physiographic position of each major soil component identified within the respective map units.

Soils that have profiles that are almost alike make up a *soil series*. The soils of a series have major horizons that are similar in composition, thickness, and arrangement. Soils of one series can differ in texture of the upper layer or of the underlying layers. They also can differ in slope, stoniness, salinity, wetness, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Kodra loam, 0 to 4 percent slopes, is a phase of the Kodra series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are associations. An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. The Donna-Stampede-Gance association is an example.

This survey includes *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. The Rock outcrop in the Rock outcrop-Pernty-Pernog association is an example.

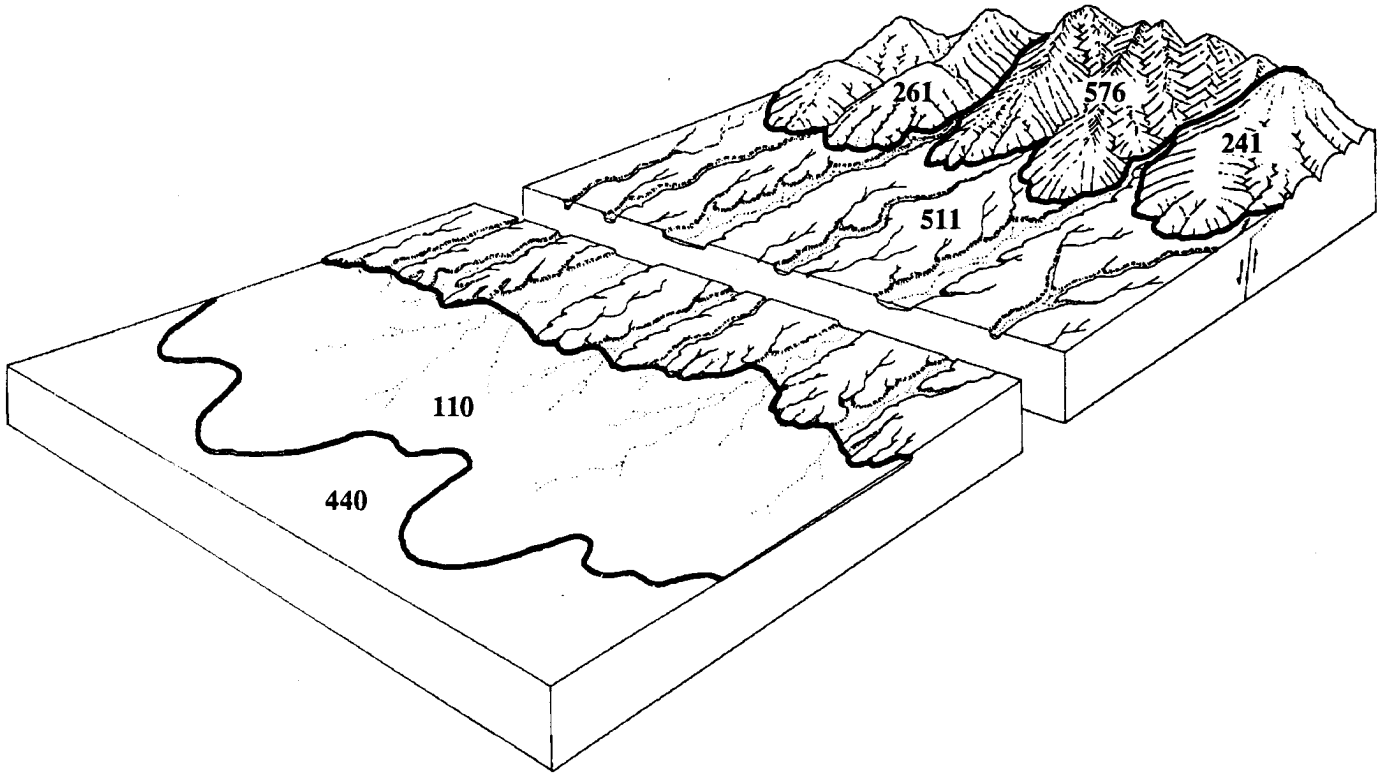

Figure 5.—Representative detailed soil map units as they occur in various landscape positions. Units 261 (Linkup-Roca-Vanwyper association), 241 (Cleavage-Cleavage, very cobbly-Loncan association), and 576 (Sumine-Cleavage-Hapgood association) are on mountains; unit 511 (Dacker-Gance-Kelk association) is on fan piedmont remnants and inset fans; unit 110 (Moranch-Ocala-Orovada association) is on fan skirts; and unit 440 (Devilsgait-Woofus-Devilsgait, gravelly substratum association) is on basin floors.

This survey area was mapped at two levels of detail. At the more detailed level, map unit boundaries were plotted and verified at closely spaced intervals. At the less detailed level, map unit boundaries were plotted and verified at wider intervals. The narrowly defined units are 60, 80, 184, 447, and 740. The detail of mapping was selected to meet the anticipated long-term use of the survey, and the map units were designed to meet the needs for that use.

Table 4 gives the acreage and proportionate extent of each map unit.

The following paragraphs explain some of the headings used in the map unit descriptions. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

Map unit setting is given for the entire map unit. The landscape positions given under this heading generally are broader than those given for each major component.

Composition is given for the components identified in the name of the map unit as well as for the contrasting inclusions. Inclusions are soils or miscellaneous areas that differ from the soils or miscellaneous areas for which the unit is named. Inclusions can be either similar or contrasting. Similar inclusions are components that differ from the components for which the unit is named but that for purposes of use and management can be considered to be comparable to the named components. In the "Composition" section, a single percentage is provided for a named soil and the similar inclusions because their use and management are similar. Contrasting inclusions are components that differ so significantly from the components for which the unit is named that they would have different use and management if they were extensive enough to be managed separately. For most uses, contrasting inclusions have limited effect on use and management. Inclusions generally are in small areas, and they could not be mapped separately because of the scale used. Some small areas of strongly contrasting inclusions are identified by a special symbol on the detailed soil maps. A few inclusions may not have been observed and

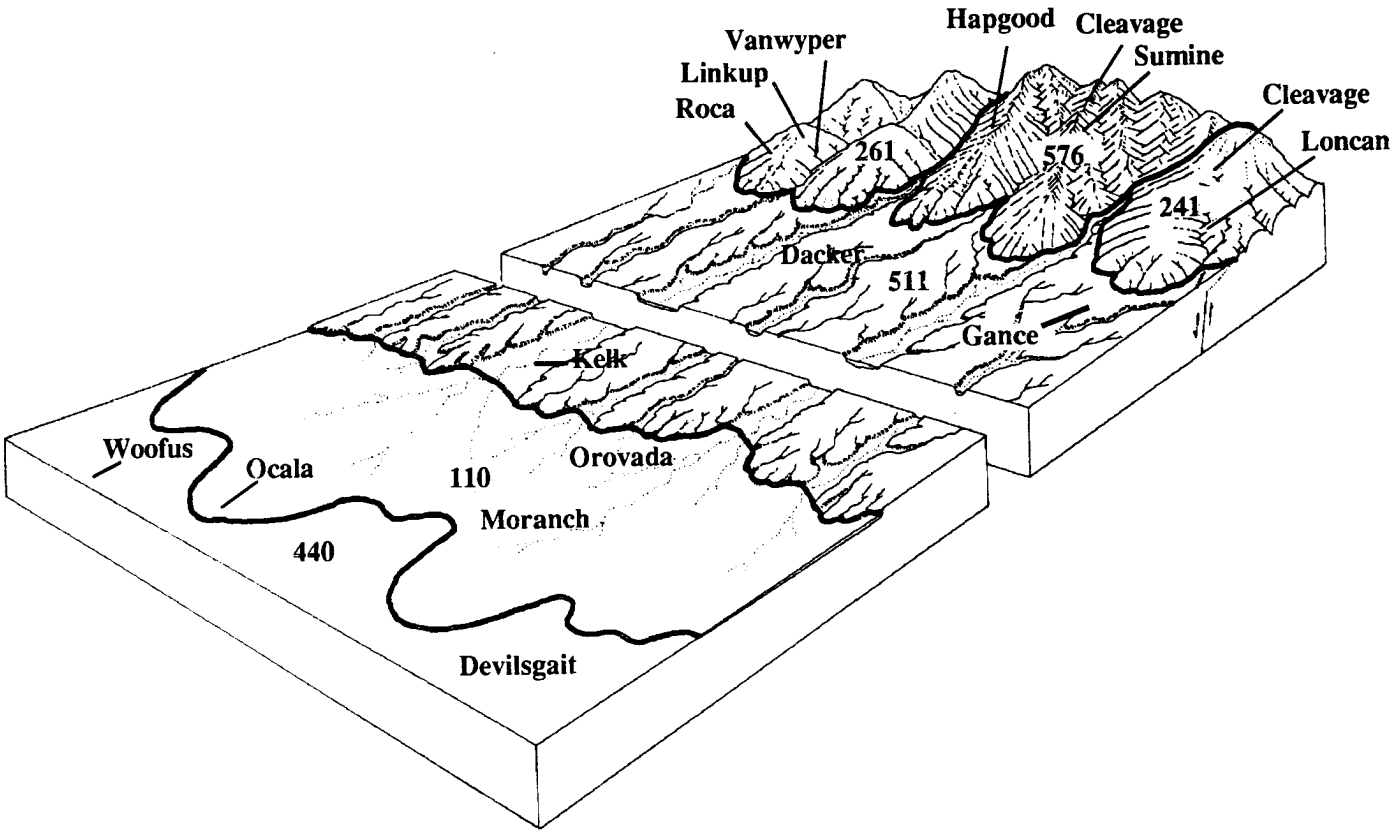

Figure 6.—The physiographic position of each major soil component in some detailed soil map units. Units 261 (Linkup-Roca-Vanwyper association), 241 (Cleavage-Cleavage, very cobbly-Loncan association), and 576 (Sumine-Cleavage-Hapgood association) are on mountains; unit 511 (Dacker-Gance-Kelk association) is on fan piedmont remnants and inset fans; unit 110 (Moranch-Ocala-Orovada association) is on fan skirts; and unit 440 (Devilsgait-Woofus-Devilsgait, gravelly substratum association) is on basin floors.

consequently are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the inclusions on the landscape.

A description of the characteristics of the soils in the map unit follows the description of composition. The major uses, ratings for various uses, and interpretive groups also are given. More information about the various uses and the interpretive groups is available under the heading "Use and Management of the Soils."

Map Unit Descriptions

010—Boulflat, cobbly-Boulflat-Humdun association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:

- Boulflat cobbly loam, 4 to 15 percent slopes (35 percent)
- Boulflat gravelly loam, 4 to 15 percent slopes (25 percent)
- Humdun loam, 15 to 30 percent slopes (25 percent)

Contrasting inclusions:

- Inclusion 1: Rock outcrop (6 percent)
- Inclusion 2: Enko fine sandy loam, 4 to 8 percent slopes (5 percent)
- Inclusion 3: Xerollic Durargids, loamy-skeletal, mixed, mesic, shallow, 4 to 15 percent slopes (4 percent)

Characteristics of the Cobbly Boulflat Soil

Classification: Haploxerollic Durargids, fine-loamy, mixed, mesic

Position on landscape: Summits and slightly convex side slopes of hills

Parent material: Residuum derived from andesite and influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,200 to 5,900 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 15

Depth: 0 to 6 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 6 to 20 inches
Texture: Gravelly clay loam
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 20 to 34 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline

Depth: 34 to 39 inches
Texture: Cemented hardpan
Structure: Massive
Consistence: Extremely hard, very firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 39 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to a hardpan: 20 to 34 inches
Depth to bedrock: 22 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.7 to 5.7 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Boulflat Soil

Classification: Haploxerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Summits and slightly convex side slopes of hills
Parent material: Residuum derived from andesite and influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,200 to 5,900 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 6 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 6 to 20 inches
Texture: Gravelly clay loam
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 20 to 34 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline

Depth: 34 to 39 inches
Texture: Cemented hardpan
Structure: Massive
Consistence: Extremely hard, very firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 39 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to a hardpan: 20 to 34 inches
Depth to bedrock: 22 to 40 inches
Depth to a seasonal high water table: More than 60 inches

Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.7 to 5.7 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Humdun Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, frigid
Position on landscape: East-facing, concave side slopes of hills
Parent material: Loess over alluvium and residuum derived from andesite
Slope range: 15 to 30 percent
Elevation: 5,200 to 5,900 feet
Dominant present vegetation: Wyoming big sagebrush, Thurber needlegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 7 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 29 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 29 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 2 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 10.1 to 11 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Summits of fan piedmont remnants adjacent to the lower side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xerollic Durargids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Crests and convex side slopes of hills adjacent to areas of rock outcrop
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the cobbly Boulflat soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Boulflat soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Humdun soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cobbly Boulflat Soil for Various Uses and Practices

Range seeding: Fair—too arid, large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—thin layer

Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Boulflat Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Humdun Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Fair—slope
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—slope
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Boulflat soils—6s, nonirrigated; Humdun soil—6e, nonirrigated
Range site: Both Boulflat soils—025X019N; Humdun soil—025X019N; Inclusion 1—none; Inclusion 2—025X019N; Inclusion 3—025X019N

011—Cherry Spring-Orovada-Yuko association

Map Unit Setting

Position on landscape: Fan piedmonts

Composition

Major components:
• Cherry Spring silt loam, 2 to 8 percent slopes (35 percent)
• Orovada fine sandy loam, 4 to 15 percent slopes (30 percent)
• Yuko very gravelly coarse sandy loam, 30 to 50 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Rad silt loam, 2 to 8 percent slopes (5 percent)
• Inclusion 2: Tuffo fine sandy loam, 30 to 75 percent slopes (5 percent)

Characteristics of the Cherry Spring Soil

Classification: Haploxerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 10 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 23 to 41 inches
Texture: Cemented hardpan
Structure: Massive
Consistence: Extremely hard, very firm
Reaction: Moderately alkaline

Depth: 41 to 63 inches
Texture: Stratified sandy loam to extremely gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.7 to 4.6 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium

Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 30 to 50 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 50

Depth: 0 to 2 inches
Texture: Very gravelly coarse sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5 to 7.5 inches
Runoff: Rapid
Hydrologic group: D

Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Cherry Spring soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Orovada soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Cherry Spring Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope, erodes easily
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Orovada Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, slope, erodes easily
Terraces and diversions: Slope, erodes easily, soil blowing

Suitability and Limitations of the Yuko Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cherry Spring soil—3e, irrigated, 7s, nonirrigated; Orovada soil—4e, irrigated, 6c, nonirrigated; Yuko soil—7s, nonirrigated
Range site: Cherry Spring soil—025X019N; Orovada soil—025X019N; Yuko soil—025X015N; Inclusion 1—025X019; Inclusion 2—025X015N

021—Betra-McIvey-Heechee association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Betra cobbly loam, 2 to 8 percent slopes (40 percent)
• McIvey gravelly loam, 2 to 8 percent slopes (25 percent)
• Heechee cobbly loam, 4 to 15 percent slopes (25 percent)

Contrasting inclusions:
- Inclusion 1: Vanwyper cobbly sandy loam, 15 to 50 percent slopes (3 percent)
- Inclusion 2: Kleckner gravelly loam, 2 to 8 percent slopes (3 percent)
- Inclusion 3: Alburz Variant loam, 2 to 4 percent slopes (2 percent)
- Inclusion 4: Welch silt loam, 0 to 4 percent slopes (2 percent)

Characteristics of the Betra Soil

Classification: Abruptic Aridic Durixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Alluvium derived from granitic rocks and influenced by loess
Slope range: 2 to 8 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Low sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 5 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 5 to 9 inches
Texture: Very gravelly clay loam
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 9 to 21 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 21 to 42 inches
Texture: Cemented hardpan

Soil and Water Features

Depth to a hardpan: 20 to 30 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2 to 2.7 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly convex summits and shoulders of fan piedmont remnants
Parent material: Alluvium derived from mixed rocks
Slope range: 2 to 8 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable

Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Heechee Soil

Classification: Typic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: North-facing side slopes of fan piedmont remnants
Parent material: Alluvium derived from mixed rocks
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, serviceberry, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 3
Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 11 inches
Texture: Cobbly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 11 to 33 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 33 to 63 inches
Texture: Extremely cobbly sandy loam
Structure: Massive
Consistence: Hard, very friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.2 to 6.4 inches
Water-supplying capacity: 9 to 12 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: South-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Typic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Cottonwood, willow
Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Mat muhly, alpine timothy
Other inclusions of minor extent
Location of one of the inclusions: Near Lee
Classification: Pachic Argixerolls, fine, montmorillonitic, frigid
Distinctive present vegetation: Basin big sagebrush

Location of the other inclusion: Near Lee
Classification: Abruptic Aridic Durixerolls, fine, montmorillonitic, frigid
Distinctive present vegetation: Mulesear wyethia, tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture

Potential foreseeable use: Cropland

Suitability of the Betra soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability of the McIvey soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good; wetland plants—very poor; shallow water areas—very poor

Suitability of the Heechee soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Betra Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, too clayey, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Large stones, droughty, percs slowly
Terraces and diversions: Large stones, cemented pan

Suitability and Limitations of the McIvey Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—too clayey, small stones
Shallow excavations: Moderate—too clayey, large stones
Local roads and streets: Moderate—frost action, shrink-swell potential
Pond reservoir areas: Moderate—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Large stones, droughty, percs slowly
Terraces and diversions: Large stones, percs slowly

Suitability and Limitations of the Heechee Soil for Various Uses and Practices

Range seeding: Fair—large stones
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Moderate—large stones, slope
Local roads and streets: Moderate—slope, frost action, large stones
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—large stones
Gravel: Improbable source—large stones
Drainage: Deep to water
Irrigation: Large stones, droughty, slope
Terraces and diversions: Slope, large stones

Interpretive Groups

Capability classification: Betra soil—4e, irrigated, 7s, nonirrigated; McIvey soil—4e, irrigated, 6c, nonirrigated; Heechee soil—4s, irrigated, 7s, nonirrigated

Range site: Betra soil—025X017N; McIvey soil—025X012N; Heechee soil—025X007N; Inclusion 1—025X015N; Inclusion 2—025X014N; Inclusion 3—025X053N; Inclusion 4—025X006N

030—Gollaher-Cleavage-Hapgood association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:

- Gollaher very gravelly loam, 30 to 75 percent slopes (40 percent)
- Cleavage extremely gravelly loam, 30 to 75 percent slopes (30 percent)
- Hapgood very gravelly loam, 30 to 50 percent slopes (15 percent)

Contrasting inclusions:

- Inclusion 1: Gollaher very gravelly loam, 4 to 15 percent slopes (5 percent)
- Inclusion 2: Bullump gravelly loam, 15 to 50 percent slopes (5 percent)
- Inclusion 3: Sumine very gravelly loam, 15 to 50 percent slopes (5 percent)

Characteristics of the Gollaher Soil

Classification: Lithic Xerorthents, loamy-skeletal, carbonatic, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from limestone
Slope range: 30 to 75 percent
Elevation: 6,400 to 7,700 feet
Dominant present vegetation: Black sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Depth: 4 to 7 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Depth: 7 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 10 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: .36 to .67 inches
Water-supplying capacity: 5.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 30 to 75 percent
Elevation: 6,400 to 7,700 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: North-facing, concave side slopes of mountains
Parent material: Colluvium and residuum derived from rhyolite
Slope range: 30 to 50 percent
Elevation: 6,400 to 7,700 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, Idaho fescue

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Xerorthents, loamy-skeletal, carbonatic, frigid
Position on landscape: Crests of mountains
Distinctive present vegetation: Black sagebrush, Thurber needlegrass

Inclusion 2
Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing, upper side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 3
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing, lower side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Gollaher soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Gollaher Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones, depth to rock
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope

Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Gollaher soil—7s, nonirrigated; Cleavage soil—7s, nonirrigated; Hapgood soil—7s, nonirrigated
Range site: Gollaher soil—025X057N; Cleavage soil—025X024N; Hapgood soil—025X004N; Inclusion 1—025X057N; Inclusion 2—025X016N; Inclusion 3—025X009N

060—Kodra loam, 0 to 4 percent slopes

Map Unit Setting

Position on landscape: Fan piedmonts

Composition

Major component:
• Kodra loam, 0 to 4 percent slopes (85 percent)
Contrasting inclusions:
• Inclusion 1: Chiara loam, 2 to 4 percent slopes (5 percent)
• Inclusion 2: Enko loam, 0 to 4 percent slopes (5 percent)
• Inclusion 3: Rad silt loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Kodra Soil

Classification: Haploxerollic Durorthids, coarse-loamy, mixed, mesic
Position on landscape: Smooth or slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 4 percent
Elevation: 5,700 to 5,800 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 95 days

Typical Profile

Depth: 0 to 4 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 4 to 22 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 22 to 44 inches
Texture: Cemented hardpan
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 44 to 60 inches
Texture: Stratified sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 30 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.4 to 4.3 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Shoulders of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Kodra soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Kodra Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Fair—cemented pan, small stones, thin layer
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Moderate—seepage, cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, erodes easily
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Kodra soil—3e, irrigated, 6s, nonirrigated
Range site: Kodra soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N

070—Tenvorrd-Kodra association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Tenvorrd silt loam, 4 to 15 percent slopes (45 percent)
• Kodra loam, 2 to 8 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Kelk silt loam, 2 to 15 percent slopes (8 percent)
• Inclusion 2: Chiara loam, 15 to 30 percent slopes (7 percent)

Characteristics of the Tenvorrd Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Slightly convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,700 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt Loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 20 inches
Texture: Loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 20 to 28 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.5 to 2.9 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate

Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kodra Soil

Classification: Haploxerollic Durorthids, coarse-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,900 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 95 days

Typical Profile

Depth: 0 to 4 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 4 to 22 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 22 to 44 inches
Texture: Cemented hardpan

Depth: 44 to 60 inches
Texture: Stratified sand to silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 30 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.4 to 4.3 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnant side slopes and inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Tenvorrd soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Kodra soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Tenvorrd Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty, cemented pan
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope, erodes easily
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Kodra Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Fair—cemented pan, small stones, thin layer
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope, erodes easily
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Tenvorrd soil—4e, irrigated, 7s, nonirrigated; Kodra soil—3e, irrigated, 6s, nonirrigated
Range site: Tenvorrd soil—025X019N; Kodra soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N

080—Loncan Variant loam, 0 to 2 percent slopes

Map Unit Setting

Position on landscape: Inset fans, fan skirts

Composition

Major component:
• Loncan Variant loam, 0 to 2 percent slopes (90 percent)
Contrasting inclusions:
• Inclusion 1: Enko loam, 4 to 15 percent slopes (5 percent)
• Inclusion 2: Kelk silt loam, 0 to 4 percent slopes (5 percent)

Characteristics of the Loncan Variant Soil

Classification: Aridic Duric Haploxerolls, fine-loamy, mixed, mesic
Position on landscape: Inset fans and fan skirts
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 12 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Mildly alkaline

Depth: 12 to 38 inches
Texture: Stratified loam to clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 38 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 9.6 to 11 inches
Water-supplying capacity: 8 to 14 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnant side slopes
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Alluvial plains
Distinctive present vegetation: Black greasewood, basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Loncan Variant soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Loncan Variant Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Fair—small stones
Daily cover for landfill: Fair—too clayey
Shallow excavations: Slight
Local roads and streets: Moderate—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Loncan Variant soil—3c, irrigated, 6c, nonirrigated
Range site: Loncan Variant soil—025X003N; Inclusion 1—025X019N; Inclusion 2—024X006N

110—Moranch-Ocala-Orovada association

Map Unit Setting

Position on landscape: Fan skirts

Composition

Major components:
• Moranch silt loam, 0 to 2 percent slopes (35 percent)
• Ocala silt loam, slightly saline, 0 to 2 percent slopes (30 percent)
• Orovada loam, 2 to 4 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Connel sandy loam, 0 to 4 percent slopes (5 percent)
• Inclusion 2: Bloor silt loam, 0 to 2 percent slopes (3 percent)
• Inclusion 3: Devilsgait silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 4: Sonoma silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Moranch Soil

Classification: Durorthidic Torriorthents, coarse-silty, mixed (calcareous), mesic
Position on landscape: Upper part of fan skirts
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 4,900 to 5,300 feet
Dominant present vegetation: Black greasewood, rubber rabbitbrush, inland saltgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 13

Depth: 5 to 20 inches
Texture: Very fine sandy loam
Structure: Platy
Consistence: Slightly hard, firm
Reaction: Very strongly alkaline
Salinity: 4 to 16 mmhos per cm
Sodicity (SAR): 0 to 13

Depth: 20 to 61 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Very strongly alkaline
Salinity: 4 to 16 mmhos per cm
Sodicity (SAR): 0 to 13

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 10.5 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.64; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—moderate

Potential for frost action: Low

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Lower part of fan skirts
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 4,900 to 5,300 feet
Dominant present vegetation: Black greasewood, alkali sacaton, basin wildrye

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8.0 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Upper parts of fan skirts adjacent to toe slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 4 percent
Elevation: 4,900 to 5,300 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8.0 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low

Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Upper parts of fan skirts adjacent to fan drainageways
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Alluvial flats adjacent to toe slopes of fan skirts
Distinctive present vegetation: Black greasewood, basin wildrye
Inclusion 3
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 4
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan skirts
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Moranch soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Orovada soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—poor

Suitability and Limitations of the Moranch Soil for Various Uses and Practices
Range seeding: Poor—excess salts, too crusty
Roadfill: Good
Topsoil: Poor—thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Slight
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, erodes easily, excess salts
Terraces and diversions: Erodes easily, soil blowing

Suitability and Limitations of the Ocala Soil for Various Uses and Practices
Range seeding: Poor—excess salts, too crusty
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Orovada Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Slope, erodes easily
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Moranch soil—3s, irrigated, 7s, nonirrigated; Ocala soil—4w, irrigated, 6w, nonirrigated; Orovada soil—2e, irrigated, 6c, nonirrigated

Range site: Moranch soil—024X008N; Ocala soil—024X007N; Orovada soil—025X019N; Inclusion 1—025X019N; Inclusion 2—024X007N; Inclusion 3—025X003N; Inclusion 4—024X006N

121—Pernog-Rock outcrop association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
- Pernog very stony loam, 15 to 50 percent slopes (45 percent)
- Rock outcrop (45 percent)

Contrasting inclusions:
- Inclusion 1: Eboda gravelly loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Hackwood loam, 15 to 30 percent slopes (1 percent)
- Inclusion 3: Akler very cobbly loam, 15 to 30 percent slopes (3 percent)
- Inclusion 4: Lithic Argixerolls, loamy-skeletal, mixed, frigid, 15 to 50 percent slopes (1 percent)

Characteristics of the Pernog Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Summits and convex side slopes of mountains
Parent material: Residuum and colluvium derived from quartzite
Slope range: 15 to 50 percent
Elevation: 6,800 to 8,000 feet
Dominant present vegetation: Curlleaf mountainmahogany, snowberry

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Percent stones and boulders on the surface: 1

Depth: 0 to 10 inches
Texture: Very stony loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 17 inches
Texture: Very stony clay loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 17 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 12 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.3 to 1.7 inches
Water-supplying capacity: 10 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rock Outcrop

Position on landscape: Crests and side slopes of mountains
Elevation: 6,800 to 8,000 feet
Dominant present vegetation: None

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Lower, north-facing, concave side slopes of mountains
Distinctive present vegetation: Big sagebrush, Idaho fescue

Inclusion 2
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Upper, north-facing, concave side slopes of mountains
Distinctive present vegetation: Mountain brome, quaking aspen

Inclusion 3
Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Lower, convex side slopes of mountains
Distinctive present vegetation: Low sagebrush, Thurber needlegrass

Inclusion 4
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of mountains
Distinctive present vegetation: Curlleaf mountainmahogany

Major Uses

Current uses: Livestock grazing, wildlife habitat

Suitability of the Pernog soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Pernog Soil for Various Uses and Practices

Range seeding: Poor—droughty, large stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Pernog soil—7s, nonirrigated; Rock outcrop—8s, nonirrigated
Range site: Pernog soil—028B042N; Rock outcrop—none; Inclusion 1—025X027N; Inclusion 2—025X065N; Inclusion 3—025X018N; Inclusion 4—028B043N

131—Zevadez-Puett-Puett, steep association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Zevadez fine sandy loam, 4 to 15 percent slopes (50 percent)
• Puett sandy loam, 15 to 30 percent slopes (20 percent)
• Puett gravelly sandy loam, 30 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Chiara silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Kelk silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 3: Orovada loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,000 to 6,200 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.2 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow

Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff, tuffaceous sandstone, and siltstone
Slope range: 15 to 30 percent
Elevation: 5,000 to 6,200 feet
Dominant present vegetation: Wyoming big sagebrush, black sagebrush

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 2 inches
Texture: Sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 30 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Steep Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff, tuffaceous sandstone, and siltstone
Slope range: 30 to 50 percent
Elevation: 5,000 to 6,200 feet
Dominant present vegetation: Wyoming big sagebrush, black sagebrush

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 15 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—4
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Zevadez soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the steep Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Fair—small stones, slope
Daily cover for landfill: Fair—too sandy, slope
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly, rooting depth
Terraces and diversions: Slope, erodes easily, too sandy

Suitability and Limitations of the Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Steep Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Zevadez soil—4e, irrigated, 6c, nonirrigated; both Puett soils—7e, nonirrigated
Range site: Zevadez soil—025X019N; both Puett soils—025X025N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N

132—Zevadez-Soughe-Hunewill association

Map Unit Setting

Position on landscape: Fan piedmont remnants and hills

Composition

Major components:
• Zevadez gravelly loam, 4 to 15 percent slopes (45 percent)
• Soughe very cobbly loam, 30 to 50 percent slopes, eroded (25 percent)
• Hunewill gravelly sandy loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Enko sandy loam, 15 to 30 percent slopes (5 percent)
• Inclusion 2: Grina very gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 3: Samor very gravelly loam, 15 to 50 percent slopes (5 percent)

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent

Elevation: 6,000 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.2 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Soughe Soil

Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Hills and side slopes of fan piedmont remnants with a rock core
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,000 to 6,600 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 14 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 14 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.8 inch to 1.2 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hunewill Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium

Slope range: 15 to 30 percent
Elevation: 6,000 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 19 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 19 to 62 inches
Texture: Extremely gravelly sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.6 to 4.5 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Utah juniper

Inclusion 3
Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Side slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Zevadez soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Soughe soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Hunewill soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Fair—small stones, slope
Daily cover for landfill: Fair—too sandy, slope
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Soughe Soil for Woodland
Site index for common trees: Utah juniper—30
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Soughe Soil for Various Uses and Practices
Range seeding: Poor—droughty, too arid, large stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer

Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hunewill Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Zevadez soil—6c, nonirrigated; Soughe soil—7s, nonirrigated; Hunewill soil—6e, nonirrigated
Range site: Zevadez soil—025X019N; Soughe soil—025X059N; Hunewill soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X059N; Inclusion 3—025X059N

133—Zevadez-Wieland-Dewar association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Zevadez gravelly loam, 4 to 15 percent slopes (35 percent)
• Wieland gravelly loam, 15 to 30 percent slopes (30 percent)
• Dewar gravelly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Gance very gravelly loam, 30 to 50 percent slopes (10 percent)
• Inclusion 2: Alburz very gravelly loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,200 to 5,700 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.2 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants

Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,200 to 5,700 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.7 to 9.2 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Dewar Soil

Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Loess over mixed alluvium influenced by volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,200 to 5,700 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 11 inches
Texture: Gravelly silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 11 to 17 inches
Texture: Gravelly silty loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 17 to 44 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 13 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.1 to 2.8 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium

Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Zevadez soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Dewar soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones
Daily cover for landfill: Fair—too sandy, slope
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Fair—too arid, erodes easily
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Dewar Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones, slope
Daily cover for landfill: Poor—cemented pan, slope
Shallow excavations: Severe—cemented pan, slope
Local roads and streets: Severe—cemented pan, slope
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Zevadez soil—4e, irrigated, 6c, nonirrigated; Wieland soil—6e, nonirrigated; Dewar soil—7e, nonirrigated
Range site: Zevadez soil—025X019N; Wieland soil—025X019N; Dewar soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X003N

134—Zevadez-Humdun-Vanwyper association

Map Unit Setting

Position on landscape: Hills, fan piedmont remnants

Composition

Major components:
• Zevadez gravelly loam, 15 to 30 percent slopes (40 percent)
• Humdun loam, 15 to 30 percent slopes (30 percent)
• Vanwyper very cobbly loam, 30 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Gochea silt loam, 15 to 30 percent slopes (10 percent)
• Inclusion 2: Cleavage extremely gravelly loam, 4 to 15 percent slopes (3 percent)
• Inclusion 3: Rock outcrop (1 percent)
• Inclusion 4: Rubble land (1 percent)

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic

Position on landscape: South-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,200 to 5,600 feet
Dominant present vegetation: Big sagebrush, basin wildrye, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.2 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Humdun Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, frigid
Position on landscape: North- and east-facing side slopes of fan piedmont remnants
Parent material: Loess over alluvium and residuum derived from tuff
Slope range: 15 to 30 percent
Elevation: 5,200 to 5,600 feet
Dominant present vegetation: Big sagebrush, basin wildrye, cheatgrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 7 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 29 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 29 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 2 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 10 to 11.9 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low

Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: South-facing side slopes of hills
Parent material: Residuum and colluvium derived from tuff
Slope range: 30 to 50 percent
Elevation: 5,200 to 5,600 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 8 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 8 to 39 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 39 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: North- and east-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper side slopes of hills
Distinctive present vegetation: Low sagebrush, black sagebrush
Inclusion 3
Position on landscape: Crests and upper side slopes of hills
Distinctive present vegetation: None
Inclusion 4
Position on landscape: Lower side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Zevadez soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Humdun soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices

Range seeding: Fair—too arid, erodes easily
Roadfill: Fair—slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Humdun Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Fair—slope
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope

Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices

Range seeding: Poor—large stones
Roadfill: Poor—depth to rock, low strength, large stones
Topsoil: Poor—large stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, large stones, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Interpretive Groups

Capability classification: Zevadez soil—6e, nonirrigated; Humdun soil—6e, nonirrigated; Vanwyper soil—7s, nonirrigated
Range site: Zevadez soil—025X019N; Humdun soil—025X019N; Vanwyper soil—025X015N; Inclusion 1—025X014N; Inclusion 2—025X024N; Inclusion 3—none; Inclusion 4—none

135—Zevadez-Enko-Puett association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Zevadez gravelly loam, 15 to 30 percent slopes (35 percent)
• Enko gravelly sandy loam, 15 to 30 percent slopes (30 percent)
• Puett gravelly sandy loam, 15 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Wieland gravelly silt loam, 4 to 15 percent slopes (5 percent)
• Inclusion 2: Grina very gravelly sandy loam, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Rock outcrop (5 percent)

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,200 to 6,400 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.2 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate

Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,200 to 6,400 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Gravelly sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—5; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 50 percent
Elevation: 5,200,to 6,400 feet
Dominant present vegetation: Wyoming big sagebrush, Indian ricegrass, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—4
Hazard of erosion: By water—moderate; by wind—slight

Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Summits and shoulders of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Utah juniper
Inclusion 3
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Zevadez soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Enko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices
Range seeding: Fair—too arid, erodes easily
Roadfill: Fair—slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Fair—slope
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Zevadez soil—6e, nonirrigated; Enko soil—6e, nonirrigated; Puett soil—7e, nonirrigated
Range site: Zevadez soil—025X019N; Enko soil—025X019N; Puett soil—025X025N; Inclusion 1—025X019N; Inclusion 2—025X059N; Inclusion 3—none

141—Kelk-Kelk, occasionally flooded-Enko association

Map Unit Setting

Position on landscape: Inset fans, fan skirts

Composition

Major components:
• Kelk silt loam, 0 to 2 percent slopes (60 percent)
• Kelk silt loam, 0 to 2 percent slopes, occasionally flooded (15 percent)
• Enko fine sandy loam, 2 to 4 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Bloor silt loam, 0 to 2 percent slopes, rarely flooded (3 percent)
• Inclusion 2: Wieland very gravelly loam, 2 to 4 percent slopes (3 percent)
• Inclusion 3: Torriorthentic Haploxerolls, loamy-skeletal, mixed, mesic, 0 to 2 percent slopes (4 percent)

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans

Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,100 to 5,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Occasionally Flooded Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans adjacent to stream channels
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,100 to 5,600 feet
Dominant present vegetation: Big sagebrush, basin wildrye, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—February through June
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan skirts
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,100 to 5,600 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Fine sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Alkali sacaton, basin wildrye
Inclusion 2
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Lower side slopes of fan piedmont remnants adjacent to inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Torriorthentic Haploxerolls, loamy-skeletal, mixed, mesic
Position on landscape: Inset fans adjacent to stream channels
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the occasionally flooded Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts

Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Occasionally Flooded Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Moderate—flooding
Local roads and streets: Severe—low strength, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Enko Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly, slope
Terraces and diversions: Erodes easily, soil blowing

Interpretive Groups

Capability classification: Kelk soil—2s, irrigated, 6s, nonirrigated; the occasionally flooded Kelk soil—2w, irrigated, 6w, nonirrigated; Enko soil—2e, irrigated, 6s, nonirrigated
Range site: Kelk soil—025X019N; the occasionally flooded Kelk soil—024X006N; Enko soil—025X019N; Inclusion 1—024X007N; Inclusion 2—025X019N; Inclusion 3—024X006N

142—Kelk-Dacker-Puett association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Kelk silt loam, 2 to 8 percent slopes (45 percent)
- Dacker silt loam, 2 to 4 percent slopes (25 percent)
- Puett gravelly sandy loam, 15 to 50 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Zevadez gravelly loam, 8 to 30 percent slopes (5 percent)
- Inclusion 2: Chiara silt loam, 2 to 4 percent slopes (5 percent)
- Inclusion 3: Orovada fine sandy loam, 4 to 15 percent slopes (4 percent)
- Inclusion 4: Kelk silt loam, 0 to 2 percent slopes (1 percent)

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,500 to 5,800 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable

Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,500 to 5,800 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4 to 6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 50 percent
Elevation: 5,500 to 5,800 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Soft, very friable

Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—4
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—very poor; shallow water areas—very poor
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Dacker Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Puett Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Kelk soil—3e, irrigated, 6s, nonirrigated; Dacker soil—3e, irrigated, 6s, nonirrigated; Puett soil—7e, nonirrigated
Range site: Kelk soil—025X019N; Dacker soil—025X019N; Puett soil—025X025N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—024X006N

145—Kelk-Ocala-Moranch association

Map Unit Setting

Position on landscape: Fan skirts and alluvial flats

Composition

Major components:
• Kelk silt loam, 0 to 2 percent slopes (35 percent)
• Ocala silt loam, 0 to 2 percent slopes (30 percent)
• Moranch silt loam, 0 to 2 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Tweba sandy loam, saline-alkali, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Ocala silt loam, strongly saline-sodic, 0 to 2 percent slopes (5 percent)

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Lower part of fan skirts
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—February through June
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Black greasewood, rubber rabbitbrush, inland saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Characteristics of the Moranch Soil

Classification: Durorthidic Torriorthents, coarse-silty, mixed (calcareous), mesic
Position on landscape: Upper part of fan skirts
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Black greasewood, spiny hopsage, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 13

Depth: 5 to 20 inches
Texture: Very fine sandy loam
Structure: Platy
Consistence: Slightly hard, firm
Reaction: Very strongly alkaline
Salinity: 4 to 16 mmhos per cm
Sodicity (SAR): 0 to 13

Depth: 20 to 61 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Very strongly alkaline
Salinity: 4 to 16 mmhos per cm
Sodicity (SAR): 0 to 13

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 10.5 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.64; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aeric Fluvaquents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Flood plains along streams
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 2
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats

Distinctive present vegetation: Black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Moranch soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Poor—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Moderate—flooding
Local roads and streets: Severe—low strength, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Ocala Soil for Various Uses and Practices
Range seeding: Poor—too crusty, excess salts
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Moranch Soil for Various Uses and Practices
Range seeding: Poor—excess salts, too crusty
Roadfill: Good
Topsoil: Poor—thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Slight
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, erodes easily, excess salts
Terraces and diversions: Erodes easily, soil blowing

Interpretive Groups

Capability classification: Kelk soil—2w, irrigated, 6w, nonirrigated; Ocala soil—4w, irrigated, 6w, nonirrigated; Moranch soil—3s, irrigated, 7s, nonirrigated
Range site: Kelk soil—024X006N; Ocala soil—024X007N; Moranch soil—024X008N; Inclusion 1—024X007N; Inclusion 2—024X008N

146—Kelk-Bloor-Ocala association

Map Unit Setting

Position on landscape: Fan skirts, alluvial flats, flood plains

Composition

Major components:
- Kelk silt loam, 0 to 2 percent slopes (40 percent)
- Bloor silt loam, 0 to 2 percent slopes (30 percent)
- Ocala silty clay loam, 0 to 2 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Aeric Halaquepts, fine, montmorillonitic, mesic, ponded, 0 to 2 percent slopes (5 percent)
- Inclusion 2: Ocala silt loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Lower fan skirts
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet

Dominant present vegetation: Basin big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—February through June
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 7 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bloor Soil

Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by loess
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Black greasewood, rubber rabbitbrush, inland saltgrass, alkali sacaton

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 8 to 20 inches
Texture: Silty clay loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Strongly alkaline
Salinity: More than 8 mmhos per cm
Sodicity (SAR): 46 to 70

Depth: 20 to 42 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Very strongly alkaline
Salinity: More than 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 42 to 60 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Very strongly alkaline
Salinity: More than 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 60 to 72 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 4.7 to 7.3 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—high
Potential for frost action: Moderate

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Black greasewood, rubber rabbitbrush, inland saltgrass, alkali sacaton

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silty clay loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Halaquepts, fine, montmorillonitic, mesic
Position on landscape: Concave areas on the flood plains
Distinctive present vegetation: Inland saltgrass, rush

Inclusion 2
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable use: Pasture
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Bloor soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Poor—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Moderate—flooding
Local roads and streets: Severe—low strength, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Bloor Soil for Various Uses and Practices

Range seeding: Poor—excess salts, excess sodium

Roadfill: Good
Topsoil: Poor—excess salts
Daily cover for landfill: Good
Shallow excavations: Moderate—wetness
Local roads and streets: Moderate—flooding, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping, excess salts
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Ocala Soil for Various Uses and Practices

Range seeding: Poor—excess salts, too crusty
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Kelk soil—2w, irrigated, 6w, nonirrigated; Bloor soil—6s, irrigated, 7s, nonirrigated; Ocala soil—4w, irrigated, 6w, nonirrigated
Range site: Kelk soil—024X006N; Bloor soil—024X007N; Ocala soil—024X007N; Inclusion 1—026X002N; Inclusion 2—024X008N

149—Kelk-Sonoma association

Map Unit Setting

Position on landscape: Fan skirts and alluvial flats

Composition

Major components:
- Kelk silt loam, 0 to 2 percent slopes (70 percent)
- Sonoma silt loam, 0 to 2 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Kelk silt loam, 2 to 4 percent slopes (4 percent)
- Inclusion 2: Ocala silt loam, slightly saline, 0 to 2 percent slopes (4 percent)
- Inclusion 3: Devilsgait silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Lower part of fan skirts
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low

Potential for frost action: Moderate

Characteristics of the Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Upper part of fan skirts
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Distinctive present vegetation: Alkali sacaton, inland saltgrass

Inclusion 3

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Sonoma soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Sonoma Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey

Shallow excavations: Slight
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Kelk soil—2s, irrigated, 6s, nonirrigated; Sonoma soil—2w, irrigated, 7w, nonirrigated
Range site: Kelk soil—024X006N; Sonoma soil—025X003N; Inclusion 1—025X019N; Inclusion 2—024X007N; Inclusion 3—025X003N

151—Dewar-Gance-Wieland association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Dewar gravelly silt loam, 2 to 8 percent slopes (60 percent)
• Gance very cobbly loam, 15 to 30 percent slopes (15 percent)
• Wieland very gravelly loam, 8 to 15 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Cherry Spring silt loam, 2 to 8 percent slopes (5 percent)
• Inclusion 2: Linkup gravelly loam, 8 to 15 percent slopes (3 percent)
• Inclusion 3: Puett gravelly sandy loam, 30 to 50 percent slopes (2 percent)

Characteristics of the Dewar Soil

Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Smooth or slightly convex summits of fan piedmont remnants
Parent material: Loess over mixed alluvium influenced by volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,900 to 6,400 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Douglas rabbitbrush

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 11 inches
Texture: Gravelly silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 11 to 17 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 17 to 44 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 13 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.1 to 2.8 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent

Elevation: 5,500 to 6,400 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 5
Percent cobbles on the surface: 30
Percent pebbles on the surface: 30

Depth: 0 to 4 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 8 to 15 percent
Elevation: 5,500 to 6,400 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Douglas rabbitbrush

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.5 to 9.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low

Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Haploxerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Concave summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Lithic Xerollic Haplargids, clayey, montmorillonitic, frigid
Position on landscape: Foot slopes of the side slopes of hills
Distinctive present vegetation: Low sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, black sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture
Suitability of the Dewar soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Dewar Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope, erodes easily
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—large stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Dewar soil—4e, irrigated, 7s, nonirrigated; Gance soil—7s, nonirrigated; Wieland soil—6s, nonirrigated
Range site:; Dewar soil—025X019N; Gance soil—025X019N; Wieland soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X018N; Inclusion 3—025X025N

152—Dewar-Zevadez-Puett association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Dewar gravelly silt loam, 2 to 8 percent slopes (45 percent)
• Zevadez gravelly loam, 15 to 30 percent slopes (20 percent)
• Puett gravelly sandy loam, 30 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Hunewill gravelly sandy loam, 8 to 15

percent slopes (7 percent)
• Inclusion 2: Orovada fine sandy loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Yuko very gravelly sandy loam, 4 to 15 percent slopes (2 percent)
• Inclusion 4: Rock outcrop (1 percent)

Characteristics of the Dewar Soil

Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess over mixed alluvium influenced by volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,500 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 11 inches
Texture: Gravelly silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 11 to 17 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 17 to 44 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 13 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.1 to 2.8 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.2 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 30 to 50 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Black sagebrush, big sagebrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.9 to 2.2 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—4
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Convex foot slopes of fan piedmont remnant side slopes
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Concave foot slopes of fan piedmont remnant side slopes
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 4
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Dewar soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Zevadez soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Dewar Soil for Various Uses and Practices

Range seeding: Poor—droughty, too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—cemented pan
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope, erodes easily
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices

Range seeding: Fair—too arid, erodes easily
Roadfill: Fair—slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Puett Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Capability classification: Dewar soil—4e, irrigated, 7s, nonirrigated; Zevadez soil—6e, nonirrigated; Puett soil—7e, nonirrigated
Range site: Dewar soil—025X019N; Zevadez soil—025X019N; Puett soil—025X025N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—none

153—Dewar-Gance-Bilbo association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Dewar gravelly loam, 2 to 8 percent slopes (45 percent)
- Gance very gravelly loam, 8 to 15 percent slopes (30 percent)
- Bilbo very gravelly loam, 15 to 50 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Chiara silt loam, 2 to 8 percent slopes (5 percent)
- Inclusion 2: McIvey gravelly silt loam, 30 to 50 percent slopes (2 percent)
- Inclusion 3: Orovada loam, 4 to 30 percent slopes (2 percent)
- Inclusion 4: Welch silt loam, 2 to 15 percent slopes (1 percent)

Characteristics of the Dewar Soil

Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess over mixed alluvium influenced by volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,600 to 6,000 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 11 inches
Texture: Gravelly silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 11 to 17 inches
Texture: Gravelly silt loam

Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 17 to 44 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 13 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.1 to 2.8 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 8 to 15 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Big sagebrush, phlox, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 50 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 70

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.1 inches
Water-supplying capacity: 6.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Shoulders of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: North-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 3
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans and foot slopes of fan piedmont remnant side slopes
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Dewar soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Dewar Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope, erodes easily
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Moderate—too clayey, large stones, slope
Local roads and streets: Moderate—slope, shrink-swell potential, large stones
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope

Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Dewar soil—4e, irrigated, 7s, nonirrigated; Gance soil—7s, nonirrigated; Bilbo soil—7s, nonirrigated
Range site: Dewar soil—025X019N; Gance soil—025X019N; Bilbo soil—025X015N; Inclusion 1—025X019N; Inclusion 2—025X012N; Inclusion 3—025X019N; Inclusion 4—025X003N

154—Dewar-Chiara-Gance association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Dewar gravelly silt loam, 2 to 4 percent slopes (40 percent)
• Chiara silt loam, 2 to 4 percent slopes (25 percent)
• Gance very gravelly loam, 2 to 8 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Hunnton gravelly loam, 0 to 4 percent slopes (8 percent)
• Inclusion 2: Chiara silt loam, 4 to 15 percent slopes (3 percent)
• Inclusion 3: Bilbo loam, 2 to 8 percent slopes (2 percent)
• Inclusion 4: Kelk silt loam, 2 to 8 percent slopes (2 percent)

Characteristics of the Dewar Soil

Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Smooth, upper parts of the summits of fan piedmont remnants
Parent material: Loess over mixed alluvium influenced by volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,900 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 11 inches
Texture: Gravelly silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 11 to 17 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 17 to 44 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 13 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.1 to 2.8 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Upper parts of the convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 4 percent

Elevation: 5,900 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Smooth, lower parts of the summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,600 to 5,900 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants

Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow

Position on landscape: Side slopes of fan piedmont remnants

Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic

Position on landscape: Inset fan remnants

Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic

Position on landscape: Inset fans

Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat

Potential foreseeable uses: Cropland, hayland, pasture

Suitability of the Dewar soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Dewar Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty

Roadfill: Poor—cemented pan

Topsoil: Poor—cemented pan, small stones

Daily cover for landfill: Poor—cemented pan

Shallow excavations: Severe—cemented pan

Local roads and streets: Severe—cemented pan

Pond reservoir areas: Severe—cemented pan

Embankments, dikes, and levees: Severe—piping

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Drainage: Deep to water

Irrigation: Cemented pan, slope, erodes easily

Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Chiara Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty

Roadfill: Poor—cemented pan

Topsoil: Poor—cemented pan

Daily cover for landfill: Poor—cemented pan

Shallow excavations: Severe—cemented pan

Local roads and streets: Severe—cemented pan

Sand: Improbable source—small stones

Gravel: Probable source

Interpretive Groups

Capability classification: Dewar soil—4e, irrigated, 7s, nonirrigated; Chiara soil—4e, irrigated, 7s, nonirrigated; Gance soil—7s, nonirrigated

Range site: Dewar soil—025X019N; Chiara soil—025X019N; Gance soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

161—Sonoma-Sonoma, rarely flooded association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:

- Sonoma silt loam, 0 to 2 percent slopes (60 percent)
- Sonoma silt loam, 0 to 2 percent slopes, rarely flooded (25 percent)

Contrasting inclusions:
- Inclusion 1: Sonoma silt loam, 0 to 2 percent slopes, occasionally flooded (10 percent)
- Inclusion 2: Hussa silt loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,900 to 6,100 feet
Dominant present vegetation: Basin big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Rarely Flooded Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains near entrenched stream channels
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,900 to 6,100 feet
Dominant present vegetation: Basin big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to stream channels
Distinctive present vegetation: Black greasewood, western wheatgrass

Inclusion 2

Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, cropland, pasture
Suitability of the Sonoma soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—good
Suitability of the rarely flooded Sonoma soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Sonoma Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Slight
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Suitability and Limitations of the Rarely Flooded Sonoma Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Slight
Local roads and streets: Severe—low strength, frost action,
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Both Sonoma soils—2w, irrigated, 7w, nonirrigated
Range site: Both Sonoma soils—025X003N; Inclusion 1—024X006N; Inclusion 2—025X003N

162—Sonoma-Hussa association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Sonoma silt loam, 0 to 2 percent slopes (50 percent)
• Hussa silt loam, 0 to 2 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Welsum silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Devilsgait silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 3: Crooked Creek silt loam, 0 to 2 percent slopes (3 percent)
• Inclusion 4: Ocala silt loam, 0 to 2 percent slopes, occasionally flooded (2 percent)

Characteristics of the Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,700 to 6,300 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 2 to 8 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 42 to 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Hussa Soil

Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,700 to 6,300 feet
Dominant present vegetation: Tufted hairgrass, dandelion, sedge

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 16 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 60 inches
Texture: Stratified sandy clay loam to silty clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 6 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), frigid
Position on landscape: Natural levees on the flood plains
Distinctive present vegetation: Tufted hairgrass, Nevada bluegrass

Inclusion 2
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Slightly lower areas of the flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Wildrye, inland saltgrass

Inclusion 3
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass, Nevada bluegrass

Inclusion 4
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, pasture, hayland

Suitability of the Sonoma soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair

Suitability of the Hussa soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—fair

Suitability and Limitations of the Sonoma Soil for Various Uses and Practices

Range seeding: Fair—too crusty, excess salts
Roadfill: Poor—low strength
Topsoil: Fair—excess salts
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping, wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Hussa Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—low strength, wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily, flooding
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Sonoma and Hussa soils—3w, irrigated, 6w, nonirrigated
Range site: Sonoma soil—024X006N; Hussa soil—025X005N; Inclusion 1—025X005N; Inclusion 2—025X001N; Inclusion 3—025X005N; Inclusion 4—024X008N

163—Sonoma, frequently flooded-Devilsgait-Sonoma association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
- Sonoma silty clay loam, 0 to 2 percent slopes, frequently flooded (40 percent)
- Devilsgait silt loam, 0 to 2 percent slopes (30 percent)
- Sonoma silt loam, 0 to 2 percent slopes, occasionally flooded (20 percent)

Contrasting inclusions:
- Inclusion 1: Sonoma silt loam, 0 to 2 percent slopes, rarely flooded (5 percent)
- Inclusion 2: Devilsgait silty clay, ponded, 0 to 2 percent slopes (4 percent)
- Inclusion 3: Halleck silt loam, 0 to 2 percent slopes (1 percent)

Characteristics of the Frequently Flooded Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,700 feet
Dominant present vegetation: Alkali sacaton, basin wildrye, alkali bluegrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silty clay loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 8

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 36 inches
Flooding: Frequency—frequent; duration—brief to long; months—February through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,700 feet
Dominant present vegetation: Basin wildrye, creeping wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,700 feet
Dominant present vegetation: Black greasewood, basin big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 2 to 8 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches

Depth to a seasonal high water table: 42 to 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Black greasewood, rubber rabbitbrush, inland saltgrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Ponded areas of flood plains
Distinctive present vegetation: Basin wildrye, sedge
Inclusion 3
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), frigid
Position on landscape: Slightly elevated areas of flood plains adjacent to stream channels
Distinctive present vegetation: Tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the frequently flooded Sonoma soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Sonoma soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair

Suitability and Limitations of the Frequently Flooded Sonoma Soil for Various Uses and Practices
Range seeding: Poor—too crusty, excess salts, excess sodium
Roadfill: Poor—low strength
Topsoil: Fair—too clayey, excess salts
Daily cover for landfill: Fair—too clayey, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Suitability and Limitations of the Sonoma Soil for Various Uses and Practices
Range seeding: Fair—excess salts, too crusty
Roadfill: Poor—low strength
Topsoil: Fair—excess salts
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping, wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Both Sonoma soils—3w,

irrigated, 6w, nonirrigated; Devilsgait soil—5w, irrigated, 6w, nonirrigated
Range site: The frequently flooded Sonoma soil—024X009N; Devilsgait soil—025X001N; Sonoma soil—024X006N; Inclusion 1—024X007N; Inclusion 2—025X001N; Inclusion 3—025X005N

166—Sonoma-Devilsgait association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Sonoma silt loam, 0 to 2 percent slopes, occasionally flooded (50 percent)
• Devilsgait silt loam, 0 to 2 percent slopes, frequently flooded (35 percent)
Contrasting inclusions:
• Inclusion 1: Devilsgait silt loam, 0 to 2 percent slopes, occasionally flooded (10 percent)
• Inclusion 2: Sonoma silt loam, 0 to 2 percent slopes, rarely flooded (3 percent)
• Inclusion 3: Tweba very fine sandy loam, drained, 0 to 2 percent slopes (2 percent)

Characteristics of the Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,400 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye, alkali bluegrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 2 to 8 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 42 to 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,400 feet
Dominant present vegetation: Wildrye, sedge, inland saltgrass, Nevada bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam

Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 2
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, inland saltgrass
Inclusion 3
Classification: Aeric Fluvaquents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Slightly higher areas of flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Sonoma soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair

Suitability and Limitations of the Sonoma Soil for Various Uses and Practices
Range seeding: Fair—excess salts, too crusty
Roadfill: Poor—low strength
Topsoil: Fair—excess salts
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping, wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Sonoma soil—3w, irrigated, 6w, nonirrigated; Devilsgait soil—5w, irrigated, 6w, nonirrigated
Range site: Sonoma soil—024X006N; Devilsgait soil—025X001N; Inclusion 1—025X003N; Inclusion 2—024X007N; Inclusion 3—025X003N

167—Sonoma-Kelk association

Map Unit Setting

Position on landscape: Flood plains and fan skirts

Composition

Major components:
- Sonoma silt loam, 0 to 2 percent slopes (55 percent)
- Kelk silt loam, 0 to 2 percent slopes (35 percent)

Contrasting inclusions:
- Inclusion 1: Ocala silt loam, 0 to 2 percent slopes (8 percent)
- Inclusion 2: Devilsgait silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,500 to 5,700 feet
Dominant present vegetation: Basin big sagebrush, Douglas rabbitbrush, basin wildrye, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Fan skirts
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,500 to 5,700 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 11 to 12.5 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6

Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, inland saltgrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Sonoma soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—good
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Sonoma Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Slight
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Sonoma soil—2w, irrigated, 7w, nonirrigated; Kelk soil—2s, irrigated, 6s, nonirrigated
Range site: Sonoma soil—025X003N; Kelk soil—024X006N; Inclusion 1—024X007N; Inclusion 2—025X003N

171—Hussa-Ocala-Welsum association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Hussa silt loam, 0 to 2 percent slopes (40 percent)
• Ocala silt loam, 0 to 2 percent slopes (30 percent)
• Welsum silt loam, 0 to 2 percent slopes, frequently flooded (15 percent)
Contrasting inclusions:
• Inclusion 1: Ocala silt loam, 0 to 2 percent slopes, rarely flooded (10 percent)
• Inclusion 2: Crooked Creek silty clay loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Hussa Soil

Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Rubber rabbitbrush, inland saltgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 4 to 60 inches
Texture: Stratified loam to clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 6 to 18 inches
Flooding: Frequency—occasional; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 9.1 to 11 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Rubber rabbitbrush, alkali sacaton, inland saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Characteristics of the Welsum Soil

Classification: Cumulic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Willow, rush, iris, sedge

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, friable

Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 20 to 35 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 35 to 61 inches
Texture: Extremely cobbly loamy sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through May
Permeability: Moderately slow
Available water capacity: 7.4 to 8.6 inches
Water-supplying capacity: 12 to 16 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—3; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats adjacent to fan skirts
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 2
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Hussa soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—good
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Welsum soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Hussa Soil for Various Uses and Practices
Range seeding: Fair—excess salts
Roadfill: Poor—wetness, frost action
Topsoil: Poor—wetness, excess sodium
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—flooding, wetness
Local roads and streets: Severe—flooding, wetness, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly, excess sodium
Terraces and diversions: Wetness, percs slowly

Suitability and Limitations of the Ocala Soil for Various Uses and Practices
Range seeding: Poor—too crusty, excess salts
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Welsum Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—area reclaim, wetness

Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, wetness
Sand: Probable source
Gravel: Probable source
Drainage: Flooding, large stones, frost action
Irrigation: Wetness, erodes easily, flooding
Terraces and diversions: Large stones, erodes easily, wetness

Interpretive Groups

Capability classification: Hussa soil—4w, irrigated, 6w, nonirrigated; Ocala soil—4w, irrigated, 6w, nonirrigated; Welsum soil—5w, irrigated, 6w, nonirrigated
Range site: Hussa soil—024X007N; Ocala soil—024X007N; Welsum soil—025X005N; Inclusion 1—024X007N; Inclusion 2—025X003N

172—Hussa-Halleck-Welsum association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Hussa silt loam, 0 to 2 percent slopes (35 percent)
• Halleck silt loam, 0 to 2 percent slopes (30 percent)
• Welsum silt loam, 0 to 2 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Fluvaquentic Haploxerolls, sandy-skeletal, mixed, frigid, 0 to 2 percent slopes (6 percent)
• Inclusion 2: Sonoma silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 3: Alburz Variant loam, 0 to 2 percent slopes (4 percent)

Characteristics of the Hussa Soil

Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Slightly higher areas of flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Willow, mountain silver sagebrush, Nevada bluegrass, tufted hairgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 16 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 60 inches
Texture: Stratified sandy clay loam to silty clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 6 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 12 to 16 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Halleck Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), frigid
Position on landscape: Slightly lower areas of flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Willow, mountain silver sagebrush, Nevada bluegrass, tufted hairgrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 9 to 36 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 36 to 61 inches
Texture: Stratified loam to silty clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 30 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 12 to 16 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Welsum Soil

Classification: Cumulic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), frigid
Position on landscape: Areas of flood plains near stream channels
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Willow, Nevada bluegrass, tufted hairgrass, mountain silver sagebrush

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 20 to 35 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 35 to 61 inches
Texture: Extremely cobbly loamy sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 7.4 to 8.6 inches
Water-supplying capacity: 12 to 16 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—3; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Fluvaquentic Haploxerolls, sandy-skeletal, mixed, frigid
Position on landscape: Stream terraces
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 3
Classification: Typic Haplaquolls, sandy-skeletal, mixed, frigid

Position on landscape: Natural levees on the flood plains adjacent to stream channels
Distinctive present vegetation: Cottonwood

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Hussa soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—fair
Suitability of the Halleck soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good
Suitability of the Welsum soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Hussa Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength, wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily, flooding
Terraces and diversions: Erodes easily, wetness

Suitability and Limitations of the Halleck Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, flooding
Terraces and diversions: Erodes easily, wetness

Suitability and Limitations of the Welsum Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—area reclaim, wetness
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, wetness
Sand: Probable source
Gravel: Probable source
Drainage: Flooding, large stones, frost action
Irrigation: Wetness, erodes easily, flooding
Terraces and diversions: Large stones, erodes easily, wetness

Interpretive Groups

Capability classification: Hussa soil—3w, irrigated, 6w, nonirrigated; Halleck soil—5w irrigated and nonirrigated; Welsum soil—5w, irrigated, 6w, nonirrigated
Range site: Hussa soil—025X005N; Halleck soil—025X005N; Welsum soil—025X005N; Inclusion 1—025X014N; Inclusion 2—024X007N; Inclusion 3—025X053N

181—Crooked Creek-Crooked Creek, gravelly substratum-Ocala association

Map Unit Setting

Position on landscape: Flood plains and alluvial flats

Composition

Major components:
• Crooked Creek silty clay loam, 0 to 2 percent slopes (45 percent)
• Crooked Creek silty clay loam, gravelly substratum, 0 to 2 percent slopes (30 percent)
• Ocala silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Welch silty clay loam, 2 to 8 percent slopes (5 percent)
• Inclusion 2: Devilsgait very fine sandy loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Willow, rush, bluestem, sedge

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 38 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 38 to 60 inches
Texture: Silty clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Slow
Available water capacity: 6.2 to 7.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Crooked Creek Soil, Gravelly Substratum

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Willow, rush, bluestem, sedge

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline

Depth: 7 to 40 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 40 to 60 inches
Texture: Stratified very gravelly sandy loam to extremely gravelly sand
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Slow
Available water capacity: 6.7 to 8.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Rubber rabbitbrush, black greasewood, alkali sacaton, saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture
Suitability of the Crooked Creek soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good
Suitability of the Crooked Creek soil, gravelly substratum, for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair

Suitability and Limitations of the Crooked Creek Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Poor—thin layer
Daily cover for landfill: Poor—too clayey, hard to pack, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly

Terraces and diversions: Wetness, percs slowly

Suitability and Limitations of the Crooked Creek Soil, Gravelly Substratum, for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—wetness
Topsoil: Poor—area reclaim
Daily cover for landfill: Poor—too clayey, hard to pack, wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Probable source
Gravel: Probable source
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly
Terraces and diversions: Wetness, percs slowly

Suitability and Limitations of the Ocala Soil for Various Uses and Practices

Range seeding: Poor—too crusty, excess salts
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Both Crooked Creek soils—5w, irrigated and nonirrigated; Ocala soil—4w, irrigated, 6w, nonirrigated
Range site: Both Crooked Creek soils—025X005N; Ocala soil—024X007N; Inclusion 1—025X005N; Inclusion 2—025X001N

182—Crooked Creek-Hussa-Alburz association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
- Crooked Creek silty clay loam, 0 to 2 percent slopes (35 percent)
- Hussa loam, 0 to 2 percent slopes (30 percent)
- Alburz loam, drained, 0 to 2 percent slopes, rarely flooded (20 percent)

Contrasting inclusions:
- Inclusion 1: Crooked Creek silty clay loam, 0 to 2 percent slopes (5 percent)
- Inclusion 2: Hussa silt loam, 0 to 2 percent slopes (5 percent)
- Inclusion 3: Hussa loam, 0 to 2 percent slopes, rarely flooded (5 percent)

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 38 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 38 to 60 inches
Texture: Silty clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 6.8 to 7.4 inches
Water-supplying capacity: 8 to 12 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Hussa Soil

Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: The entrenched part of flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 16 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 60 inches
Texture: Stratified fine sandy loam to silty clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 9.4 to 11 inches
Water-supplying capacity: 8 to 12 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Alburz Soil

Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Natural levees on the flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 20 inches
Texture: Stratified gravelly coarse sandy loam to gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 20 to 60 inches
Texture: Stratified extremely gravelly loamy coarse sand to extremely gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Moderately rapid
Available water capacity: 2.8 to 4.2 inches
Water-supplying capacity: 7.5 to 12 inches
Runoff: Very slow
Hydrologic group: B

Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Slightly lower areas of flood plains adjacent to stream channels
Distinctive present vegetation: Tufted hairgrass
Inclusion 2
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Slightly higher areas of flood plains adjacent to stream channels
Distinctive present vegetation: Tufted hairgrass
Inclusion 3
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Black greasewood, basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Crooked Creek soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—poor
Suitability of the Hussa soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Alburz soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Crooked Creek Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Poor—thin layer
Daily cover for landfill: Poor—too clayey, hard to pack
Shallow excavations: Moderate—too clayey, wetness
Local roads and streets: Severe—low strength, frost action, shrink-swell potential
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Hussa Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—shrink-swell potential
Topsoil: Fair—small stones
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Suitability and Limitations of the Alburz Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—flooding, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—small stones
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty, rooting depth, erodes easily
Terraces and diversions: Large stones, erodes easily, too sandy

Interpretive Groups

Capability classification: Crooked Creek soil—3w, irrigated, 6w, nonirrigated; Hussa soil—3w, irrigated, 6w, nonirrigated; Alburz soil—4s, irrigated, 7c, nonirrigated
Range site: Crooked Creek soil—025X003N; Hussa soil—025X003N; Alburz soil—025X003N;

Inclusion 1—025X005N; Inclusion 2—025X005N; Inclusion 3—024X006N

183—Crooked Creek-Welsum association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Crooked Creek silty clay loam, 0 to 2 percent slopes (50 percent)
• Welsum silt loam, 0 to 2 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Hussa silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Welch silty clay loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,700 to 6,300 feet
Dominant present vegetation: Tufted hairgrass, Nevada bluegrass, alpine timothy

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 38 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 38 to 60 inches
Texture: Silty clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Slow
Available water capacity: 6.2 to 7.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Welsum Soil

Classification: Cumulic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), frigid
Position on landscape: Natural levees on flood plains adjacent to stream channels
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,700 to 6,300 feet
Dominant present vegetation: Tufted hairgrass, Nevada bluegrass, alpine timothy

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 20 to 35 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 35 to 61 inches
Texture: Extremely cobbly loamy sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through May
Permeability: Moderately slow
Available water capacity: 7.4 to 8.6 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—3; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Tufted hairgrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Crooked Creek soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good
Suitability of the Welsum soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Crooked Creek Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Poor—thin layer
Daily cover for landfill: Poor—too clayey, hard to pack, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly
Terraces and diversions: Wetness, percs slowly

Suitability and Limitations of the Welsum Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—area reclaim, wetness
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, wetness
Sand: Probable source
Gravel: Probable source
Drainage: Flooding, large stones, frost action
Irrigation: Wetness, erodes easily, flooding
Terraces and diversions: Large stones, erodes easily, wetness

Interpretive Groups

Capability classification: Crooked Creek soil—5w irrigated and nonirrigated; Welsum soil—5w, irrigated, 6w, nonirrigated
Range site: Crooked Creek soil—025X005N; Welsum soil—025X005N; Inclusion 1—025X005N; Inclusion 2—025X005N

184—Crooked Creek silty clay loam, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

Position on landscape: Flood plains

Composition

Major component:
• Crooked Creek silty clay loam, 0 to 2 percent slopes, frequently flooded (90 percent)
Contrasting inclusions:
• Inclusion 1: Welch silty clay loam, 0 to 2 percent slopes (7 percent)
• Inclusion 2: Welch silt loam, 0 to 2 percent slopes (3 percent)

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Meadow barley, Nevada bluegrass, tufted hairgrass, sedge

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 38 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 38 to 60 inches
Texture: Silty clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Slow
Available water capacity: 6.2 to 7.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Crooked Creek soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Crooked Creek Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Poor—thin layer
Daily cover for landfill: Poor—too clayey, hard to pack, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly
Terraces and diversions: Wetness, percs slowly

Interpretive Groups

Capability classification: Crooked Creek soil—5w irrigated and nonirrigated
Range site: Crooked Creek soil—025X005N; Inclusion 1—025X005N; Inclusion 2—025X003N

187—Crooked Creek-Devilsgait-Ocala association

Map Unit Setting

Position on landscape: Flood plains and alluvial flats

Composition

Major components:
- Crooked Creek silty clay loam, 0 to 2 percent slopes (35 percent)
- Devilsgait silt loam, 0 to 2 percent slopes (30 percent)
- Ocala silt loam, 0 to 2 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Ocala silt loam, 0 to 2 percent slopes, nonflooded (5 percent)
- Inclusion 2: Welch silt loam, 0 to 2 percent slopes, rarely flooded (4 percent)
- Inclusion 3: Xerollic Camborthids, loamy-skeletal, mixed, mesic, 0 to 2 percent slopes (3 percent)
- Inclusion 4: Welch silt loam, 0 to 2 percent slopes, occasionally flooded (3 percent)

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,500 to 6,300 feet
Dominant present vegetation: Tufted hairgrass, Nevada bluegrass, alpine timothy, willow

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline

Depth: 7 to 40 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 40 to 60 inches
Texture: Stratified very gravelly sandy loam to extremely gravelly sand
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Slow
Available water capacity: 6.7 to 8.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous) mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,500 to 6,300 feet
Dominant present vegetation: Basin wildrye, creeping wildrye, inland saltgrass, alkali sacaton, willow

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June

Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,500 to 6,300 feet
Dominant present vegetation: Black greasewood, rubber rabbitbrush, inland saltgrass, basin wildrye

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: More than 16 mmhos per cm
Sodicity (SAR): 46 to 70

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: More than 4 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, firm
Reaction: Strongly alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 42 to 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 11 to 12.5 inches
Water-supplying capacity: 8 to 12 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—high
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: The entrenched part of flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Basin big sagebrush
Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush
Inclusion 3
Classification: Xerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Black greasewood, inland saltgrass, basin wildrye
Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Slightly higher areas of flood plains adjacent to stream channels
Distinctive present vegetation: Nevada bluegrass, alpine timothy

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Crooked Creek soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair

Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—poor; shallow water areas—fair

Suitability and Limitations of the Crooked Creek Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—wetness
Topsoil: Poor—area reclaim
Daily cover for landfill: Poor—too clayey, hard to pack, wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Probable source
Gravel: Probable source
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly
Terraces and diversions: Wetness, percs slowly

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Suitability and Limitations of the Ocala Soil for Various Uses and Practices

Range seeding: Poor—excess salts, excess sodium, too crusty
Roadfill: Poor—low strength
Topsoil: Poor—excess salts, excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—excess sodium, excess salts
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, excess sodium
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Crooked Creek soil—5w irrigated and nonirrigated; Devilsgait soil—5w, irrigated, 6w, nonirrigated; Ocala soil—6w, irrigated, 7w, nonirrigated
Range site: Crooked Creek soil—025X005N; Devilsgait soil—025X001N; Ocala soil—024X007N; Inclusion 1—024X006N; Inclusion 2—025X003N; Inclusion 3—024X007N; Inclusion 4—025X006N

189—Crooked Creek, gravelly substratum-Crooked Creek association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Crooked Creek silty clay loam, gravelly substratum, 0 to 2 percent slopes (60 percent)
• Crooked Creek silty clay loam, 0 to 2 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Alburz loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Crooked Creek silty clay loam, 0 to 2 percent slopes, occasionally flooded (5 percent)
• Inclusion 3: Cumulic Haplaquolls, clayey over sandy or sandy-skeletal, montmorillonitic, frigid, 0 to 2 percent slopes (5 percent)

Characteristics of the Crooked Creek Soil, Gravelly Substratum

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,900 to 6,400 feet
Dominant present vegetation: Tufted hairgrass, Nevada bluegrass, sedge

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline

Depth: 7 to 40 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 40 to 60 inches
Texture: Stratified very gravelly sandy loam to extremely gravelly sand
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Slow
Available water capacity: 6.7 to 8.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid

Contrasting Inclusions

Inclusion 1
Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Natural levees adjacent to stream channels
Distinctive present vegetation: Tufted hairgrass, Nevada bluegrass

Inclusion 2
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Slightly higher areas of flood plains and flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Alpine timothy, Nevada bluegrass

Inclusion 3
Classification: Cumulic Haplaquolls, clayey over sandy or sandy-skeletal, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to stream channels

Distinctive present vegetation: Tufted hairgrass, Nevada bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture

Suitability of the Crooked Creek soil, gravelly substratum, for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair

Suitability of the Crooked Creek soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Crooked Creek Soil, Gravelly Substratum, for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—wetness
Topsoil: Poor—area reclaim
Daily cover for landfill: Poor—too clayey, hard to pack, wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, flooding, frost action

Sand: Probable source
Gravel: Probable source
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly
Terraces and diversions: Wetness, percs slowly

Suitability and Limitations of the Crooked Creek Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Poor—thin layer
Daily cover for landfill: Poor—too clayey, hard to pack, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly
Terraces and diversions: Wetness, percs slowly

Interpretive Groups

Capability classification: Both Crooked Creek soils—5w, irrigated and nonirrigated
Range site: Both Crooked Creek soils—025X005N; Inclusion 1—025X005N; Inclusion 2—025X006N; Inclusion 3—025X005N

191—Tustell-Gance-Mahala association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Tustell gravelly loam, 4 to 15 percent slopes (40 percent)
- Gance very gravelly loam, 15 to 30 percent slopes (25 percent)
- Mahala very gravelly clay loam, 15 to 50 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Wieland very gravelly loam, 30 to 50 percent slopes (5 percent)
- Inclusion 2: Hunnton loam, 4 to 15 percent slopes (4 percent)
- Inclusion 3: Kelk silt loam, 0 to 4 percent slopes (4 percent)
- Inclusion 4: Puett very gravelly loam, 8 to 30 percent slopes (2 percent)

Characteristics of the Tustell Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Salinity: 0 to 2 mmhos per cm

Depth: 5 to 19 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 19 to 30 inches
Texture: Gravelly loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified very gravelly loamy sand to gravelly loamy fine sand
Structure: Massive
Consistence: Slightly hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.8 to 5.9 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—3; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Mahala Soil

Classification: Xerollic Paleargids, fine, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Loess over residuum derived from tuff
Slope range: 15 to 50 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches

Average annual air temperature: About 47 degrees F
Frost-free period: About 100 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 4 inches
Texture: Very gravelly clay loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 4 to 11 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 30 inches
Texture: Clay
Structure: Subangular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 30 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.0 to 5.1 inches
Water-supplying capacity: 9.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans and fan skirts
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, black sagebrush

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Tustell soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Mahala soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Tustell Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones

Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Mahala Soil for Various Uses and Practices

Range seeding: Poor—small stones, rooting depth
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Tustell, Gance, and Mahala soils—7s, nonirrigated
Range site: Tustell soil—025X019N; Gance soil—025X019N; Mahala soil—025X018N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X025N

198—Tustell-Tustell, strongly sloping-Gance association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Tustell gravelly loam, 2 to 8 percent slopes (50 percent)
• Tustell gravelly loam, 8 to 15 percent slopes (25 percent)
• Gance very gravelly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusion:
• Inclusion 1: Devilsgait silt loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Tustell Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,700 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 19 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 19 to 30 inches
Texture: Gravelly loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified very gravelly loamy sand to gravelly loamy fine sand
Structure: Massive
Consistence: Slightly hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.8 to 5.9 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—3; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Strongly Sloping Tustell Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 8 to 15 percent
Elevation: 5,700 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 19 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 19 to 30 inches
Texture: Gravelly loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified very gravelly loamy sand to gravelly loamy fine sand
Structure: Massive
Consistence: Slightly hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.8 to 5.9 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—3; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Slightly convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,700 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none

Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusion

Inclusion 1
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Tustell soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the strongly sloping Tustell soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Tustell Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Slight
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty, percs slowly, rooting depth
Terraces and diversions: Too sandy

Suitability and Limitations of the Strongly Sloping Tustell Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Interpretive Groups

Capability classification: Tustell soil—3e, irrigated, 7s, nonirrigated; the strongly sloping Tustell soil—7s, nonirrigated; Gance soil—7s, nonirrigated
Range site: Both Tustell soils—025X019N; Gance soil—025X019N; Inclusion 1—025X003N

200—Tustell-Zevadez-Donna association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Tustell gravelly loam, 2 to 8 percent slopes (40 percent)
- Zevadez loam, 4 to 15 percent slopes (30 percent)
- Donna gravelly loam, 4 to 15 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Gance very gravelly loam, 4 to 15 percent slopes (10 percent)
- Inclusion 2: Vanwyper very gravelly loam, 15 to 50 percent slopes (5 percent)

Characteristics of the Tustell Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants

Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,800 to 6,400 feet
Dominant present vegetation: Big sagebrush, bluegrass, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 19 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 19 to 30 inches
Texture: Gravelly loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified very gravelly loamy sand to gravelly loamy fine sand
Structure: Massive
Consistence: Slightly hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.8 to 5.9 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—3; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,400 feet
Dominant present vegetation: Big sagebrush, bluegrass, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.4 to 9.3 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium

Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Summits of upper fan piedmont remnants adjacent to mountains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 6,100 to 6,400 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, cheatgrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, very firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Slightly convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, pasture, hayland
Suitability of the Tustell soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Zevadez soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Tustell Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim

Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Slight
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty, percs slowly, rooting depth
Terraces and diversions: Too sandy

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Fair—small stones, slope
Daily cover for landfill: Fair—too sandy, slope
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, rooting depth
Terraces and diversions: Slope, erodes easily, too sandy

Suitability and Limitations of the Donna Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Tustell soil—3e, irrigated, 7s, nonirrigated; Zevadez soil—4e, irrigated, 6c, nonirrigated; Donna soil—7s, nonirrigated
Range site: Tustell soil—025X019N; Zevadez soil—025X019N; Donna soil—025X018N; Inclusion 1—025X019N; Inclusion 2—025X015N

201—Hopeka-Cavehill association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Hopeka very gravelly loam, 15 to 50 percent slopes (55 percent)
• Cavehill very gravelly silt loam, 15 to 50 percent slopes (30 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop—5 percent
• Inclusion 2: Lithic Haploxerolls, loamy-skeletal, mixed, frigid, 15 to 50 percent slopes (4 percent)
• Inclusion 3: Typic Argixerolls, fine, montmorillonitic, frigid, 15 to 30 percent slopes (3 percent)
• Inclusion 4: Nirac very gravelly silt loam, 15 to 50 percent slopes (3 percent)

Characteristics of the Hopeka Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, frigid
Position on landscape: South- and west-facing, convex side slopes of mountains
Parent material: Residuum and colluvium derived from limestone and dolostone
Slope range: 15 to 50 percent
Elevation: 6,000 to 8,200 feet
Dominant present vegetation: Black sagebrush, bluegrass, singleleaf pinyon, Utah juniper

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 85 days

Typical Profile

Percent cobbles on the surface: 15
Percent pebbles on the surface: 45

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 10 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.2 to 0.5 inch
Water-supplying capacity: 5.5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D

Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cavehill Soil

Classification: Typic Calcixerolls, loamy-skeletal, carbonatic, frigid
Position on landscape: North- and east-facing, convex side slopes in the mountains
Parent material: Residuum and colluvium derived from dolostone and influenced by loess
Slope range: 15 to 50 percent
Elevation: 6,000 to 8,200 feet
Dominant present vegetation: Big sagebrush, Idaho fescue, singleleaf pinyon

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 85 days

Typical Profile

Percent stones and boulders on the surface: 30
Percent pebbles on the surface: 20

Depth: 0 to 3 inches
Texture: Very gravelly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 3 to 16 inches
Texture: Very cobbly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Strongly alkaline

Depth: 16 to 37 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 37 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.3 to 4.4 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Inclusion 2
Classification: Lithic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of mountains, on all aspects, adjacent to areas of rock outcrop
Distinctive present vegetation: Big sagebrush, singleleaf pinyon, Utah juniper

Inclusion 3
Classification: Typic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: South- and west-facing foot slopes of mountains
Distinctive present vegetation: Big sagebrush, singleleaf pinyon, Utah juniper

Inclusion 4
Classification: Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: North- and east-facing, smooth side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Major Uses

Current uses: Woodland, livestock grazing, wildlife habitat
Suitability of the Hopeka soil for named elements: Wild herbaceous plants (nonirrigated)—poor; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Cavehill soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair

Suitability of the Hopeka Soil for Woodland

Site index for common trees: Singleleaf pinyon, Utah juniper—33
Most important native understory plants: Black sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Hopeka Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Severe—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Cavehill Soil for Woodland

Site index for common trees: Singleleaf pinyon—35
Most important native understory plants: Big sagebrush, Idaho fescue

Suitability and Limitations of the Cavehill Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Severe—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Hopeka and Cavehill soils—7s, nonirrigated
Range site: Hopeka soil—028B060N; Cavehill soil—028B085N; Inclusion 1—none; Inclusion 2—025X062N; Inclusion 3—025X062N; Inclusion 4—025X012N

206—Hopeka-Grina-Izod association

Map Unit Setting

Position on landscape: Hills and mountains

Composition

Major components:
• Hopeka very gravelly loam, 15 to 50 percent slopes (40 percent)
• Grina silty clay loam, 30 to 50 percent slopes (30 percent)
• Izod very gravelly loam, 15 to 50 percent slopes (20 percent)

Contrasting inclusions:
• Inclusion 1: Karpp gravelly silt loam, 4 to 15 percent slopes (5 percent)
• Inclusion 2: Rad silt loam, 0 to 2 percent slopes (3 percent)
• Inclusion 3: Samor very gravelly loam, 8 to 15 percent slopes (2 percent)

Characteristics of the Hopeka Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, frigid
Position on landscape: Crests and side slopes of mountains
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 5,400 to 6,400 feet
Dominant present vegetation: Black sagebrush, singleleaf pinyon, Utah juniper

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 85 days

Typical Profile

Percent cobbles on the surface: 15
Percent pebbles on the surface: 45

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 10 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.2 to 0.5 inch
Water-supplying capacity: 5.5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Grina Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of hills
Parent material: Residuum derived from tuff or siltstone
Slope range: 30 to 50 percent
Elevation: 5,400 to 6,400 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 7 inches
Texture: Silty clay loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 7 to 18 inches
Texture: Silty clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 18 to 35 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.6 to 3.4 inches
Water-supplying capacity: 7.0 to 8.0 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—1; wind erodibility group—4L
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Crests and side slopes of hills and mountains
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 5,400 to 6,400 feet
Dominant present vegetation: Black sagebrush, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Xerollic Durorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Wyoming big sagebrush, Utah juniper

Inclusion 2
Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Crests of hills
Distinctive present vegetation: Wyoming big sagebrush, Utah juniper

Major Uses

Current uses: Woodland, livestock grazing, wildlife habitat
Suitability of the Hopeka soil for named elements: Wild herbaceous plants (nonirrigated)—poor; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Grina soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability of the Hopeka Soil for Woodland
Site index for common trees: Singleleaf pinyon, Utah juniper—33
Most important native understory plants: Black sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Hopeka Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Severe—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Grina Soil for Woodland
Site index for common trees: Utah juniper—20
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Grina Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Izod Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Hopeka soil—7s, nonirrigated; Grina soil—7e, nonirrigated; Izod soil—7s, nonirrigated
Range site: Hopeka soil—028B060N; Grina soil—025X059N; Izod soil—024X030N; Inclusion 1—025X059N; Inclusion 2—025X019N; Inclusion 3—025X059N

211—McIvey-Igdell-Bilbo association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- McIvey gravelly loam, 2 to 8 percent slopes (40 percent)
- Igdell gravelly silt loam, 2 to 8 percent slopes (25 percent)
- Bilbo very gravelly loam, 15 to 30 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Chen very gravelly loam, 4 to 15 percent slopes (5 percent)
- Inclusion 2: Heechee cobbly loam, 4 to 15 percent slopes (5 percent)
- Inclusion 3: Welch silt loam, 0 to 2 percent slopes (3 percent)
- Crooked Creek silty clay loam, 0 to 2 percent slopes (2 percent)

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Colluvium
Slope range: 2 to 8 percent
Elevation: 6,400 to 6,800 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Igdell Soil

Classification: Abruptic Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Loess over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 6,400 to 6,800 feet
Dominant present vegetation: Low sagebrush, antelope bitterbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 17 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 17 to 38 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 38 to 39 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 39 to 40 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.3 to 4.3 inches

Water-supplying capacity: 7.5 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 70

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.1 inches
Water-supplying capacity: 7.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Foot slopes of mountains
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 2
Classification: Typic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth side slopes of fan piedmont remnants adjacent to mountains
Distinctive present vegetation: Antelope bitterbrush, Idaho fescue

Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains next to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 4
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass, alpine timothy

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the McIvey soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good; wetland plants—very poor; shallow water areas—very poor
Suitability of the Igdell soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the McIvey Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—too clayey, small stones
Shallow excavations: Moderate—too clayey, large stones
Local roads and streets: Moderate—frost action, shrink-swell potential
Pond reservoir areas: Moderate—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Large stones, droughty, percs slowly
Terraces and diversions: Large stones, percs slowly

Suitability and Limitations of the Igdell Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan, low strength, shrink-swell potential
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, too clayey, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Droughty, percs slowly, cemented pan
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Fair—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: McIvey soil—4e, irrigated, 6c, nonirrigated; Igdell soil—4e, irrigated, 7s, nonirrigated; Bilbo soil—7s, nonirrigated
Range site: McIvey soil—025X012N; Igdell soil—025X017N; Bilbo soil—025X015N; Inclusion 1—025X017N; Inclusion 2—025X007N; Inclusion 3—025X003N; Inclusion 4—025X005N

212—McIvey-Eboda-Akler association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• McIvey gravelly loam, 2 to 15 percent slopes (45 percent)
• Eboda gravelly loam, 2 to 15 percent slopes (25 percent)
• Akler very cobbly loam, 2 to 15 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Welch silt loam, 0 to 2 percent slopes, rarely flooded (7 percent)
• Inclusion 2: Lerrow cobbly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Rock outcrop (2 percent)
• Inclusion 4: Welch silt loam, 0 to 2 percent slopes, frequently flooded (1 percent)

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Colluvium derived from tuff
Slope range: 2 to 15 percent
Elevation: 6,200 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Eboda Soil

Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Parent material: Loess over residuum derived from tuff
Slope range: 2 to 15 percent
Elevation: 6,200 to 7,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 9 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 33 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 33 to 39 inches
Texture: Gravelly sandy clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 39 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 23 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.9 to 6.8 inches
Water-supplying capacity: 10.5 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Convex crests and side slopes of hills
Parent material: Residuum derived from tuff
Slope range: 2 to 15 percent
Elevation: 6,200 to 7,500 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass, squirreltail

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 15
Percent pebbles on the surface: 25

Depth: 0 to 6 inches
Texture: Very cobbly loam
Structure: Platy

Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 21 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.4 to 2.1 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 2
Classification: Aridic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth, south-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 3
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Tufted hairgrass, alpine timothy

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good
Suitability of the Eboda soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the McIvey Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—too clayey, small stones
Shallow excavations: Moderate—too clayey, large stones, slope
Local roads and streets: Moderate—slope, frost action, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Eboda Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Moderate—depth to rock, slope
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Akler Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: McIvey soil—6c, nonirrigated;

Eboda soil—6c, nonirrigated; Akler soil—7s, nonirrigated
Range site: McIvey soil—025X012N; Eboda soil—025X027N; Akler soil—025X018N; Inclusion 1—025X003N; Inclusion 2—025X009N; Inclusion 3—none; Inclusion 4—025X005N

213—McIvey-Quarz-Rock outcrop association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• McIvey gravelly silt loam, 15 to 50 percent slopes (45 percent)
• Quarz very gravelly loam, 30 to 50 percent slopes (25 percent)
• Rock outcrop (15 percent)
Contrasting inclusions:
• Inclusion 1: Cotant cobbly sandy clay loam, 8 to 30 percent slopes (5 percent)
• Inclusion 2: Eboda gravelly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Shively loam, 30 to 50 percent slopes (3 percent)
• Inclusion 4: Welch silt loam, drained, 0 to 2 percent slopes (2 percent)

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of mountains
Parent material: Colluvium derived from rhyolite and welded tuff
Slope range: 15 to 50 percent
Elevation: 6,500 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, Douglas rabbitbrush

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly silt loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Quarz Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff and rhyolite
Slope range: 30 to 50 percent
Elevation: 6,500 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Nevada bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 85 days

Typical Profile

Percent cobbles on the surface: 5

Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 26 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 26 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.5 to 3.1 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Rock Outcrop

Position on landscape: Crests and upper side slopes of mountains
Elevation: 7,000 to 8,000 feet
Dominant present vegetation: None

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Crests and convex side slopes of mountains
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 2
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: North-facing, concave side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Pachic Haploxerolls, coarse-loamy, mixed, frigid
Position on landscape: North-facing, slightly convex side slopes of mountains
Distinctive present vegetation: Serviceberry, snowberry, Idaho fescue

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good
Suitability of the Quarz soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the McIvey Soil for Various Uses and Practices
Range seeding: Fair—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—too clayey, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Quarz Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: McIvey soil—7e, nonirrigated; Quarz soil—7s, nonirrigated; Rock outcrop—8s, nonirrigated

Range site: McIvey soil—025X012N; Quarz soil—025X009N; Rock outcrop—none; Inclusion 1—025X017N; Inclusion 2—025X027N; Inclusion 3—025X010N; Inclusion 4—025X003N

215—McIvey-Short Creek-Cotant association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- McIvey gravelly silt loam, 15 to 30 percent slopes (40 percent)
- Short Creek very cobbly loam, 15 to 50 percent slopes (30 percent)
- Cotant very cobbly clay loam, 15 to 30 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Typic Xerorthents, loamy-skeletal, mixed, frigid, 30 to 50 percent slopes (10 percent)
- Inclusion 2: Pachic Argixerolls, clayey-skeletal, montmorillonitic, frigid, 30 to 50 percent slopes (5 percent)

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Colluvium derived from rhyolite and welded tuff
Slope range: 15 to 30 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Mountain big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly silt loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Short Creek Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, south-facing side slopes of hills
Parent material: Colluvium derived from rhyolite and welded tuff
Slope range: 15 to 50 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 100 days

Typical Profile

Percent stones and boulders on the surface: 15
Percent cobbles on the surface: 30
Percent pebbles on the surface: 25

Depth: 0 to 3 inches
Texture: Very cobbly loam
Structure: Platy

Consistence: Soft, very friable
Reaction: Neutral

Depth: 3 to 45 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 45 to 64 inches
Texture: Extremely gravelly sandy clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.3 to 5.6 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cotant Soil

Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum derived from welded tuff and rhyolite
Slope range: 15 to 30 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 10
Percent cobbles on the surface: 30
Percent pebbles on the surface: 20

Depth: 0 to 3 inches
Texture: Very cobbly clay loam

Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 19 inches
Texture: Clay
Structure: Prismatic
Consistence: Hard, very firm
Reaction: Mildly alkaline

Depth: 19 to 31 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 12 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 3.0 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Typic Xerorthents, loamy-skeletal, mixed, frigid
Position on landscape: Convex, south-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Pachic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Serviceberry, snowberry, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good
Suitability of the Short Creek soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cotant soil for named elements: Wild

herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the McIvey Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—large stones, slope, shrink-swell potential
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—too clayey, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Short Creek Soil for Various Uses and Practices

Range seeding: Poor—large stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cotant Soil for Various Uses and Practices

Range seeding: Poor—large stones
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: McIvey soil—6e, nonirrigated; Short Creek soil—7s, nonirrigated; Cotant soil—7s, nonirrigated
Range site: McIvey soil—025X012N; Short Creek soil—025X015N; Cotant soil—025X017N; Inclusion 1—025X015N; Inclusion 2—025X010N

218—McIvey-Stampede-Heechee association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- McIvey gravelly loam, 2 to 8 percent slopes (35 percent)
- Stampede gravelly loam, 2 to 8 percent slopes (30 percent)
- Heechee cobbly loam, 4 to 15 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Heechee cobbly loam, 8 to 15 percent slopes (5 percent)
- Inclusion 2: McIvey cobbly loam, 15 to 30 percent slopes (5 percent)
- Inclusion 3: Hussa loam, 0 to 2 percent slopes (4 percent)
- Inclusion 4: Gochea loam, 2 to 4 percent slopes (1 percent)

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Colluvium
Slope range: 2 to 8 percent
Elevation: 6,000 to 6,400 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 8 percent
Elevation: 6,000 to 6,400 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Heechee Soil

Classification: Typic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,200 feet
Dominant present vegetation: Antelope bitterbrush, mountain big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 3
Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 11 inches
Texture: Cobbly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 11 to 33 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky

Consistence: Hard, friable
Reaction: Neutral

Depth: 33 to 63 inches
Texture: Extremely cobbly sandy loam
Structure: Massive
Consistence: Hard, very friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.2 to 6.4 inches
Water-supplying capacity: 9 to 12 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Typic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex summits and side slopes of fan piedmont remnants adjacent to foot slopes of mountains
Distinctive present vegetation: Antelope bitterbrush, Idaho fescue

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush

Inclusion 4
Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Basin big sagebrush, bluebunch wheatgrass

Other inclusions of minor extent
Location: Near Lee
Classification: Pachic Argixerolls, fine, montmorillonitic, frigid
Distinctive present vegetation: Basin big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the McIvey soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good; wetland plants—very poor; shallow water areas—very poor
Suitability of the Stampede soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Heechee soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the McIvey Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—too clayey, small stones
Shallow excavations: Moderate—too clayey, large stones
Local roads and streets: Moderate—frost action, shrink-swell potential
Pond reservoir areas: Moderate—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Large stones, droughty, percs slowly
Terraces and diversions: Large stones, percs slowly

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—small stones, too clayey

Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Heechee Soil for Various Uses and Practices

Range seeding: Fair—large stones
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Moderate—large stones, slope
Local roads and streets: Moderate—slope, frost action, large stones
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—large stones
Gravel: Improbable source—large stones
Drainage: Deep to water
Irrigation: Large stones, droughty, slope
Terraces and diversions: Slope, large stones

Interpretive Groups

Capability classification: McIvey soil—4e, irrigated, 6c, nonirrigated; Stampede soil—4e, irrigated, 6s, nonirrigated; Heechee soil—4s, irrigated, 7s, nonirrigated
Range site: McIvey soil—025X012N; Stampede soil—025X014N; Heechee soil—025X007N; Inclusion 1—025X007N; Inclusion 2—025X012N; Inclusion 3—025X003N; Inclusion 4—025X014N

219—McIvey-Chen-Tweener association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• McIvey very gravelly loam, 15 to 50 percent slopes (35 percent)
• Chen very gravelly loam, 15 to 30 percent slopes (35 percent)
• Tweener very gravelly loam, 15 to 30 percent slopes (15 percent)

Contrasting inclusions:
• Inclusion 1: McIvey gravelly loam, 8 to 15 percent slopes (5 percent)
• Inclusion 2: Quarz very gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 3: Cotant very gravelly loam, 8 to 30 percent slopes (3 percent)
• Inclusion 4: Welch silt loam, 0 to 8 percent slopes (2 percent)

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,200 to 6,600 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 18 inches
Texture: Very gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Mildly alkaline

Depth: 18 to 23 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 23 to 62 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.0 to 7.3 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Rapid

Hydrologic group: C
Erosion factors (surface layer): K value—.05; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chen Soil

Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex side slopes of hills
Parent material: Residuum derived from rhyolite and influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,600 feet
Dominant present vegetation: Low sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 35

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 15 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 12 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 0.9 inch to 1.5 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tweener Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex shoulders of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,600 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 15

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 10 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 10 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.7 inch to 1.2 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification:—Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid

Position on landscape: Concave, north-facing side slopes of hills

Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 2

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid

Position on landscape: Concave, south-facing side slopes of hills

Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 3

Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow

Position on landscape: Smooth or slightly concave foot slopes of hills

Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 4

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid

Position on landscape: Narrow drainageways on hills

Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat

Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability of the Chen soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Tweener soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the McIvey Soil for Various Uses and Practices

Range seeding: Poor—small stones

Roadfill: Poor—slope

Topsoil: Poor—small stones, area reclaim, slope

Daily cover for landfill: Poor—too clayey, small stones, slope

Shallow excavations: Severe—slope

Local roads and streets: Severe—slope

Pond reservoir areas: Severe—slope

Embankments, dikes, and levees: Moderate—large stones

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Suitability and Limitations of the Chen Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones

Roadfill: Poor—depth to rock

Topsoil: Poor—depth to rock, small stones, slope

Daily cover for landfill: Poor—depth to rock, too clayey, small stones

Shallow excavations: Severe—depth to rock, slope

Local roads and streets: Severe—depth to rock, slope

Pond reservoir areas: Severe—depth to rock, slope

Embankments, dikes, and levees: Severe—thin layer

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Suitability and Limitations of the Tweener Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones

Roadfill: Poor—depth to rock

Topsoil: Poor—depth to rock, small stones, slope

Daily cover for landfill: Poor—depth to rock, slope

Shallow excavations: Severe—depth to rock, slope

Local roads and streets: Severe—depth to rock, slope

Pond reservoir areas: Severe—depth to rock, slope

Embankments, dikes, and levees: Severe—thin layer

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: McIvey, Chen, and Tweener soils—7s, nonirrigated

Range site: McIvey soil—025X012N; Chen soil—025X017N; Tweener soil—025X007N; Inclusion 1—025X027N; Inclusion 2—025X009N; Inclusion 3—025X017N; Inclusion 4—025X003N

221—Enko-Kelk-Enko, very fine sandy loam association

Map Unit Setting

Position on landscape: Piedmont slopes

Composition

Major components:

- Enko fine sandy loam, 2 to 8 percent slopes (35 percent)
- Kelk silt loam, 0 to 2 percent slopes (35 percent)
- Enko very fine sandy loam, 0 to 2 percent slopes (20 percent)

Contrasting inclusions:

- Inclusion 1: Puett fine sandy loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Chiara silt loam, 0 to 2 percent slopes (3 percent)

• Inclusion 3: Zevadez gravelly loam, 4 to 8 percent slopes (1 percent)
• Inclusion 4: Durixerollic Camborthids, coarse-loamy, mixed, mesic, 0 to 2 percent slopes (1 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Toe slopes and foot slopes of fan piedmont remnant side slopes
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Fine sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches

Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of Enko Very Fine Sandy Loam

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan skirts
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Very fine sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.5 to 8.9 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass
Inclusion 2
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 4
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and

legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability of Enko very fine sandy loam for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly, slope
Terraces and diversions: Erodes easily, soil blowing

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of Enko Very Fine Sandy Loam for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Enko soil—3e, irrigated, 6s, nonirrigated; Kelk soil—2s, irrigated, 6s, nonirrigated; Enko very fine sandy loam—2s, irrigated, 6s, nonirrigated
Range site: Both Enko soils—025X019N; Kelk soil—025X019N; Inclusion 1—025X025N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X003N

222—Enko-Zevadez-Puett association

Map Unit Setting

Position on landscape: Fan skirts, fan piedmont remnants

Composition

Major components:
• Enko fine sandy loam, 2 to 8 percent slopes (45 percent)
• Zevadez gravelly loam, 4 to 15 percent slopes (25 percent)
• Puett gravelly sandy loam, 15 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Haybourne coarse sandy loam, 4 to 15 percent slopes (6 percent)
• Inclusion 2: Kelk silt loam, 0 to 4 percent slopes (5 percent)
• Inclusion 3: Connel coarse sandy loam, 0 to 2 percent slopes (2 percent)
• Inclusion 4: Bioya loam, 2 to 8 percent slopes (2 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan skirts
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,400 to 5,700 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Fine sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,400 to 5,700 feet
Dominant present vegetation: Big sagebrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.2 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core

Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 50 percent
Elevation: 5,400 to 5,700 feet
Dominant present vegetation: Big sagebrush, black sagebrush

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—4
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Zevadez soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly, slope
Terraces and diversions: Erodes easily, soil blowing

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones
Daily cover for landfill: Fair—too sandy, slope
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, rooting depth
Terraces and diversions: Slope, erodes easily, too sandy

Suitability and Limitations of the Puett Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Enko soil—3e, irrigated, 6s, nonirrigated; Zevadez soil—4e, irrigated, 6c, nonirrigated; Puett soil—7e, nonirrigated
Range site: Enko soil—025X019N; Zevadez soil—025X019N; Puett soil—025X025N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

223—Enko-Kelk-Connel association

Map Unit Setting

Position on landscape: Fan piedmont remnants, inset fans

Composition

Major components:
- Enko very fine sandy loam, 2 to 4 percent slopes (40 percent)
- Kelk silt loam, 0 to 2 percent slopes (40 percent)
- Connel loam, 0 to 2 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Connel sandy loam, 15 to 30 percent slopes (3 percent)
- Inclusion 2: Kelk silt loam, 0 to 2 percent slopes, occasionally flooded (2 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,100 to 5,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Very fine sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow

Available water capacity: 6.5 to 8.9 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,100 to 5,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Connel Soil

Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,100 to 5,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 7 to 20 inches
Texture: Loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Depth: 20 to 60 inches
Texture: Stratified very gravelly coarse sand to extremely gravelly loamy sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 5.0 inches

Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.32; T value—3; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Basin big sagebrush, black greasewood

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Connel soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope
Terraces and diversions: Erodes easily

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Connel Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty
Terraces and diversions: Large stones, too sandy

Interpretive Groups

Capability classification: Enko soil—2e, irrigated, 6s, nonirrigated; Kelk soil—2s, irrigated, 6s, nonirrigated; Connel soil—4s, irrigated, 7s, nonirrigated
Range site: Enko soil—025X019N; Kelk soil—025X019N; Connel soil—025X019N; Inclusion 1—025X019N; Inclusion 2—024X006N

224—Enko-Enko, gravelly association

Map Unit Setting

Position on landscape: Partial ballenas

Composition

Major components:
- Enko sandy loam, 0 to 2 percent slopes (50 percent)
- Enko gravelly sandy loam, 4 to 15 percent slopes (35 percent)

Contrasting inclusions:
- Inclusion 1: Zevadez silt loam, 2 to 8 percent slopes (8 percent)
- Inclusion 2: Rad silt loam, 0 to 2 percent slopes (7 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of partial ballenas
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,600 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8.0 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gravelly Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Back slopes of partial ballenas
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,600 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Gravelly sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive

Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—5; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Crests and shoulders of partial ballenas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the gravelly Enko soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly
Terraces and diversions: Erodes easily, soil blowing

Suitability and Limitations of the Gravelly Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Fair—small stones, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, excess salts
Terraces and diversions: Slope, erodes easily, percs slowly

Interpretive Groups

Capability classification: Enko soil—2s, irrigated, 6s, nonirrigated; the gravelly Enko soil—6e, irrigated, 6s, nonirrigated
Range site: Both Enko soils—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N

225—Enko-Hunnton association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Enko sandy loam, 2 to 8 percent slopes (50 percent)
• Hunnton loam, 2 to 15 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Wieland loam, 2 to 8 percent slopes (4 percent)
• Inclusion 2: Fulstone gravelly silt loam, 2 to 15 percent slopes (8 percent)
• Inclusion 3: Rad silt loam, 0 to 2 percent slopes (3 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8.0 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits and back slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 15 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline

Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Abruptic Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Low sagebrush, Thurber needlegrass
Inclusion 3
Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly, slope
Terraces and diversions: Erodes easily, soil blowing

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Interpretive Groups

Capability classification: Enko soil—3e, irrigated, 6s, nonirrigated; Hunnton soil—4e, irrigated, 6s, nonirrigated
Range site: Enko soil—025X019N; Hunnton soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X018N; Inclusion 3—025X019N

226—Enko-Rad association

Map Unit Setting

Position on landscape: Fan piedmont remnants, inset fans

Composition

Major components:
- Enko loam, 2 to 8 percent slopes (60 percent)
- Rad silt loam, 2 to 4 percent slopes (25 percent)

Contrasting inclusions:
- Inclusion 1: Enko loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Connel sandy loam, 15 to 30 percent slopes (3 percent)
- Inclusion 3: Rad silt loam, 4 to 8 percent slopes (2 percent)
- Inclusion 4: Zevadez loam, 2 to 15 percent slopes (5 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,100 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.6 to 8.8 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rad Soil

Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess over mixed alluvium
Slope range: 2 to 4 percent
Elevation: 5,100 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 26 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 56 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline

Salinity: 8 to 16 mmhos per cm

Depth: 56 to 62 inches
Texture: Stratified sandy loam to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Strongly alkaline
Salinity: 8 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Rad soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope
Terraces and diversions: Erodes easily

Suitability and Limitations of the Rad Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Poor—thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Slight
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Enko soil—3e, irrigated, 6s, nonirrigated; Rad soil—2e, irrigated, 6c, nonirrigated
Range site: Enko soil—025X019N; Rad soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

227—Enko-Wieland-Enko, moderately steep association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Enko loam, 8 to 15 percent slopes (40 percent)
- Wieland loam, 4 to 8 percent slopes (25 percent)
- Enko very gravelly loam, 15 to 30 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Zevadez silt loam, 8 to 15 percent slopes (6 percent)
- Inclusion 2: Bunky silt loam, 4 to 8 percent slopes (5 percent)
- Inclusion 3: Chiara silt loam, 2 to 4 percent slopes (4 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 8 to 15 percent
Elevation: 5,600 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, invaded Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.6 to 8.8 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 8 percent
Elevation: 5,600 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, invaded Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay

Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Moderately Steep Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Slightly concave back slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,600 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, invaded Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex back slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Haploxerollic Durorthids, fine-loamy,mixed, mesic

Position on landscape: Shoulders of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—very poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the moderately steep Enko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope
Terraces and diversions: Slope, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Moderately Steep Enko Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—slope
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Enko soil—4e, irrigated, 6s, nonirrigated; Wieland soil—3e, irrigated, 6s, nonirrigated; the moderately steep Enko soil—7s, nonirrigated
Range site: Both Enko soils—025X019N; Wieland soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N

228—Enko-Kelk association

Map Unit Setting

Position on landscape: Fan skirts, inset fans

Composition

Major components:
- Enko sandy loam, 2 to 8 percent slopes (60 percent)
- Kelk silt loam, 0 to 2 percent slopes (30 percent)

Contrasting inclusions:
- Inclusion 1: Rad silt loam, 0 to 8 percent slopes (8 percent)
- Inclusion 2: Sonoma silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan skirts
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,200 to 6,200 feet

Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8.0 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,200 to 6,200 feet
Dominant present vegetation: Basin big sagebrush, black greasewood, western wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—February through June
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate

Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Inset fans adjacent to the entrenched part of stream channels
Distinctive present vegetation: Nevada bluegrass, mat muhly

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly, slope
Terraces and diversions: Erodes easily, soil blowing

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Moderate—flooding
Local roads and streets: Severe—low strength, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Enko soil—3e, irrigated, 6s, nonirrigated; Kelk soil—2w, irrigated, 6w, nonirrigated
Range site: Enko soil—025X019N; Kelk soil—024X006N; Inclusion 1—025X019N; Inclusion 2—025X003N

229—Enko-Puett association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Enko loam, 4 to 15 percent slopes (50 percent)
• Puett fine sandy loam, 15 to 30 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Rad silt loam, 2 to 8 percent slopes (10 percent)
• Inclusion 2: Badland (5 percent)

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,500 to 5,800 feet
Dominant present vegetation: Big sagebrush, rubber rabbitbrush, Sandberg bluegrass, invaded Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.6 to 8.8 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 30 percent
Elevation: 5,400 to 5,800 feet
Dominant present vegetation: Wyoming big sagebrush, bottlebrush squirreltail, invaded Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 2 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.9 to 2.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Inset fans and foot slopes of fan piedmont remnant side slopes
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2

Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—very poor; shallow water areas—very poor
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope
Terraces and diversions: Slope, erodes easily

Suitability and Limitations of the Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Enko soil—4e, irrigated, 6s, nonirrigated; Puett soil—7e, nonirrigated
Range site: Enko soil—025X019N; Puett soil—025X025N; Inclusion 1—025X019N; Inclusion 2—none

232—Bioya-Orovada association

Map Unit Setting

Position on landscape: Fan piedmonts

Composition

Major components:
• Bioya very fine sandy loam, 2 to 4 percent slopes (60 percent)
• Orovada fine sandy loam, 4 to 15 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Puett fine sandy loam, 15 to 50 percent slopes (5 percent)
• Inclusion 2: Zevadez gravelly very fine sandy loam, 8 to 30 percent slopes (4 percent)
• Inclusion 3: Hunewill gravelly sandy loam, 8 to 30 percent slopes (2 percent)
• Inclusion 4: Kelk silt loam, 0 to 2 percent slopes (4 percent)

Characteristics of the Bioya Soil

Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess over mixed alluvium
Slope range: 2 to 4 percent
Elevation: 5,200 to 5,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data
Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile
Percent pebbles on the surface: 5

Depth: 0 to 14 inches
Texture: Very fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 14 to 27 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 27 to 41 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, brittle
Reaction: Moderately alkaline

Depth: 41 to 60 inches
Texture: Fine sandy loam

Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 4.2 to 5.8 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.55; T value—2; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,200 to 5,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Inclusion 2
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Slightly concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Bioya soil for named elements: Grain

and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability of the Orovada soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Bioya Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—cemented pan
Topsoil: Fair—cemented pan, thin layer
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Orovada Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, slope, erodes easily
Terraces and diversions: Slope, erodes easily, soil blowing

Interpretive Groups

Capability classification: Bioya soil—3e, irrigated, 7s, nonirrigated; Orovada soil—4e, irrigated, 6c, nonirrigated
Range site: Bioya soil—025X019N; Orovada soil—025X019N; Inclusion 1—025X025N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—024X006N

236—Cleavage-Bullump-Hapgood association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
- Cleavage very cobbly loam, 30 to 50 percent slopes (50 percent)
- Bullump very gravelly loam, 30 to 50 percent slopes (20 percent)
- Hapgood very gravelly loam, 30 to 50 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Entic Cryumbrepts, loamy-skeletal, mixed, 30 to 50 percent slopes (10 percent)
- Inclusion 2: Pachic Argixerolls, loamy-skeletal, mixed, frigid, 4 to 15 percent slopes (3 percent)
- Inclusion 3: Rock outcrop (2 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 30 to 50 percent
Elevation: 6,200 to 8,000 feet
Dominant present vegetation: Black sagebrush, low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bullump Soil

Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth or concave, south-facing side slopes of mountains
Parent material: Colluvium derived from rhyolite and influenced by loess
Slope range: 30 to 50 percent
Elevation: 6,200 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, mountain brome, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 15 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 80 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 35

Depth: 0 to 23 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 23 to 54 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 54 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.3 to 5.2 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing back slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 30 to 50 percent
Elevation: 6,200 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, mountain brome

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches

Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Concave, north-facing, upper back slopes of mountains
Distinctive present vegetation: Tailcup lupine, Letterman needlegrass
Inclusion 2
Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing foot slopes of mountains
Distinctive present vegetation: Big sagebrush, Idaho fescue, bluebunch wheatgrass
Inclusion 3
Position on landscape: Crests and upper side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bullump soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, large stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bullump Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cleavage, Bullump, and Hapgood soils—7s, nonirrigated
Range site: Cleavage soil—025X024N; Bullump soil—025X016N; Hapgood soil—025X004N; Inclusion 1—025X028N; Inclusion 2—025X027N; Inclusion 3—none

237—Cleavage-Tweener-Pernog association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Cleavage extremely gravelly loam, 15 to 30 percent slopes (45 percent)
• Tweener very gravelly loam, 8 to 15 percent slopes (25 percent)
• Pernog gravelly loam, 15 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Loncan very gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 2: Tusel very gravelly loam, 30 to 50 percent slopes (5 percent)
• Inclusion 3: Heechee cobbly loam, 15 to 30 percent slopes (3 percent)
• Inclusion 4: Welch silt loam, 2 to 4 percent slopes,

occasionally flooded (2 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex, upper side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 7,100 to 7,500 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tweener Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex, lower side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,800 to 7,200 feet
Dominant present vegetation: Antelope bitterbrush, mountain big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 15

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 10 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 10 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.7 inch to 1.2 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Pernog Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex, upper side slopes of mountains
Parent material: Residuum derived from welded tuff
Slope range: 15 to 50 percent

Elevation: 7,100 to 7,500 feet
Dominant present vegetation: Curlleaf mountainmahogany, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 17 inches
Texture: Very stony clay loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 17 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 12 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 10 to 12.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, lower side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, upper side slopes of mountains
Distinctive present vegetation: Serviceberry, mountain brome

Inclusion 3
Classification: Typic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Summits of fan piedmont remnants
Distinctive present vegetation: Antelope bitterbrush, Idaho fescue

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Nevada bluegrass, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tweener soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Pernog soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tweener Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Suitability and Limitations of the Pernog Soil for Various Uses and Practices

Range seeding: Poor—droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cleavage soil—7s, nonirrigated; Tweener soil—7s, nonirrigated; Pernog soil—7e, nonirrigated
Range site: Cleavage soil—025X024N; Tweener soil—025X007N; Pernog soil—028B042N; Inclusion 1—025X012N; Inclusion 2—025X004N; Inclusion 3—025X007N; Inclusion 4—025X006N

238—Cleavage-Tweener-Graley association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Cleavage extremely gravelly loam, 4 to 15 percent slopes (40 percent)
• Tweener very gravelly loam, 15 to 50 percent slopes (25 percent)
• Graley very gravelly loam, 15 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Sumine very gravelly loam, 15 to 50 percent slopes (4 percent)
• Inclusion 2: Bullump gravelly loam, 15 to 50 percent slopes (4 percent)
• Inclusion 3: Hapgood very gravelly loam, 15 to 50 percent slopes (4 percent)
• Inclusion 4: Rock outcrop (3 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex, upper side slopes of mountains
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 4 to 15 percent
Elevation: 6,900 to 7,400 feet
Dominant present vegetation: Black sagebrush, low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tweener Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex, lower side slopes of mountains
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 15 to 50 percent
Elevation: 6,500 to 7,000 feet
Dominant present vegetation: Antelope bitterbrush, mountain big sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches

Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 15

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 10 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 10 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.7 inch to 1.2 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Graley Soil

Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex, lower side slopes of mountains
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 15 to 50 percent
Elevation: 6,500 to 7,000 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, snowberry, Idaho fescue

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 7 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 17 inches
Texture: Very gravelly clay loam
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 17 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.3 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, south-facing, lower side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, south-facing, upper side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, mountain brome

Inclusion 3
Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Distinctive present vegetation: Snowberry, mountain brome

Inclusion 4
Position on landscape: Crests and upper side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tweener soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Graley soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tweener Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Graley Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, area reclaim
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cleavage, Tweener, and Graley soils—7s, nonirrigated

239—Cleavage-Vitale association

Map Unit Setting

Position on landscape: Plateaus

Composition

Major components:
• Cleavage extremely gravelly loam, 8 to 30 percent slopes (40 percent)
• Cleavage very gravelly loam, 4 to 15 percent slopes (25 percent)
• Vitale very gravelly loam, 4 to 15 percent slopes, rubbly (20 percent)
Contrasting inclusions:
• Inclusion 1: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid, 30 to 75 percent slopes (5 percent)
• Inclusion 2: Sumine very gravelly loam, 30 to 75 percent slopes (5 percent)
• Inclusion 3: Argic Cryoborolls, loamy-skeletal, mixed, 15 to 30 percent slopes (3 percent)
• Inclusion 4: Argic Lithic Cryoborolls, loamy-skeletal, mixed, 4 to 15 percent slopes (2 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex summits and side slopes of plateaus
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 8 to 30 percent
Elevation: 6,300 to 6,800 feet
Dominant present vegetation: Black sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam

Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 10 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Very Gravelly Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth summits and side slopes of plateaus
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 4 to 15 percent
Elevation: 6,400 to 6,800 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Vitale Soil

Classification: Typic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave summits and side slopes of plateaus
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 8 to 15 percent
Elevation: 6,300 to 6,800 feet
Dominant present vegetation: Basin big sagebrush, mountain big sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 41 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 20
Percent cobbles on the surface: 5

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 6 to 23 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 23 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.5 to 4.2 inches
Water-supplying capacity: 9 to 12 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly convex side slopes of plateaus
Distinctive present vegetation: Black sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Slightly concave side slopes of plateaus
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Argic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Slightly concave, upper, north-facing side slopes of plateaus
Distinctive present vegetation: Ceanothus, Letterman needlegrass

Inclusion 4
Classification: Argic Lithic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Convex summits of plateaus
Distinctive present vegetation: Curlleaf mountainmahogany

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the very gravelly Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Vitale soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—good

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Very Gravelly Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Vitale Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Cleavage soils and the Vitale soil—7s, nonirrigated
Range site: Cleavage soil—025X024N; the very gravelly Cleavage soil—025X017N; Vitale soil—025X027N; Inclusion 1—025X055N; Inclusion 2—025X009N; Inclusion 3—025X052N; Inclusion 4—028X043N

240—Cleavage-Cleavage, strongly sloping association

Map Unit Setting

Position on landscape: Plateaus

Composition

Major components:
• Cleavage very gravelly loam, 2 to 4 percent slopes, stony (65 percent)
• Cleavage very gravelly loam, 8 to 15 percent slopes, stony (20 percent)
Contrasting inclusions:
• Inclusion 1: Chen gravelly loam, 2 to 8 percent slopes, stony (10 percent)
• Inclusion 2: Rubble land (5 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth or slightly convex summits of plateaus
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 2 to 4 percent
Elevation: 6,300 to 7,200 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: .1

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Strongly Sloping Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Back slopes and foot slopes of plateaus
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,300 to 7,200 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: .1

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Medium

Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Shoulders and slightly concave summits of plateaus
Distinctive present vegetation: Low sagebrush, Idaho fescue
Inclusion 2
Position on landscape: Side slopes of plateaus
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the strongly sloping Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Strongly Sloping Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Cleavage soils—7s, nonirrigated;
Range site: Both Cleavage soils—025X017N; Inclusion 1—025X017N; Inclusion 2—none

241—Cleavage-Cleavage, very cobbly-Loncan association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Cleavage very gravelly loam, 15 to 50 percent slopes (45 percent)
• Cleavage very cobbly loam, 30 to 70 percent slopes (20 percent)
• Loncan very gravelly loam, 30 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (8 percent)
• Inclusion 2: Sumine very gravelly loam, 30 to 50 percent slopes (5 percent)
• Inclusion 3: Hackwood gravelly loam, 30 to 50 percent slopes (2 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 15 to 50 percent
Elevation: 6,400 to 8,000 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Very Cobbly Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Adjacent to areas of rock outcrop on convex side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 30 to 70 percent
Elevation: 6,400 to 8,000 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Idaho fescue, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Loncan Soil

Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north- and east-facing, lower side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 30 to 50 percent
Elevation: 6,400 to 7,200 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 14 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 14 to 31 inches
Texture: Extremely cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 21 to 38 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 3.1 inches
Water-supplying capacity: 7.0 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None
Inclusion 2
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush
Inclusion 3
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Concave, north- and east-facing, upper side slopes of mountains
Distinctive present vegetation: Quaking aspen

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the very cobbly Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Loncan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Very Cobbly Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, large stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope

Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Loncan Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Cleavage soils and the Loncan soil—7s, nonirrigated
Range site: Cleavage soil—025X017N; the very cobbly Cleavage soil—025X024N; Loncan soil—025X012N; Inclusion 1—none; Inclusion 2—025X009N; Inclusion 3—025X065N

242—Cleavage-Loncan-Lyra association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Cleavage very gravelly loam, 15 to 50 percent slopes (30 percent)
• Loncan very gravelly loam, 30 to 75 percent slopes (30 percent)
• Lyra gravelly loam, 15 to 30 percent slopes (30 percent)

Contrasting inclusions:
- Inclusion 1: Loncan Variant loam, 2 to 8 percent slopes (5 percent)
- Inclusion 2: Lyra gravelly loam, 30 to 50 percent slopes (3 percent)
- Inclusion 3: Rock outcrop (2 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 15 to 50 percent
Elevation: 7,000 to 7,700 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Loncan Soil

Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 30 to 75 percent
Elevation: 6,300 to 7,700 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 14 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 14 to 31 inches
Texture: Extremely cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 21 to 38 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 3.1 inches
Water-supplying capacity: 7.0 to 10 inches
Runoff: Very rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Lyra Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid, shallow
Position on landscape: Convex, lower side slopes of mountains

Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 15 to 30 percent
Elevation: 6,300 to 7,000 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 2 inches
Texture: Gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 7 inches
Texture: Extremely gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 12 inches
Texture: Extremely cobbly clay
Structure: Platy
Consistence: Hard, very friable
Reaction: Mildly alkaline

Depth: 12 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 0.6 to 1.0 inch
Water-supplying capacity: 5.5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Duric Haploxerolls, fine-loamy, mixed, mesic
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 2
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid, shallow
Position on landscape: Convex, lower side slopes of mountains
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Loncan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Lyra soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Loncan Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Lyra Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Interpretive Groups

Capability classification: Cleavage soil—7s, nonirrigated; Loncan soil—7s, nonirrigated; Lyra soil—7e, nonirrigated
Range site: Cleavage soil—025X017N; Loncan soil—025X012N; Lyra soil—025X014N; Inclusion 1—025X003N; Inclusion 2—025X014N; Inclusion 3—none

243—Cleavage-Sumine-McIvey association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Cleavage very gravelly loam, 15 to 50 percent slopes (35 percent)
• Sumine very gravelly loam, 15 to 50 percent slopes (30 percent)
• McIvey very gravelly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Hapgood very gravelly loam, 15 to 30 percent slopes (7 percent)
• Inclusion 2: Rock outcrop (4 percent)
• Inclusion 3: Cleavage very cobbly loam, 8 to 15 percent slopes (3 percent)
• Inclusion 4: Crooked Creek silty clay loam, 0 to 2 percent slopes, frequently flooded (1 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 15 to 50 percent
Elevation: 6,400 to 7,600 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 15 to 50 percent
Elevation: 6,400 to 7,600 feet
Dominant present vegetation: Mountain big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches

Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: South- and north-facing side slopes of mountains
Parent material: Colluvium derived from shale, sandstone, and conglomerate
Slope range: 15 to 30 percent
Elevation: 6,400 to 7,600 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5

Percent pebbles on the surface: 40

Depth: 0 to 18 inches
Texture: Very gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Mildly alkaline

Depth: 18 to 23 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 23 to 62 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.0 to 7.3 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.05; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Distinctive present vegetation: Mountain brome

Inclusion 2
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Inclusion 3
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex foot slopes of mountains
Distinctive present vegetation: Black sagebrush

Inclusion 4
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid

Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the McIvey Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope, shrink-swell potential
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—too clayey, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cleavage, Sumine, and McIvey soils—7s, nonirrigated
Range site: Cleavage soil—025X017N; Sumine soil—025X009N; McIvey soil—025X012N; Inclusion 1—025X004N; Inclusion 2—none; Inclusion 3—025X024N; Inclusion 4—025X005N

244—Cleavage, moderately steep-Cleavage-Eboda association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Cleavage very gravelly loam, 15 to 30 percent slopes (40 percent)
• Cleavage very gravelly loam, 8 to 15 percent slopes (25 percent)
• Eboda loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (7 percent)
• Inclusion 2: Welch loam, drained, 2 to 4 percent slopes (5 percent)
• Inclusion 3: Cleavage very cobbly loam, 15 to 30 percent slopes (3 percent)

Characteristics of the Moderately Steep Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 15 to 30 percent
Elevation: 6,300 to 7,000 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable

Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests of hills
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 8 to 15 percent
Elevation: 6,800 to 7,000 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 7.0 to 8.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Eboda Soil

Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Parent material: Loess over residuum derived from shale, sandstone, and conglomerate
Slope range: 4 to 15 percent
Elevation: 6,300 to 6,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 9 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 33 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 33 to 39 inches
Texture: Gravelly sandy clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 39 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 23 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 5.2 to 6.8 inches
Water-supplying capacity: 10.5 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.28; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: The entrenched part of narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 3
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of hills in areas of rock outcrop
Distinctive present vegetation: Black sagebrush, low sagebrush

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the moderately steep Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Eboda soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Moderately Steep Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Eboda Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Moderate—depth to rock, slope
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Cleavage soils—7s, nonirrigated; Eboda soil—6c, nonirrigated
Range site: Both Cleavage soils—025X017N; Eboda soil—025X027N; Inclusion 1—none; Inclusion 2—025X003N; Inclusion 3—025X024N

245—Cleavage-Glean-Inpendence association

Map Unit Setting

Position on landscape: Plateaus

Composition

Major components:
- Cleavage very gravelly loam, 4 to 15 percent slopes, stony (45 percent)
- Glean gravelly sandy loam, 8 to 15 percent slopes (25 percent)
- Inpendence gravelly loam, 15 to 50 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Ebic gravelly loam, 8 to 15 percent slopes, stony (5 percent)
- Inclusion 2: Chen gravelly loam, 4 to 15 percent slopes, stony (5 percent)
- Inclusion 3: Entic Cryumbrepts, fine-loamy, mixed, 15 to 50 percent slopes (3 percent)
- Inclusion 4: Hackwood loam, 4 to 15 percent slopes (2 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Slightly convex summits and shoulders of plateaus
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 4 to 15 percent
Elevation: 7,000 to 7,900 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: .1

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Glean Soil

Classification: Pachic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Foot slopes of plateaus
Parent material: Colluvium derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,500 to 7,000 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 45 days

Typical Profile

Depth: 0 to 7 inches
Texture: Gravelly silt loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 25 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 25 to 60 inches
Texture: Very gravelly sandy loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 60 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none

Permeability: Moderately rapid
Available water capacity: 3.5 to 5.3 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.24; T value—3; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Inpendence Soil

Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: North-facing, upper back slopes of plateaus
Parent material: Colluvium derived from welded tuff
Slope range: 15 to 50 percent
Elevation: 7,000 to 7,900 feet
Dominant present vegetation: Quaking aspen

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 40 degrees F
Frost-free period: About 70 days

Typical Profile

Surface litter: Organic material 4 inches thick

Depth: 0 to 9 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Strongly acid

Depth: 9 to 60 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Strongly acid

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 3.6 to 6.0 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—high
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Typic Palexerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave side slopes of plateaus
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 2
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave summits and smooth side slopes of plateaus
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 3
Classification: Entic Cryumbrepts, fine-loamy, mixed
Position on landscape: Upper, north-facing back slopes of plateaus
Distinctive present vegetation: Snowbrush ceanothus

Inclusion 4
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Lower, north-facing, concave back slopes of plateaus
Distinctive present vegetation: Quaking aspen

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Glean soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good
Suitability of the Inpendence soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Glean Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—depth to rock, thin layer
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—depth to rock, slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Inpendence Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cleavage soil—7s, nonirrigated; Glean soil—6e, nonirrigated; Inpendence soil—7e, nonirrigated
Range site: Cleavage soil—025X017N; Glean soil—025X056N; Inpendence soil—025X002N; Inclusion 1—025X017N; Inclusion 2—025X017N; Inclusion 3—025X052N; Inclusion 4—025X065N

247—Cleavage-Sumine-Hapgood association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Cleavage extremely gravelly loam, 30 to 50 percent slopes (40 percent)
• Sumine very gravelly loam, 30 to 50 percent slopes (30 percent)
• Hapgood very gravelly loam, 30 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Inpendence loam, 30 to 50 percent slopes (5 percent)
• Inclusion 2: Rock outcrop (5 percent)
• Inclusion 3: Tusel gravelly loam, 30 to 50 percent slopes (2 percent)
• Inclusion 4: Entic Cryumbrepts, loamy-skeletal, mixed, 30 to 50 percent slopes (3 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex crests and side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,800 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid

Position on landscape: Concave, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,800 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,800 feet
Dominant present vegetation: Mountain big sagebrush, mountain brome, Idaho fescue

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Upper, concave, north-facing back slopes of mountains
Distinctive present vegetation: Quaking aspen

Inclusion 2

Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Inclusion 3
Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth side slopes of mountains
Distinctive present vegetation: Idaho fescue
Inclusion 4
Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Concave, north-facing, upper back slopes directly below the shoulders of mountains
Distinctive present vegetation: Letterman needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cleavage, Sumine, and Hapgood soils—7s, nonirrigated
Range site: Cleavage soil—025X024N; Sumine soil—025X009N; Hapgood soil—025X004N; Inclusion 1—025X002N; Inclusion 2—none; Inclusion 3—025X010N; Inclusion 4—025X028N

248—Cleavage-Tweener-Lerrow association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Cleavage very gravelly loam, 4 to 15 percent slopes (35 percent)
• Tweener very gravelly sandy loam, 4 to 15 percent slopes (25 percent)
• Lerrow gravelly loam, 4 to 15 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Durargidic Argixerolls, fine-loamy, mixed, frigid, 8 to 15 percent slopes (5 percent)
• Inclusion 2: Sumine very gravelly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Welch silt loam, 0 to 2 percent slopes, occasionally flooded (3 percent)
• Inclusion 4: Welch silt loam, 0 to 2 percent slopes, frequently flooded (2 percent)

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and shoulders of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 4 to 15 percent
Elevation: 6,300 to 6,500 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data
Average annual precipitation: About 14 inches

Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tweener Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex back slopes and foot slopes of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 4 to 15 percent
Elevation: 6,100 to 6,400 feet
Dominant present vegetation: Antelope bitterbrush, mountain big sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 15

Depth: 0 to 4 inches
Texture: Very gravelly sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 10 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 10 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.6 inch to 1.1 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Lerrow Soil

Classification: Aridic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Residuum derived from rhyolite
Slope range: 4 to 15 percent
Elevation: 6,100 to 6,500 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 30

Depth: 0 to 5 inches
Texture: Gravelly loam

Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 5 to 15 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 15 to 32 inches
Texture: Cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 32 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.1 to 5.0 inches
Water-supplying capacity: 9 to 12 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Idaho fescue

Inclusion 2
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Alpine timothy, Nevada bluegrass

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tweener soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Lerrow soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tweener Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Lerrow Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Moderate—depth to rock, too clayey, slope

Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cleavage soil—7s, nonirrigated; Tweener soil—7s, nonirrigated; Lerrow soil—6s, nonirrigated
Range site: Cleavage soil—025X017N; Tweener soil—025X007N; Lerrow soil—025X027N; Inclusion 1—025X027N; Inclusion 2—025X009N; Inclusion 3—025X006N; Inclusion 4—025X005N

251—Ocala-Kelk-Devilsgait association

Map Unit Setting

Position on landscape: Alluvial flats, fan skirts, flood plains

Composition

Major components:
• Ocala silt loam, 0 to 2 percent slopes (30 percent)
• Kelk silt loam, 0 to 2 percent slopes (30 percent)
• Devilsgait silt loam, 0 to 2 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Crooked Creek silty clay loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Crooked Creek silty clay loam, drained, 0 to 2 percent slopes (5 percent)
• Inclusion 3: Woofus loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,500 feet
Dominant present vegetation: Black greasewood, rubber rabbitbrush, basin wildrye, inland saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 12.5 inches
Water-supplying capacity: 8 to 11 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Fan skirts adjacent to flood plains
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,500 feet
Dominant present vegetation: Creeping wildrye, inland saltgrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—February through June
Permeability: Slow
Available water capacity: 11 to 12.5 inches
Water-supplying capacity: 7 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,500 feet
Dominant present vegetation: Willow, wildrye, basin wildrye, rush

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand, silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 9 to 12 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to stream channels
Distinctive present vegetation: Tufted hairgrass

Inclusion 2
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 3
Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Natural levees adjacent to abandoned stream channels
Distinctive present vegetation: Wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture

Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair

Suitability and Limitations of the Ocala Soil for Various Uses and Practices

Range seeding: Poor—excess salts, too crusty
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—excess sodium, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Moderate—flooding
Local roads and streets: Severe—low strength, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Ocala soil—4w, irrigated, 6w, nonirrigated; Kelk soil—2w, irrigated, 6w, nonirrigated; Devilsgait soil—5w, irrigated, 6w, nonirrigated
Range site: Ocala soil—024X007N; Kelk soil—024X006N; Devilsgait soil—025X001N; Inclusion 1—025X005N; Inclusion 2—025X003N; Inclusion 3—025X001N

256—Ocala, occasionally flooded-Ocala association

Map Unit Setting

Position on landscape: Alluvial flats, fan skirts

Composition

Major components:
• Ocala silt loam, 0 to 2 percent slopes, occasionally flooded (60 percent)
• Ocala silt loam, 0 to 2 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Sonoma silt loam, 0 to 2 percent slopes (10 percent)
• Inclusion 2: Typic Halaquepts, coarse-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic, 0 to 2 percent slopes (3 percent)
• Inclusion 3: Devilsgait silt loam, drained, 0 to 2 percent slopes (2 percent)

Characteristics of the Occasionally Flooded Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,700 feet

Dominant present vegetation: Black greasewood, inland saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: More than 16 mmhos per cm
Sodicity (SAR): 46 to 70

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: More than 4 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Stratified gravelly very fine sandy loam to silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 10 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—high
Potential for frost action: High

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Lower fan skirts
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Rubber rabbitbrush, black greasewood

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: More than 16 mmhos per cm
Sodicity (SAR): 46 to 70

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: More than 4 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 42 to 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 11 to 12.5 inches
Water-supplying capacity: 7 to 12 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—high
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Upper alluvial flats
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 2
Classification: Typic Halaquepts, coarse-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan skirts
Distinctive present vegetation: Inland saltgrass
Inclusion 3
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Channeled fan skirts
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the occasionally flooded Ocala soil for named elements: Wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor
Suitability of the Ocala soil for named elements: Wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor

Suitability and Limitations of the Occasionally Flooded Ocala Soil for Various Uses and Practices
Range seeding: Poor—excess salts, excess sodium, too crusty
Roadfill: Good
Topsoil: Poor—excess salts, excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—excess sodium, excess salts
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Ocala Soil for Various Uses and Practices
Range seeding: Poor—excess salts, excess sodium, too crusty
Roadfill: Poor—low strength
Topsoil: Poor—excess salts, excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—excess sodium, excess salts
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Ocala soils—7w, nonirrigated
Range site: The occasionally flooded Ocala soil—024X008N; Ocala soil—024X007N; Inclusion 1—025X003N; Inclusion 2—026X002N; Inclusion 3—025X003N

258—Ocala-Devilsgait-Devilsgait, occasionally flooded association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Ocala silt loam, 0 to 2 percent slopes (50 percent)
• Devilsgait silt loam, 0 to 2 percent slopes (20 percent)
• Devilsgait very fine sandy loam—0 to 2 percent slopes, occasionally flooded (15 percent)
Contrasting inclusions:
• Inclusion 1: Sonoma silt loam, 0 to 2 percent slopes (4 percent)
• Inclusion 2: Moranch very fine sandy loam, 0 to 2 percent slopes (4 percent)
• Inclusion 3: Devilsgait silt loam, 0 to 2 percent slopes, frequently flooded (4 percent)
• Inclusion 4: Bloor silt loam, 0 to 2 percent slopes (3 percent)

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,100 to 5,250 feet
Dominant present vegetation: Rubber rabbitbrush, black greasewood, basin wildrye

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,100 to 5,250 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Occasionally Flooded Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,100 to 5,250 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches

Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 11.5 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to inset fans
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Inclusion 2
Classification: Durorthidic Torriorthents, coarse-silty, mixed (calcareous), mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 3
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to stream channels
Distinctive present vegetation: Basin wildrye, creeping wildrye

Inclusion 4
Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, basin wildrye, inland saltgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—poor
Suitability of the occasionally flooded Devilsgait soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Ocala Soil for Various Uses and Practices
Range seeding: Poor—excess salts, too crusty
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices
Range seeding: Good

Roadfill: Fair—shrink-swell potential
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Moderate—thin layer, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Suitability and Limitations of the Occasionally Flooded Devilsgait Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—shrink-swell potential
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Moderate—thin layer, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Ocala soil—4w, irrigated, 6w, nonirrigated; Devilsgait soil—3c, irrigated, 6c, nonirrigated; the occasionally flooded Devilsgait soil—3w, irrigated, 6w, nonirrigated
Range site: Ocala soil—024X007N; both Devilsgait soils—025X003N; Inclusion 1—024X006N; Inclusion 2—024X008N; Inclusion 3—025X001N; Inclusion 4—024X007N

259—Ocala-Sonoma association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Ocala silt loam, 0 to 2 percent slopes (70 percent)
• Sonoma silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Ocala silt loam, 0 to 2 percent slopes, occasionally flooded (10 percent)
• Inclusion 2: Devilsgait silt loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,000 to 6,000 feet
Dominant present vegetation: Rubber rabbitbrush, black greasewood, basin wildrye, inland saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: More than 16 mmhos per cm
Sodicity (SAR): 46 to 70

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 42 to 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 11 to 12.5 inches
Water-supplying capacity: 7 to 12 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—high
Potential for frost action: High

Characteristics of the Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,000 to 6,000 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye, Nevada bluegrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Slightly lower areas of flood plains
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 2

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—poor; shallow water areas—fair
Suitability of the Sonoma soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Ocala Soil for Various Uses and Practices

Range seeding: Poor—excess salts, excess sodium, too crusty
Roadfill: Poor—low strength
Topsoil: Poor—excess salts, excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—excess sodium, excess salts
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, excess sodium
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Sonoma Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Slight

Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Ocala soil—6w, irrigated, 7w, nonirrigated; Sonoma soil—2w, irrigated, 7w, nonirrigated
Range site: Ocala soil—024X007N; Sonoma soil—025X003N; Inclusion 1—024X008N; Inclusion 2—025X003N

260—Ocala-Halleck association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Ocala silt loam, 0 to 2 percent slopes (50 percent)
• Halleck silt loam, 0 to 2 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Aeric Fluvaquents, coarse-loamy, mixed (calcareous), mesic, 0 to 2 percent slopes (6 percent)
• Inclusion 2: Woofus loam, 0 to 2 percent slopes (4 percent)

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,000 to 6,000 feet
Dominant present vegetation: Rubber rabbitbrush, greasewood, basin wildrye, inland saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline

Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Characteristics of the Halleck Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,000 to 6,000 feet
Dominant present vegetation: Tufted hairgrass, alpine timothy, cinquefoil, sedge

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam

Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 9 to 36 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 36 to 61 inches
Texture: Stratified loam to silty clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 30 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 12 to 14 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Fluvaquents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Low areas on flood plains
Distinctive present vegetation: Alkali muhly, alkali sacaton
Inclusion 2
Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture

Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Halleck soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Ocala Soil for Various Uses and Practices
Range seeding: Poor—excess salts, too crusty
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Halleck Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, flooding
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Ocala soil—4w, irrigated, 6w, nonirrigated; Halleck soil—5w, irrigated and nonirrigated
Range site: Ocala soil—024X007N; Halleck soil—025X005N; Inclusion 1—024X009N; Inclusion 2—025X003N

261—Linkup-Roca-Vanwyper association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
- Linkup very cobbly loam, 15 to 30 percent slopes (40 percent)
- Roca very gravelly loam, 15 to 30 percent slopes (30 percent)
- Vanwyper very cobbly loam, 15 to 30 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Hussa loam, gravelly substratum, 0 to 2 percent slopes (5 percent)
- Inclusion 2: Bregar very gravelly loam, 8 to 15 percent slopes (3 percent)
- Inclusion 3: Rock outcrop (2 percent)

Characteristics of the Linkup Soil

Classification: Lithic Xerollic Haplargids, clayey, montmorillonitic, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from andesite, sandstone, and conglomerate
Slope range: 15 to 30 percent
Elevation: 6,000 to 7,000 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 5
Percent cobbles on the surface: 25
Percent pebbles on the surface: 25

Depth: 0 to 3 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 8 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 8 to 16 inches
Texture: Cobbly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 16 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.4 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Roca Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from andesite, sandstone, and conglomerate
Slope range: 15 to 30 percent
Elevation: 6,000 to 7,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 45

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 5 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 29 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 1.7 to 3.0 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from andesite, rhyolite, quartzite, and shale
Slope range: 15 to 30 percent
Elevation: 6,000 to 7,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, cheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 8 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 8 to 39 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 39 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 2
Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, frigid
Position on landscape: Crests of mountains
Distinctive present vegetation: Low sagebrush, Thurber needlegrass
Inclusion 3
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Linkup soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Roca soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Linkup Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, large stones, slope

Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, low strength, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Roca Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, low strength, large stones
Topsoil: Poor—large stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, large stones, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Linkup, Roca, and Vanwyper soils—7s, nonirrigated
Range site: Linkup soil—025X018N; Roca soil—025X014N; Vanwyper soil—025X019N; Inclusion 1—025X003N; Inclusion 2—025X018N; Inclusion 3—none

262—Linkup-Roca association

Map Unit Setting

Position on landscape: Hills, mountains

Composition

Major components:
• Linkup cobbly loam, 4 to 15 percent slopes (65 percent)
• Roca very gravelly loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Vanwyper very cobbly loam, 4 to 15 percent slopes (5 percent)
• Inclusion 2: McIvey gravelly loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Rock outcrop (5 percent)

Characteristics of the Linkup Soil

Classification: Lithic Xerollic Haplargids, clayey, montmorillonitic, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 4 to 15 percent
Elevation: 6,600 to 7,200 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 20

Depth: 0 to 3 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 8 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 8 to 16 inches
Texture: Cobbly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 16 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.5 to 2.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Roca Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 4 to 15 percent
Elevation: 6,600 to 7,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 45

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 5 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 29 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 1.7 to 3.0 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Concave, south-facing side slopes of mountains
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing, upper side slopes of mountains
Distinctive present vegetation: Big sagebrush, Idaho fescue

Inclusion 3
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Linkup soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Roca soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Linkup Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, large stones
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock, low strength
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Roca Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Linkup and Roca soils—7s, nonirrigated
Range site: Linkup soil—025X018N; Roca soil—025X014N; Inclusion 1—025X019N; Inclusion 2—025X012N; Inclusion 3—none

271—Pernty-Shivlum association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Pernty very gravelly loam, 4 to 15 percent slopes (45 percent)
• Shivlum silt loam, 15 to 30 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Loncan gravelly loam, 30 to 50 percent slopes (6 percent)
• Inclusion 2: Lithic Calcixerolls, loamy-skeletal, mixed, frigid, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Sumine very gravelly loam, 30 to 50 percent slopes (3 percent)
• Inclusion 4: Rock outcrop (1 percent)

Characteristics of the Pernty Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,200 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 18 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 18 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Shivlum Soil

Classification: Aridic Argixerolls, fine-silty, mixed, frigid
Position on landscape: Smooth, north-facing side slopes of mountains
Parent material: Colluvium derived from sandstone or conglomerate and influenced by loess
Slope range: 15 to 30 percent
Elevation: 6,000 to 6,200 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, basin wildrye

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 9 to 34 inches
Texture: Silty clay loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Neutral

Depth: 34 to 60 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Lithic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex foot slopes of mountains
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 4
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Pernty soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Shivlum soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Pernty Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Shivlum Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—low strength
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Pernty soil—7s, nonirrigated; Shivlum soil—6e, nonirrigated
Range site: Pernty soil—025X012N; Shivlum soil—025X012N; Inclusion 1—025X012N; Inclusion 2—025X014N; Inclusion 3—025X009N; Inclusion 4—none

272—Pernty-Sumine-Cleavage association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Pernty very gravelly loam, 30 to 50 percent slopes (50 percent)
- Sumine very gravelly loam, 15 to 50 percent slopes (20 percent)
- Cleavage extremely gravelly loam, 15 to 50 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Quarz gravelly loam, 4 to 15 percent slopes (5 percent)
- Inclusion 2: Rock outcrop (5 percent)
- Inclusion 3: Cleavage gravelly loam, 4 to 15 percent slopes (3 percent)
- Inclusion 4: Cotant gravelly loam, 4 to 15 percent slopes (2 percent)

Characteristics of the Pernty Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex or smooth, lower side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 30 to 50 percent
Elevation: 6,300 to 6,800 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 18 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 18 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,300 to 7,300 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches

Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,800 to 7,300 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: South-facing, lower side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 3
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Slightly concave areas on crests of hills
Distinctive present vegetation: Low sagebrush, Idaho fescue
Inclusion 4
Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Slightly convex, lower side slopes of hills
Distinctive present vegetation: Low sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Pernty soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Pernty Soil for Various Uses and Practices

Range seeding: Poor—droughty, too arid, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Pernty, Sumine, and Cleavage soils—7s, nonirrigated
Range site: Pernty soil—025X012N; Sumine soil—025X009N; Cleavage soil—025X024N; Inclusion 1—025X0014N; Inclusion 2—none; Inclusion 3—025X017N; Inclusion 4—025X017N

282—Bloor-Enko association

Map Unit Setting

Position on landscape: Alluvial flats, fan skirts

Composition

Major components:
• Bloor silt loam, 0 to 2 percent slopes (50 percent)
• Enko fine sandy loam, 2 to 4 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Kelk silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Sonoma silt loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Bloor Soil

Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by loess
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,300 feet
Dominant present vegetation: Black greasewood, rubber rabbitbrush, basin wildrye, inland saltgrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 8 to 16 mmhos per cm

Depth: 8 to 20 inches
Texture: Silty clay loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Strongly alkaline
Salinity: More than 16 mmhos per cm
Sodicity (SAR): 46 to 70

Depth: 20 to 42 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Very strongly alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 42 to 60 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Very strongly alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 60 to 72 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 4.7 to 7.3 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C

Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—high
Potential for frost action: Moderate

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan skirts
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,200 to 5,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Fine sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Flood plains adjacent to fan skirts
Distinctive present vegetation: Basin big sagebrush, western wheatgrass

Inclusion 2
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Distinctive present vegetation: Basin big sagebrush, western wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Bloor soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Bloor Soil for Various Uses and Practices

Range seeding: Poor—excess salts, excess sodium
Roadfill: Good
Topsoil: Poor—excess salts
Daily cover for landfill: Good
Shallow excavations: Moderate—wetness
Local roads and streets: Moderate—frost action, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping, excess salts
Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Enko Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly, slope
Terraces and diversions: Erodes easily, soil blowing

Interpretive Groups

Capability classification: Bloor soil—6s, irrigated, 7s, nonirrigated; Enko soil—2e, irrigated, 6s, nonirrigated
Range site: Bloor soil—024X007N; Enko soil—025X019N; Inclusion 1—024X006N; Inclusion 2—024X006N

283—Bloor-Connel-Kelk association

Map Unit Setting

Position on landscape: Flood plains, fan skirts

Composition

Major components:
- Bloor silt loam, slightly saline, 0 to 2 percent slopes (35 percent)
- Connel loam, 0 to 2 percent slopes (35 percent)
- Kelk silt loam, 0 to 2 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Ocala silt loam, 0 to 2 percent slopes (5 percent)
- Inclusion 2: Orovada silt loam, 0 to 2 percent slopes (5 percent)
- Inclusion 3: Bloor silt loam, 0 to 2 percent slopes (3 percent)
- Inclusion 4: Woofus silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Bloor Soil

Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,700 feet
Dominant present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 8 to 20 inches
Texture: Silty clay loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Strongly alkaline
Salinity: More than 16 mmhos per cm
Sodicity (SAR): 46 to 70

Depth: 20 to 42 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Very strongly alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 42 to 60 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Very strongly alkaline
Salinity: 8 to 16 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 60 to 72 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 4.7 to 7.3 inches
Water-supplying capacity: 6 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low

Corrosivity: To steel—high; to concrete—high
Potential for frost action: Moderate

Characteristics of the Connel Soil

Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Upper fan skirts
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,700 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 7 to 20 inches
Texture: Loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Depth: 20 to 60 inches
Texture: Stratified very gravelly coarse sand to extremely gravelly loamy sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.32; T value—3; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Lower fan skirts
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,700 feet
Dominant present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—occasional; duration—brief to long; months—February through June
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Inclusion 2

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3

Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Alkali sacaton, inland saltgrass

Inclusion 4

Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Bloor soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—fair; shallow water areas—very poor
Suitability of the Connel soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Bloor Soil for Various Uses and Practices

Range seeding: Poor—excess salts, excess sodium
Roadfill: Good
Topsoil: Poor—excess salts
Daily cover for landfill: Good
Shallow excavations: Moderate—wetness
Local roads and streets: Moderate—flooding, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping, excess salts
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Connel Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty
Terraces and diversions: Large stones, too sandy

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Moderate—flooding
Local roads and streets: Severe—low strength, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Bloor soil—6s, irrigated, 7s, nonirrigated; Connel soil—4s, irrigated, 7s, nonirrigated; Kelk soil—2w, irrigated, 6w, nonirrigated
Range site: Bloor soil—024X006N; Connel soil—025X019N; Kelk soil—024X006N; Inclusion 1—024X006N; Inclusion 2—025X019N; Inclusion 3—024X007N; Inclusion 4—025X003N

291—Tweba-Moranch association

Map Unit Setting

Position on landscape: Flood plains, alluvial flats

Composition

Major components:
- Tweba very fine sandy loam, 0 to 2 percent slopes (60 percent)
- Moranch silt loam, 0 to 2 percent slopes (30 percent)

Contrasting inclusions:
- Inclusion 1: Kelk silt loam, 0 to 2 percent slopes (8 percent)
- Inclusion 2: Woofus silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Tweba Soil

Classification: Aeric Fluvaquents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,400 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush, basin wildrye, Nevada bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 19 inches
Texture: Very fine sandy loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 19 to 34 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 34 to 60 inches
Texture: Stratified very fine sandy loam to loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 42 to 60 inches
Flooding: Frequency—rare
Permeability: Moderate
Available water capacity: 6.4 to 8.6 inches
Water-supplying capacity: 9 to 12 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Moranch Soil

Classification: Durorthidic Torriorthents, coarse-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,400 feet
Dominant present vegetation: Black greasewood, basin wildrye, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 5 to 20 inches
Texture: Very fine sandy loam
Structure: Platy
Consistence: Hard, firm
Reaction: Very strongly alkaline
Salinity: 4 to 16 mmhos per cm

Depth: 20 to 61 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Very strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Moderately slow

Available water capacity: 10.5 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: B
Erosion factors (surface layer): K value—.64; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Fan skirts adjacent to flood plains
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye
Inclusion 2
Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Natural levees on the flood plains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Tweba soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Moranch soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Tweba Soil for Various Uses and Practices
Range seeding: Fair—excess salts
Roadfill: Good
Topsoil: Good
Daily cover for landfill: Fair—too sandy
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—flooding, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, erodes easily
Terraces and diversions: Erodes easily, too sandy, soil blowing

Suitability and Limitations of the Moranch Soil for Various Uses and Practices
Range seeding: Poor—excess salts, too crusty
Roadfill: Good
Topsoil: Poor—thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—flooding
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, erodes easily, excess salts
Terraces and diversions: Erodes easily, soil blowing

Interpretive Groups

Capability classification: Tweba soil—3w, irrigated, 6w, nonirrigated; Moranch soil—3s, irrigated, 7s, nonirrigated
Range site:; Tweba soil—025X003N; Moranch soil—024X008N; Inclusion 1—024X006N; Inclusion 2—025X003N

294—Sonoma Variant-Halleck association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Sonoma Variant silt loam, 0 to 2 percent slopes (70 percent)
• Halleck silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Aeric Halaquepts, fine-loamy over sandy or sandy-skeletal, mixed, mesic, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Aeric Halaquepts, clayey over sandy or sandy-skeletal, montmorillonitic, mesic, 0 to 2 percent slopes (5 percent)
• Inclusion 3: Ocala silt loam, 0 to 2 percent slopes (3 percent)
• Inclusion 4: Devilsgait silt loam, drained, 0 to 2 percent slopes (2 percent)

Characteristics of the Sonoma Variant Soil

Classification: Aeric Fluvaquents, coarse-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Flood plains

Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,550 feet
Dominant present vegetation: Rubber rabbitbrush, basin wildrye, alkali sacaton, inland saltgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 15
Depth: 0 to 2 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 2 to 29 inches
Texture: Loam
Structure: Massive
Consistence: Slightly Hard, friable
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 29 to 61 inches
Texture: Stratified extremely gravelly coarse sand to very gravelly loamy sand
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 24 to 36 inches
Flooding: Frequency—rare
Permeability: Moderate
Available water capacity: 5.0 to 6.8 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—3; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Halleck Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,550 feet
Dominant present vegetation: Tufted hairgrass, Nevada bluegrass, sedge

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 9 to 36 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 36 to 61 inches
Texture: Stratified loam to silty clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 30 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1

Classification: Aeric Halaquepts, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic

Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 2
Classification: Aeric Halaquepts, clayey over sandy or sandy-skeletal, montmorillonitic, mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 3
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to stream channels
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 4
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Sonoma Variant soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair
Suitability of the Halleck soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Sonoma Variant Soil for Various Uses and Practices
Range seeding: Poor—excess salts
Roadfill: Fair—wetness
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Frost action, cutbanks cave
Irrigation: Wetness, rooting depth, erodes easily
Terraces and diversions: Erodes easily, wetness, too sandy

Suitability and Limitations of the Halleck Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, flooding
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Sonoma Variant soil—3w, irrigated, 6w, nonirrigated; Halleck soil—5w, irrigated and nonirrigated
Range site: Sonoma Variant soil—024X007N; Halleck soil—025X005N; Inclusion 1—024X007N; Inclusion 2—024X007N; Inclusion 3—024X007N; Inclusion 4—025X003N

303—Akler-Cleavage-McIvey association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Akler very cobbly loam, 15 to 30 percent slopes (40 percent)
• Cleavage very cobbly loam, 15 to 50 percent slopes (25 percent)
• McIvey gravelly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (5 percent)
• Inclusion 2: Sumine very gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 3: Rubble land (5 percent)

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Convex, lower side slopes of mountains

Parent material: Residuum derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 6,000 to 8,400 feet
Dominant present vegetation: Low sagebrush, Sandberg bluegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 15
Percent pebbles on the surface: 25

Depth: 0 to 6 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 21 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.1 to 1.7 inches
Water-supplying capacity: 5.5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex, upper side slopes of mountains
Parent material: Residuum and colluvium derived from tuff
Slope range: 15 to 50 percent
Elevation: 6,500 to 8,400 feet
Dominant present vegetation: Black sagebrush, low sagebrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 8.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: North-facing, concave side slopes of mountains
Parent material: Colluvium derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 6,000 to 8,400 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Inclusion 2
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing, concave side slopes of mountains
Distinctive present vegetation: Wyoming big sagebrush, bluebunch wheatgrass

Inclusion 3
Position on landscape: Side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Akler Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty, large stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the McIvey Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—large stones, slope, shrink-swell potential
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—too clayey, small stones, slope
Shallow excavations: Severe—slope

Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Akler soil—7s, nonirrigated; Cleavage soil—7s, nonirrigated; McIvey soil—6e, nonirrigated
Range site: Akler soil—025X018N; Cleavage soil—025X024N; McIvey soil—025X012N; Inclusion 1—none; Inclusion 2—025X009N; Inclusion 3—none

304—Akler-Yuko-Welch association

Map Unit Setting

Position on landscape: Hills, drainageways on hills

Composition

Major components:
• Akler cobbly clay loam, 8 to 15 percent slopes (40 percent)
• Yuko very gravelly loam, 8 to 15 percent slopes (30 percent)
• Welch silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Puett gravelly loamy sand, 15 to 50 percent slopes (10 percent)
• Inclusion 2: Donna silt loam, 2 to 8 percent slopes (5 percent)

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Smooth or slightly concave summits and side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,000 to 6,400 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 15

Depth: 0 to 6 inches
Texture: Cobbly clay loam

Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 21 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.6 to 2.3 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Summits and convex side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,000 to 6,400 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 50

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam

Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 6,000 to 6,400 feet
Dominant present vegetation: Basin big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 9.6 to 12 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Eroded shoulders of hills
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Inclusion 2
Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Toe slopes of hills and summits of fan piedmont remnants
Distinctive present vegetation: Low sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Welch soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—poor

Suitability and Limitations of the Akler Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock

Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Yuko Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, low strength, frost action
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Welch Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Fair—small stones
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Akler soil—7s, nonirrigated; Yuko soil—7s, nonirrigated; Welch soil—6w, nonirrigated
Range site: Akler soil—025X018N; Yuko soil—025X019N; Welch soil—025X003N; Inclusion 1—025X025N; Inclusion 2—025X018N

305—Akler-Kleckner-Short Creek association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Akler gravelly clay loam, 15 to 30 percent slopes (50 percent)
• Kleckner gravelly loam, 30 to 50 percent slopes, stony (20 percent)
• Short Creek very cobbly loam, 15 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (10 percent)
• Inclusion 2: Cotant very gravelly loam, 15 to 50 percent slopes (3 percent)
• Inclusion 3: Shively loam, 30 to 50 percent slopes (2 percent)

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 6,000 to 7,500 feet
Dominant present vegetation: Alkali sagebrush, low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 25

Depth: 0 to 6 inches
Texture: Gravelly clay loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 21 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight

Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Kleckner Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing, lower side slopes of hills
Parent material: Colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,000 to 7,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: .1

Depth: 0 to 9 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 25 to 41 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.8 to 8.5 inches
Water-supplying capacity: 9 to 10.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—iow
Potential for frost action: Low

Characteristics of the Short Creek Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, south-facing side slopes of hills
Parent material: Colluvium derived from welded tuff
Slope range: 15 to 50 percent
Elevation: 6,000 to 7,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 100 days

Typical Profile

Percent stones and boulders on the surface: 15
Percent cobbles on the surface: 30
Percent pebbles on the surface: 25

Depth: 0 to 3 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 3 to 45 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 45 to 64 inches
Texture: Extremely gravelly sandy clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.3 to 5.6 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Rapid

Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 2
Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Concave side slopes of hills
Distinctive present vegetation: Low sagebrush, Idaho fescue
Inclusion 3
Classification: Pachic Haploxerolls, coarse-loamy, mixed, frigid
Position on landscape: Smooth, north-facing, upper side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Kleckner soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Short Creek soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Akler Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Kleckner Soil for Various Uses and Practices
Range seeding: Fair—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Short Creek Soil for Various Uses and Practices
Range seeding: Poor—large stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Akler soil—7e, nonirrigated; Kleckner soil—7e, nonirrigated; Short Creek soil—7s, nonirrigated
Range site: Akler soil—025X018N; Kleckner soil—025X014N; Short Creek soil—025X015N; Inclusion 1—none; Inclusion 2—025X017N; Inclusion 3—025X010N

306—Akler-Quarz-Soughe association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Akler extremely cobbly loam, 15 to 30 percent slopes (35 percent)
• Quarz cobbly loam, 8 to 15 percent slopes (30 percent)
• Soughe very cobbly loam, 8 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Aridic Haploxerolls, loamy-skeletal, mixed, frigid, 0 to 4 percent slopes (5 percent)
• Inclusion 2: Short Creek cobbly loam, 30 to 50 percent slopes (5 percent)
• Inclusion 3: Xerollic Durargids, loamy-skeletal, mixed, mesic, shallow, 8 to 15 percent slopes (3 percent)
• Inclusion 4: Rock outcrop (2 percent)

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 6,200 to 7,200 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 30
Percent pebbles on the surface: 35

Depth: 0 to 6 inches
Texture: Extremely cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 21 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.1 to 1.7 inches
Water-supplying capacity: 5.5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Quarz Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,200 to 7,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 15

Depth: 0 to 4 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 26 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 26 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.6 to 3.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Soughe Soil

Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Smooth, south-facing, lower side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff

Slope range: 8 to 15 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 14 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 14 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.2 to 1.6 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 2
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave, south-facing, upper side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Xerollic Durargids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Slightly concave areas on crests of hills
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Inclusion 4
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Quarz soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Soughe soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Akler Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Quarz Soil for Various Uses and Practices

Range seeding: Fair—large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, large stones

Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Soughe Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Akler, Quarz, and Soughe soils—7s, nonirrigated
Range site: Akler soil—025X018N; Quarz soil—025X014N; Soughe soil—025X019N; Inclusion 1—025X003N; Inclusion 2—025X015N; Inclusion 3—025X019N; Inclusion 4—none

307—Akler-Lerrow association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Akler loam, 4 to 15 percent slopes (50 percent)
• Lerrow gravelly loam, 4 to 15 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Welch silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Crooked Creek silty clay loam, 0 to 2 percent slopes (3 percent)
• Inclusion 3: Eboda loam, 4 to 15 percent slopes (2 percent)

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,500 feet
Dominant present vegetation: Low sagebrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 28 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.6 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Lerrow Soil

Classification: Aridic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly concave areas on crests and smooth side slopes of hills
Parent material: Residuum derived from welded tuff or andesite
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,500 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 30

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 5 to 15 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 15 to 32 inches
Texture: Cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 32 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.1 to 5.0 inches
Water-supplying capacity: 9 to 10.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Slightly higher areas of narrow drainageways on hills
Distinctive present vegetation: Alpine timothy, Nevada bluegrass

Inclusion 2
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Slightly lower areas of narrow drainageways on hills
Distinctive present vegetation: Tufted hairgrass

Inclusion 3
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Lerrow soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Akler Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, hard to pack
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Lerrow Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Moderate—depth to rock, too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Akler soil—7s, nonirrigated; Lerrow soil—6s, nonirrigated

309—Akler-Vanwyper-Rock outcrop association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Akler extremely cobbly loam, 15 to 50 percent slopes (50 percent)
- Vanwyper gravelly loam, 15 to 30 percent slopes, stony (25 percent)
- Rock outcrop (15 percent)

Contrasting inclusions:
- Inclusion 1: Lithic Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Linkup cobbly loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Convex, north-facing and smooth, south-facing side slopes of hills
Parent material: Residuum derived from rhyolite and welded tuff
Slope range: 15 to 50 percent
Elevation: 6,000 to 6,200 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 30
Percent pebbles on the surface: 35

Depth: 0 to 6 inches
Texture: Extremely cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 21 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.1 to 1.7 inches
Water-supplying capacity: 5.5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Slightly concave, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite and welded tuff
Slope range: 15 to 30 percent
Elevation: 6,000 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: .1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.3 to 3.5 inches
Water-supplying capacity: 6.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Rock Outcrop

Position on landscape: Summits of hills
Elevation: 6,000 to 6,200 feet
Dominant present vegetation: None

Contrasting Inclusions

Inclusion 1
Classification: Lithic Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex, south-facing side slopes of hills
Distinctive present vegetation: Low sagebrush, Thurber needlegrass
Inclusion 2
Classification: Lithic Xerollic Haplargids, clayey, montmorillonitic, frigid
Position on landscape: Crests of hills
Distinctive present vegetation: Low sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Akler Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—hard to pack, large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Interpretive Groups

Capability classification: Akler soil—7s, nonirrigated; Vanwyper soil—7e, nonirrigated; Rock outcrop—8s, nonirrigated
Range site: Akler soil—025X018N; Vanwyper soil—025X019N; Rock outcrop—none; Inclusion 1—025X018N; Inclusion 2—025X018N

311—Shayla-Dewar-Vanwyper association

Map Unit Setting

Position on landscape: Fan piedmont remnants, hills

Composition

Major components:
• Shayla very gravelly silty clay loam, 30 to 50 percent slopes (45 percent)
• Dewar gravelly loam, 2 to 8 percent slopes (25 percent)
• Vanwyper gravelly loam, 15 to 30 percent slopes, stony (20 percent)
Contrasting inclusions:
• Inclusion 1: Loncan Variant loam, 2 to 8 percent slopes (5 percent)
• Inclusion 2: Rock outcrop (3 percent)
• Inclusion 3: Devilsgait silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Shayla Soil

Classification: Typic Torriorthents, loamy-skeletal, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and siltstone
Slope range: 30 to 50 percent
Elevation: 5,500 to 6,200 feet

Dominant present vegetation: Black sagebrush, big sagebrush, bottlebrush squirreltail, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 45

Depth: 0 to 5 inches
Texture: Very gravelly silty clay loam
Structure: Subangular blocky
Consistence: Soft, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 13 inches
Texture: Very gravelly silt loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 13 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 8 to 15 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.9 inch to 1.3 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Dewar Soil

Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 11 inches
Texture: Gravelly silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 11 to 17 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 17 to 44 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 13 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.1 to 2.8 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of hills

Parent material: Residuum and colluvium derived from tuff
Slope range: 15 to 30 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, cheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: .1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.3 to 3.5 inches
Water-supplying capacity: 6.5 to 8.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aridic Duric Haploxerolls, fine-loamy, mixed, mesic
Position on landscape: Inset fan remnants
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 2
Position on landscape: Side slopes of fan piedmont remnants with a rock core and side slopes of hills
Distinctive present vegetation: None

Inclusion 3
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Inset fans and narrow drainageways on hills
Distinctive present vegetation: Basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Shayla soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Dewar soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Shayla Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Dewar Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones, slope

Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—hard to pack, large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Interpretive Groups

Capability classification: Shayla soil—7s, nonirrigated; Dewar soil—7s, nonirrigated; Vanwyper soil—7e, nonirrigated
Range site: Shayla soil—025X025N; Dewar soil—025X019N; Vanwyper soil—025X019N; Inclusion 1—025X003N; Inclusion 2—none; Inclusion 3—025X001N

321—Grina-Lyra-Loncan Variant association

Map Unit Setting

Position on landscape: Hills, drainageways on hills

Composition

Major components:
• Grina loam, 30 to 50 percent slopes (40 percent)
• Lyra gravelly loam, 15 to 30 percent slopes (30 percent)
• Loncan Variant loam, 2 to 8 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Loncan very gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 2: Rock outcrop (5 percent)

Characteristics of the Grina Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Convex, south-facing side slopes of hills
Parent material: Residuum derived from tuff
Slope range: 30 to 50 percent
Elevation: 6,300 to 7,400 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 7 to 18 inches
Texture: Silty clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 18 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.3 to 3.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—1; wind erodibility group—4L
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Lyra Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid, shallow
Position on landscape: Crests and convex, north-facing and smooth, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from tuff or shale
Slope range: 15 to 30 percent
Elevation: 6,300 to 7,400 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 2 inches
Texture: Gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 7 inches
Texture: Extremely gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 12 inches
Texture: Extremely cobbly clay
Structure: Platy
Consistence: Hard, very friable
Reaction: Mildly alkaline

Depth: 12 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 0.6 to 1.0 inch
Water-supplying capacity: 5.5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Loncan Variant Soil

Classification: Aridic Duric Haploxerolls, fine-loamy, mixed, mesic
Position on landscape: Narrow drainageways on hills
Parent material: Mixed alluvium
Slope range: 2 to 8 percent
Elevation: 6,300 to 7,400 feet
Dominant present vegetation: Big sagebrush, rubber rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 12 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Mildly alkaline

Depth: 12 to 38 inches
Texture: Stratified loam to clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 38 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 9.6 to 11 inches
Water-supplying capacity: 8 to 14 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Grina soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Lyra soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Loncan Variant soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Grina Soil for Woodland
Site index for common trees: Utah juniper—18
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Grina Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Lyra Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Loncan Variant Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Fair—small stones
Daily cover for landfill: Fair—too clayey
Shallow excavations: Slight
Local roads and streets: Moderate—low strength, flooding, frost action
Pond reservoir areas: Moderate—slope
Embankments, dikes, and levees: Moderate—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Grina soil—7e, nonirrigated; Lyra soil—7e, nonirrigated; Loncan Variant soil—6c, nonirrigated
Range site: Grina soil—025X059N; Lyra soil—025X014N; Loncan Variant soil—025X003N; Inclusion 1—025X012N; Inclusion 2—none

322—Grina-Enko, moderately steep-Enko association

Map Unit Setting

Position on landscape: Partial ballenas

Composition

Major components:
- Grina loam, 15 to 50 percent slopes (45 percent)
- Enko sandy loam, 15 to 30 percent slopes (25 percent)
- Enko loam, 4 to 15 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Karpp silt loam, 4 to 15 percent slopes (5 percent)
- Inclusion 2: Chiara silt loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Grina Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: South-facing side slopes of partial ballenas with a rock core
Parent material: Residuum derived from tuff and siltstone
Slope range: 15 to 50 percent
Elevation: 6,200 to 6,400 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass, Indian ricegrass, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 7 to 18 inches
Texture: Silty clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 18 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.3 to 3.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid

Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—1; wind erodibility group—4L
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Moderately Steep Enko Soil

Classification: Durixerollic Calciorthids, coarse-loamy, mixed, mesic
Position on landscape: North-facing side slopes of partial ballenas
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,400 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8.0 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of partial ballenas and inset fans
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,400 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.6 to 8.8 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Shoulders of partial ballenas
Distinctive present vegetation: Big sagebrush, Utah juniper
Inclusion 2
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Grina soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the moderately steep Enko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Enko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability of the Grina Soil for Woodland
Site index for common trees: Utah juniper—18
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Grina Soil for Various Uses and Practices
Range seeding: Poor—droughty
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Moderately Steep Enko Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Fair—slope
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Grina soil—7e, nonirrigated; the moderately steep Enko soil—6e, nonirrigated; Enko soil—6s, nonirrigated
Range site: Grina soil—025X059N; both Enko soils—025X019N; Inclusion 1—025X059N; Inclusion 2—025X019N

323—Grina-Kelk-Orovada association

Map Unit Setting

Position on landscape: Hills, piedmont slopes

Composition

Major components:
- Grina gravelly loam, 15 to 30 percent slopes (40 percent)
- Kelk silt loam, 2 to 8 percent slopes (25 percent)
- Orovada silt loam, 8 to 15 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Hunewill loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Puett sandy loam, 15 to 30 percent slopes (5 percent)
- Inclusion 3: Hunnton loam, 4 to 15 percent slopes (4 percent)
- Inclusion 4: Rock outcrop (1 percent)

Characteristics of the Grina Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Convex side slopes of hills and partial ballenas with a rock core
Parent material: Residuum derived from tuff and siltstone
Slope range: 15 to 30 percent
Elevation: 5,100 to 5,700 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 7 to 18 inches
Texture: Silty clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 18 to 22 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.3 to 3.3 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Fan skirts
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,100 to 5,700 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches

Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans of hills and partial ballenas
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 8 to 15 percent
Elevation: 5,100 to 5,700 feet
Dominant present vegetation: Douglas rabbitbrush, big sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Side slopes of partial ballenas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Convex side slopes of hills and partial ballenas with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Inclusion 3
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Position on landscape: Side slopes of hills and partial ballenas with a rock core
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Grina soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Kelk soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Orovada soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Grina Soil for Woodland

Site index for common trees: Utah juniper—18
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Grina Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty, depth to rock

Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Orovada Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Grina soil—7e, nonirrigated; Kelk soil—6s, nonirrigated; Orovada soil—6c, nonirrigated
Range site: Grina soil—025X059N; Kelk soil—025X019N; Orovada soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X025N; Inclusion 3—025X019N; Inclusion 4—none

324—Grina-Samor association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Grina silty clay loam, 30 to 75 percent slopes (65 percent)
• Samor very gravelly loam, 50 to 75 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Karpp gravelly sandy loam, 4 to 25 percent slopes (5 percent)
• Inclusion 2: Rad silt loam, 2 to 4 percent slopes (3 percent)
• Inclusion 3: Enko silt loam, 2 to 8 percent slopes (2 percent)
• Inclusion 4: Perwick sandy loam, 8 to 15 percent slopes (5 percent)

Characteristics of the Grina Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Convex side slopes of hills
Parent material: Residuum derived from tuff and siltstone
Slope range: 30 to 75 percent
Elevation: 6,000 to 7,100 feet
Dominant present vegetation: Big sagebrush, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 7 inches
Texture: Silty clay loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 7 to 18 inches
Texture: Silty clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 18 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.6 to 3.4 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Very rapid
Hydrologic group: D

Erosion factors (surface layer): K value—.43; T value—1; wind erodibility group—4L
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Samor Soil

Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 50 to 75 percent
Elevation: 6,000 to 7,100 feet
Dominant present vegetation: Big sagebrush, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 6 to 19 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.5 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Utah juniper

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnant side slopes
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Xeric Torriorthents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Foot slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Grina soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Samor soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair

Suitability of the Grina Soil for Woodland
Site index for common trees: Utah juniper—18
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Grina Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope

Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Samor Soil for Woodland
Site index for common trees: Utah juniper—23
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Samor Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Grina soil—7e, nonirrigated; Samor soil—7s, nonirrigated
Range site: Grina soil—025X059N; Samor soil—025X059N; Inclusion 1—025X059N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X059N

325—Grina-Karpp-Rad association

Map Unit Setting

Position on landscape: Hills, fan piedmont remnants

Composition

Major components:
- Grina gravelly loam, 15 to 50 percent slopes (35 percent)
- Karpp silt loam, 4 to 15 percent slopes (35 percent)
- Rad silt loam, 2 to 8 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Perwick sandy loam, 8 to 15 percent slopes (5 percent)
- Inclusion 2: Samor very gravelly loam, 30 to 50 percent slopes (3 percent)
- Inclusion 3: Kelk silt loam, 0 to 4 percent slopes (2 percent)

Characteristics of the Grina Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Crests and side slopes of hills
Parent material: Residuum derived from tuff and siltstone
Slope range: 15 to 50 percent
Elevation: 5,200 to 6,000 feet
Dominant present vegetation: Big sagebrush, Indian ricegrass, Douglas rabbitbrush, Utah juniper

Climatic Data
Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile
Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 7 to 18 inches
Texture: Silty clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 18 to 22 inches
Texture: Weathered bedrock

Soil and Water Features
Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.3 to 3.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Karpp Soil

Classification: Xerollic Durorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Summits and side slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over limestone alluvium
Slope range: 4 to 15 percent
Elevation: 5,200 to 6,000 feet

Dominant present vegetation: Big sagebrush, Indian ricegrass, Douglas rabbitbrush, Utah juniper

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 100 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 15 inches
Texture: Very gravelly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 15 to 41 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm

Soil and Water Features

Depth to a hardpan: 14 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.1 to 4.7 inches
Water-supplying capacity: 6.5 to 8.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rad Soil

Classification: Durixeroilic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Parent material: Loess over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,200 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 26 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Massive
Consistence: Slightly hard, brittle
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 56 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 8 to 16 mmhos per cm

Depth: 56 to 62 inches
Texture: Stratified sandy loam to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Strongly alkaline
Salinity: 8 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Foot slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper
Inclusion 2
Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Side slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper
Inclusion 3
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans and narrow drainageways on hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Grina soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Karpp soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Rad soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Grina Soil for Woodland
Site index for common trees: Utah juniper—18
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Grina Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, erodes easily
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Karpp Soil for Woodland
Site index for common trees: Utah juniper—25
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Karpp Soil for Various Uses and Practices
Range seeding: Fair—too arid, cemented pan
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Rad Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Poor—thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Slight
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Grina soil—7e, nonirrigated; Karpp soil—7s, nonirrigated; Rad soil—6c, nonirrigated
Range site: Grina soil—025X059N; Karpp soil—025X059N; Rad soil—025X019N; Inclusion 1—025X059N; Inclusion 2—025X059N; Inclusion 3—025X019N

331—Bunky-Grina-Enko association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Bunky loam, 2 to 15 percent slopes (45 percent)
- Grina silty clay loam, 15 to 30 percent slopes (20 percent)
- Enko sandy loam, 2 to 8 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Karpp silt loam, 4 to 15 percent slopes (10 percent)
- Inclusion 2: Chiara silt loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Bunky Soil

Classification: Haploxerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 2 to 15 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 9 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 21 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline

Depth: 21 to 60 inches
Texture: Cemented hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.2 to 3.7 inches
Water-supplying capacity: 6.5 to 8.0 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Grina Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and siltstone
Slope range: 15 to 30 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, basin wildrye, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30
Depth: 0 to 7 inches
Texture: Silty clay loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 7 to 18 inches
Texture: Silty clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 18 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.6 to 3.4 inches
Water-supplying capacity: 6.5 to 8.0 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—1; wind erodibility group—4L
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Slightly concave side slopes and concave foot slopes of fan piedmont remnants

Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8.0 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Shoulders of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Utah juniper

Inclusion 2
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bunky soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Grina soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Enko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Bunky Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Grina Soil for Woodland

Site index for common trees: Utah juniper—18
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Grina Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, slope

Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Enko Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Bunky soil—6s, nonirrigated; Grina soil—7e, nonirrigated; Enko soil—6s, nonirrigated
Range site: Bunky soil—025X019N; Grina soil—025X059N; Enko soil—025X019N; Inclusion 1—025X059N; Inclusion 2—025X019N

345—Perwick-Puett-Rad association

Map Unit Setting

Position on landscape: Hills, drainageways on hills

Composition

Major components:
• Perwick gravelly loam, 15 to 50 percent slopes (40 percent)
• Puett gravelly loam, 15 to 50 percent slopes (35 percent)
• Rad silt loam, 2 to 8 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (7 percent)
• Inclusion 2: Hunewill gravelly loam, 4 to 15 percent slopes (3 percent)

Characteristics of the Perwick Soil

Classification: Xeric Torriorthents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Slightly convex, lower side slopes of hills
Parent material: Residuum derived from siltstone and tuff
Slope range: 15 to 50 percent
Elevation: 5,200 to 5,700 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Thurber needlegrass, Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 5 to 24 inches
Texture: Loam
Structure: Massive
Consistence: Hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 24 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.4 to 4.6 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—2; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Convex crests and upper side slopes of hills
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 50 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Big sagebrush, Indian ricegrass, Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 1 inch
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 1 to 10 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 10 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.9 to 2.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rad Soil

Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Narrow drainageways on hills
Parent material: Loess over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,200 to 6,000 feet
Dominant present vegetation: Big sagebrush, basin wildrye, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 26 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 56 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 8 to 16 mmhos per cm

Depth: 56 to 62 inches
Texture: Stratified sandy loam to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Strongly alkaline
Salinity: 8 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 2
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Summits and side slopes of fan piedmont remnants

Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Perwick soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Rad soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Perwick Soil for Woodland
Site index for common trees: Utah juniper—20
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Perwick Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Puett Soil for Woodland
Site index for common trees: Utah juniper—20
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Rad Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Poor—thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Slight
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Perwick soil—7e, nonirrigated; Puett soil—7e, nonirrigated; Rad soil—6c, nonirrigated
Range site: Perwick soil—025X059N; Puett soil—025X059N; Rad soil—025X019N; Inclusion 1—none; Inclusion 2—025X019N

367—Peeko-Hunnton-Puett association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Peeko silt loam, 2 to 8 percent slopes (35 percent)
- Hunnton loam, 4 to 15 percent slopes (30 percent)
- Puett sandy loam, 15 to 50 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Chiara silt loam, 2 to 8 percent slopes (4 percent)
- Inclusion 2: Zevadez loam, 8 to 30 percent slopes (4 percent)
- Inclusion 3: Kelk silt loam, 0 to 4 percent slopes (4 percent)
- Inclusion 4: Connel sandy loam, 0 to 4 percent slopes (3 percent)

Characteristics of the Peeko Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent materiai: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass, Thurber needlegrass

Climatic Data
Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 8 inches
Texture: Gravelly silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 11 inches
Texture: Very gravelly silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 36 inches
Texture: Indurated hardpan

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 2.0 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—1; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low

Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 50 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Black sagebrush, big sagebrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 2 inches
Texture: Sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.9 to 2.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—3
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Shoulders of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Slightly concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Peeko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Peeko Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan

Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Puett Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Peeko soil—7s, nonirrigated; Hunnton soil—4e, irrigated, 6s, nonirrigated; Puett soil—7e, nonirrigated
Range site: Peeko soil—024X030N; Hunnton soil—025X019N; Puett soil—025X025N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

370—Chiara-Cherry Spring-Orovada association

Map Unit Setting

Position on landscape: Fan piedmonts

Composition

Major components:
- Chiara very fine sandy loam, 4 to 15 percent slopes (35 percent)
- Cherry Spring silt loam, 2 to 8 percent slopes (30 percent)
- Orovada fine sandy loam, 8 to 15 percent slopes (25 percent)

Contrasting inclusions:
- Inclusion 1: Enko very fine sandy loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Puett sandy loam, 15 to 30 percent slopes (5 percent)

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits and side slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,000 to 5,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Very fine sandy loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cherry Spring Soil

Classification: Haploxerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Smooth or slightly concave summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,000 to 5,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 10 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 23 to 41 inches
Texture: Cemented hardpan
Structure: Massive
Consistence: Extremely hard, very firm
Reaction: Moderately alkaline

Depth: 41 to 63 inches
Texture: Stratified sandy loam to extremely gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.7 to 4.6 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 8 to 15 percent
Elevation: 5,000 to 5,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Cherry Spring soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Orovada soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Cherry Spring Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—area reclaim
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope, erodes easily
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Orovada Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, slope, erodes easily
Terraces and diversions: Slope, erodes easily, soil blowing

Interpretive Groups

Capability classification: Chiara soil—4e, irrigated, 7s, nonirrigated; Cherry Spring soil—3e, irrigated, 7s,

nonirrigated; Orovada soil—4e, irrigated, 6c, nonirrigated
Range site: Chiara soil—025X019N; Cherry Spring soil—025X019N; Orovada soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X025N

371—Chiara-Bioya association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Chiara silt loam, 4 to 15 percent slopes (45 percent)
• Bioya very fine sandy loam, 2 to 8 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Grina sandy loam, 15 to 30 percent slopes (7 percent)
• Inclusion 2: Orovada fine sandy loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Puett sandy loam, 15 to 30 percent slopes (3 percent)

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits and side slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,600 to 5,700 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bioya Soil

Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Loess over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,600 to 5,700 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 14 inches
Texture: Very fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 14 to 27 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 27 to 41 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, brittle
Reaction: Moderately alkaline

Depth: 41 to 60 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 4.2 to 5.8 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.55; T value—2; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Utah juniper

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, black sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Bioya soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Bioya Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—cemented pan
Topsoil: Fair—cemented pan, thin layer
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Chiara soil—4e, irrigated, 7s, nonirrigated; Bioya soil—3e, irrigated, 7s, nonirrigated
Range site: Chiara soil—025X019N; Bioya soil—

025X019N; Inclusion 1—025X059N; Inclusion 2—025X019N; Inclusion 3—025X025N

374—Chiara-Wieland-Enko association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Chiara silt loam, 2 to 4 percent slopes (40 percent)
- Wieland loam, 4 to 15 percent slopes (30 percent)
- Enko fine sandy loam, 2 to 8 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Soughe silt loam, 4 to 15 percent slopes (5 percent)
- Inclusion 2: Zevadez silt loam, 8 to 15 percent slopes (5 percent)

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 4 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm

Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants and the adjacent inset fans
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Fine sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.3 to 8.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Foot slopes of the side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous

plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Chiara Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Slope, erodes easily, percs slowly

Suitability and Limitations of the Enko Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, percs slowly, slope
Terraces and diversions: Erodes easily, soil blowing

Interpretive Groups

Capability classification: Chiara soil—4e, irrigated, 7s, nonirrigated; Wieland soil—4e, irrigated, 6s, nonirrigated; Enko soil—3e, irrigated, 6s, nonirrigated
Range site: Chiara soil—025X019N; Wieland soil—025X019N; Enko soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N

378—Chiara-Spilock-Kelk association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Chiara silt loam, 2 to 8 percent slopes (40 percent)
- Spilock very gravelly loam, 15 to 50 percent slopes (25 percent)
- Kelk silt loam, 8 to 15 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Aridic Duric Haploxerolls, fine-silty, mixed, mesic, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Loncan very gravelly loam, 30 to 50 percent slopes (4 percent)
- Inclusion 3: Soughe gravelly loam, 4 to 30 percent slopes (4 percent)
- Inclusion 4: Puett gravelly sandy loam, 15 to 30 percent slopes (2 percent)

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F

Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Spilock Soil

Classification: Xerollic Paleorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Alluvium derived from limestone and conglomerate
Slope range: 15 to 50 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Black sagebrush, cheatgrass, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 45

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 10 to 30 inches
Texture: Indurated hardpan
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 8 to 14 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.6 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 8 to 15 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F

Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Duric Haploxerolls, fine-silty, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 3
Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper

Inclusion 4
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Spilock soil for named elements: Wild herbaceous plants (nonirrigated)—poor; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability of the Spilock Soil for Woodland
Site index for common trees: Utah juniper—25
Most important native understory plants: Black sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Spilock Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts, cemented pan
Roadfill: Poor—low strength
Topsoil: Fair—slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Slope, erodes easily, percs slowly

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—cemented pan, slope
Topsoil: Poor—cemented pan, small stones, slope
Daily cover for landfill: Poor—cemented pan, slope
Shallow excavations: Severe—cemented pan, slope
Local roads and streets: Severe—cemented pan, slope
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Droughty, cemented pan, slope
Terraces and diversions: Slope, cemented pan

Interpretive Groups

Capability classification: Chiara soil—4e, irrigated, 7s, nonirrigated; Spilock soil—7s, nonirrigated; Kelk soil—4e, irrigated, 6s, nonirrigated
Range site: Chiara soil—025X019N; Spilock soil—025X060N; Kelk soil—025X019N; Inclusion 1—025X014N; Inclusion 2—025X012N; Inclusion 3—025X059N; Inclusion 4—025X025N

379—Chiara-Kelk-Kelk, rarely flooded association

Map Unit Setting

Position on landscape: Fan piedmont remnants, inset fans

Composition

Major components:
• Chiara silt loam, 2 to 4 percent slopes (50 percent)
• Kelk silt loam, 2 to 8 percent slopes (20 percent)
• Kelk silt loam, 0 to 2 percent slopes, rarely flooded (15 percent)
Contrasting inclusions:
• Inclusion 1: Puett gravelly sandy loam, 8 to 30 percent slopes (10 percent)
• Inclusion 2: Connel sandy loam, 4 to 15 percent slopes (3 percent)
• Inclusion 3: Dacker silt loam, 2 to 4 percent slopes (2 percent)

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 4 percent
Elevation: 5,500 to 5,700 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches

Water-supplying capacity: 5 to 6.5 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,500 to 5,700 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, cheatgrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rarely Flooded Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,500 to 5,700 feet
Dominant present vegetation: Big sagebrush, black greasewood, rubber rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 11 to 12.5 inches
Water-supplying capacity: 8 to 10 inches

Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—very poor; shallow water areas—very poor
Suitability of the rarely flooded Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Rarely Flooded Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Chiara soil—4e, irrigated, 7s, nonirrigated; Kelk soil—3e, irrigated, 6s, nonirrigated; the rarely flooded Kelk soil—2s, irrigated, 6s, nonirrigated
Range site: Chiara soil—025X019N; Kelk soil—025X019N; the rarely flooded Kelk soil—024X006N;

Inclusion 1—025X025N; Inclusion 2—025X019N; Inclusion 3—025X019N

380—Chiara-Peeko-Izod association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Chiara silt loam, 2 to 8 percent slopes (35 percent)
- Peeko silt loam, 2 to 8 percent slopes (35 percent)
- Izod very gravelly loam, 30 to 50 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Gochea gravelly sandy loam, 15 to 50 percent slopes (5 percent)
- Inclusion 2: Hunnton silt loam, 4 to 15 percent slopes (5 percent)
- Inclusion 3: Puett gravelly sandy loam, 15 to 50 percent slopes (5 percent)

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,600 to 6,000 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Peeko Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,600 to 6,000 feet
Dominant present vegetation: Black sagebrush, Thurber needlegrass, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 8 inches
Texture: Gravelly silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 11 inches
Texture: Very gravelly silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 36 inches
Texture: Indurated hardpan

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 2.0 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mixed
Position on landscape: Convex side slopes of fan piedmont remnants with a rock core
Parent material: Residuum and colluvium derived from limestone
Slope range: 30 to 50 percent
Elevation: 5,600 to 6,000 feet
Dominant present vegetation: Black sagebrush, Thurber needlegrass, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Convex side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Chiara soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Peeko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Peeko Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Izod Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Chiara, Peeko, and Izod soils—7s, nonirrigated
Range site: Chiara soil—025X019N; Peeko soil—024X030N; Izod soil—024X030N; Inclusion 1—025X014N; Inclusion 2—025X019N; Inclusion 3—025X025N

400—Bilbo-Gance-Tustell association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Bilbo gravelly loam, 30 to 50 percent slopes (40 percent)
- Gance very gravelly loam, 15 to 30 percent slopes (30 percent)
- Tustell gravelly loam, 4 to 15 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Yuko gravelly loam, 15 to 30 percent slopes (6 percent)
- Inclusion 2: Xerollic Camborthids, loamy-skeletal, mixed, mesic, 15 to 50 percent slopes (5 percent)
- Inclusion 3: Connel very gravelly loamy sand, 2 to 8 percent slopes (4 percent)

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex, south-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 30 to 50 percent
Elevation: 5,400 to 5,900 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 4 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline

Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex, north-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,400 to 5,900 feet
Dominant present vegetation: Big sagebrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Tustell Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,400 to 5,900 feet
Dominant present vegetation: Big sagebrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 19 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 19 to 30 inches
Texture: Gravelly loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified very gravelly loamy sand to gravelly loamy fine sand
Structure: Massive
Consistence: Slightly hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.8 to 5.9 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—3; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Xerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans and foot slopes of fan piedmont remnant side slopes
Distinctive present vegetation: Needleandthread

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tustell soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—area reclaim, small stones, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Tustell Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Bilbo soil—7e, nonirrigated; Gance soil—7s, nonirrigated; Tustell soil—7s, nonirrigated
Range site: Bilbo soil—025X015N; Gance soil—025X019N; Tustell soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—024X017N

403—Bilbo-Shivlum-McIvey association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Bilbo gravelly loam, 30 to 75 percent slopes (35 percent)
- Shivlum silt loam, 15 to 30 percent slopes (30 percent)
- McIvey gravelly loam, 30 to 50 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Yuko gravelly sandy loam, 30 to 75 percent slopes (9 percent)
- Inclusion 2: Cumulic Cryaquolls, fine-loamy, mixed, 2 to 8 percent slopes (4 percent)
- Inclusion 3: Kleckner gravelly loam, 15 to 30 percent slopes (2 percent)

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex, south-facing side slopes of partial ballenas
Parent material: Mixed alluvium
Slope range: 30 to 75 percent
Elevation: 5,600 to 6,400 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 4 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6.0 to 9 inches
Runoff: Very rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Shivlum Soil

Classification: Aridic Argixerolls, fine-silty, mixed, frigid
Position on landscape: Concave, north-facing side slopes of partial ballenas
Parent material: Mixed alluvium influenced by loess
Slope range: 15 to 30 percent
Elevation: 5,600 to 6,400 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 9 to 34 inches
Texture: Silty clay loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Neutral

Depth: 34 to 60 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex, north-facing side slopes of partial ballenas
Parent material: Mixed alluvium
Slope range: 30 to 50 percent
Elevation: 5,600 to 6,400 feet
Dominant present vegetation: Antelope bitterbrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 9.5 to 13 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Cumulic Cryaquolls, fine-loamy, mixed
Position on landscape: Flood plains
Distinctive present vegetation: Quaking aspen
Inclusion 3
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Foot slopes of partial ballenas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Shivlum soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices

Range seeding: Poor—erodes easily

Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Shivlum Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—low strength
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the McIvey Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—too clayey, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Bilbo soil—7e, nonirrigated; Shivlum soil—6e, nonirrigated; McIvey soil—7e, nonirrigated
Range site: Bilbo soil—025X015N; Shivlum soil—025X012N; McIvey soil—025X012N; Inclusion 1—025X015N; Inclusion 2—025X064N; Inclusion 3—025X014N

411—Bilbo-Wieland-Soughe association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Bilbo gravelly loam, 15 to 30 percent slopes (40 percent)
• Wieland very gravelly loam, 4 to 15 percent slopes (25 percent)
• Soughe very gravelly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Kelk silt loam, 2 to 8 percent slopes (6 percent)
• Inclusion 2: Rock outcrop (3 percent)
• Inclusion 3:
• Inclusion 3: Hunnton gravelly loam, 2 to 4 percent slopes (3 percent)
• Inclusion 4: Shayla very gravelly silty clay loam, 30 to 50 percent slopes (3 percent)

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 30 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 4 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6.5 to 9 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.5 to 9.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Soughe Soil

Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 45

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 14 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline

Salinity: 0 to 2 mmhos per cm

Depth: 14 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.0 to 1.4 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans and foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: None
Inclusion 3
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 4
Classification: Typic Torriorthents, loamy-skeletal, mixed (calcareous), mesic, shallow
Position on landscape: Fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Soughe soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty
Roadfill: Fair—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Soughe Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Bilbo soil—7e, nonirrigated; Wieland soil—6s, nonirrigated; Soughe soil—7s, nonirrigated
Range site: Bilbo soil—025X015N; Wieland soil—025X019N; Soughe soil—025X019N; Inclusion 1—025X019N; Inclusion 2—none; Inclusion 3—025X019N; Inclusion 4—025X025N

413—Vanwyper-Bilbo-Soughe association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Vanwyper gravelly loam, 30 to 50 percent slopes (40 percent)
- Bilbo gravelly loam, 30 to 50 percent slopes (35 percent)
- Soughe very gravelly loam, 4 to 15 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Eboda loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Orovada fine sandy loam, 8 to 15 percent slopes (4 percent)
- Inclusion 3: Hussa loam, 0 to 2 percent slopes (1 percent)

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from shale, sandstone, and conglomerate
Slope range: 30 to 50 percent
Elevation: 5,000 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.3 to 3.5 inches
Water-supplying capacity: 6.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Concave, south-facing side slopes of hills
Parent material: Colluvium derived from shale, sandstone, and conglomerate
Slope range: 30 to 50 percent
Elevation: 5,000 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 4 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.0 to 1.4 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Idaho fescue

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Foot slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Soughe soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope

Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—hard to pack, large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Soughe Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock

414—Vanwyper-Loomis association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Vanwyper gravelly loam, 30 to 50 percent slopes (55 percent)
• Loomis very cobbly loam, 15 to 30 percent slopes (30 percent)

Contrasting inclusions:
• Inclusion 1: Quarz very gravelly loam, 4 to 15 percent slopes (7 percent)
• Inclusion 2: Humdun loam, 15 to 50 percent slopes (3 percent)
• Inclusion 3: Chiara loam, 4 to 15 percent slopes (3 percent)
• Inclusion 4: Rock outcrop (2 percent)

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Slightly concave, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite and andesite
Slope range: 30 to 50 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.3 to 3.5 inches
Water-supplying capacity: 6.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6

Hazard of erosion: By water—high; by wind—slight

Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Loomis Soil

Classification: Lithic Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite and andesite
Slope range: 15 to 30 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Black sagebrush, bluebunch wheatgrass, Indian ricegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 7 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 11 inches
Texture: Very cobbly clay
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 11 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 8 to 14 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.0 to 1.9 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7

Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Loomis soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—hard to pack, large stones

415—Vanwyper-Akler-Eboda association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Vanwyper very gravelly loam, 30 to 50 percent slopes (40 percent)
• Akler cobbly clay loam, 8 to 15 percent slopes (25 percent)
• Eboda loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: McIvey gravelly loam, 15 to 30 percent slopes (10 percent)
• Inclusion 2: Cotant cobbly loam, 8 to 15 percent slopes (3 percent)
• Inclusion 3: Welch loam, drained, 0 to 2 percent slopes (2 percent)

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Concave, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from shale
Slope range: 30 to 50 percent
Elevation: 5,700 to 6,100 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, basin wildrye, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 35

Depth: 0 to 10 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, very firm
Reaction: Mildly alkaline

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.2 to 3.1 inches
Water-supplying capacity: 6.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum derived from shale
Slope range: 8 to 15 percent
Elevation: 5,700 to 6,100 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 15

Depth: 0 to 6 inches
Texture: Cobbly clay loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 21 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.6 to 2.3 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Eboda Soil

Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Parent material: Loess over residuum derived from shale
Slope range: 15 to 30 percent
Elevation: 5,700 to 6,100 feet
Dominant present vegetation: Big sagebrush, serviceberry, antelope bitterbrush, Idaho fescue

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 9 inches
Texture: Loam

Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 33 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 33 to 39 inches
Texture: Gravelly sandy clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 39 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 23 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 5.2 to 6.8 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.28; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Slightly concave areas on crests and upper side slopes of hills
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills

Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Eboda soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Akler Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Eboda Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Vanwyper soil—7s, nonirrigated; Akler soil—7s, nonirrigated; Eboda soil—6e, nonirrigated
Range site: Vanwyper soil—025X015N; Akler soil—025X018N; Eboda soil—025X027N; Inclusion 1—025X012N; Inclusion 2—025X017N; Inclusion 3—025X003N

416—Vanwyper-Roca association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Vanwyper very gravelly loam, 15 to 50 percent slopes (50 percent)
• Roca very gravelly loam, 15 to 50 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Xerollic Camborthids, loamy-skeletal, mixed, frigid, 15 to 30 percent slopes (5 percent)
• Inclusion 2: Aridic Argixerolls, loamy-skeletal, mixed, frigid, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Soughe very gravelly loam, 8 to 15 percent slopes (5 percent)

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Smooth, south- and west-facing side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,000 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 35

Depth: 0 to 10 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.2 to 3.1 inches
Water-supplying capacity: 6.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Roca Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north- and east-facing side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,000 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 45

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 5 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 29 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 1.7 to 3.0 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Camborthids, loamy-skeletal, mixed, frigid
Position on landscape: Concave, south- and west-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north- and east-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Crests of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Roca soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Roca Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope

Interpretive Groups

Capability classification: Vanwyper soil—7s, nonirrigated; Roca soil—7s, nonirrigated
Range site: Vanwyper soil—025X015N; Roca soil—025X014N; Inclusion 1—025X014N; Inclusion 2—025X014N; Inclusion 3—025X019N

417—Vanwyper-Linkup-Loomis association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Vanwyper very cobbly loam, 15 to 50 percent slopes (35 percent)
• Linkup very gravelly loam, 8 to 15 percent slopes (30 percent)
• Loomis very cobbly loam, 8 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Aridic Argixerolls, fine-loamy, mixed, frigid, 4 to 8 percent slopes (8 percent)
• Inclusion 2: Roca gravelly loam, 15 to 30 percent slopes (7 percent)

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Smooth, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from andesite and rhyolite
Slope range: 15 to 50 percent
Elevation: 5,400 to 6,600 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 8 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 8 to 39 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 39 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Linkup Soil

Classification: Lithic Xerollic Haplargids, clayey, montmorillonitic, frigid
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from andesite and rhyolite
Slope range: 8 to 15 percent
Elevation: 5,400 to 6,600 feet
Dominant present vegetation: Low sagebrush, bottlebrush squirreltail, Thurber needlegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 40

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 8 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 8 to 16 inches
Texture: Gravelly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 16 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.9 to 2.9 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Loomis Soil

Classification: Lithic Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Crests of hills
Parent material: Residuum and colluvium derived from andesite and rhyolite
Slope range: 8 to 15 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 7 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 11 inches
Texture: Very cobbly clay
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 11 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 8 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.0 to 1.9 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Linkup soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Loomis soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices
Range seeding: Poor—large stones
Roadfill: Poor—depth to rock, low strength, large stones
Topsoil: Poor—large stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, large stones, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Linkup Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock, low strength
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Loomis Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock

418—Vanwyper-Connel-Hunewill association

Map Unit Setting

Position on landscape: Piedmont slopes

Composition

Major components:
• Vanwyper very gravelly loamy coarse sand, 30 to 50 percent slopes (35 percent)
• Connel fine sandy loam, 0 to 4 percent slopes (30 percent)
• Hunewill gravelly coarse sandy loam, 15 to 30 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Wieland gravelly loam, 4 to 15 percent slopes (4 percent)
• Inclusion 2: Bioya sandy loam, 2 to 4 percent slopes (4 percent)
• Inclusion 3: Puett gravelly loam, 30 to 50 percent slopes (2 percent)

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of partial ballenas with a rock core
Parent material: Residuum and colluvium derived from tuff
Slope range: 30 to 50 percent
Elevation: 5,300 to 5,800 feet
Dominant present vegetation: Big sagebrush, basin wildrye, Indian ricegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 4 inches
Texture: Very gravelly loamy coarse sand
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 24 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 24 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.2 to 3.1 inches
Water-supplying capacity: 6.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.05; T value—2; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Connel Soil

Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 4 percent
Elevation: 5,300 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, basin wildrye

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 7 to 20 inches
Texture: Loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Depth: 20 to 60 inches
Texture: Stratified very gravelly coarse sand to extremely gravelly loamy sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.32; T value—3; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hunewill Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Side slopes of partial ballenas
Parent material: Mixed alluvium
Slope range: 15 to 30 percent
Elevation: 5,300 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly coarse sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 19 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 19 to 62 inches
Texture: Extremely gravelly sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.5 to 4.5 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Relict summit areas of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Convex relict summit areas of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Eroded side slopes of partial pallenas with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Connel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hunewill soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Connel Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Hunewill Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

431—Gance-Shayla-Roca association

Map Unit Setting

Position on landscape: Fan piedmont remnants, hills

Composition

Major components:
• Gance very gravelly loam, 15 to 30 percent slopes (40 percent)
• Shayla very gravelly silty clay loam, 30 to 50 percent slopes (25 percent)
• Roca very gravelly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Loncan very gravelly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 2: Rock outcrop (3 percent)
• Inclusion 3: Alburz very gravelly loam, 0 to 2 percent slopes, rarely flooded (3 percent)
• Inclusion 4: Xerollic Haplargids, fine, montmorillonitic, mesic, 4 to 15 percent slopes (4 percent)

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,900 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Shayla Soil

Classification: Typic Torriorthents, loamy-skeletal, mixed (calcareous), mesic, shallow
Position on landscape: Convex side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 5,900 to 6,600 feet
Dominant present vegetation: Black sagebrush, Wyoming big sagebrush

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 45

Depth: 0 to 5 inches
Texture: Very gravelly silty clay loam
Structure: Subangular blocky
Consistence: Soft, very friable

Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 13 inches
Texture: Very gravelly silt loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 13 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 8 to 15 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.9 inch to 1.3 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Roca Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 5,900 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 45

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 5 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 29 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 1.7 to 3.0 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue
Inclusion 2
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 3
Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 4
Classification: Xerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Crests of hills
Distinctive present vegetation: Low sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Gance soil for named elements: Wild

herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Shayla soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Roca soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Gance Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—area reclaim, small stones, slope
Daily cover for landfill: Poor—area reclaim, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Shayla Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Roca Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Gance, Shayla, and Roca soils—7s, nonirrigated
Range site: Gance soil—025X019N; Shayla soil—025X025N; Roca soil—025X014N; Inclusion 1—025X012N; Inclusion 2—none; Inclusion 3—025X003N; Inclusion 4—025X018N

432—Gance-Chiara-Hunnton association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Gance very gravelly loam, 15 to 50 percent slopes (35 percent)
- Chiara silt loam, 4 to 8 percent slopes (25 percent)
- Hunnton silt loam, 4 to 8 percent slopes (25 percent)

Contrasting inclusions:
- Inclusion 1: Wieland silt loam, 4 to 15 percent slopes (7 percent)
- Inclusion 2: Kelk silt loam, 0 to 2 percent slopes (4 percent)
- Inclusion 3: Bioya silt loam, 2 to 4 percent slopes (4 percent)

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 50 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, scattered Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 8 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 8 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Gance soil—7s, nonirrigated; Chiara soil—4e, irrigated, 7s, nonirrigated; Hunnton soil—4e, irrigated, 6s, nonirrigated
Range site: Gance soil—025X019N; Chiara soil—025X019N; Hunnton soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N

440—Devilsgait-Woofus-Devilsgait, gravelly substratum association

Map Unit Setting

Position on landscape: Basin floors

Composition

Major components:
• Devilsgait silt loam, 0 to 2 percent slopes (40 percent)
• Woofus silty clay loam, 0 to 2 percent slopes (25 percent)
• Devilsgait silt loam, gravelly substratum, 0 to 2 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Ocala silt loam, slightly saline, 0 to 2 percent slopes (7 percent)
• Inclusion 2: Woofus silty clay loam, 0 to 2 percent slopes, ponded (3 percent)
• Inclusion 3: Sonoma silt loam, 0 to 2 percent slopes (3 percent)
• Inclusion 4: Tweba very fine sandy loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,000 to 5,400 feet
Dominant present vegetation: Basin wildrye, Nevada bluegrass, creeping wildrye, sedge, rush

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 10.3 to 11 inches
Water-supplying capacity: 9 to 13 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Woofus Soil

Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Natural levees on the flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,000 to 5,400 feet
Dominant present vegetation: Basin wildrye, Nevada bluegrass, creeping wildrye, sedge, rush

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 30 inches
Texture: Stratified loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified loamy fine sand to gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 24 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 7.2 to 9.5 inches
Water-supplying capacity: 9 to 13 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—3; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Devilsgait Soil, Gravelly Substratum

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,000 to 5,400 feet
Dominant present vegetation: Basin wildrye, Nevada bluegrass, creeping wildrye, sedge, rush

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 13 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 13 to 42 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 42 to 54 inches
Texture: Stratified gravelly silt loam to silty clay loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 54 to 63 inches
Texture: Extremely gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 11.5 inches
Water-supplying capacity: 9.0 to 13 inches
Runoff: Slow
Hydrologic group: D

Erosion factors (surface layer): K value—.37; T value—3; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats adjacent to fan piedmont remnants
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 2
Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Lower areas on the flood plains
Distinctive present vegetation: Basin wildrye

Inclusion 3
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 4
Classification: Aeric Fluvaquents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Slightly higher areas on the flood plains
Distinctive present vegetation: Basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Woofus soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—fair
Suitability of the Devilsgait soil, gravelly substratum, for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Suitability and Limitations of the Woofus Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—wetness
Topsoil: Fair—area reclaim, too clayey, small stones
Daily cover for landfill: Poor—seepage, too sandy, wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, piping, wetness
Sand: Probable source
Gravel: Probable source
Drainage: Flooding, frost action, cutbanks cave
Irrigation: Wetness, rooting depth, flooding
Terraces and diversions: Wetness, too sandy

Suitability and Limitations of the Devilsgait Soil, Gravelly Substratum, for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Probable source
Gravel: Probable source
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily, flooding
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Devilsgait soil—5w, irrigated, 6w, nonirrigated; Woofus soil—5w, irrigated and nonirrigated; Devilsgait soil, gravelly substratum—5w irrigated and nonirrigated
Range site: Both Devilsgait soils—025X001N; Woofus soil—025X001N; Inclusion 1—024X007N; Inclusion 2—025X001N; Inclusion 3—024X006N; Inclusion 4—025X001N

441—Devilsgait-Devilsgait, frequently flooded-Ocala association

Map Unit Setting

Position on landscape: Flood plains, alluvial flats

Composition

Major components:
• Devilsgait silt loam, drained, 0 to 2 percent slopes (40 percent)
• Devilsgait silt loam, 0 to 2 percent slopes, frequently flooded (25 percent)
• Ocala silt loam, 0 to 2 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Kelk silt loam, 0 to 2 percent slopes (10 percent)
• Inclusion 2: Zevadez sandy loam, 4 to 8 percent slopes (5 percent)

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,500 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 11.5 inches
Water-supplying capacity: 8 to 11 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Frequently Flooded Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,500 feet
Dominant present vegetation: Creeping wildrye, basin wildrye, rush, willow

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 10.3 to 11 inches
Water-supplying capacity: 9 to 13 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,500 feet
Dominant present vegetation: Rubber rabbitbrush, black greasewood, inland saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 12 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Inclusion 2
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs

(nonirrigated)—poor; wetland plants—poor; shallow water areas—poor
Suitability of the frequently flooded Devilsgait soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—shrink-swell potential
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Moderate—thin layer, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, erodes easily, flooding
Terraces and diversions: Erodes easily, soil blowing

Suitability and Limitations of the Frequently Flooded Devilsgait Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Suitability and Limitations of the Ocala Soil for Various Uses and Practices

Range seeding: Poor—excess salts, too crusty
Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Devilsgait soil—3w, irrigated, 6w, nonirrigated; the frequently flooded Devilsgait soil—5w, irrigated, 6w, nonirrigated; Ocala soil—4w, irrigated, 6w, nonirrigated
Range site: Devilsgait soil—025X003N; the frequently flooded Devilsgait soil—025X001N; Ocala soil—024X007N; Inclusion 1—024X006N; Inclusion 2—025X019N

442—Devilsgait-Crooked Creek association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Devilsgait silt loam, 0 to 2 percent slopes (50 percent)
• Crooked Creek silty clay loam, 0 to 2 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Alburz loam, 0 to 2 percent slopes (10 percent)
• Inclusion 2: Crooked Creek silty clay loam, 0 to 2 percent slopes, frequently flooded (3 percent)
• Inclusion 3: Ocala silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,900 feet
Dominant present vegetation: Basin big sagebrush, Nevada bluegrass, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,200 to 5,900 feet
Dominant present vegetation: Basin big sagebrush, Nevada bluegrass, basin wildrye

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 38 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 38 to 60 inches
Texture: Silty clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 6.8 to 7.4 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Natural levees on the flood plains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 2
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to stream channels
Distinctive present vegetation: Tufted hairgrass

Inclusion 3
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, alkali sacaton

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—poor
Suitability of the Crooked Creek soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—poor

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—shrink-swell potential
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Moderate—thin layer, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Suitability and Limitations of the Crooked Creek Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Poor—thin layer
Daily cover for landfill: Poor—too clayey, hard to pack
Shallow excavations: Moderate—too clayey, wetness
Local roads and streets: Severe—low strength, frost action, shrink-swell potential
Pond reservoir areas: Slight
Embankments, dikes, and levees: Moderate—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Devilsgait soil—3c, irrigated, 6c, nonirrigated; Crooked Creek soil—3w, irrigated, 6w, nonirrigated
Range site: Devilsgait soil—025X003N; Crooked Creek soil—025X003N; Inclusion 1—025X003N; Inclusion 2—025X005N; Inclusion 3—024X007N

443—Devilsgait-Sonoma association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
- Devilsgait silt loam, 0 to 2 percent slopes (45 percent)
- Sonoma silt loam, 0 to 2 percent slopes (40 percent)

Contrasting inclusions:
- Inclusion 1: Sonoma silt loam, drained, 0 to 2 percent slopes (7 percent)
- Inclusion 2: Devilsgait silt loam, 0 to 2 percent slopes, rarely flooded (5 percent)
- Inclusion 3: Sonoma silt loam, 0 to 2 percent slopes, occasionally flooded (3 percent)

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Lower areas on the flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Nevada bluegrass, wildrye, rush, willow

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 9 to 13 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Sonoma Soil

Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Higher areas on the flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Nevada bluegrass, wildrye, rush, willow

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 11 to 62 inches
Texture: Stratified silt loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm
Sodicity (SAR): 0 to 5

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 36 inches
Flooding: Frequency—frequent; duration—brief to long; months—February through June
Permeability: Moderately slow
Available water capacity: 11 to 12.5 inches
Water-supplying capacity: 9 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, basin wildrye

Inclusion 2
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 3
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs

(nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Sonoma soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Suitability and Limitations of the Sonoma Soil for Various Uses and Practices

Range seeding: Poor—excess salts
Roadfill: Poor—low strength
Topsoil: Fair—excess salts
Daily cover for landfill: Fair—too clayey, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Devilsgait soil—5w, irrigated, 6w, nonirrigated; Sonoma soil—3w, irrigated, 6w, nonirrigated
Range site: Devilsgait soil—025X001N; Sonoma soil—025X001N; Inclusion 1—024X007N; Inclusion 2—025X003N; Inclusion 3—024X006N

447—Donna gravelly loam, 2 to 8 percent slopes

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major component:
• Donna gravelly loam, 2 to 8 percent slopes (90 percent)
Contrasting inclusions:
• Inclusion 1: Crooked Creek silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Kleckner gravelly loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 6,200 to 6,400 feet
Dominant present vegetation: Low sagebrush, cheatgrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Alpine timothy, Nevada bluegrass
Inclusion 2
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Donna Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Donna soil—7s, nonirrigated
Range site: Donna soil—025X018N; Inclusion 1—025X006N; Inclusion 2—025X014N

448—Donna-Stampede-Quarz association

Map Unit Setting

Position on landscape: Fan piedmont remnants, hills

Composition

Major components:
• Donna gravelly loam, 2 to 8 percent slopes (40 percent)
• Stampede gravelly loam, 4 to 15 percent slopes (30 percent)
• Quarz very gravelly loam, 4 to 15 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Welch loam, 2 to 8 percent slopes (5 percent)
• Inclusion 2: Welch silt loam, 2 to 8 percent slopes (4 percent)
• Inclusion 3: Hunnton very gravelly loam, 4 to 15 percent slopes (4 percent)
• Inclusion 4: Gance very gravelly loam, 15 to 30 percent slopes (2 percent)

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Big sagebrush, cheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Quarz Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave foot slopes of hills
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Big sagebrush, cheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 26 inches
Texture: Very gravelly clay

Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 26 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.5 to 3.1 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains next to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush
Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Alpine timothy, Nevada bluegrass
Inclusion 3
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Summits and side slopes of fan piedmont remnants in the lower areas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 4
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Stampede soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Quarz soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Donna Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Quarz Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Donna soil—7s, nonirrigated; Stampede soil—6s, nonirrigated; Quarz soil—7s, nonirrigated
Range site: Donna soil—025X018N; Stampede soil—025X014N; Quarz soil—025X014N; Inclusion 1—025X003N; Inclusion 2—025X006N; Inclusion 3—025X019N; Inclusion 4—025X019N

449—Donna-Stampede-Short Creek association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Donna gravelly loam, 2 to 8 percent slopes (40 percent)
• Stampede gravelly loam, 4 to 15 percent slopes (25 percent)
• Short Creek gravelly clay loam, 30 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Cotant gravelly loam, 2 to 15 percent slopes (5 percent)
• Inclusion 2: Sumine very gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 3: Welch silt loam, 2 to 8 percent slopes (5 percent)

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Low sagebrush, Sandberg bluegrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Short Creek Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 30 to 50 percent
Elevation: 5,500 to 6,000 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 25

Depth: 0 to 3 inches
Texture: Gravelly clay loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 3 to 45 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 45 to 64 inches
Texture: Extremely gravelly sandy clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.6 to 5.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Low sagebrush, Idaho fescue
Inclusion 2
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Side slopes of hills
Distinctive present vegetation: Mountain big sagebrush
Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Stampede soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Short Creek soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Donna Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Short Creek Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Donna soil—7s, nonirrigated; Stampede soil—6s, nonirrigated; Short Creek soil—7e, nonirrigated
Range site: Donna soil—025X018N; Stampede soil—025X014N; Short Creek soil—025X015N; Inclusion 1—025X017N; Inclusion 2—025X009N; Inclusion 3—025X003N

452—Donna-Bilbo-Stampede association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Donna gravelly loam, 4 to 15 percent slopes (45 percent)
• Bilbo very gravelly loam, 15 to 30 percent slopes (30 percent)
• Stampede gravelly loam, 4 to 8 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Alburz very gravelly loam, 0 to 2 percent slopes (4 percent)
• Inclusion 2: Hussa silt loam, 0 to 2 percent slopes (2 percent)
• Inclusion 3: Crooked Creek silty clay loam, 0 to 2 percent slopes (2 percent)
• Inclusion 4: McIvey gravelly silt loam, 15 to 50 percent slopes (2 percent)

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Low sagebrush, Thurber needlegrass, Sandberg bluegrass

Climatic Data
Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile
Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy

Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.4 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex, south-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 30 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 70

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.1 inches
Water-supplying capacity: 6.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 8 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush
Inclusion 2
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass
Inclusion 3
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass
Inclusion 4
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Stampede soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Donna Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave

Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—small stones

454—Donna-Short Creek-Kleckner association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Donna gravelly loam, 2 to 8 percent slopes (35 percent)
• Short Creek very cobbly loam, 30 to 50 percent slopes (25 percent)
• Kleckner gravelly silt loam, 15 to 50 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Donna gravelly loam, 8 to 15 percent slopes (10 percent)
• Inclusion 2: McIvey gravelly silt loam, 15 to 50 percent slopes (5 percent)

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 6,000 to 6,500 feet
Dominant present vegetation: Low sagebrush, Thurber needlegrass, Webber ricegrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Short Creek Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex, south-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 30 to 50 percent
Elevation: 6,000 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 100 days

Typical Profile

Percent stones and boulders on the surface: 15
Percent cobbles on the surface: 30
Percent pebbles on the surface: 25

Depth: 0 to 3 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 3 to 45 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 45 to 64 inches
Texture: Extremely gravelly sandy clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.3 to 5.6 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kleckner Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 50 percent
Elevation: 6,000 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, lupine

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 25 to 41 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.8 to 8.6 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave, upper side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Short Creek soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Kleckner soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Donna Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Short Creek Soil for Various Uses and Practices
Range seeding: Poor—large stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Kleckner Soil for Various Uses and Practices
Range seeding: Fair—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Donna soil—7s, nonirrigated; Short Creek soil—7s, nonirrigated; Kleckner soil—7e, nonirrigated
Range site: Donna soil—025X0018N; Short Creek soil—025X015N; Kleckner soil—025X014N; Inclusion 1—025X018N; Inclusion 2—025X012N

455—Donna-Kleckner-Donna, strongly sloping association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Donna gravelly loam, 2 to 8 percent slopes (40 percent)
• Kleckner gravelly silt loam, 4 to 15 percent slopes (25 percent)
• Donna gravelly loam, 8 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Stampede gravelly loam, 2 to 8 percent slopes (7 percent)
• Inclusion 2: Eboda loam, 4 to 15 percent slopes (4 percent)
• Inclusion 3: McIvey gravelly silt loam, 15 to 30 percent slopes (3 percent)
• Inclusion 4: Crooked Creek silty clay loam, 0 to 2 percent slopes, frequently flooded (1 percent)

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 6,200 to 6,500 feet
Dominant present vegetation: Low sagebrush, Thurber needlegrass, Webber ricegrass

Climatic Data
Average annual precipitation: About 11 inches

Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kleckner Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, south-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 25 to 41 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.8 to 8.6 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Strongly Sloping Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave side slopes of fan piedmont remnants

Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 8 to 15 percent
Elevation: 6,200 to 6,500 feet
Dominant present vegetation: Low sagebrush, Thurber needlegrass, Webber ricegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Idaho fescue
Inclusion 3
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue
Inclusion 4
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Kleckner soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the strongly sloping Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Donna Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Kleckner Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones
Daily cover for landfill: Fair—small stones, slope
Shallow excavations: Moderate—too clayey, large stones, slope
Local roads and streets: Moderate—slope, shrink-swell potential, large stones
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Strongly Sloping Donna Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Donna soils—7s, nonirrigated; Kleckner soil—6s, nonirrigated
Range site: Both Donna soils—025X018N; Kleckner soil—025X014N; Inclusion 1—025X014N; Inclusion 2—025X027N; Inclusion 3—025X012N; Inclusion 4—025X005N

456—Donna-Stampede-Gance association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Donna gravelly loam, 2 to 8 percent slopes (45 percent)
• Stampede gravelly loam, 4 to 15 percent slopes (30 percent)
• Gance very gravelly loam, 15 to 30 percent slopes (20 percent)

Contrasting inclusions:
• Inclusion 1: Welsum loam, 0 to 2 percent slopes (3 percent)
• Inclusion 2: Crooked Creek silty clay loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Smooth or slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,600 to 6,600 feet
Dominant present vegetation: Low sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow

Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits and smooth, upper side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,600 to 6,600 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15
Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,600 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow

Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass, sedge

Inclusion 2
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass, sedge

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Stampede soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Donna Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Probable source

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—excess fines
Gravel: Probable source

Interpretive Groups

Capability classification: Donna soil—7s, nonirrigated; Stampede soil—6s, nonirrigated; Gance soil—7s, nonirrigated
Range site: Donna soil—025X018N; Stampede soil—025X014N; Gance soil—025X019N; Inclusion 1—025X005N; Inclusion 2—025X005N

457—Donna-Gochea-Kleckner association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Donna very cobbly loam, 4 to 15 percent slopes (35 percent)
• Gochea loam, 4 to 15 percent slopes (30 percent)
• Kleckner very cobbly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: McIvey very cobbly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 2: Cotant very cobbly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Aridic Haploxerolls, loamy-skeletal, mixed, frigid, 0 to 2 percent slopes (5 percent)

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Low sagebrush, Thurber needlegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified very gravelly sandy loam to very gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 2.6 to 3.1 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 21 to 41 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 60 inches
Texture: Extremely gravelly sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 5.0 to 7.3 inches
Water-supplying capacity: 9.5 to 11 inches
Runoff: Medium

Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—4; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kleckner Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: South-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 25 to 41 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.6 to 8.0 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: North-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Upper, north-facing side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 3
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gochea soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Kleckner soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Donna Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope

Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gochea Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Kleckner Soil for Various Uses and Practices

Range seeding: Poor—large stones
Roadfill: Fair—large stones, slope, shrink-swell potential
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Donna soil—7s, nonirrigated; Gochea soil—6c, nonirrigated; Kleckner soil—7s, nonirrigated
Range site: Donna soil—025X018N; Gochea soil—025X014N; Kleckner soil—025X014N; Inclusion 1—025X012N; Inclusion 2—025X017N; Inclusion 3—025X003N

460—Stampede-Betra-McIvey association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Stampede loam, 2 to 15 percent slopes (35 percent)
• Betra cobbly loam, 4 to 15 percent slopes (30 percent)
• McIvey gravelly loam, 2 to 15 percent slopes (20 percent)

Contrasting inclusions:
• Inclusion 1: McIvey very cobbly loam, 8 to 15 percent slopes (10 percent)
• Inclusion 2: McIvey gravelly loam, 8 to 15 percent slopes, stony (5 percent)

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 15 percent
Elevation: 6,100 to 6,600 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 11 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight

Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Betra Soil

Classification: Abruptic Aridic Durixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess
Slope range: 4 to 15 percent
Elevation: 6,100 to 6,600 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 5 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 5 to 9 inches
Texture: Very gravelly clay loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 21 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 21 to 42 inches
Texture: Cemented hardpan

Soil and Water Features

Depth to a hardpan: 20 to 30 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.0 to 2.7 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 15 percent
Elevation: 6,100 to 6,600 feet
Dominant present vegetation: Mountain big sagebrush, serviceberry, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches

Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Stampede soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Betra soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the McIvey soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—small stones
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Betra Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, too clayey, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Large stones, droughty, percs slowly
Terraces and diversions: Slope, large stones, cemented pan

Suitability and Limitations of the McIvey Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—too clayey, large stones
Shallow excavations: Moderate—too clayey, large stones, slope
Local roads and streets: Moderate—slope, frost action, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Large stones, droughty, percs slowly
Terraces and diversions: Slope, large stones, percs slowly

Interpretive Groups

Capability classification: Stampede soil—4e, irrigated, 6s, nonirrigated; Betra soil—4e, irrigated, 7s, nonirrigated; McIvey soil—4e, irrigated, 6c, nonirrigated
Range site: Stampede soil—025X014N; Betra soil—025X017N; McIvey soil—025X012N; Inclusion 1—025X012N; Inclusion 2—025X012N

461—Stampede-Kleckner association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Stampede loam, 4 to 15 percent slopes (60 percent)
• Kleckner very gravelly silty loam, 4 to 15 percent slopes (30 percent)
Contrasting inclusions:
• Inclusion 1: Fulstone gravelly loam, 4 to 15 percent slopes (7 percent)
• Inclusion 2: Welch silt loam, 0 to 2 percent slopes (3 percent)

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 11 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kleckner Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 25 to 41 inches
Texture: Gravelly clay loam
Structure: Subangular blocky

Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.8 to 8.6 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Abruptic Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Low sagebrush
Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Stampede soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Kleckner soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—too clayey
Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Kleckner Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones
Daily cover for landfill: Fair—small stones, slope
Shallow excavations: Moderate—too clayey, large stones, slope
Local roads and streets: Moderate—slope, shrink-swell potential, large stones
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Stampede soil—4e, irrigated, 6s, nonirrigated; Kleckner soil—6s, nonirrigated
Range site: Stampede soil—025X014N; Kleckner soil—025X014N; Inclusion 1—025X018N; Inclusion 2—025X003N

462—Stampede-Donna-Bilbo association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Stampede gravelly loam, 4 to 15 percent slopes (35 percent)
• Donna gravelly loam, 4 to 15 percent slopes (25 percent)
• Bilbo gravelly loam, 15 to 30 percent slopes (25 percent)

Contrasting inclusions:
- Inclusion 1: Puett loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Roca very gravelly loam, 15 to 30 percent slopes (5 percent)
- Inclusion 3: Aridic Argixerolls, fine-loamy, mixed, frigid, 4 to 15 percent slopes (5 percent)

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,200 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches

Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 30 percent
Elevation: 5,800 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 4 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 7 to 9 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: South-facing side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Inclusion 2
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Stampede soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Stampede Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—small stones, too clayey
Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan

Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Donna Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Fair—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Stampede soil—6s, nonirrigated; Donna soil—7s, nonirrigated; Bilbo soil—7e, nonirrigated
Range site: Stampede soil—025X014N; Donna soil—025X018N; Bilbo soil—025X015N; Inclusion 1—025X025N; Inclusion 2—025X014N; Inclusion 3—025X014N

465—Stampede-Gochea-Zevadez association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Stampede gravelly loam, 2 to 8 percent slopes (50 percent)
- Gochea gravelly loam, 8 to 15 percent slopes (25 percent)
- Zevadez gravelly loam, 30 to 50 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Shivlum silt loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Kleckner gravelly loam, 4 to 15 percent slopes (4 percent)
- Inclusion 3: Alburz gravelly loam, 0 to 2 percent slopes (1 percent)

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,600 to 5,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, crested wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess
Slope range: 8 to 15 percent
Elevation: 5,600 to 5,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, crested wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 21 to 41 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 60 inches
Texture: Extremely gravelly sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 7.0 inches
Water-supplying capacity: 9 to 10.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—4; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Moderate

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex, south-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 30 to 50 percent
Elevation: 5,600 to 5,800 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.2 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-silty, mixed, frigid
Position on landscape: Foot slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex summits and smooth, north-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Stampede soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Gochea soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Zevadez soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—small stones, too clayey
Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Gochea Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty, rooting depth, slope
Terraces and diversions: Slope, too sandy

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—slope
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Stampede soil—4e, irrigated, 6s, nonirrigated; Gochea soil—4e, irrigated, 6c, nonirrigated; Zevadez soil—7e, nonirrigated
Range site: Stampede soil—025X014N; Gochea soil—025X014N; Zevadez soil—025X015N; Inclusion 1—025X012N; Inclusion 2—025X014N; Inclusion 3—025X003N

466—Stampede-Bilbo association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Stampede gravelly loam, 4 to 15 percent slopes (60 percent)
• Bilbo very gravelly loam, 15 to 50 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Donna gravelly loam, 4 to 15 percent slopes (7 percent)
• Inclusion 2: McIvey very gravelly loam, 15 to 50 percent slopes (4 percent)
• Inclusion 3: Wieland gravelly loam, 2 to 8 percent slopes (2 percent)
• Inclusion 4: Puett gravelly sandy loam, 15 to 50 percent slopes (2 percent)

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,700 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: South-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 50 percent
Elevation: 5,700 to 6,300 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, Sandberg bluegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 70

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.1 inches
Water-supplying capacity: 6.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Low sagebrush

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: North-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 3
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Summits of fan piedmont remnants in the lower areas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Convex, south-facing side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Stampede soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—small stones, too clayey
Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Stampede soil—4e, irrigated, 6s, nonirrigated; Bilbo soil—7s, nonirrigated

Range site: Stampede soil—025X014N; Bilbo soil—025X015N; Inclusion 1—025X018N; Inclusion 2—025X012N; Inclusion 3—025X019N; Inclusion 4—025X025N

467—Stampede-Donna-Gance association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Stampede gravelly loam, 2 to 4 percent slopes (35 percent)
- Donna gravelly loam, 4 to 15 percent slopes (30 percent)
- Gance very cobbly loam, 15 to 30 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Loncan Variant loam, 2 to 8 percent slopes (5 percent)
- Inclusion 2: Dewar silt loam, 2 to 4 percent slopes (5 percent)
- Inclusion 3: Kelk silt loam, 2 to 4 percent slopes (5 percent)

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 4 percent
Elevation: 5,800 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits and smooth, upper side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,000 feet
Dominant present vegetation: Low sagebrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,800 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 5
Percent cobbles on the surface: 30
Percent pebbles on the surface: 30

Depth: 0 to 4 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aridic Duric Hapoxerolls, fine-loamy, mixed, mesic
Position on landscape: Inset fans next to stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 2
Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants in the lower areas
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass
Inclusion 3
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic

Position on landscape: Inset fans adjacent to fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Stampede soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Stampede Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—small stones, too clayey
Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Donna Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gance Soil for Various Uses and Practices

Range seeding: Poor—large stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Interpretive Groups

Capability classification: Stampede soil—6s, nonirrigated; Donna soil—7s, nonirrigated; Gance soil—7s, nonirrigated
Range site: Stampede soil—025X014N; Donna soil—025X018N; Gance soil—025X019N; Inclusion 1—025X003N; Inclusion 2—025X019N; Inclusion 3—025X019N

469—Stampede-Donna association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Stampede gravelly loam, 4 to 15 percent slopes (45 percent)
• Donna gravelly loam, 2 to 8 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Short Creek gravelly clay loam, 15 to 50 percent slopes (9 percent)
• Inclusion 2: Aridic Argixerolls, fine-loamy, mixed, frigid, 2 to 8 percent slopes (3 percent)
• Inclusion 3: Pachic Argixerolls, fine, montmorillonitic, frigid, 8 to 15 percent slopes (2 percent)
• Inclusion 4: Welch silt loam, 2 to 8 percent slopes (1 percent)

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Convex summits and upper side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches

Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

470—Stampede-Puett-Peeko association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Stampede Gravelly loam, 4 to 8 percent slopes (40 percent)
• Puett gravelly fine sandy loam, 15 to 30 percent slopes (25 percent)
• Peeko silt loam, 2 to 8 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Yuko gravelly loam, 15 to 30 percent slopes (7 percent)
• Inclusion 2: Xerollic Camborthids, loamy-skeletal, mixed, mesic, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Izod very gravelly loam, 8 to 15 percent slopes (3 percent)

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth, upper parts of summits on fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 8 percent
Elevation: 5,700 to 6,000 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Nevada bluegrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed, (calcareous) mesic, shallow
Position on landscape: Eroded side slopes of fan piedmont remnants
Parent material: Residuum derived from tuff
Slope range: 15 to 30 percent
Elevation: 5,700 to 6,000 feet
Dominant present vegetation: Black sagebrush, big sagebrush, Indian ricegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 2 inches
Texture: Gravelly fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 15 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Peeko Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Smooth, lower parts of summits on fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,700 to 5,900 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass, Thurber needlegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 5 inches
Texture: Silt loam

Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 8 inches
Texture: Gravelly silty loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 11 inches
Texture: Very gravelly silty loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 36 inches
Texture: Indurated hardpan

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—1; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Foot slopes of hills
Distinctive present vegetation: Black sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Stampede soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Peeko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—small stones, too clayey
Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Peeko Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones

Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Stampede soil—6s, nonirrigated; Puett soil—7e, nonirrigated; Peeko soil—7s, nonirrigated
Range site: Stampede soil—025X014N; Puett soil—025X025N; Peeko soil—024X030N; Inclusion 1—025X019N; Inclusion 2—025X014N; Inclusion 3—024X030N

477—Hunnton-Dacker association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Hunnton loam, 4 to 15 percent slopes (50 percent)
• Dacker silt loam, 2 to 8 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Chiara silt loam, 2 to 8 percent slopes (7 percent)
• Inclusion 2: Gance very gravelly loam, 8 to 15 percent slopes (5 percent)
• Inclusion 3: Norfork cobbly silty clay loam, 4 to 15 percent slopes (2 percent)
• Inclusion 4: Kelk silt loam, 0 to 2 percent slopes (1 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, cheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic

Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, cheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Black sagebrush, Indian ricegrass

Inclusion 4
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Dacker Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Hunnton soil—4e, irrigated, 6s, nonirrigated; Dacker soil—3e, irrigated, 6s, nonirrigated
Range site: Hunnton soil—025X019N; Dacker soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—024X030N; Inclusion 4—024X006N

478—Hunnton-Wieland-Bilbo association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Hunnton loam, 2 to 8 percent slopes (35 percent)
- Wieland gravelly loam, 4 to 15 percent slopes (30 percent)
- Bilbo very gravelly loam, 15 to 50 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Kleckner very gravelly loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Connel loam, 0 to 4 percent slopes (4 percent)
- Inclusion 3: Hunewill coarse sandy loam, 4 to 15 percent slopes (3 percent)
- Inclusion 4: Hunewill loam, 4 to 15 percent slopes (3 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,600 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive

Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly convex summits and smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,600 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.7 to 9.2 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: South-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 50 percent
Elevation: 5,600 to 5,800 feet
Dominant present vegetation: Big sagebrush, basin wildrye, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 70

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy

Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.1 inches
Water-supplying capacity: 6.0 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: North-facing foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, needleandthread
Inclusion 4
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: South-facing foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer

Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Hunnton soil—4e, irrigated, 6s, nonirrigated; Wieland soil—6s, nonirrigated; Bilbo soil—7s, nonirrigated

479—Hunnton-Wieland-Bloor association

Map Unit Setting

Position on landscape: Fan piedmont remnants, inset fans

Composition

Major components:
• Hunnton silt loam, 2 to 8 percent slopes (35 percent)
• Wieland silt loam, 2 to 8 percent slopes (35 percent)
• Bloor silt loam, 0 to 2 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Xerollic Nadurargids, fine, montmorillonitic, mesic, 0 to 2 percent slopes (7 percent)
• Inclusion 2: Alburz loam, 0 to 2 percent slopes (3 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Big sagebrush, cheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, Very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low

Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Big sagebrush, cheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.5 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bloor Soil

Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Fan skirts
Parent material: Mixed alluvium influenced by loess
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 0 to 10

Depth: 8 to 20 inches
Texture: Silty clay loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Strongly alkaline
Salinity: More than 8 mmhos per cm
Sodicity (SAR): 46 to 70

Depth: 20 to 42 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Very strongly alkaline
Salinity: More than 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 42 to 60 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Very strongly alkaline
Salinity: More than 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 60 to 72 inches
Flooding: Frequency—rare
Permeability: Slow
Available water capacity: 4.7 to 7.3 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—high
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Nadurargids, fine, montmorillonitic, mesic
Position on landscape: Concave summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Alpine timothy, Nevada bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Bloor soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—very poor; shrubs (nonirrigated)—very poor; wetland plants—fair; shallow water areas—very poor

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Bloor Soil for Various Uses and Practices
Range seeding: Poor—excess salts, excess sodium
Roadfill: Good
Topsoil: Poor—excess salts
Daily cover for landfill: Good
Shallow excavations: Moderate—wetness
Local roads and streets: Moderate—flooding, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping, excess salts
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Hunnton soil—4e, irrigated, 6s, nonirrigated; Wieland soil—3e, irrigated, 6s, nonirrigated; Bloor soil—6s, irrigated, 7s, nonirrigated
Range site: Hunnton soil—025X019N; Wieland soil—025X019N; Bloor soil—024X006N; Inclusion 1—025X019N; Inclusion 2—025X006N

480—Hunnton-Wieland-Gance association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Hunnton loam, 2 to 4 percent slopes (35 percent)
• Wieland loam, 4 to 15 percent slopes (35 percent)
• Gance very gravelly loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Orovada silt loam, 8 to 15 percent slopes (5 percent)
• Inclusion 2: Puett silt loam, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Chiara loam, 2 to 8 percent slopes (3 percent)
• Inclusion 4: Kelk silt loam, 2 to 8 percent slopes (2 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,000 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,000 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.5 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,000 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Concave foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Black sagebrush, Wyoming big sagebrush, spiny hopsage
Inclusion 3
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 4
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, pasture, hayland
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Slope, erodes easily, percs slowly

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Interpretive Groups

Capability classification: Hunnton soil—4e, irrigated, 6s, nonirrigated; Wieland soil—4e, irrigated, 6s, nonirrigated; Gance soil—7s, nonirrigated
Range site: Hunnton soil—025X019N; Wieland soil—025X019N; Gance soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X025N; Inclusion 3—025X019N; Inclusion 4—025X019N

481—Hunnton-Chiara association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Hunnton silt loam, 2 to 8 percent slopes (60 percent)
- Chiara silt loam, 2 to 8 percent slopes (30 percent)

Contrasting inclusions:
- Inclusion 1: Enko sandy loam, 0 to 2 percent slopes (5 percent)
- Inclusion 2: Wieland silt loam, 8 to 15 percent slopes (5 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,700 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,700 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky

Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 to 20 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass
Inclusion 2
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Hunnton soil—4e, irrigated, 6s, nonirrigated; Chiara soil—4e, irrigated, 7s, nonirrigated
Range site: Hunnton soil—025X019N; Chiara soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N

482—Hunnton-Wieland-Hunnton, gravelly association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Hunnton loam, 4 to 15 percent slopes (35 percent)
- Wieland very gravelly loam, 15 to 30 percent slopes (35 percent)
- Hunnton gravelly loam, 2 to 4 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Puett loam, 30 to 50 percent slopes (5 percent)
- Inclusion 2: Gance very gravelly loam, 15 to 30 percent slopes (5 percent)
- Inclusion 3: Kelk silt loam, 0 to 2 percent slopes (3 percent)
- Inclusion 4: Bloor silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.5 to 9.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gravelly Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.6 to 3.9 inches
Water-supplying capacity: 7 to 8 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, black sagebrush

Inclusion 2
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic

Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Black greasewood, basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the gravelly Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gravelly Hunnton Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty, percs slowly, cemented pan
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Both Hunnton soils—4e, irrigated, 6s, nonirrigated; Wieland soil—6s, nonirrigated
Range site: Both Hunnton soils—025X019N; Wieland soil—025X019N; Inclusion 1—025X025N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—024X007N

485—Hunnton-Wieland-Wieland, moderately steep association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Hunnton loam, 2 to 8 percent slopes (45 percent)

• Wieland silt loam, 2 to 8 percent slopes (25 percent)
• Wieland gravelly loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Enko sandy loam, 0 to 4 percent slopes (7 percent)
• Inclusion 2: Chiara silt loam, 2 to 4 percent slopes (5 percent)
• Inclusion 3: Bloor silt loam, 0 to 2 percent slopes (2 percent)
• Inclusion 4: Gochea silt loam, 30 to 50 percent slopes (1 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.5 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Moderately Steep Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.7 to 9.2 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Fan skirts

Distinctive present vegetation: Basin big sagebrush, black greasewood, basin wildrye

Inclusion 4

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid

Position on landscape: Concave side slopes of fan piedmont remnants and the adjacent hills

Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat

Potential foreseeable uses: Cropland, hayland, pasture

Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability of the moderately steep Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices

Range seeding: Fair—too arid

Roadfill: Poor—cemented pan

Topsoil: Poor—small stones, area reclaim

Daily cover for landfill: Poor—cemented pan, seepage, small stones

Shallow excavations: Severe—cemented pan, cutbanks cave

Local roads and streets: Severe—low strength, shrink-swell potential

Pond reservoir areas: Moderate—seepage, cemented pan, slope

Embankments, dikes, and levees: Severe—seepage

Sand: Probable source

Gravel: Probable source

Drainage: Deep to water

Irrigation: Percs slowly, cemented pan, slope

Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices

Range seeding: Fair—too arid

Roadfill: Good

Topsoil: Poor—small stones, area reclaim

Daily cover for landfill: Poor—small stones

Shallow excavations: Moderate—too clayey

Local roads and streets: Severe—low strength, shrink-swell potential

Pond reservoir areas: Moderate—seepage, slope

Embankments, dikes, and levees: Moderate—thin layer

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Drainage: Deep to water

Irrigation: Percs slowly, slope, erodes easily

Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Moderately Steep Wieland Soil for Various Uses and Practices

Range seeding: Fair—too arid, erodes easily

Roadfill: Fair—slope

Topsoil: Poor—small stones, area reclaim, slope

Daily cover for landfill: Poor—small stones, slope

Shallow excavations: Severe—slope

Local roads and streets: Severe—low strength, slope, shrink-swell potential

Pond reservoir areas: Severe—slope

Embankments, dikes, and levees: Moderate—thin layer

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Hunnton soil—4e, irrigated, 6s, nonirrigated; Wieland soil—3e, irrigated, 6s, nonirrigated; the moderately steep Wieland soil—6e, nonirrigated

Range site: Hunnton soil—025X019N; both Wieland soils—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—024X006N; Inclusion 4—025X014N

486—Hunnton-Chiara-Wieland association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:

- Hunnton silt loam, 2 to 8 percent slopes (40 percent)
- Chiara silt loam, 2 to 8 percent slopes (30 percent)
- Wieland silt loam, 4 to 15 percent slopes (15 percent)

Contrasting inclusions:

- Inclusion 1: Enko sandy loam, 2 to 8 percent slopes (9 percent)
- Inclusion 2: Stampede silt loam, 2 to 8 percent slopes (6 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic

Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,200 to 6,200 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock. More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,200 to 6,200 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, thickspike wheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 to 14 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches

Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,200 to 6,200 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.5 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans and foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Summits of fan piedmont remnants in the higher areas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Chiara Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Slope, erodes easily, percs slowly

Interpretive Groups

Capability classification: Hunnton soil—4e, irrigated, 6s, nonirrigated; Chiara soil—4e, irrigated, 7s, nonirrigated; Wieland soil—4e, irrigated, 6s, nonirrigated
Range site: Hunnton soil—025X019N; Chiara soil—025X019N; Wieland soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X014N

489—Hunnton-Wieland-Bioya association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Hunnton loam, 2 to 8 percent slopes (35 percent)
- Wieland loam, 2 to 8 percent slopes (30 percent)
- Bioya loam, 2 to 8 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Chiara loam, 2 to 4 percent slopes (5 percent)
- Inclusion 2: Gance very gravelly loam, 15 to 30 percent slopes (5 percent)
- Inclusion 3: Grina gravelly loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,200 to 5,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam

Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,200 to 5,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bioya Soil

Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants

Parent material: Loess over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,200 to 5,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 14 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 14 to 27 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 27 to 41 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, brittle
Reaction: Moderately alkaline

Depth: 41 to 60 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 4.2 to 5.7 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.55; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Utah juniper
Other inclusions of minor extent
Classification: Pachic Argixerolls, fine, montmorillonitic, frigid
Location: Near Lee
Distinctive present vegetation: Tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Bioya soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Bioya Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—cemented pan
Topsoil: Fair—cemented pan, thin layer
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Hunnton soil—4e, irrigated, 6s, nonirrigated; Wieland soil—3e, irrigated, 6s, nonirrigated; Bioya soil—3e, irrigated, 7s, nonirrigated
Range site: Hunnton soil—025X019N; Wieland soil—025X019N; Bioya soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X059N

490—Orovada-Bioya-Haybourne association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Orovada fine sandy loam, 4 to 15 percent slopes (35 percent)
• Bioya very fine sandy loam, 2 to 4 percent slopes (30 percent)
• Haybourne sandy loam, 15 to 30 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Puett gravelly sandy loam, 15 to 50 percent slopes (5 percent)
• Inclusion 2: Chiara loam, 2 to 8 percent slopes (5 percent)

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,300 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam

Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bioya Soil

Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Loess over mixed alluvium
Slope range: 2 to 4 percent
Elevation: 5,300 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 14 inches
Texture: Very fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 14 to 27 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 27 to 41 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, brittle
Reaction: Moderately alkaline

Depth: 41 to 60 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 4.2 to 5.8 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.55; T value—2; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Haybourne Soil

Classification: Xerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 30 percent
Elevation: 5,300 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 35 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 35 to 60 inches
Texture: Stratified gravelly coarse sand to fine sandy loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 5.1 to 6.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, black sagebrush

Inclusion 2

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat

Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Orovada soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Bioya soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Haybourne soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—fair; shallow water areas—fair

Suitability and Limitations of the Orovada Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, slope, erodes easily
Terraces and diversions: Slope, erodes easily, soil blowing

Suitability and Limitations of the Bioya Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—cemented pan
Topsoil: Fair—cemented pan, thin layer
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Haybourne Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Fair—slope
Topsoil: Poor—small stones
Daily cover for landfill: Poor—too sandy, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Droughty, slope
Terraces and diversions: Slope, too sandy

Interpretive Groups

Capability classification: Orovada soil—4e, irrigated, 6c, nonirrigated; Bioya soil—3e, irrigated, 7s, nonirrigated; Haybourne soil—6e, irrigated, 6c, nonirrigated
Range site: Orovada soil—025X019N; Bioya soil—025X019N; Haybourne soil—025X019N; Inclusion 1—025X025N; Inclusion 2—025X019N

491—Orovada-Puett association

Map Unit Setting

Position on landscape: Fan piedmonts

Composition

Major components:
• Orovada loam, 4 to 15 percent slopes (50 percent)
• Puett fine sandy loam, 15 to 30 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Connel coarse sandy loam, 2 to 8 percent slopes (4 percent)
• Inclusion 2: Kelk silt loam, 2 to 8 percent slopes (4 percent)
• Inclusion 3: Chiara silt loam, 2 to 8 percent slopes (4 percent)
• Inclusion 4: Zevadez sandy loam, 8 to 15 percent slopes (3 percent)

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of partial ballenas with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 30 percent
Elevation: 5,300 to 5,500 feet

Dominant present vegetation: Big sagebrush, black sagebrush, antelope bitterbrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 2 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 15 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.9 to 2.3 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Foot slopes of partial ballenas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Relict summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 4
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex side slopes of partial ballenas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Orovada soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Orovada Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Puett Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Orovada soil—6c, nonirrigated; Puett soil—7e, nonirrigated

Range site: Orovada soil—025X019N; Puett soil—025X025N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

492—Orovada-Humdun-Puett association

Map Unit Setting

Position on landscape: Fan piedmonts

Composition

Major components:
- Orovada fine sandy loam, 4 to 15 percent slopes (35 percent)
- Humdun loam, 15 to 30 percent slopes (30 percent)
- Puett fine sandy loam, 15 to 30 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Grina sandy loam, 15 to 50 percent slopes (7 percent)
- Inclusion 2: Xerollic Camborthids, coarse-loamy, mixed, frigid, 15 to 30 percent slopes (5 percent)
- Inclusion 3: Chiara loam, 2 to 8 percent slopes (3 percent)

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,000 to 5,600 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Humdun Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, frigid
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 15 to 30 percent
Elevation: 5,000 to 5,600 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 7 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 29 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 29 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 2 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 10 to 11.9 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 30 percent
Elevation: 5,000 to 5,600 feet
Dominant present vegetation: Big sagebrush, black sagebrush, antelope bitterbrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 2 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 15 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.9 to 2.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core and the adjacent hills
Distinctive present vegetation: Big sagebrush, Utah juniper
Inclusion 2
Classification: Xerollic Camborthids, coarse-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Orovada soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Humdun soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Orovada Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Humdun Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Fair—slope
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Orovada soil—6c, nonirrigated; Humdun soil—6e, nonirrigated; Puett soil—7e, nonirrigated
Range site: Orovada soil—025X019N; Humdun soil—025X019N; Puett soil—025X025N; Inclusion 1—025X059N; Inclusion 2—025X014N; Inclusion 3—025X019N

494—Orovada-Puett-Chiara association

Map Unit Setting

Position on landscape: Fan piedmonts

Composition

Major components:
- Orovada fine sandy loam, 4 to 15 percent slopes (45 percent)
- Puett sandy loam, 15 to 30 percent slopes (20 percent)
- Chiara silt loam, 2 to 8 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Enko fine sandy loam, 0 to 4 percent slopes (4 percent)
- Inclusion 2: Zevadez loamy fine sand, 4 to 15 percent slopes (4 percent)
- Inclusion 3: Haybourne coarse sandy loam, 8 to 15 percent slopes (4 percent)
- Inclusion 4: Bioya loam, 2 to 8 percent slopes (3 percent)

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 30 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Wyoming big sagebrush, black sagebrush, Indian ricegrass

Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,300 to 5,500 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 to 14 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 4
Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Orovada soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Orovada Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, slope, erodes easily
Terraces and diversions: Slope, erodes easily, soil blowing

Suitability and Limitations of the Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water

Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Orovada soil—4e, irrigated, 6c, nonirrigated; Puett soil—7e, nonirrigated; Chiara soil—4e, irrigated, 7s, nonirrigated
Range site: Orovada soil—025X019N; Puett soil—025X025N; Chiara soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

496—Orovada-Grina-Upsteer association

Map Unit Setting

Position on landscape: Hills, fan piedmonts

Composition

Major components:
• Orovada fine sandy loam, 4 to 15 percent slopes (35 percent)
• Grina gravelly loam, 15 to 50 percent slopes (30 percent)
• Upsteer silt loam, 15 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Tuffo coarse sandy loam, 30 to 50 percent slopes (7 percent)
• Inclusion 2: Tuffo coarse sandy loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Yuko gravelly sandy loam, 30 to 50 percent slopes (3 percent)

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,200 to 5,600 feet
Dominant present vegetation: Big sagebrush, cheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Grina Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum derived from siltstone and tuff
Slope range: 15 to 50 percent
Elevation: 5,200 to 5,600 feet
Dominant present vegetation: Big sagebrush, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable

Reaction: Moderately alkaline

Depth: 7 to 18 inches
Texture: Silty clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline

Depth: 18 to 22 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.3 to 3.2 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Upsteer Soil

Classification: Aridic Duric Haploxerolls, fine-silty, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Parent material: Loess over alluvium derived from tuff
Slope range: 15 to 50 percent
Elevation: 5,200 to 5,600 feet
Dominant present vegetation: Big sagebrush, Idaho fescue, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 11 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 35 to 61 inches
Texture: Loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 11.5 to 13 inches
Water-supplying capacity: 12 to 16 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Convex side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Convex foot slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 3
Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Smooth side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Orovada soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Grina soil for named elements: Wild herbaceous plants (nonirrigated)—poor; coniferous plants (nonirrigated)—very poor; shrubs (nonirrigated)—poor

Suitability of the Upsteer soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Orovada Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Grina Soil for Woodland

Site index for common trees: Utah juniper—18
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Grina Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty, depth to rock
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Upsteer Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Orovada soil—4e, irrigated, 6c, nonirrigated; Grina soil—7e, nonirrigated; Upsteer soil—7e, nonirrigated
Range site: Orovada soil—025X019N; Grina soil—025X059N; Upsteer soil—025X027N; Inclusion 1—025X015N; Inclusion 2—025X015N; Inclusion 3—025X019N

501—Short Creek-Short Creek, very steep association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Short Creek gravelly clay loam, 30 to 50 percent slopes (50 percent)
• Short Creek gravelly clay loam, 50 to 75 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Aridic Calcic Argixerolls, fine, montmorillonitic, frigid (5 percent)
• Inclusion 2: Enko loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Short Creek Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: South-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 30 to 50 percent
Elevation: 5,400 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass
rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 100 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 25

Depth: 0 to 3 inches
Texture: Gravelly clay loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 3 to 45 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 45 to 64 inches
Texture: Extremely gravelly sandy clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.6 to 5.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Very Steep Short Creek Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: North-facing side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 50 to 75 percent
Elevation: 5,400 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, antelope bitterbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 100 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 25

Depth: 0 to 3 inches
Texture: Gravelly clay loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 3 to 45 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 45 to 64 inches
Texture: Extremely gravelly sandy clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.6 to 5.9 inches
Water-supplying capacity: 7.5 to 12 inches
Runoff: Very rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Calcic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Concave foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Short Creek soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the very steep Short Creek soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Short Creek Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Very Steep Short Creek Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Short Creek soils—7e, nonirrigated
Range site: Short Creek soil—025X015N; the very steep Short Creek soil—025X012N; Inclusion 1—025X014N; Inclusion 2—025X019N

511—Dacker-Gance-Kelk association

Map Unit Setting

Position on landscape: Fan piedmont remnants, inset fans

Composition

Major components:
• Dacker silt loam, 2 to 8 percent slopes (50 percent)
• Gance very gravelly loam, 15 to 30 percent slopes (20 percent)
• Kelk silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Hunnton loam, 4 to 15 percent slopes (5 percent)
• Inclusion 2: Puett silt loam, 30 to 50 percent slopes (5 percent)
• Inclusion 3: Wieland gravelly loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low

Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass
Inclusion 3
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Dacker Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Gance Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Dacker soil—3e, irrigated, 6s, nonirrigated; Gance soil—7s, nonirrigated; Kelk soil—2s, irrigated, 6s, nonirrigated
Range site: Dacker soil—025X019N; Gance soil—025X019N; Kelk soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X025N; Inclusion 3—025X019N

512—Dacker-Zevadez-Kelk association

Map Unit Setting

Position on landscape: Fan piedmont remnants, inset fans

Composition

Major components:
- Dacker silt loam, 2 to 4 percent slopes (45 percent)
- Zevadez loam, 4 to 15 percent slopes (25 percent)
- Kelk silt loam, 0 to 2 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Haybourne gravelly coarse sandy loam, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Hunnton loam, 2 to 4 percent slopes (4 percent)
- Inclusion 3: Enko fine sandy loam, 0 to 4 percent slopes (3 percent)
- Inclusion 4: Connel sandy loam, 0 to 8 percent slopes (3 percent)

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,400 to 5,800 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Zevadez Soil

Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,400 to 5,800 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 16 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable

Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 16 to 33 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 33 to 62 inches
Texture: Loamy sand
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 7.4 to 9.3 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,800 feet
Dominant present vegetation: Big sagebrush, cheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans and the adjacent fan skirts
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4

Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans and the adjacent fan skirts
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Zevadez soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Dacker Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Zevadez Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Fair—small stones, slope
Daily cover for landfill: Fair—too sandy, slope
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, rooting depth
Terraces and diversions: Slope, erodes easily, too sandy

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Dacker soil—3e, irrigated, 6s, nonirrigated; Zevadez soil—4e, irrigated, 6c, nonirrigated; Kelk soil—2s, irrigated, 6s, nonirrigated
Range site: Dacker soil—025X019N; Zevadez soil—025X019N; Kelk soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

513—Dacker-Dewar-Hunewill association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Dacker silt loam, 4 to 8 percent slopes (40 percent)
• Dewar gravelly silt loam, 2 to 4 percent slopes (30 percent)
• Hunewill gravelly sandy loam, 8 to 15 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Orovada gravelly loam, 8 to 15 percent slopes (5 percent)
• Inclusion 2: Hunewill very gravelly coarse sandy loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Xerollic Camborthids, loamy-skeletal, mixed, mesic, 15 to 30 percent slopes (5 percent)

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 8 percent
Elevation: 5,500 to 5,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Dewar Soil

Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,500 to 5,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 11 inches
Texture: Gravelly silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 11 to 17 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 17 to 44 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm

Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 13 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.1 to 2.8 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hunewill Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 8 to 15 percent
Elevation: 5,500 to 5,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 19 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 19 to 62 inches
Texture: Extremely gravelly sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.5 to 4.5 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Needleandthread

Inclusion 3
Classification: Xerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Dewar soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Hunewill soil for named elements: Grain

and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Dacker Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Dewar Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope, erodes easily
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Hunewill Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action, large stones
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Large stones, droughty, slope
Terraces and diversions: Slope, large stones, too sandy

Interpretive Groups

Capability classification: Dacker soil—3e, irrigated, 6s, nonirrigated; Dewar soil—4e, irrigated, 7s, nonirrigated; Hunewill soil—4e, irrigated, 6c, nonirrigated
Range site: Dacker soil—025X019N; Dewar soil—025X019N; Hunewill soil—025X019N; Inclusion 1—025X019N; Inclusion 2—024X017N; Inclusion 3—025X019N

516—Dacker-Yuko-Wieland association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Dacker silt loam, 2 to 4 percent slopes (40 percent)
• Yuko very gravelly loam, 15 to 30 percent slopes (25 percent)
• Wieland loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Puett sandy loam, 15 to 50 percent slopes (8 percent)
• Inclusion 2: Kelk silt loam, 0 to 2 percent slopes (4 percent)
• Inclusion 3: Zevadez gravelly loam, 4 to 15 percent slopes (3 percent)

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches

Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Smooth side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 15 to 30 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 50

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Convex side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, black sagebrush

Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Dacker Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Yuko Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Wieland Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Slope, erodes easily, percs slowly

Interpretive Groups

Capability classification: Dacker soil—3e, irrigated, 6s, nonirrigated; Yuko soil—7s, nonirrigated; Wieland soil—4e, irrigated, 6s, nonirrigated
Range site: Dacker soil—025X019N; Yuko soil—025X019N; Wieland soil—025X019N; Inclusion 1—025X025N; Inclusion 2—025X019N; Inclusion 3—025X019N

521—Norfork-Loomis-Chiara association

Map Unit Setting

Position on landscape: Hills, fan piedmont remnants

Composition

Major components:
• Norfork very cobbly silt loam, 15 to 30 percent slopes (40 percent)
• Loomis very cobbly loam, 15 to 30 percent slopes (25 percent)
• Chiara silt loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (5 percent)
• Inclusion 2: Devilsgait silt loam, 0 to 2 percent slopes (4 percent)
• Inclusion 3: Hunnton loam, 15 to 30 percent slopes (3 percent)
• Inclusion 4: Rubble land (3 percent)

Characteristics of the Norfolk Soil

Classification: Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Smooth side slopes of hills
Parent material: Residuum derived from basalt and influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,500 to 6,500 feet
Dominant present vegetation: Black sagebrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 2 inches
Texture: Very cobbly silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 12 inches
Texture: Gravelly silty clay
Structure: Prismatic
Consistence: Hard, very friable
Reaction: Mildly alkaline

Depth: 12 to 24 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Depth: 24 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: 21 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.7 to 2.3 inches
Water-supplying capacity: 6 to 7.5 inches
Runoff: Rapid
Hydrologic group: D

Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Loomis Soil

Classification: Lithic Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum and colluvium derived from andesite and rhyolite
Slope range: 15 to 30 percent
Elevation: 5,500 to 6,500 feet
Dominant present vegetation: Black sagebrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 7 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 11 inches
Texture: Very cobbly clay
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 11 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 8 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.0 to 1.9 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,500 to 6,500 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass, basin wildrye

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 to 20 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 14 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches

Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 2
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Wildrye, willow
Inclusion 3
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 4
Position on landscape: Side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Norfork soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Loomis soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Chiara soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Norfork Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—cemented pan, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, cemented pan, slope
Local roads and streets: Severe—cemented pan, slope
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Loomis Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Norfork soil—7e, nonirrigated; Loomis soil—7s, nonirrigated; Chiara soil—7s, nonirrigated
Range site: Norfork soil—024X030N; Loomis soil—024X030N; Chiara soil—025X019N; Inclusion 1—none; Inclusion 2—025X001N; Inclusion 3—025X019N; Inclusion 4—none

530—Upville-Connel-Halleck association

Map Unit Setting

Position on landscape: Stream terraces, flood plains

Composition

Major components:
• Upville gravelly loam, 0 to 4 percent slopes (55 percent)
• Connel gravelly loam, 0 to 2 percent slopes (20 percent)
• Halleck silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Alburz Variant loam, 0 to 4 percent slopes (5 percent)
• Inclusion 2: Welsum loam, 0 to 2 percent slopes (3 percent)
• Inclusion 3: Aridic Argixerolls, fine-loamy, mixed, frigid, 2 to 8 percent slopes (2 percent)

Characteristics of the Upville Soil

Classification: Aridic Haploxerolls, sandy-skeletal, mixed, frigid
Position on landscape: Upper stream terraces
Parent material: Alluvium derived from granitic rock
Slope range: 0 to 4 percent
Elevation: 5,500 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, antelope bitterbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 95 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 10

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 10 to 19 inches
Texture: Very gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 19 to 61 inches
Texture: Extremely gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.1 to 4.8 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Connel Soil

Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Lower stream terraces
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,500 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 7 to 20 inches
Texture: Loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Depth: 20 to 60 inches
Texture: Stratified very gravelly loamy sand to extremely gravelly coarse sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.6 to 4.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.24; T value—3; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Halleck Soil

Classification: Cumulic Haplaquolls fine-silty, mixed (calcareous), frigid
Position on landscape: Flood plains

Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,500 to 6,100 feet
Dominant present vegetation: Willow, rush, sedge

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 9 to 36 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 36 to 61 inches
Texture: Stratified loam to silty clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 30 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 12 to 14 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Typic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Natural levees on the flood plains adjacent to stream channels
Distinctive present vegetation: Cottonwood

Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to stream channels
Distinctive present vegetation: Tufted hairgrass

Inclusion 3
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Upper stream terraces
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the Upville soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Connel soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Halleck soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Upville Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action, large stones
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Large stones, droughty
Terraces and diversions: Large stones, too sandy

Suitability and Limitations of the Connel Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty
Terraces and diversions: Too sandy

Suitability and Limitations of the Halleck Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Fair—too clayey, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, flooding
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Upville soil—4s, irrigated, 7s, nonirrigated; Connel soil—3s, irrigated, 7c, nonirrigated; Halleck soil—5w, irrigated and nonirrigated
Range site: Upville soil—025X014N; Connel soil—025X019N; Halleck soil—025X005N; Inclusion 1—025X053N; Inclusion 2—025X005N; Inclusion 3—025X014N

540—Gando-Inpendence-Bullump association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Gando very gravelly loam, 15 to 30 percent slopes (30 percent)
• Inpendence gravelly loam, 30 to 50 percent slopes (30 percent)
• Bullump very gravelly loam, 30 to 50 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Hapgood very gravelly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 2: Entic Cryumbrepts, loamy-skeletal, mixed, 30 to 50 percent slopes (5 percent)
• Inclusion 3: Hackwood gravelly loam, 30 to 50 percent slopes (3 percent)
• Inclusion 4: Cumulic Cryaquolls, loamy-skeletal, mixed, 0 to 4 percent slopes (2 percent)

Characteristics of the Gando Soil

Classification: Lithic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex, upper side slopes of mountains
Parent material: Residuum and colluvium derived from chert, argillite, and quartzite
Slope range: 15 to 30 percent
Elevation: 7,500 to 8,500 feet
Dominant present vegetation: Low sagebrush, Sandberg bluegrass, Idaho fescue, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 85 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 45

Depth: 0 to 9 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 17 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 17 to 21 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.2 to 1.7 inches

Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Inpendence Soil

Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Colluvium derived from chert, argillite, and quartzite
Slope range: 30 to 50 percent
Elevation: 6,600 to 8,500 feet
Dominant present vegetation: Mountain brome, Idaho fescue, quaking aspen

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 40 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 9 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Strongly acid

Depth: 9 to 60 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Strongly acid

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 3.6 to 6.0 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—high
Potential for frost action: Moderate

Characteristics of the Bullump Soil

Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of mountains
Parent material: Colluvium derived from chert, argillite, and quartzite
Slope range: 30 to 50 percent
Elevation: 6,600 to 8,500 feet
Dominant present vegetation: Snowberry, mountain big sagebrush, serviceberry, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 15 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 80 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 35

Depth: 0 to 23 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 23 to 54 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 54 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.3 to 5.2 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Pachic Cryoborolls, loamy-skeletal, mixed

Position on landscape: Foot slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Concave, upper, north-facing side slopes of mountains
Distinctive present vegetation: Letterman needlegrass

Inclusion 3
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Distinctive present vegetation: Quaking aspen

Inclusion 4
Classification: Cumulic Cryaquolls, loamy-skeletal, mixed
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Quaking aspen

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Gando soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Inpendence soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bullump soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Gando Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Inpendence Soil for Various Uses and Practices
Range seeding: Fair—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bullump Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Gando soil—7s, nonirrigated; Inpendence soil—7e, nonirrigated; Bullump soil—7s, nonirrigated
Range site: Gando soil—025X024N; Inpendence soil—025X002N; Bullump soil—025X016N; Inclusion 1—025X004N; Inclusion 2—025X028N; Inclusion 3—025X065N; Inclusion 4—025X064N

570—Sumine-Hapgood-Cleavage association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 30 to 50 percent slopes (35 percent)
• Hapgood very gravelly loam, 30 to 50 percent slopes (35 percent)
• Cleavage extremely gravelly loam, 15 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Tusel very gravelly loam, 30 to 50 percent slopes (9 percent)
• Inclusion 2: Welch silt loam, 0 to 2 percent slopes (2 percent)
• Inclusion 3: Pachic Argixerolls, loamy-skeletal, mixed, frigid, 15 to 30 percent slopes (2 percent)
• Inclusion 4: Loncan very gravelly loam, 15 to 30 percent slopes (2 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of mountains

Parent material: Residuum and colluvium derived from rhyolite
Slope range: 30 to 50 percent
Elevation: 6,500 to 7,800 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 30 to 50 percent
Elevation: 6,500 to 7,800 feet
Dominant present vegetation: Mountain big sagebrush, mountain brome, Idaho fescue

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 to 46 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,500 to 7,800 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Convex, north-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Nevada bluegrass, alpine timothy

Inclusion 3
Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex, north-facing foot slopes of mountains
Distinctive present vegetation: Basin wildrye

Inclusion 4
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Lower side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—small stones, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope

Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine, Hapgood, and Cleavage soils—7s, nonirrigated
Range site: Sumine soil—025X009N; Hapgood soil—025X004N; Cleavage soil—025X024N; Inclusion 1—025X004N; Inclusion 2—025X006N; Inclusion 3—025X029N; Inclusion 4—025X012N

571—Sumine-Tusel-Gando association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 15 to 50 percent slopes (50 percent)
• Tusel gravelly loam, 15 to 50 percent slopes (20 percent)
• Gando very gravelly loam, 8 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (7 percent)
• Inclusion 2: Hackwood gravelly loam, 30 to 50 percent slopes (6 percent)
• Inclusion 3: Cumulic Cryaquolls, loamy-skeletal, mixed, 2 to 4 percent slopes (1 percent)
• Inclusion 4: Cumulic Haplaquolls, loamy-skeletal, mixed, frigid, 0 to 4 percent slopes (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of mountains
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 15 to 50 percent
Elevation: 6,400 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tusel Soil

Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 15 to 50 percent
Elevation: 6,400 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, serviceberry, antelope bitterbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 17 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 19 inches
Texture: Gravelly loam

Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 19 to 45 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 45 to 49 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.2 to 6.3 inches
Water-supplying capacity: 13 to 16.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.20; T value—3; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gando Soil

Classification: Lithic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex, upper side slopes of mountains
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 8 to 30 percent
Elevation: 7,000 to 7,500 feet

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 85 days
Dominant present vegetation: Low sagebrush, Sandberg bluegrass, bottlebrush squirreltail

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 45

Depth: 0 to 9 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 17 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 17 to 21 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.2 to 1.7 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None
Inclusion 2
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Distinctive present vegetation: Quaking aspen, mountain brome
Inclusion 3
Classification: Cumulic Cryaquolls, loamy-skeletal, mixed
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Quaking aspen, tufted hairgrass
Inclusion 4
Classification: Cumulic Haplaquolls, loamy-skeletal, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild

herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tusel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gando soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tusel Soil for Various Uses and Practices

Range seeding: Fair—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gando Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine soil—7s, nonirrigated; Tusel soil—7e, nonirrigated; Gando soil—7s, nonirrigated
Range site: Sumine soil—025X009N; Tusel soil—025X010N; Gando soil—025X024N; Inclusion 1—none; Inclusion 2—025X065N; Inclusion 3—025X064N; Inclusion 4—025X003N

572—Sumine-Shivlum-Cleavage association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Sumine very gravelly loam, 15 to 50 percent slopes (40 percent)
- Shivlum silt loam, 15 to 30 percent slopes (30 percent)
- Cleavage very gravelly loam, 8 to 15 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Loncan gravelly loam, 15 to 30 percent slopes (10 percent)
- Inclusion 2: Cotant cobbly loam, 4 to 15 percent slopes (2 percent)
- Inclusion 3: Cleavage extremely gravelly loam, 8 to 15 percent slopes (2 percent)
- Inclusion 4: Rock outcrop (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 50 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Shivlum Soil

Classification: Aridic Argixerolls, fine-silty, mixed, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Colluvium derived from welded tuff and influenced by loess
Slope range: 15 to 30 percent
Elevation: 6,000 to 6,800 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 9 to 34 inches
Texture: Silty clay loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Neutral

Depth: 34 to 60 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests of hills
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,500 to 6,800 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Medium

Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Slightly concave areas on crests and convex side slopes of hills
Distinctive present vegetation: Low sagebrush, Idaho fescue
Inclusion 3
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests of hills
Distinctive present vegetation: Black sagebrush, low sagebrush
Inclusion 4
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Shivlum soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Shivlum Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—low strength
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine soil—7s, nonirrigated; Shivlum soil—6e, nonirrigated; Cleavage soil—7s, nonirrigated
Range site: Sumine soil—025X009N; Shivlum soil—025X012N; Cleavage soil—025X017N; Inclusion 1—025X012N; Inclusion 2—025X017N; Inclusion 3—025X024N; Inclusion 4—none

573—Sumine-Hackwood-Gando association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 15 to 50 percent slopes (45 percent)
• Hackwood silt loam, 15 to 50 percent slopes (25 percent)
• Gando very gravelly loam, 8 to 30 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Rock outcrop (6 percent)
- Inclusion 2: Hapgood very gravelly loam, 30 to 50 percent slopes (5 percent)
- Inclusion 3: Cleavage very gravelly loam, 15 to 50 percent slopes (2 percent)
- Inclusion 4: Welch silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from chert, argillite, and quartzite
Slope range: 15 to 50 percent
Elevation: 7,400 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hackwood Soil

Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Colluvium derived from chert, argillite, and quartzite
Slope range: 15 to 50 percent
Elevation: 7,400 to 8,000 feet
Dominant present vegetation: Quaking aspen, mountain brome

Climatic Data

Average annual precipitation: About 18 inches
Average annual air temperature: About 41 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 20 to 30 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 30 to 60 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Slightly acid

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 6.6 to 10.0 inches
Water-supplying capacity: 14 to 18 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low

Potential for frost action: Moderate

Characteristics of the Gando Soil

Classification: Lithic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of mountains
Parent material: Residuum and colluvium derived from chert, argillite, and quartzite
Slope range: 8 to 30 percent
Elevation: 7,700 to 8,000 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 85 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 45

Depth: 0 to 9 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 17 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 17 to 21 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.2 to 1.7 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Inclusion 2
Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Distinctive present vegetation: Snowberry, mountain brome

Inclusion 3
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of mountains
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hackwood soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good
Suitability of the Gando soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Hackwood Soil for Woodland

Site index for common trees: Quaking aspen—44
Most important native understory plants: Currant, snowberry, Idaho fescue

Suitability and Limitations of the Hackwood Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gando Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine soil—7s, nonirrigated; Hackwood soil—7e, nonirrigated; Gando soil—7s, nonirrigated
Range site: Sumine soil—025X009N; Hackwood soil—025X065N; Gando soil—025X024N; Inclusion 1—none; Inclusion 2—025X004N; Inclusion 3—025X017N; Inclusion 4—025X003N

574—Sumine-Cleavage-Cleavage, very cobbly association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 15 to 50 percent slopes (40 percent)
• Cleavage very gravelly loam, 15 to 30 percent slopes (30 percent)
• Cleavage very cobbly loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Loncan very gravelly loam, 30 to 50 percent slopes (8 percent)
• Inclusion 2: Rock outcrop (5 percent)
• Inclusion 3: Roca very gravelly loam, 30 to 50 percent slopes (2 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing, concave side slopes of mountains
Parent material: Residuum and colluvium derived from sandstone and conglomerate
Slope range: 15 to 50 percent
Elevation: 5,600 to 7,600 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth or slightly convex side slopes of mountains
Parent material: Residuum and colluvium derived from sandstone and conglomerate
Slope range: 15 to 30 percent
Elevation: 5,600 to 7,600 feet
Dominant present vegetation: Low sagebrush, antelope bitterbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Very Cobbly Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from sandstone and conglomerate
Slope range: 15 to 30 percent
Elevation: 5,600 to 7,600 feet
Dominant present vegetation: Black sagebrush, low sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: North-facing, concave side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2

Position on landscape: Crests and side slopes of mountains

Distinctive present vegetation: None

Inclusion 3

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, lower side slopes of mountains
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the very cobbly Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Very Cobbly Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty, large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine soil and both Cleavage soils—7s, nonirrigated
Range site: Sumine soil—025X009N; Cleavage soil—025X017N; the very cobbly Cleavage soil—025X024N; Inclusion 1—025X012N; Inclusion 2—none; Inclusion 3—025X014N

575—Sumine-Hapgood-Hackwood association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 15 to 50 percent slopes (40 percent)
• Hapgood very gravelly loam, 30 to 50 percent slopes (30 percent)
• Hackwood silt loam, 15 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (6 percent)
• Inclusion 2: Heechee gravelly loam, 15 to 30 percent slopes, very stony (3 percent)
• Inclusion 3: Pernty very gravelly loam, 15 to 50 percent slopes (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of mountains
Parent material: Residuum and colluvium derived from granitic rock and welded tuff
Slope range: 15 to 50 percent
Elevation: 6,500 to 8,300 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F

Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: North-facing side slopes of mountains
Parent material: Residuum and colluvium derived from granitic rock and welded tuff
Slope range: 30 to 50 percent
Elevation: 6,500 to 8,300 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, mountain brome

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 to 46 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hackwood Soil

Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: North-facing side slopes of mountains
Parent material: Colluvium derived from granitic rock and welded tuff
Slope range: 15 to 50 percent
Elevation: 6,500 to 8,300 feet
Dominant present vegetation: Quaking aspen

Climatic Data

Average annual precipitation: About 18 inches
Average annual air temperature: About 41 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 20 to 30 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 30 to 60 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Slightly acid

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 6.6 to 10.0 inches
Water-supplying capacity: 14 to 18 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Side slopes of mountains
Distinctive present vegetation: None
Inclusion 2
Classification: Typic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Foot slopes of mountains
Distinctive present vegetation: Antelope bitterbrush
Inclusion 3
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex crests and side slopes of mountains
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hackwood soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Hackwood Soil for Woodland
Site index for common trees: Quaking aspen—44
Most important native understory plants: Currant, snowberry, Idaho fescue

Suitability and Limitations of the Hackwood Soil for Various Uses and Practices

576—Sumine-Cleavage-Hapgood association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 50 to 75 percent slopes (40 percent)
• Cleavage extremely gravelly loam, 30 to 75 percent slopes (30 percent)
• Hapgood very gravelly loam, 50 to 75 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Tusel gravelly loam, 30 to 50 percent slopes (4 percent)
• Inclusion 2: Pernty very gravelly loam, 30 to 50 percent slopes, very stony (3 percent)
• Inclusion 3: Welch silt loam, 0 to 2 percent slopes (2 percent)
• Inclusion 4: Rubble land (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 50 to 75 percent
Elevation: 6,500 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 75 percent
Elevation: 6,500 to 7,500 feet
Dominant present vegetation: Low sagebrush, black sagebrush

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 50 to 75 percent
Elevation: 6,500 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, serviceberry, Idaho fescue

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 to 46 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Very rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth, north-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of mountains
Distinctive present vegetation: Serviceberry, Idaho fescue

Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 4
Position on landscape: Side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—small stones, erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope

Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—small stones, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices

Range seeding: Poor—small stones, erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine, Cleavage, and Hapgood soils—7s, nonirrigated
Range site: Sumine soil—025X009N; Cleavage soil—025X024N; Hapgood soil—025X004N; Inclusion 1—025X010N; Inclusion 2—025X046N; Inclusion 3—025X003N; Inclusion 4—none

577—Sumine-Tusel-Hapgood association, steep

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 30 to 50 percent slopes (35 percent)
• Tusel very gravelly loam, 30 to 50 percent slopes (30 percent)
• Hapgood very gravelly loam, 50 to 75 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: McIvey very gravelly loam, 15 to 50 percent slopes (8 percent)
• Inclusion 2: Bullump very gravelly loam, 30 to 50 percent slopes (3 percent)
• Inclusion 3: Welch silt loam, 2 to 8 percent slopes, rarely flooded (2 percent)
• Inclusion 4: Lithic Argixerolls, loamy-skeletal, mixed, 30 to 50 percent slopes (2 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,700 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid

Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tusel Soil

Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Convex, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,700 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, Idaho fescue, mountain brome

Climatic Data

Average annual precipitation: About 17 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 19 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 19 to 45 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 45 to 49 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.9 to 6.2 inches
Water-supplying capacity: 13 to 16.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 50 to 75 percent
Elevation: 6,700 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, serviceberry, Idaho fescue

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 to 46 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Very rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Foot slopes of mountains and side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of mountains
Distinctive present vegetation: Antelope bitterbrush, mountain big sagebrush, mountain brome
Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 4
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing, lower side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tusel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: improbable source—excess fines

Suitability and Limitations of the Tusel Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices
Range seeding: Poor—small stones, erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine, Tusel, and Hapgood soils—7s, nonirrigated
Range site: Sumine soil—025X009N; Tusel soil—025X004N; Hapgood soil—025X004N; Inclusion 1—025X012N; Inclusion 2—025X016N; Inclusion 3—025X003N; Inclusion 4—025X015N

578—Sumine-Tusel-Hapgood association, very steep

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 50 to 75 percent slopes (45 percent)
• Tusel extremely gravelly loam, 50 to 75 percent slopes (25 percent)
• Hapgood very gravelly loam, 50 to 75 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Cleavage extremely gravelly loam, 15 to 50 percent slopes (10 percent)
• Inclusion 2: Chen very gravelly loam, 15 to 30 percent slopes (3 percent)

• Inclusion 3: Welch silt loam, 2 to 8 percent slopes (1 percent)
• Inclusion 4: Bullump very gravelly loam, 30 to 50 percent slopes (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 50 to 75 percent
Elevation: 6,400 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tusel Soil

Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Convex, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 50 to 75 percent
Elevation: 6,400 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 17 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 19 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 19 to 45 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 45 to 49 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.2 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.05; T value—3; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff

Slope range: 50 to 75 percent
Elevation: 6,400 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, Idaho fescue

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 to 46 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Very rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of mountains
Distinctive present vegetation: Low sagebrush, black sagebrush

Inclusion 2
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Crests and shoulders of mountains
Distinctive present vegetation: Low sagebrush

Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Tufted hairgrass, sedge

Inclusion 4
Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, upper, south-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, antelope bitterbrush, mountain brome

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tusel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—small stones, erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tusel Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope

Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices

Range seeding: Poor—small stones, erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine, Tusel, and Hapgood soils—7s, nonirrigated
Range site: Sumine soil—025X009N; Tusel soil—025X010N; Hapgood soil—025X004N; Inclusion 1—025X024N; Inclusion 2—025X017N; Inclusion 3—025X005N; Inclusion 4—025X016N

579—Sumine-Pernty-Tusel association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 30 to 50 percent slopes (35 percent)
• Pernty very gravelly loam, 15 to 50 percent slopes, very stony (30 percent)
• Tusel very gravelly loam, 30 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Cleavage extremely gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 2: Rock outcrop (5 percent)
• Inclusion 3: Hapgood very gravelly loam, 30 to 50 percent slopes (5 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Pernty Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 50 percent
Elevation: 6,600 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, serviceberry, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 11 inches

Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 18 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 18 to 22 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tusel Soil

Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, Idaho fescue

Climatic Data

Average annual precipitation: About 17 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 19 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 19 to 45 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 45 to 49 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.9 to 6.2 inches
Water-supplying capacity: 13 to 16.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—3; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper side slopes of mountains
Distinctive present vegetation: Black sagebrush, low sagebrush

Inclusion 2
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Inclusion 3
Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Distinctive present vegetation: Snowberry, mountain brome

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild

herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Pernty soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tusel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Pernty Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tusel Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine, Pernty, and Tusel soils—7s, nonirrigated
Range site: Sumine soil—025X009N; Pernty soil—025X046N; Tusel soil—025X004N; Inclusion 1—025X024N; Inclusion 2—none; Inclusion 3—025X004N

580—Sumine-Cleavage-Pernty association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Sumine very gravelly loam, 15 to 50 percent slopes (35 percent)
• Cleavage extremely gravelly loam, 4 to 15 percent slopes (30 percent)
• Pernty very gravelly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Loncan gravelly loam, 30 to 50 percent slopes (6 percent)
• Inclusion 2: Hart Camp very gravelly loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Lerrow cobbly loam, 15 to 30 percent slopes (3 percent)
• Inclusion 4: Crooked Creek silty clay loam, 0 to 4 percent slopes (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from shale, chert, and quartzite
Slope range: 15 to 50 percent
Elevation: 6,200 to 7,000 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data
Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile
Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm

Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of hills
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 4 to 15 percent
Elevation: 6,700 to 7,000 feet
Dominant present vegetation: Black sagebrush, low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Pernty Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex, lower side slopes of hills
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 15 to 30 percent
Elevation: 6,200 to 7,000 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, serviceberry, Idaho fescue

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 18 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 18 to 22 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow

Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: North-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Aridic Argixerolls, loamy, mixed, frigid, shallow
Position on landscape: Slightly concave crests of hills
Distinctive present vegetation: Antelope bitterbrush, Idaho fescue
Inclusion 3
Classification: Aridic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Concave, south-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 4
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Entrenched drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Pernty soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—small stones, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Pernty Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine, Cleavage, and Pernty soils—7s, nonirrigated
Range site: Sumine soil—025X009N; Cleavage soil—025X024N; Pernty soil—025X012N; Inclusion 1—025X012N; Inclusion 2—025X007N; Inclusion 3—025X009N; Inclusion 4—025X003N

582—Sumine-Vitale-Bullvaro association

Map Unit Setting

Position on landscape: Plateaus

Composition

Major components:
• Sumine extremely stony loam, 30 to 75 percent slopes

(35 percent)
• Vitale very gravelly loam, 30 to 75 percent slopes, bouldery (30 percent)
• Bullvaro loam, 30 to 75 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Rubble land (5 percent)
• Inclusion 2: Rock outcrop (5 percent)
• Inclusion 3: Cumulic Cryaquolls, loamy-skeletal, mixed, 2 to 4 percent slopes (3 percent)
• Inclusion 4: Lithic Xerorthents, loamy-skeletal, mixed, frigid, 15 to 50 percent slopes (2 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South- and west-facing side slopes of plateaus
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 75 percent
Elevation: 5,600 to 7,200 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 20
Percent cobbles on the surface: 10
Percent pebbles on the surface: 30

Depth: 0 to 6 inches
Texture: Extremely stony loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.0 to 3.9 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Very rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—2; wind erodibility group—8
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Vitale Soil

Classification: Typic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Lower, north- and east-facing side slopes of plateaus
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 75 percent
Elevation: 5,600 to 6,500 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 41 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 20
Percent cobbles on the surface: 5

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 6 to 23 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 23 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.5 to 4.2 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—8

Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bullvaro Soil

Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Upper, north- and east-facing side slopes of plateaus
Parent material: Colluvium derived from welded tuff
Slope range: 30 to 75 percent
Elevation: 6,500 to 7,200 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 15 inches
Texture: Loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 15 to 23 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 23 to 37 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 37 to 60 inches
Texture: Extremely gravelly sandy loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 5.0 to 6.9 inches
Water-supplying capacity: 11 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Below areas of rock outcrop on side slopes of plateaus
Distinctive present vegetation: None
Inclusion 2
Position on landscape: Middle side slopes and rims of plateaus
Distinctive present vegetation: None
Inclusion 3
Classification: Cumulic Cryaquolls, loamy-skeletal, mixed
Position on landscape: Narrow drainageways on plateaus
Distinctive present vegetation: Quaking aspen
Inclusion 4
Classification: Lithic Xerorthents, loamy-skeletal, mixed, frigid
Position on landscape: Adjacent to areas of rock outcrop on side slopes of plateaus
Distinctive present vegetation: Wyoming big sagebrush, Rocky Mountain juniper

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Vitale soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—fair
Suitability of the Bullvaro soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—large stones, erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Vitale Soil for Various Uses and Practices

Range seeding: Poor—small stones, erodes easily, large stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bullvaro Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—small stones
Gravel: Probable source

Interpretive Groups

Capability classification: Sumine soil—7s, nonirrigated; Vitale soil—7s, nonirrigated; Bullvaro soil—7e, nonirrigated
Range site: Sumine soil—025X009N; Vitale soil—025X012N; Bullvaro soil—025X017N; Inclusion 1—none; Inclusion 2—none; Inclusion 3—025X064N; Inclusion 4—025X068N

583—Sumine-Cleavage-Rock outcrop association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 15 to 50 percent slopes (40 percent)
• Cleavage extremely gravelly loam, 15 to 50 percent slopes (30 percent)
• Rock outcrop (15 percent)
Contrasting inclusions:
• Inclusion 1: Hapgood very gravelly loam, 30 to 50 percent slopes (9 percent)
• Inclusion 2: Pernty very gravelly loam, 15 to 50 percent slopes, very stony (4 percent)
• Inclusion 3: Welch silt loam, 2 to 8 percent slopes, frequently flooded (1 percent)
• Inclusion 4: Welch silt loam, 2 to 8 percent slopes (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite and welded tuff
Slope range: 15 to 50 percent
Elevation: 6,000 to 7,900 feet
Dominant present vegetation: Mountain big sagebrush, basin wildrye, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low

Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 7,000 to 7,900 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rock Outcrop

Position on landscape: Crests and side slopes of mountains
Elevation: 6,000 to 7,900 feet
Distinctive present vegetation: None

Contrasting Inclusions

Inclusion 1
Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: North-facing side slopes of mountains
Distinctive present vegetation: Snowberry, mountain brome

Inclusion 2
Classification: Lithic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Distinctive present vegetation: Serviceberry

Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Tufted hairgrass, sedge

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Adjacent to entrenched stream channels in narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—small stones, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope

Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine soil—7s, nonirrigated; Cleavage soil—7s, nonirrigated; Rock outcrop—8s, nonirrigated
Range site: Sumine soil—025X009N; Cleavage soil—025X024N; Rock outcrop—none; Inclusion 1—025X004N; Inclusion 2—025X046N; Inclusion 3—025X005N; Inclusion 4—025X003N

584—Sumine-Pernty-Hapgood association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Sumine very gravelly loam, 15 to 50 percent slopes (40 percent)
• Pernty very gravelly loam, 15 to 50 percent slopes (30 percent)
• Hapgood very gravelly loam, 15 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Cleavage extremely gravelly loam, 15 to 50 percent slopes (10 percent)
• Inclusion 2: McIvey very cobbly loam, 15 to 50 percent slopes (2 percent)
• Inclusion 3: Welch silt loam, 0 to 2 percent slopes (2 percent)
• Inclusion 4: Rock outcrop (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,400 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, basin wildrye, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Pernty Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,400 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, Idaho fescue

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 18 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 18 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 50 percent
Elevation: 6,400 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, Idaho fescue, mountain brome

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 to 46 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of mountains
Distinctive present vegetation: Low sagebrush, black sagebrush, Idaho fescue

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, north-facing and concave, south-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Tufted hairgrass, sedge

Inclusion 4
Position on landscape: Crests and side slopes of mountains

Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Pernty soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Pernty Soil for Various Uses and Practices
Range seeding: Poor—small stones, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope

585—Sumine-Pernty-McIvey association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Sumine very gravelly loam, 15 to 30 percent slopes (35 percent)
• Pernty very gravelly loam, 15 to 30 percent slopes (30 percent)
• McIvey gravelly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Quarz very gravelly loam, 15 to 30 percent slopes (10 percent)
• Inclusion 2: Graley very gravelly loam, 15 to 30 percent slopes (4 percent)
• Inclusion 3: Rock outcrop (1 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from andesite or rhyolite
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,600 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of hills
Parent material: Colluvium derived from andesite and rhyolite
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,600 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Hard, very firm

Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, south-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex, south-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 3
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Pernty soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Pernty Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the McIvey Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—large stones, slope, shrink-swell potential
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—too clayey, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine soil—7s, nonirrigated; Pernty soil—7s, nonirrigated; McIvey soil—6e, nonirrigated
Range site: Sumine soil—025X009N; Pernty soil—025X012N; McIvey soil—025X012N; Inclusion 1—

025X009N; Inclusion 2—025X012N; Inclusion 3—none

586—Sumine-Loncan-Cleavage association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
- Sumine very gravelly loam, 15 to 50 percent slopes (40 percent)
- Loncan very gravelly loam, 15 to 50 percent slopes (30 percent)
- Cleavage extremely gravelly loam, 8 to 15 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Quarz very gravelly loam, 15 to 50 percent slopes (5 percent)
- Inclusion 2: McIvey cobbly loam, 8 to 15 percent slopes (4 percent)
- Inclusion 3: Chen very cobbly loam, 4 to 15 percent slopes (4 percent)
- Inclusion 4: Rock outcrop (2 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from sandstone or conglomerate
Slope range: 15 to 50 percent
Elevation: 6,600 to 7,000 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Loncan Soil

Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from sandstone and conglomerate
Slope range: 15 to 50 percent
Elevation: 6,600 to 7,000 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, serviceberry, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 14 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 14 to 31 inches
Texture: Extremely cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 21 to 38 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 3.1 inches
Water-supplying capacity: 6 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests of mountains
Parent material: Residuum and colluvium derived from sandstone and conglomerate
Slope range: 8 to 15 percent
Elevation: 6,800 to 7,000 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex, south-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave foot slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex foot slopes of mountains
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 4
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Loncan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Sumine Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope

Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Loncan Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—small stones, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine, Loncan, and Cleavage soils—7s, nonirrigated
Range site: Sumine soil—025X009N; Loncan soil—025X012N; Cleavage soil—025X024N; Inclusion 1—025X009N; Inclusion 2—025X012N; Inclusion 3—025X017N; Inclusion 4—none

587—Sumine-Bullvaro-Hackwood association

Map Unit Setting

Position on landscape: Plateaus, mountains

Composition

Major components:
- Sumine gravelly loam, 30 to 75 percent slopes (35 percent)
- Bullvaro loam, 30 to 75 percent slopes (25 percent)
- Hackwood silt loam, 15 to 50 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Typic Haploxerolls, loamy-skeletal, mixed, frigid, 15 to 50 percent slopes (10 percent)
- Inclusion 2: Cumulic Cryaquolls, loamy-skeletal, mixed, 2 to 4 percent slopes (3 percent)
- Inclusion 3: Rock outcrop (2 percent)
- Inclusion 4: Rubble land (5 percent)

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South- and west-facing side slopes of plateaus
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 75 percent
Elevation: 5,600 to 7,200 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 35

Depth: 0 to 6 inches
Texture: Gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.4 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Very rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—2; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low

Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bullvaro Soil

Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, north- and east-facing side slopes of hills
Parent material: Colluvium derived from welded tuff
Slope range: 30 to 75 percent
Elevation: 5,600 to 7,200 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 15 inches
Texture: Loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 15 to 23 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 23 to 37 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 37 to 60 inches
Texture: Extremely gravelly sandy loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 5.0 to 6.9 inches
Water-supplying capacity: 12.5 to 16 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hackwood Soil

Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Concave, north- and east-facing side slopes of mountains
Parent material: Colluvium derived from welded tuff
Slope range: 15 to 50 percent
Elevation: 5,600 to 7,200 feet
Dominant present vegetation: Quaking aspen, mountain brome

Climatic Data

Average annual precipitation: About 18 inches
Average annual air temperature: About 41 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 20 to 30 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 30 to 60 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Slightly acid

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 6.6 to 10 inches
Water-supplying capacity: 14 to 18 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Typic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: North-facing foot slopes of plateaus
Distinctive present vegetation: Curlleaf mountainmahogany
Inclusion 2
Classification: Cumulic Cryaquolls, loamy-skeletal, mixed
Position on landscape: Narrow drainageways on plateaus
Distinctive present vegetation: Quaking aspen, tufted hairgrass
Inclusion 3
Position on landscape: Side slopes of plateaus
Distinctive present vegetation: None
Inclusion 4
Position on landscape: Below or adjacent to areas of rock outcrop on side slopes of plateaus
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bullvaro soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good
Suitability of the Hackwood soil for named.elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bullvaro Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—small stones
Gravel: Probable source

Suitability of the Hackwood Soil for Woodland
Site index for common trees: Quaking aspen—44
Most important native understory plants: Mountain brome, snowberry, Idaho fescue

Suitability and Limitations of the Hackwood Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Sumine soil—7e, nonirrigated; Bullvaro soil—7e, nonirrigated; Hackwood soil—6e, nonirrigated
Range site: Sumine soil—025X009N; Bullvaro soil—025X017N; Hackwood soil—025X065N; Inclusion 1—028B042N; Inclusion 2—025X064N; Inclusion 3—none; Inclusion 4—none

590—Bucan-Kelk-Orovada association

Map Unit Setting

Position on landscape: Hills, fan piedmonts

Composition

Major components:
• Bucan gravelly loam, 30 to 50 percent slopes (40 percent)
• Kelk silt loam, 4 to 15 percent slopes (20 percent)
• Orovada fine sandy loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Lerrow gravelly loam, 30 to 50 percent slopes (6 percent)
• Inclusion 2: Eboda loam, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Bucan loam, 30 to 50 percent slopes (4 percent)

• Inclusion 4: Rock outcrop (5 percent)

Characteristics of the Bucan Soil

Classification: Xerollic Haplargids, fine, montmorillonitic, frigid
Position on landscape: South- and west-facing side slopes of hills
Parent material: Loess over residuum derived from tuff
Slope range: 30 to 50 percent
Elevation: 5,000 to 5,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 11 to 30 inches
Texture: Clay
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Mildly alkaline

Depth: 30 to 57 inches
Texture: Gravelly clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 57 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.2 to 7.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—3; wind erodibility group—7
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Concave summits and side slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,000 to 5,500 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass, bluebunch wheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6

Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Orovada Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,000 to 5,500 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass, bluebunch wheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 7 to 15 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 15 to 60 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 8.4 to 9.6 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: South- and west-facing, upper side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Idaho fescue

Inclusion 3
Classification: Xerollic Haplargids, fine, montmorillonitic, frigid
Position on landscape: South- and west-facing side slopes of hills in areas of rock outcrop
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Position on landscape: Side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bucan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—very poor; shallow water areas—very poor
Suitability of the Orovada soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Bucan Soil for Various Uses and Practices

Range seeding: Poor—erodes easily
Roadfill: Poor—low strength, slope, shrink-swell potential
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope

Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Fair—slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Slope, erodes easily, percs slowly

Suitability and Limitations of the Orovada Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer, slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Soil blowing, slope, erodes easily
Terraces and diversions: Slope, erodes easily, soil blowing

Interpretive Groups

Capability classification: Bucan soil—7e, nonirrigated; Kelk soil—4e, irrigated, 6s, nonirrigated; Orovada soil—4e, irrigated, 6c, nonirrigated
Range site: Bucan soil—025X019N; Kelk soil—025X019N; Orovada soil—025X019N; Inclusion 1—025X009N; Inclusion 2—025X027N; Inclusion 3—025X019N; Inclusion 4—none

591—Bucan-Vanwyper-Akler association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Bucan loam, 30 to 50 percent slopes (40 percent)
• Vanwyper gravelly loam, 15 to 30 percent slopes, stony (35 percent)
• Akler very gravelly loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Loncan loam, 30 to 50 percent slopes (5 percent)
• Inclusion 2: Rock outcrop (5 percent)

Characteristics of the Bucan Soil

Classification: Xerollic Haplargids, fine, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Loess over residuum and colluvium derived from tuff
Slope range: 30 to 50 percent
Elevation: 5,800 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 11 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 11 to 30 inches
Texture: Clay
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Mildly alkaline

Depth: 30 to 57 inches
Texture: Gravelly clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 57 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.4 to 7.2 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—3; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: South-facing side slopes of hills
Parent material: Residuum and colluvium derived from tuff
Slope range: 15 to 30 percent
Elevation: 5,800 to 6,600 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 0.1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.3 to 3.5 inches
Water-supplying capacity: 6.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Convex, north-facing side slopes of hills
Parent material: Residuum derived from tuff
Slope range: 15 to 30 percent
Elevation: 5,800 to 6,600 feet
Dominant present vegetation: Low sagebrush, antelope bitterbrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 35

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 21 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.2 to 1.8 inches
Water-supplying capacity: 5.5 to 6.5 inches
Runoff: Rapid

Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue
Inclusion 2
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bucan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Bucan Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—low strength, slope, shrink-swell potential
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—hard to pack, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Akler Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Bucan soil—7e, nonirrigated; Vanwyper soil—7e, nonirrigated; Akler soil—7s, nonirrigated
Range site: Bucan soil—025X019N; Vanwyper soil—025X019N; Akler soil—025X018N; Inclusion 1—025X012N; Inclusion 2—none

600—Hapgood-Bullump-Gando association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Hapgood very gravelly loam, 30 to 50 percent slopes (30 percent)
• Bullump very gravelly loam, 15 to 50 percent slopes (30 percent)
• Gando very gravelly loam, 15 to 30 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Hackwood very gravelly loam, 30 to 50 percent slopes (8 percent)
• Inclusion 2: Welch silt loam, 2 to 4 percent slopes (3 percent)
• Inclusion 3: Cumulic Cryaquolls, loamy-skeletal, mixed, 2 to 4 percent slopes (2 percent)
• Inclusion 4: Rock outcrop (2 percent)

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: North-facing, lower side slopes of mountains

Parent material: Residuum derived from chert, shale, quartzite, and argillic siltstone
Slope range: 30 to 50 percent
Elevation: 6,500 to 7,700 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, chokecherry, antelope bitterbrush

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: moderate

Characteristics of the Bullump Soil

Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of mountains
Parent material: Colluvium derived from chert, shale, and quartzite
Slope range: 15 to 50 percent
Elevation: 6,500 to 7,700 feet
Dominant present vegetation: Snowberry, mountain big sagebrush, serviceberry, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 15 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 80 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 35

Depth: 0 to 23 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 23 to 54 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 54 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.3 to 5.2 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gando Soil

Classification: Lithic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests of mountains
Parent material: Residuum and colluvium derived from chert, shale, and quartzite
Slope range: 15 to 30 percent
Elevation: 6,500 to 7,700 feet

Dominant present vegetation: Low sagebrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 85 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 45

Depth: 0 to 9 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 17 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 17 to 21 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.2 to 1.7 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: North-facing, upper side slopes of mountains
Distinctive present vegetation: Quaking aspen, mountain brome

Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Drainageways in the mountains
Distinctive present vegetation: Tufted hairgrass, Nevada bluegrass, alpine timothy, meadow sedge

Inclusion 3
Classification: Cumulic Cryaquolls, loamy-skeletal, mixed
Position on landscape: Drainageways in the mountains
Distinctive present vegetation: Quaking aspen, mountain brome

Inclusion 4
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bullump soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gando soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bullump Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gando Soil for Various Uses and Practices

Range seeding: Poor—small stones, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones

Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Hapgood, Bullump, and Gando soils—7s, nonirrigated
Range site: Hapgood soil—025X004N; Bullump soil—025X016N; Gando soil—025X024N; Inclusion 1—025X065N; Inclusion 2—025X005N; Inclusion 3—025X064N; Inclusion 4—none

620—Soughe, eroded-Soughe association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Soughe very cobbly loam, 30 to 50 percent slopes, eroded (50 percent)
• Soughe very cobbly loam, 30 to 50 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (3 percent)
• Inclusion 2: Cowgil Variant very cobbly loam, 15 to 30 percent slopes (3 percent)
• Inclusion 3: Hunewill sandy loam, 15 to 30 percent slopes (2 percent)
• Inclusion 4: Rubble land (2 percent)

Characteristics of the Eroded Soughe Soil

Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Lower, convex side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff or andesite
Slope range: 30 to 50 percent
Elevation: 5,900 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Indian ricegrass, Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 2 to 10 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 10 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.8 inch to 1.2 inches
Water-supplying capacity: 5.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Soughe Soil

Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Crests and upper, convex side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff and andesite
Slope range: 30 to 50 percent
Elevation: 6,000 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very cobbly loam

Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 14 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 14 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.2 to 1.6 inches
Water-supplying capacity: 5.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 2
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Smooth, lower side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Lower, concave side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 4
Position on landscape: Adjacent to or below areas of rock outcrop on side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the eroded Soughe soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Soughe soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Eroded Soughe Soil for Woodland
Site index for common trees: Utah juniper—30
Most important native understory plants: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Suitability and Limitations of the Eroded Soughe Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Soughe Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope

Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Soughe soils—7s, nonirrigated
Range site: The eroded Soughe soil—025X059N; Soughe soil—025X015N; Inclusion 1—none; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—none

630—Cowgil Variant-Soughe association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Cowgil Variant very cobbly loam, 30 to 50 percent slopes (50 percent)
• Soughe very cobbly loam, 30 to 50 percent slopes, eroded (35 percent)
Contrasting inclusions:
• Inclusion 1: Zevadez gravelly loam, 15 to 30 percent slopes (8 percent)
• Inclusion 2: Rock outcrop (3 percent)
• Inclusion 3: Devilsgait silty clay loam, 0 to 2 percent slopes (2 percent)
• Inclusion 4: Rubble land (2 percent)

Characteristics of the Cowgil Variant Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Smooth side slopes of hills
Parent material: Colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 5,000 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 30

Depth: 0 to 5 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 12 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 12 to 42 inches
Texture: Very cobbly loam
Structure: Massive
Consistence: Hard, friable
Reaction: Neutral

Depth: 42 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 50 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.8 to 4.4 inches
Water-supplying capacity: 6.5 to 8.0 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.10; T value—3; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Soughe Soil

Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 5,000 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Indian ricegrass, Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

631—Hunewill-Bilbo-Devilsgait association

Map Unit Setting

Position on landscape: Inset fans, remnants of inset fans

Composition

Major components:
• Hunewill gravelly silt loam, 2 to 4 percent slopes (40 percent)
• Bilbo very gravelly loam, 2 to 8 percent slopes (30 percent)
• Devilsgait silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Kelk silt loam, 2 to 8 percent slopes (10 percent)
• Inclusion 2: Connel gravelly sandy loam, 0 to 4 percent slopes (3 percent)
• Inclusion 3: Sonoma silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Hunewill Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Lower inset fan remnants
Parent material: Mixed alluvium
Slope range: 2 to 4 percent
Elevation: 5,500 to 6,500 feet

Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 19 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 19 to 62 inches
Texture: Extremely gravelly sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.5 to 4.5 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.24; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Upper parts of inset fan remnants
Parent material: Mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,500 to 6,500 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 70

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6 to 9 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Inset fans
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,500 to 6,500 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye, Douglas rabbitbrush

Climatic Data

Average annual precipitation: About 10 inches

Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans adjacent to stream channels
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: At the confluence of the inset fans and flood plains
Distinctive present vegetation: Black greasewood, alkali sacaton

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Hunewill soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—poor

Suitability and Limitations of the Hunewill Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action, large stones
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Large stones, droughty, slope
Terraces and diversions: Large stones, too sandy

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Slight
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage

Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—shrink-swell potential
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Moderate—thin layer, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Hunewill soil—3e, irrigated, 6c, nonirrigated; Bilbo soil—7s, nonirrigated; Devilsgait soil—3c, irrigated, 6c, nonirrigated
Range site: Hunewill soil—025X019N; Bilbo soil—025X019N; Devilsgait soil—025X003N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—024X007N

632—Hunewill-Kelk-Devilsgait association

Map Unit Setting

Position on landscape: Fan piedmont remnants, flood plains

Composition

Major components:
• Hunewill gravelly sandy loam, 0 to 2 percent slopes (40 percent)
• Kelk silt loam, 0 to 2 percent slopes (30 percent)
• Devilsgait silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Ocala silt loam, 0 to 2 percent slopes (8 percent)
• Inclusion 2: Xerollic Camborthids, clayey over sandy or sandy-skeletal, montmorillonitic, mesic (7 percent)

Characteristics of the Hunewill Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,550 to 5,850 feet
Dominant present vegetation: Big sagebrush, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 19 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 19 to 62 inches
Texture: Extremely gravelly sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.5 to 4.5 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,550 to 5,850 feet
Dominant present vegetation: Big sagebrush, cheatgrass

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,550 to 5,850 feet
Dominant present vegetation: Basin big sagebrush, rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 8 to 43 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 43 to 68 inches
Texture: Stratified loamy fine sand to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 10 to 12 inches
Water-supplying capacity: 9 to 11 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Distinctive present vegetation: Black greasewood, alkali sacaton

Inclusion 2
Classification: Xerollic Camborthids, clayey over sandy or sandy-skeletal, montmorillonitic, mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Hunewill soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—poor

Suitability and Limitations of the Hunewill Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action, large stones
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Large stones, droughty
Terraces and diversions: Large stones, too sandy

Suitability and Limitations of the Kelk Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Good
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—shrink-swell potential
Topsoil: Good
Daily cover for landfill: Fair—too clayey
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Moderate—thin layer, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Erodes easily
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Hunewill soil—3s, irrigated, 6c, nonirrigated; Kelk soil—2s, irrigated, 6s, nonirrigated; Devilsgait soil—3c, irrigated, 6c, nonirrigated
Range site: Hunewill soil—025X019N; Kelk soil—025X019N; Devilsgait soil—025X003N; Inclusion 1—024X007N; Inclusion 2—025X019N

633—Hunewill, strongly sloping-Kelk-Hunewill association

Map Unit Setting

Position on landscape: Partial ballenas

Composition

Major components:
• Hunewill sandy loam, 8 to 15 percent slopes (40 percent)
• Kelk silt loam, 4 to 15 percent slopes (35 percent)
• Hunewill gravelly coarse sandy loam, 2 to 8 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Puett gravelly sandy loam, 15 to 50 percent slopes (5 percent)
• Inclusion 2: Bioya loam, 2 to 8 percent slopes (5 percent)

Characteristics of the Strongly Sloping Hunewill Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Upper, convex side slopes of partial ballenas
Parent material: Mixed alluvium
Slope range: 8 to 15 percent

Elevation: 5,400 to 5,800 feet
Dominant present vegetation: Big sagebrush, Greene rabbitbrush, horsebrush

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 7 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 19 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 19 to 62 inches
Texture: Extremely gravelly sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.7 to 4.7 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.24; T value—2; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Kelk Soil

Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Concave side slopes of partial ballenas
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,400 to 5,800 feet
Dominant present vegetation: Big sagebrush, Greene rabbitbrush, horsebrush

Climatic Data

Average annual precipitation: About 8 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 14 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 51 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 51 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 11 to 12 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hunewill Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Lower, convex side slopes of partial ballenas
Parent material: Mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,400 to 5,800 feet

Dominant present vegetation: Big sagebrush, needleandthread

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 7 inches
Texture: Gravelly coarse sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 19 inches
Texture: Very gravelly sandy clay loam
Structure: Angular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 19 to 62 inches
Texture: Extremely gravelly sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.5 to 4.5 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of partial ballenas with a rock core
Distinctive present vegetation: Wyoming big sagebrush, black sagebrush

Inclusion 2

Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Crests of partial ballenas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the strongly sloping Hunewill soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Kelk soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—very poor; shallow water areas—very poor
Suitability of the Hunewill soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Strongly Sloping Hunewill Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, large stones, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Large stones, droughty, soil blowing
Terraces and diversions: Slope, large stones, too sandy

Suitability and Limitations of the Kelk Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Poor—low strength
Topsoil: Fair—slope
Daily cover for landfill: Fair—slope
Shallow excavations: Moderate—slope
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping

Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Slope, erodes easily, percs slowly

Suitability and Limitations of the Hunewill Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty
Roadfill: Fair—large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—large stones, frost action
Pond reservoir areas: Severe—seepage

Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Large stones, droughty, slope
Terraces and diversions: Large stones, too sandy

Interpretive Groups

Capability classification: The strongly sloping Hunewill soil—4e, irrigated, 6c, nonirrigated; Kelk soil—4e, irrigated, 6s, nonirrigated; Hunewill soil—3e, irrigated, 6c, nonirrigated
Range site: The strongly sloping Hunewill soil—025X019N; Kelk soil—025X019N; Hunewill soil—024X017N; Inclusion 1—025X025N; Inclusion 2—025X019N

640—Arcia-Tusel-Hackwood association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Arcia gravelly loam, 15 to 50 percent slopes (40 percent)
• Tusel gravelly loam, 15 to 50 percent slopes (30 percent)
• Hackwood silt loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Leevan very gravelly loam, 15 to 30 percent slopes (10 percent)
• Inclusion 2: Welch silt loam, 0 to 2 percent slopes (3 percent)
• Inclusion 3: Rock outcrop (2 percent)

Characteristics of the Arcia Soil

Classification: Pachic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Lower, concave side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 50 percent
Elevation: 6,500 to 7,500 feet
Dominant present vegetation: Mountain big sagebrush, serviceberry, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 85 days

Typical Profile

Depth: 0 to 14 inches
Texture: Gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 14 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 21 to 34 inches
Texture: Clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 34 to 39 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 39 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 30 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.2 to 5.9 inches
Water-supplying capacity: 7.5 to 12 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—2; wind erodibility group—6

Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tusel Soil

Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 50 percent
Elevation: 6,500 to 8,400 feet
Dominant present vegetation: Mountain big sagebrush, Douglas rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 17 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 19 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 19 to 45 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 45 to 49 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.2 to 6.3 inches
Water-supplying capacity: 13 to 16.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.20; T value—3; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hackwood Soil

Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Upper, concave sides slopes of mountains
Parent material: Colluvium derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 7,500 to 8,400 feet
Dominant present vegetation: Chokecherry, quaking aspen, curlleaf mountainmahogany

Climatic Data

Average annual precipitation: About 18 inches
Average annual air temperature: About 41 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 20 to 30 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 30 to 60 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Slightly acid

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 6.6 to 10 inches
Water-supplying capacity: 14 to 18 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex side slopes of mountains
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush
Inclusion 3
Position on landscape: Side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Arcia soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tusel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hackwood soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Arcia Soil for Various Uses and Practices
Range seeding: Fair—erodes easily
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tusel Soil for Various Uses and Practices
Range seeding: Fair—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Hackwood Soil for Woodland
Site index for common trees: Quaking aspen—44
Most important native understory plants: Mountain brome, Idaho fescue

Suitability and Limitations of the Hackwood Soil for Various Uses and Practices
Range seeding: Fair—erodes easily
Roadfill: Fair—slope, shrink-swell potential
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Arcia soil—7e, nonirrigated; Tusel soil—7e, nonirrigated; Hackwood soil—6e, nonirrigated
Range site: Arcia soil—025X012N; Tusel soil—025X010N; Hackwood soil—025X065N; Inclusion 1—025X017N; Inclusion 2—025X003N; Inclusion 3—none

650—Karpp-Chiara-Rad association

Map Unit Setting

Position on landscape: Fan piedmont remnants, inset fans

Composition

Major components:
• Karpp silt loam, 4 to 15 percent slopes (55 percent)
• Chiara silt loam, 4 to 15 percent slopes (20 percent)
• Rad silt loam, 4 to 15 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Xerollic Durorthids, loamy-skeletal, mixed, mesic, 4 to 15 percent slopes (8 percent)
• Inclusion 2: Hunnton loam, 8 to 15 percent slopes (2 percent)

Characteristics of the Karpp Soil

Classification: Xerollic Durorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over limestone alluvium
Slope range: 4 to 15 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Utah juniper

Climatic Data
Average annual precipitation: About 11 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 100 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 15 inches
Texture: Very gravelly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 15 to 41 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm

Soil and Water Features

Depth to a hardpan: 14 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.1 to 4.7 inches
Water-supplying capacity: 6.5 to 8.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, scattered Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 to 14 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rad Soil

Classification: Durixerollic Camborthids, coarse-silty, mixed, mesic
Position on landscape: Inset fans
Parent material: Loess over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, cheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 26 inches
Texture: Stratified fine sandy loam to silt loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 56 inches
Texture: Silt loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 8 to 16 mmhos per cm

Depth: 56 to 62 inches
Texture: Stratified sandy loam to silt loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Strongly alkaline
Salinity: 8 to 16 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durorthids, loamy-skeletal, mixed, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Utah juniper

Inclusion 2
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Karpp soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Rad soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability of the Karpp Soil for Woodland
Site index for common trees: Utah juniper—25
Most important native understory plants: Big sagebrush, bluebunch wheatgrass

Suitability and Limitations of the Karpp Soil for Various Uses and Practices
Range seeding: Poor—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Chiara Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope

Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Rad Soil for Various Uses and Practices

Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Poor—thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Slight
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Karpp soil—7s, nonirrigated; Chiara soil—4e, irrigated, 7s, nonirrigated; Rad soil—4e, irrigated, 6c, nonirrigated
Range site: Karpp soil—025X059N; Chiara soil—025X019N; Rad soil—025X019N; Inclusion 1—025X059N; Inclusion 2—025X019N

651—Karpp-Chiara-Wieland association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Karpp gravelly silt loam, 4 to 15 percent slopes (35 percent)
• Chiara silt loam, 4 to 15 percent slopes (30 percent)
• Wieland silt loam, 2 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Eboda loam, 30 to 50 percent slopes (10 percent)
• Inclusion 2: Enko sandy loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Karpp Soil

Classification: Xerollic Durorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over limestone alluvium
Slope range: 4 to 15 percent
Elevation: 5,900 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Utah juniper

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 100 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 7 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 15 inches
Texture: Very gravelly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 15 to 41 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm

Soil and Water Features

Depth to a hardpan: 14 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.5 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Convex summits of fan piedmont remnants

Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,900 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, scattered Utah juniper

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 15 percent
Elevation: 5,900 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.5 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low

Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue
Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Inset fans and concave foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Cropland, hayland, pasture
Suitability of the Karpp soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Capability classification: Karpp soil—7s, nonirrigated; Chiara soil—4e, irrigated, 7s, nonirrigated; Wieland soil—4e, irrigated, 6s, nonirrigated
Range site: Karpp soil—025X059N; Chiara soil—025X019N; Wieland soil—025X019N; Inclusion 1—025X012N; Inclusion 2—025X019N

660—Ichbod-Akler association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Ichbod gravelly sandy loam, 2 to 15 percent slopes (60 percent)
• Akler cobbly loam, 2 to 15 percent slopes (25 percent)

Contrasting inclusions:
- Inclusion 1: Soughe gravelly loam, 15 to 30 percent slopes (8 percent)
- Inclusion 2: McIvey gravelly loam, 15 to 30 percent slopes (5 percent)
- Inclusion 3: Rock outcrop (2 percent)

Characteristics of the Ichbod Soil

Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Residuum derived from rhyolite or andesite
Slope range: 2 to 15 percent
Elevation: 6,200 to 7,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, scattered Utah juniper

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 3 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 3 to 7 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 7 to 19 inches
Texture: Gravelly sandy clay
Structure: Prismatic
Consistence: Hard, very firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 to 35 inches
Texture: Weathered bedrock

Depth: 35 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.7 to 2.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Akler Soil

Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Crests and convex, south-facing side slopes of hills
Parent material: Residuum derived from rhyolite
Slope range: 2 to 15 percent
Elevation: 6,200 to 7,000 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Webber ricegrass, scattered Utah juniper

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 15

Depth: 0 to 6 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 6 to 17 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 17 to 28 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.4 to 2.1 inches
Water-supplying capacity: 6.5 to 7.5 inches

Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper
Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue
Inclusion 3
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Ichbod soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Akler soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Ichbod Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, low strength, shrink-swell potential
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Akler Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, hard to pack
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Ichbod soil—7s, nonirrigated; Akler soil—7s, nonirrigated
Range site: Ichbod soil—025X014N; Akler soil—025X018N; Inclusion 1—025X059N; Inclusion 2—025X012N; Inclusion 3—none

690—Welch, drained-Welch association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Welch loam, drained, 2 to 4 percent slopes (75 percent)
• Welch silty clay loam, 2 to 4 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Welch silt loam, 2 to 8 percent slopes (5 percent)
• Inclusion 2: Crooked Creek silt loam, 2 to 8 percent slopes (5 percent)

Characteristics of the Drained Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,600 to 8,000 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye, Nevada bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Loam
Structure: Platy

Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Characteristics of the Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 2 to 4 percent
Elevation: 5,600 to 8,000 feet
Dominant present vegetation: Tufted hairgrass, alpine timothy, sedge

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silty clay loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 9.8 to 13 inches
Water-supplying capacity: 11 to 17 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to fan piedmont remnants or hills
Distinctive present vegetation: Alpine timothy, Nevada bluegrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Potential foreseeable use: Cropland
Suitability of the drained Welch soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Welch soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Drained Welch Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Fair—small stones
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness

Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Moderate—slope
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Slope
Terraces and diversions: Favorable

Suitability and Limitations of the Welch Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—low strength, wetness, shrink-swell potential
Topsoil: Fair—too clayey, small stones
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—flooding, frost action
Pond reservoir areas: Moderate—slope
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action, slope
Irrigation: Wetness, slope, flooding
Terraces and diversions: Wetness

Interpretive Groups

Capability classification: The drained Welch soil—2w, irrigated, 6w, nonirrigated; Welch soil—5w, irrigated and nonirrigated
Range site: The drained Welch soil—025X003N; Welch soil—025X005N; Inclusion 1—025X006N; Inclusion 2—025X003N

693—Welch-Woofus association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Welch loam, 0 to 2 percent slopes (50 percent)
• Woofus loam, 0 to 2 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Devilsgait silty clay loam, 0 to 2 percent slopes (9 percent)
• Inclusion 2: Kelk silt loam, 0 to 2 percent slopes (4 percent)
• Inclusion 3: Tweba sandy loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Basin big sagebrush, basin wildrye

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 9 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Characteristics of the Woofus Soil

Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,400 to 5,600 feet
Dominant present vegetation: Basin wildrye

Climatic Data

Average annual precipitation: About 10 inches

Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 8 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 30 inches
Texture: Stratified loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified loamy fine sand to gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 24 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 9.0 to 9.5 inches
Water-supplying capacity: 10 to 15 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—3; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Basin wildrye

Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Black greasewood, basin big sagebrush, basin wildrye

Inclusion 3
Classification: Aeric Fluvaquents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Flood plains
Distinctive present vegetation: Basin wildrye, creeping wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Welch soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—poor
Suitability of the Woofus soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—fair

Suitability and Limitations of the Welch Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Fair—small stones
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Favorable
Terraces and diversions: Favorable

Suitability and Limitations of the Woofus Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—wetness
Topsoil: Fair—area reclaim, small stones
Daily cover for landfill: Poor—seepage, too sandy, wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, piping, wetness
Sand: Probable source
Gravel: Probable source

Drainage: Flooding, frost action, cutbanks cave
Irrigation: Wetness, rooting depth, flooding
Terraces and diversions: Wetness, too sandy

Interpretive Groups

Capability classification: Welch soil—2w, irrigated, 6w, nonirrigated; Woofus soil—5w, irrigated and nonirrigated
Range site: Welch soil—025X003N; Woofus soil—025X001N; Inclusion 1—025X001N; Inclusion 2—024X006N; Inclusion 3—025X001N

695—Welch-Crooked Creek-Welch, occasionally flooded association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Welch silt loam, 0 to 2 percent slopes (35 percent)
• Crooked Creek silty clay loam, 0 to 2 percent slopes (30 percent)
• Welch silt loam, 0 to 2 percent slopes, occasionally flooded (20 percent)
Contrasting inclusions:
• Inclusion 1: Crooked Creek silty clay loam, 0 to 2 percent slopes, occasionally flooded (11 percent)
• Inclusion 2: Welch silt loam, 0 to 2 percent slopes, rarely flooded (3 percent)
• Inclusion 3: Crooked Creek silty clay loam, 2 to 8 percent slopes (1 percent)

Characteristics of the Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Slightly lower areas of flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,900 to 6,200 feet
Dominant present vegetation: Willow, tufted hairgrass, alpine timothy, sedge

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Slightly lower areas of flood plains
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,900 to 6,200 feet
Dominant present vegetation: Willow, tufted hairgrass, alpine timothy

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 38 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 38 to 60 inches
Texture: Silty clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Slow
Available water capacity: 6.2 to 7.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Occasionally Flooded Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Slightly higher areas of flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,900 to 6,200 feet
Dominant present vegetation: Willow, alpine timothy, Nevada bluegrass, sedge

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—occasional; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Slightly higher areas of flood plains
Distinctive present vegetation: Nevada bluegrass, alpine timothy

Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 3
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Tufted hairgrass, sedge

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Welch soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—good
Suitability of the Crooked Creek soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Suitability of the occasionally flooded Welch soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Welch Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—low strength, wetness, shrink-swell potential
Topsoil: Fair—small stones
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, flooding
Terraces and diversions: Wetness

Suitability and Limitations of the Crooked Creek Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Poor—thin layer
Daily cover for landfill: Poor—too clayey, hard to pack, wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly
Terraces and diversions: Wetness, percs slowly

Suitability and Limitations of the Occasionally Flooded Welch Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—low strength, wetness, shrink-swell potential
Topsoil: Fair—small stones
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, flooding
Terraces and diversions: Wetness

Interpretive Groups

Capability classification: Both Welch soils and the Crooked Creek soil—5w, irrigated and nonirrigated
Range site: Welch soil—025X005N; Crooked Creek soil—025X005N; the occasionally flooded Welch soil—025X006N; Inclusion 1—025X006N; Inclusion 2—025X003N; Inclusion 3—025X005N

698—Halleck, occasionally flooded-Halleck-Crooked Creek association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Halleck silt loam, 0 to 2 percent slopes, occasionally flooded (35 percent)
• Halleck silt loam, 0 to 2 percent slopes (25 percent)
• Crooked Creek Silt loam, 0 to 2 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: Hussa silt loam, 0 to 2 percent slopes (10 percent)
• Inclusion 2: Halleck silt loam, 0 to 2 percent slopes, rarely flooded (5 percent)

Characteristics of the Occasionally Flooded Halleck Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,800 to 6,200 feet
Dominant present vegetation: Nevada bluegrass, alpine timothy

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Salinity: 0 to 2 mmhos per cm

Depth: 9 to 36 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 36 to 61 inches
Texture: Stratified loam to silty clay loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 30 inches
Flooding: Frequency—occasional; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Halleck Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,800 to 6,200 feet
Dominant present vegetation: Nevada bluegrass, alpine timothy

Climatic Data

Average annual precipitation: About 11 inches

Potential for frost action: High

Characteristics of the Crooked Creek Soil

Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,800 to 6,200 feet
Dominant present vegetation: Willow, tufted hairgrass, alpine timothy

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 38 inches
Texture: Silty clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 38 to 60 inches
Texture: Silty clay loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Slow
Available water capacity: 6.7 to 7.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Slightly higher areas of flood plains
Distinctive present vegetation: Tufted hairgrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the occasionally flooded Halleck soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good
Suitability of the Halleck soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—good

Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Percs slowly, flooding, frost action
Irrigation: Wetness, percs slowly
Terraces and diversions: Wetness, percs slowly

Interpretive Groups

Capability classification: Both Halleck soils and the Crooked Creek soil—5w, irrigated and nonirrigated
Range site: The occasionally flooded Halleck soil—025X006N; Halleck soil—025X005N; Crooked Creek soil—025X005N; Inclusion 1—025X005N; Inclusion 2—025X003N

700—Leevan-Cleavage-Arcia association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Leevan cobbly loam, 15 to 50 percent slopes (40 percent)
• Cleavage cobbly loam, 15 to 50 percent slopes (30 percent)
• Arcia gravelly loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (10 percent)
• Inclusion 2: Hackwood silt loam, 15 to 30 percent slopes (2 percent)
• Inclusion 3: Tusel gravelly loam, 15 to 50 percent slopes (2 percent)
• Inclusion 4: Sumine gravelly loam, 30 to 50 percent slopes (1 percent)

Characteristics of the Leevan Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex, lower side slopes of mountains
Parent material: Residuum derived from welded tuff or rhyolite
Slope range: 15 to 50 percent
Elevation: 6,600 to 8,300 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 5 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 9 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 14 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 14 to 24 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 24 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 3.8 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Summits and convex, upper side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff or rhyolite

Slope range: 15 to 50 percent
Elevation: 6,600 to 8,300 feet
Dominant present vegetation: Black sagebrush, lupine, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 8.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Arcia Soil

Classification: Pachic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: North-facing, concave, lower side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff or rhyolite
Slope range: 15 to 30 percent
Elevation: 6,600 to 8,300 feet
Dominant present vegetation: Mountain big sagebrush, Douglas rabbitbrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 85 days

Typical Profile

Depth: 0 to 14 inches
Texture: Gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 14 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 21 to 34 inches
Texture: Clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 34 to 39 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 39 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 30 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.2 to 5.9 inches
Water-supplying capacity: 7.5 to 12 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Summits and side slopes of mountains
Distinctive present vegetation: None
Inclusion 2
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: North-facing, concave, upper side slopes of mountains

Distinctive present vegetation: Quaking aspen, mountain brome

Inclusion 3

Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed

Position on landscape: North-facing, smooth side slopes of mountains

Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 4

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid

Position on landscape: South-facing, smooth side slopes of mountains

Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat

Suitability of the Leevan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Arcia soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Leevan Soil for Various Uses and Practices

Range seeding: Fair—too arid, droughty, large stones

Roadfill: Poor—depth to rock, slope, shrink-swell potential

Topsoil: Poor—small stones, slope

Daily cover for landfill: Poor—depth to rock, too clayey, small stones

Shallow excavations: Severe—depth to rock, slope

Local roads and streets: Severe—slope, shrink-swell potential

Pond reservoir areas: Severe—slope

Embankments, dikes, and levees: Severe—thin layer

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty

Roadfill: Poor—depth to rock, slope

Topsoil: Poor—depth to rock, small stones, slope

Daily cover for landfill: Poor—depth to rock, small stones, slope

Shallow excavations: Severe—depth to rock, slope

Local roads and streets: Severe—depth to rock, slope

Pond reservoir areas: Severe—depth to rock, slope

Embankments, dikes, and levees: Severe—large stones, thin layer

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Suitability and Limitations of the Arcia Soil for Various Uses and Practices

Range seeding: Good

Roadfill: Poor—depth to rock, low strength

Topsoil: Poor—small stones, slope

Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack

Shallow excavations: Severe—depth to rock, slope

Local roads and streets: Severe—low strength, slope, shrink-swell potential

Pond reservoir areas: Severe—slope

Embankments, dikes, and levees: Moderate—thin layer, hard to pack, large stones

Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Leevan soil—7e, nonirrigated; Cleavage soil—7s, nonirrigated; Arcia soil—6e, nonirrigated

Range site: Leevan soil—025X017N; Cleavage soil—025X024N; Arcia soil—025X012N; Inclusion 1—none; Inclusion 2—025X065N; Inclusion 3—025X010N; Inclusion 4—025X009N

701—Leevan-Pernog-Rock outcrop association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:

- Leevan cobbly loam, 15 to 50 percent slopes (40 percent)
- Pernog gravelly loam, 15 to 50 percent slopes (35 percent)
- Rock outcrop (15 percent)

Contrasting inclusions:

- Inclusion 1: Tusel gravelly loam, 30 to 50 percent slopes (5 percent)
- Inclusion 2: Eboda loam, 15 to 30 percent slopes (5 percent)

Characteristics of the Leevan Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid

Position on landscape: Lower, convex side slopes of mountains

Parent material: Residuum and colluvium derived from welded tuff or rhyolite
Slope range: 15 to 50 percent
Elevation: 6,600 to 7,200 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 5 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 9 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 14 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 14 to 24 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 24 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 3.8 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Pernog Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of mountains
Parent material: Residuum and colluvium derived from welded tuff or rhyolite
Slope range: 15 to 50 percent
Elevation: 7,200 to 8,300 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, curlleaf mountainmahogany

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 17 inches
Texture: Very stony clay loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 17 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 12 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.8 to 2.2 inches
Water-supplying capacity: 10 to 13 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rock Outcrop

Position on landscape: Crests and upper side slopes of mountains

Elevation: 7,000 to 8,300 feet
Distinctive present vegetation: None

Contrasting Inclusions

Inclusion 1
Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth, north- and east-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue
Inclusion 2
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north- and east-facing side slopes of mountains
Distinctive present vegetation: Big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Leevan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Pernog soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Leevan Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty, large stones
Roadfill: Poor—depth to rock, slope, shrink-swell potential
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines

Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Leevan soil—7e, nonirrigated; Pernog soil—7e, nonirrigated; Rock outcrop—8s, nonirrigated
Range site: Leevan soil—025X017N; Pernog soil—028B042N; Rock outcrop—none; Inclusion 1—025X010N; Inclusion 2—025X027N

702—Leevan-Quarz-McIvey association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Leevan very gravelly loam, 8 to 15 percent slopes (40 percent)
• Quarz very stony loam, 15 to 30 percent slopes (35 percent)
• McIvey gravelly silt loam, 15 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (5 percent)
• Inclusion 2: Arcia gravelly silt loam, 15 to 50 percent slopes (5 percent)

Characteristics of the Leevan Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff or rhyolite
Slope range: 8 to 15 percent
Elevation: 6,400 to 7,200 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 9 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 26 inches
Texture: Very gravelly clay
Structure: Subangular blocky

Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 26 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.0 to 2.7 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Quarz Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth, south-facing side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff or rhyolite
Slope range: 15 to 30 percent
Elevation: 6,400 to 7,200 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 15

Depth: 0 to 4 inches
Texture: Very stony loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 12 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 26 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 26 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.0 to 3.4 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of hills
Parent material: Colluvium derived from welded tuff or rhyolite
Slope range: 15 to 50 percent
Elevation: 6,400 to 7,200 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 2
Percent pebbles on the surface: 20

Depth: 0 to 12 inches
Texture: Gravelly silt loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 12 to 24 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 24 to 42 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 42 to 60 inches
Texture: Extremely cobbly clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 5.6 to 7.8 inches
Water-supplying capacity: 10 to 16 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Summits and side slopes of hills
Distinctive present vegetation: None
Inclusion 2
Classification: Pachic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Leevan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Quarz soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Leevan Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, shrink-swell potential
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Quarz Soil for Various Uses and Practices
Range seeding: Poor—large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the McIvey Soil for Various Uses and Practices
Range seeding: Fair—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—too clayey, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Leevan soil—7e, nonirrigated; Quarz soil—7s, nonirrigated; McIvey soil—7e, nonirrigated
Range site: Leevan soil—025X017N; Quarz soil—025X009N; McIvey soil—025X012N; Inclusion 1—none; Inclusion 2—025X012N

710—Samor-Porrone-Rock outcrop association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Samor very gravelly loam, 15 to 50 percent slopes (45 percent)
- Porrone very gravelly loam, 15 to 50 percent slopes (30 percent)
- Rock outcrop (20 percent)

Contrasting inclusion:
- Inclusion 1: Spilock very gravelly loam, 30 to 50 percent slopes (5 percent)

Characteristics of the Samor Soil

Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 5,700 to 6,300 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 6 to 19 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.5 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Porrone Soil

Classification: Durixerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Upper, smooth or concave side slopes of hills
Parent material: Colluvium derived from limestone and influenced by loess and volcanic ash
Slope range: 15 to 50 percent
Elevation: 6,000 to 6,300 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 35

Depth: 0 to 18 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 18 to 65 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 4.1 to 4.9 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: B

Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rock Outcrop

Position on landscape: Crests and side slopes of hills
Elevation: 5,700 to 6,300 feet
Distinctive present vegetation: None

Contrasting Inclusion

Inclusion 1
Classification: Xerollic Paleorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Lower, slightly concave side slopes of hills
Distinctive present vegetation: Black sagebrush, Utah juniper

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Samor soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Porrone soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Samor Soil for Woodland
Site index for common trees: Utah juniper—23
Most important native understory plants: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Suitability and Limitations of the Samor Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Porrone Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Samor soil—7s, nonirrigated; Porrone soil—7s, nonirrigated; Rock outcrop—8s, nonirrigated
Range site: Samor soil—025X059N; Porrone soil—025X019N; Rock outcrop—none; Inclusion 1—025X060N

711—Samor-Siri-Nirac association

Map Unit Setting

Position on landscape: Mountains, hills

Composition

Major components:
• Samor very gravelly loam, 15 to 50 percent slopes (40 percent)
• Siri very gravelly loam, 30 to 50 percent slopes (30 percent)
• Nirac very gravelly loam, 30 to 50 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (7 percent)
• Inclusion 2: Izod very gravelly loam, 15 to 30 percent slopes (3 percent)

Characteristics of the Samor Soil

Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Upper, convex, south- and west-facing side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 7,000 to 7,400 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 6 to 19 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.5 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Siri Soil

Classification: Xerollic Calciorthids, loamy-skeletal, mixed, frigid
Position on landscape: Concave, south- and west-facing side slopes of mountains
Parent material: Residuum and colluvium derived from limestone and influenced by loess
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 65

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 57 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 57 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.1 to 5.0 inches
Water-supplying capacity: 9.0 to 10 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.10; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Nirac Soil

Classification: Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: North- and east-facing side slopes of mountains
Parent material: Residuum and colluvium derived from limestone and influenced by loess
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, serviceberry, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 14 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 14 to 25 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.8 to 3.9 inches
Water-supplying capacity: 6 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None
Inclusion 2
Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Lower, convex side slopes of mountains
Distinctive present vegetation: Black sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Samor soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Siri soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Nirac soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Samor Soil for Woodland
Site index for common trees: Utah juniper—23
Most important native understory plants: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Suitability and Limitations of the Samor Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Siri Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Nirac Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Samor, Siri, and Nirac soils—7s, nonirrigated
Range site: Samor soil—025X059N; Siri soil—025X009N; Nirac soil—025X012N; Inclusion 1—none; Inclusion 2—024X030N

712—Samor-Nirac-Samor, steep association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Samor gravelly loam, 15 to 30 percent slopes (40 percent)
- Nirac very gravelly loam, 15 to 50 percent slopes (30 percent)
- Samor very gravelly loam, 30 to 50 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Shivlum silt loam, 4 to 15 percent slopes (4 percent)
- Inclusion 2: Spilock very gravelly loam, 30 to 50 percent slopes (3 percent)
- Inclusion 3: Puett gravelly loam, 15 to 50 percent slopes (2 percent)
- Inclusion 4: Rock outcrop (1 percent)

Characteristics of the Samor Soil

Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Lower, convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 30 percent
Elevation: 5,500 to 5,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 6 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 6 to 19 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 2.4 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Nirac Soil

Classification: Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Slightly concave, north-facing side slopes of hills
Parent material: Residuum and colluvium derived from limestone and influenced by loess
Slope range: 15 to 50 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 14 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 14 to 25 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate

Available water capacity: 1.8 to 3.9 inches
Water-supplying capacity: 7 to 11 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Steep Samor Soil

Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Upper, convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 30 to 50 percent
Elevation: 5,800 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 6 to 19 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.5 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-silty, mixed, frigid
Position on landscape: Concave, south- and west-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Idaho fescue, bluebunch wheatgrass
Inclusion 2
Classification: Xerollic Paleorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Smooth or slightly concave side slopes of hills
Distinctive present vegetation: Black sagebrush, Utah juniper
Inclusion 3
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Lower, convex side slopes of hills
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass
Inclusion 4
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Samor soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Nirac soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the steep Samor soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair

Suitability of the Samor Soil for Woodland
Site index for common trees: Utah juniper—23
Most important native understory plants: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Suitability and Limitations of the Samor Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty

Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Nirac Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Steep Samor Soil for Woodland

Site index for common trees: Utah juniper—23
Most important native understory plants: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Suitability and Limitations of the Steep Samor Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Samor soil—7e, nonirrigated; Nirac soil—7s, nonirrigated; the steep Samor soil—7s, nonirrigated

716—Samor-Rock outcrop-Nirac association

Map Unit Setting

Position on landscape: Hills, mountains

Composition

Major components:
• Samor very gravelly silt loam, 15 to 50 percent slopes (55 percent)
• Rock outcrop (20 percent)
• Nirac gravelly silt loam, 15 to 50 percent slopes (15 percent)
Contrasting inclusion:
• Inclusion 1: Xeric Torriorthents, coarse-loamy, mixed, frigid, 15 to 50 percent slopes (10 percent)

Characteristics of the Samor Soil

Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Convex crests and side slopes of hills and mountains
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 6,200 to 7,000 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, lupine, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 6 inches
Texture: Very gravelly silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 6 to 19 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.5 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Rock Outcrop

Position on landscape: Crests and side slopes of hills and mountains
Elevation: 6,200 to 7,000 feet
Distinctive present vegetation: None

Characteristics of the Nirac Soil

Classification: Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Slightly concave, north-facing side slopes of hills and mountains
Parent material: Residuum and colluvium derived from limestone and influenced by loess
Slope range: 15 to 50 percent
Elevation: 6,200 to 7,000 feet
Dominant present vegetation: Mountain big sagebrush, Thurber needlegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 14 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 14 to 25 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.8 to 4.8 inches
Water-supplying capacity: 7.5 to 12 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—2; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusion

Inclusion 1
Classification: Xeric Torriorthents, coarse-loamy, mixed, frigid
Position on landscape: Smooth side slopes of hills and mountains
Distinctive present vegetation: Big sagebrush, Utah juniper

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Samor soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Nirac soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Samor Soil for Woodland
Site index for common trees: Utah juniper—23
Most important native understory plants: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Suitability and Limitations of the Samor Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope

719—Samor-Sumine-Eboda association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Samor very gravelly loam, 15 to 50 percent slopes (40 percent)
• Sumine very gravelly loam, 30 to 50 percent slopes (30 percent)
• Eboda gravelly loam, 30 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Aridic Argixerolls, fine-loamy, mixed, frigid, 30 to 50 percent slopes (9 percent)
• Inclusion 2: Pernty very gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 3: Rock outcrop (1 percent)

Characteristics of the Samor Soil

Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Crests and convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 5,800 to 6,277 feet
Dominant present vegetation: Big sagebrush, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 6 to 19 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.5 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Sumine Soil

Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Slightly concave side slopes of hills
Parent material: Residuum and colluvium derived from sandstone or conglomerate
Slope range: 30 to 50 percent
Elevation: 5,800 to 6,277 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches

Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 55

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 6 to 27 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 27 to 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.4 to 3.6 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Eboda Soil

Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Smooth, north-facing side slopes of hills
Parent material: Loess over residuum derived from shale, sandstone, or conglomerate
Slope range: 30 to 50 percent
Elevation: 5,800 to 6,277 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Idaho fescue, basin wildrye

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 9 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 33 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 33 to 39 inches
Texture: Gravelly sandy clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 39 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 23 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.9 to 6.8 inches
Water-supplying capacity: 10.5 to 14 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Basin wildrye, Idaho fescue
Inclusion 2
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, upper side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 3
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Samor soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Sumine soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Eboda soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Samor Soil for Woodland
Site index for common trees: Utah juniper—23
Most important native understory plants: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Suitability and Limitations of the Samor Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Sumine Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Eboda Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Samor soil—7s, nonirrigated; Sumine soil—7s, nonirrigated; Eboda soil—6e, nonirrigated
Range site: Samor soil—025X059N; Sumine soil—025X009N; Eboda soil—025X012N; Inclusion 1—025X029N; Inclusion 2—025X012N; Inclusion 3—none

722—Lerrow-Hapgood-Cleavage association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Lerrow cobbly loam, 15 to 50 percent slopes (35 percent)
• Hapgood very gravelly loam, 15 to 50 percent slopes (30 percent)
• Cleavage extremely gravelly loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Quarz gravelly loam, 15 to 50 percent slopes (6 percent)
• Inclusion 2: Tusel gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 3: McIvey very gravelly loam, 15 to 50 percent slopes (4 percent)

Characteristics of the Lerrow Soil

Classification: Aridic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Residuum derived from shale, quartzite, or chert
Slope range: 15 to 50 percent
Elevation: 6,300 to 6,600 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Climatic Data
Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile
Percent stones and boulders on the surface: 1
Percent cobbles on the surface: 10
Percent pebbles on the surface: 20

Depth: 0 to 5 inches
Texture: Cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 5 to 15 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 15 to 32 inches
Texture: Cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 32 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.2 to 5.1 inches
Water-supplying capacity: 9.0 to 12 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Upper, concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from chert, shale, or quartzite
Slope range: 15 to 50 percent
Elevation: 6,300 to 6,600 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 to 46 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of mountains
Parent material: Residuum and colluvium derived from chert, shale, or quartzite
Slope range: 4 to 15 percent
Elevation: 6,400 to 6,600 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 49 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex, south-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth or slightly convex, north-facing side slopes of mountains
Distinctive present vegetation: Bluebunch wheatgrass, Idaho fescue

Inclusion 3
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Lower, concave, north-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Lerrow soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Lerrow Soil for Various Uses and Practices
Range seeding: Fair—large stones, erodes easily
Roadfill: Poor—depth to rock, low strength, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Lerrow, Hapgood, and Cleavage soils—7s, nonirrigated
Range site: Lerrow soil—025X009N; Hapgood soil—025X004N; Cleavage soil—025X024N; Inclusion 1—025X009N; Inclusion 2—025X010N; Inclusion 3—025X012N

723—Lerrow-Cotant-Bregar association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Lerrow cobbly loam, 8 to 15 percent slopes (35 percent)
• Cotant cobbly loam, 8 to 15 percent slopes (30 percent)
• Bregar very gravelly coarse sandy loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Quarz very cobbly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 2: Leevan very gravelly loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Arcia cobbly silt loam, 8 to 15 percent slopes (5 percent)

Characteristics of the Lerrow Soil

Classification: Aridic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Lower, south-facing, smooth side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,400 to 7,000 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 1
Percent cobbles on the surface: 10
Percent pebbles on the surface: 20

Depth: 0 to 5 inches
Texture: Cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 5 to 15 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 15 to 32 inches
Texture: Cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 32 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 4.2 to 5.1 inches
Water-supplying capacity: 9.0 to 12 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Cotant Soil

Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Lower, convex side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,400 to 7,000 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 15

Depth: 0 to 3 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 19 inches
Texture: Clay
Structure: Prismatic
Consistence: Hard, very firm
Reaction: Mildly alkaline

Depth: 19 to 31 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 12 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.6 to 3.0 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Bregar Soil

Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 6,400 to 7,000 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 3
Percent pebbles on the surface: 75

Depth: 0 to 2 inches
Texture: Very gravelly coarse sandy loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 8 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 8 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 5 to 12 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.7 inch to 1.1 inches
Water-supplying capacity: 6.5 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Upper, smooth, south-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Lower, slightly concave side slopes of hills
Distinctive present vegetation: Low sagebrush, Idaho fescue

Inclusion 3
Classification: Pachic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly concave areas on crests and upper side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Lerrow soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cotant soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bregar soil for named elements: Wild

herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Lerrow Soil for Various Uses and Practices

Range seeding: Fair—large stones
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Moderate—depth to rock, too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cotant Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bregar Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Lerrow soil—6s, nonirrigated; Cotant soil—7s, nonirrigated; Bregar soil—7s, nonirrigated
Range site: Lerrow soil—025X009N; Cotant soil—025X017N; Bregar soil—025X051N; Inclusion 1—025X009N; Inclusion 2—025X017N; Inclusion 3—025X012N

740—Connel extremely gravelly coarse sandy loam, 0 to 2 percent slopes

Map Unit Setting

Position on landscape: Stream terraces

Composition

Major component:
• Connel extremely gravelly coarse sandy loam, 0 to 2 percent slopes (95 percent)
Contrasting inclusion:
• Inclusion 1: Orovada fine sandy loam, 0 to 4 percent slopes (5 percent)

Characteristics of the Connel Soil

Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Stream terraces
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,000 to 6,000 feet
Dominant present vegetation: Big sagebrush, Indian ricegrass, needleandthread, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Extremely gravelly coarse sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 7 to 20 inches
Texture: Loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline

Depth: 20 to 60 inches
Texture: Stratified very gravelly loamy sand to extremely gravelly coarse sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate

Available water capacity: 3.6 to 4.4 inches
Water-supplying capacity: 7.0 to 9.0 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.05; T value—3; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusion

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan skirts
Distinctive present vegetation: Big sagebrush, bottlebrush squirreltail

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Connel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Connel Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Connel soil—7s, nonirrigated
Range site: Connel soil—024X017N; Inclusion 1—025X019N

760—Yuko-Tuffo-Quarz association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Yuko gravelly sandy loam, 30 to 50 percent slopes (35 percent)
• Tuffo fine sandy loam, 30 to 50 percent slopes (25 percent)
• Quarz very gravelly loam, 8 to 15 percent slopes (25 percent)
Contrasting inclusions:
• Inclusion 1: McIvey gravelly loam, 15 to 30 percent slopes (10 percent)
• Inclusion 2: Akler very cobbly clay loam, 15 to 30 percent slopes (3 percent)
• Inclusion 3: Rock outcrop (2 percent)

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Upper, smooth side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,500 to 7,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 35

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow

Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—4
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tuffo Soil

Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Upper, convex side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,500 to 7,000 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, cheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 3 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 11 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.1 to 1.4 inches
Water-supplying capacity: 5 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—3
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Quarz Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Lower, smooth side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 8 to 15 percent
Elevation: 6,200 to 6,700 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 26 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 26 to 30 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.5 to 3.1 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue
Inclusion 2
Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Lower, convex side slopes of hills
Distinctive present vegetation: Low sagebrush, Sandberg bluegrass
Inclusion 3
Position on landscape: Side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Tuffo soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Quarz soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Yuko Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, depth to rock
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tuffo Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Quarz Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Yuko, Tuffo, and Quarz soils—7s, nonirrigated
Range site: Yuko soil—025X015N; Tuffo soil—025X015N; Quarz soil—025X014N; Inclusion 1—025X012N; Inclusion 2—025X018N; Inclusion 3—none

761—Yuko-Tuffo-Bregar association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Yuko gravelly sandy loam, 30 to 50 percent slopes (40 percent)
• Tuffo fine sandy loam, 30 to 50 percent slopes (25 percent)
• Bregar extremely cobbly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: McIvey gravelly loam, 15 to 30 percent slopes (10 percent)
• Inclusion 2: Akler cobbly clay loam, 15 to 30 percent slopes (3 percent)
• Inclusion 3: Rock outcrop (2 percent)

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Upper, smooth side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,300 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 35

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—4
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tuffo Soil

Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Upper, convex side slopes of hills
Parent material: Residuum derived from welded tuff
Slope range: 30 to 50 percent
Elevation: 6,300 to 6,500 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, cheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 3 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 11 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.1 to 1.4 inches
Water-supplying capacity: 5 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—3
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bregar Soil

Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, frigid
Position on landscape: Lower, convex side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,400 feet
Dominant present vegetation: Low sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 30
Percent pebbles on the surface: 45

Depth: 0 to 2 inches
Texture: Extremely cobbly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 8 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 8 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 5 to 12 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 0.7 inch to 1.1 inches
Water-supplying capacity: 6.5 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.02; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Classification: Xerollic Haplargids, clayey, montmorillonitic, frigid, shallow
Position on landscape: Lower, smooth side slopes of hills
Distinctive present vegetation: Low sagebrush, Sandberg bluegrass

Inclusion 3
Position on landscape: Side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Tuffo soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Bregar soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Yuko Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, depth to rock
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tuffo Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, depth to rock
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bregar Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock, large stones
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, large stones, slope
Local roads and streets: Severe—depth to rock, slope, large stones
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Yuko, Tuffo, and Bregar soils—7s, nonirrigated
Range site: Yuko soil—025X015N; Tuffo soil—025X015N; Bregar soil—025X022N; Inclusion 1—025X012N; Inclusion 2—025X018N; Inclusion 3—none

762—Yuko-Bilbo association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Yuko very gravelly loam, 30 to 50 percent slopes (50 percent)
• Bilbo cobbly loam, 15 to 30 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Vanwyper clay loam, 15 to 30 percent slopes (5 percent)
• Inclusion 2: Kleckner very gravelly loam, 15 to 30 percent slopes (5 percent)
• Inclusion 3: Tuffo fine sandy loam, 15 to 30 percent slopes (5 percent)

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Upper, convex side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff
Slope range: 30 to 50 percent
Elevation: 6,000 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 50

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 5.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Upper, slightly concave side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 15 to 30 percent
Elevation: 6,000 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 20

Depth: 0 to 4 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay loam

Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 7 to 9 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Lower side slopes of hills
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass
Inclusion 2
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Lower, slightly concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass
Inclusion 3
Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Lower, convex side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Yuko Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty, large stones
Roadfill: Fair—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Yuko and Bilbo soils—7s, nonirrigated
Range site: Yuko soil—025X015N; Bilbo soil—025X015N; Inclusion 1—025X019N; Inclusion 2—025X014N; Inclusion 3—025X019N

763—Yuko-Tuffo-Yuko, moderately steep association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Yuko gravelly sandy loam, 4 to 15 percent slopes (35 percent)
• Tuffo fine sandy loam, 2 to 8 percent slopes (30 percent)
• Yuko very gravelly sandy loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Tuffo coarse sandy loam, 30 to 50 percent slopes (7 percent)

• Inclusion 2: Orovada fine sandy loam, 4 to 15 percent slopes (6 percent)
• Inclusion 3: Aridic Duric Haploxerolls silt loam, 15 to 30 percent slopes (2 percent)

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Lower, convex side slopes of hills
Parent material: Residuum derived from tuff
Slope range: 4 to 15 percent
Elevation: 5,300 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 35

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tuffo Soil

Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Crests of hills
Parent material: Residuum derived from tuff
Slope range: 2 to 8 percent
Elevation: 5,300 to 6,500 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 3 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 11 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.1 to 1.4 inches
Water-supplying capacity: 5 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Moderately Steep Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Convex side slopes of hills
Parent material: Residuum derived from tuff
Slope range: 15 to 30 percent
Elevation: 5,500 to 6,200 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 50

Depth: 0 to 2 inches
Texture: Very gravelly sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 5.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Upper, convex side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 2
Classification: Durixerollic Camborthids, loamy, mixed, mesic
Position on landscape: Fan aprons
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Inclusion 3
Classification: Aridic Duric Haploxerolls, fine-silty, mixed, frigid
Position on landscape: Slightly concave, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Tuffo soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the moderately steep Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Yuko Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, depth to rock
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, frost action
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tuffo Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, depth to rock
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock

Local roads and streets: Moderate—depth to rock, frost action
Pond reservoir areas: Severe—depth to rock
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Moderately Steep Yuko Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Yuko soils and the Tuffo soil—7s, nonirrigated
Range site: Yuko soil—025X019N; Tuffo soil—025X019N; the moderately steep Yuko soil—025X015N; Inclusion 1—025X015N; Inclusion 2—025X019N; Inclusion 3—025X027N

764—Yuko-Tuffo-Upsteer association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Yuko very gravelly coarse sandy loam, 30 to 50 percent slopes (40 percent)
• Tuffo fine sandy loam, 30 to 50 percent slopes (30 percent)
• Upsteer silt loam, 30 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Orovada fine sandy loam, 4 to 15 percent slopes (5 percent)
• Inclusion 2: Tuffo very fine sandy loam, 2 to 8 percent slopes (5 percent)
• Inclusion 3: Bilbo loam, 2 to 8 percent slopes (4 percent)
• Inclusion 4: Hunewill gravelly loam, 4 to 15 percent slopes (1 percent)

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Smooth side slopes of hills
Parent material: Residuum derived from tuff
Slope range: 30 to 50 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 50

Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 11.5 to 13 inches
Water-supplying capacity: 12 to 16 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Fan aprons
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Inclusion 2
Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Crests of hills
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Inclusion 3
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass
Inclusion 4
Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Tuffo soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Upsteer soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Yuko Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tuffo Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Upsteer Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—slope
Daily cover for landfill: Poor—slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Yuko soil—7s, nonirrigated; Tuffo soil—7s, nonirrigated; Upsteer soil—7e, nonirrigated
Range site: Yuko soil—025X015N; Tuffo soil—025X015N; Upsteer soil—025X027N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

770—Gochea-Donna association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Gochea loam, 4 to 15 percent slopes (50 percent)
• Donna gravelly loam, 4 to 15 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Durixerollic Camborthids, coarse-loamy, mixed, frigid, 4 to 15 percent slopes (8 percent)
• Inclusion 2: Welch silt loam, 0 to 2 percent slopes (7 percent)

Characteristics of the Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Slightly convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,500 feet
Dominant present vegetation: Big sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy

Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 21 to 41 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 60 inches
Texture: Extremely gravelly sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 5.0 to 7.3 inches
Water-supplying capacity: 9 to 10.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—4; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,500 feet
Dominant present vegetation: Low sagebrush, Thurber needlegrass, Webber ricegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 3.6 to 4.1 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, coarse-loamy, mixed, frigid
Position on landscape: Concave foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid

Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Gochea soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Gochea Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Rooting depth, slope, erodes easily
Terraces and diversions: Slope, erodes easily, too sandy

Suitability and Limitations of the Donna Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Gochea soil—4e, irrigated, 6c, nonirrigated; Donna soil—7s, nonirrigated
Range site: Gochea soil—025X014N; Donna soil—025X018N; Inclusion 1—025X014N; Inclusion 2—025X003N

771—Gochea-Welch, drained-Welch association

Map Unit Setting

Position on landscape: Basin floors, fan piedmonts

Composition

Major components:
• Gochea gravelly loam, 4 to 15 percent slopes (45 percent)
• Welch silt loam, drained, 0 to 2 percent slopes (25 percent)
• Welch silt loam, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Durixerollic Camborthids, loamy-skeletal, mixed, frigid, 4 to 15 percent slopes (10 percent)
• Inclusion 2: Ocala silt loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 21 to 41 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 60 inches
Texture: Extremely gravelly sand
Structure: Massive

Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 7.0 inches
Water-supplying capacity: 9 to 10.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—4; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Moderate

Characteristics of the Drained Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush, basin wildrye

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 9.6 to 12 inches
Water-supplying capacity: 9 to 12 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Characteristics of the Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Tufted hairgrass, Nevada bluegrass, alpine timothy

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 9.6 to 13 inches
Water-supplying capacity: 12 to 16 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, loamy-skeletal, mixed, frigid
Position on landscape: Fan skirts
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Rubber rabbitbrush, black greasewood, inland saltgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, cropland, pasture
Suitability of the Gochea soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the drained Welch soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—poor
Suitability of the Welch soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—good

Suitability and Limitations of the Gochea Soil for Various Uses and Practices
Range seeding: Fair—too arid, small stones
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Droughty, rooting depth, slope
Terraces and diversions: Slope, too sandy

Suitability and Limitations of the Drained Welch Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Fair—small stones
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Favorable
Terraces and diversions: Favorable

Suitability and Limitations of the Welch Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—low strength, wetness, shrink-swell potential
Topsoil: Fair—small stones
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—wetness
Local roads and streets: Severe—flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Flooding, frost action
Irrigation: Wetness, flooding
Terraces and diversions: Wetness

Interpretive Groups

Capability classification: Gochea soil—4e, irrigated, 6c, nonirrigated; the drained Welch soil—2w, irrigated, 6w, nonirrigated; Welch soil—5w, irrigated and nonirrigated
Range site: Gochea soil—025X014N; the drained Welch soil—025X003N; Welch soil—025X005N; Inclusion 1—025X014N; Inclusion 2—024X007N

772—Gochea-Gochea, gravelly-Tuffo association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Gochea loam, 4 to 15 percent slopes (45 percent)
• Gochea gravelly loam, 2 to 4 percent slopes (20 percent)

• Tuffo gravelly sandy loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, frigid, 0 to 2 percent slopes (10 percent)
• Inclusion 2: Stampede loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Slightly convex side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess
Slope range: 4 to 15 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 21 to 41 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 60 inches
Texture: Extremely gravelly sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 5.0 to 7.3 inches
Water-supplying capacity: 9 to 10.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—4; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gravelly Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess
Slope range: 2 to 4 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 21 to 41 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 60 inches
Texture: Extremely gravelly sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow

Available water capacity: 4.0 to 7.0 inches
Water-supplying capacity: 9 to 10.5 inches
Runoff: Slow
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—4; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Moderate

Characteristics of the Tuffo Soil

Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff
Slope range: 15 to 30 percent
Elevation: 6,200 to 6,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 3 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 11 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.0 to 1.3 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Smooth side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Gochea soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the gravelly Gochea soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Tuffo soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Gochea Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action, slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Rooting depth, slope, erodes easily

Terraces and diversions: Too sandy, slope, erodes easily

Suitability and Limitations of the Gravelly Gochea Soil for Various Uses and Practices

Range seeding: Fair—too arid, small stones
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Rooting depth, slope, droughty
Terraces and diversions: Too sandy

Suitability and Limitations of the Tuffo Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, erodes easily
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Gochea soil—4e, irrigated, 6c, nonirrigated; the gravelly Gochea soil—3e, irrigated, 6c, nonirrigated; Tuffo soil—7s, nonirrigated
Range site: Both Gochea soils—025X014N; Tuffo soil—025X019N; Inclusion 1—025X014N; Inclusion 2—025X014N

773—Gochea-Samor-Nirac association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Gochea silt loam, 4 to 15 percent slopes (45 percent)
• Samor very gravelly loam, 15 to 50 percent slopes (25 percent)
• Nirac gravelly silt loam, 30 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Lithic Xeric Torriorthents, loamy-skeletal, mixed (calcareous), mesic, 8 to 30 percent slopes (5 percent)
• Inclusion 2: Graley very gravelly loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Lithic Argixerolls, clayey, montmorillonitic, frigid, 4 to 15 percent slopes (5 percent)

Characteristics of the Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Slightly concave summits of hills
Parent material: Colluvium derived from conglomerate and influenced by loess
Slope range: 4 to 15 percent
Elevation: 5,200 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 8 to 20 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 20 to 47 inches
Texture: Cobble sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 47 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 7.3 to 8.3 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Medium
Hydrologic group: B

Erosion factors (surface layer): K value—.43; T value—3; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Samor Soil

Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: South-facing side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 5,200 to 6,000 feet
Dominant present vegetation: Big sagebrush, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 6 to 19 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.5 to 2.2 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Nirac Soil

Classification: Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Parent material: Residuum and colluvium derived from limestone and influenced by loess
Slope range: 30 to 50 percent
Elevation: 5,200 to 6,000 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 14 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 14 to 25 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.8 to 4.8 inches
Water-supplying capacity: 7.5 to 11 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—2; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Xeric Torriorthents, loamy-skeletal, mixed (calcareous), mesic
Position on landscape: Smooth, south-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly convex summits of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue
Inclusion 3
Classification: Lithic Argixerolls, clayey, montmorillonitic, frigid
Position on landscape: Smooth summits of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Gochea soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Samor soil for named elements: Wild herbaceous plants (nonirrigated)—fair; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—fair
Suitability of the Nirac soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Gochea Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—thin layer
Topsoil: Poor—area reclaim, small stones
Daily cover for landfill: Fair—depth to rock, large stones, slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability of the Samor Soil for Woodland
Site index for common trees: Utah juniper—23
Most important native understory plants: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass

Suitability and Limitations of the Samor Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Nirac Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Gochea soil—6c, nonirrigated; Samor soil—7s, nonirrigated; Nirac soil—7e, nonirrigated
Range site: Gochea soil—025X014N; Samor soil—025X059N; Nirac soil—025X012N; Inclusion 1—025X019N; Inclusion 2—025X012N; Inclusion 3—025X014N

775—Gochea-Donna-Stampede association

Map Unit Setting

Position on landscape: Fan piedmont remnants, flood plains

Composition

Major components:
• Gochea loam, 4 to 15 percent slopes (35 percent)
• Donna silt loam, 2 to 8 percent slopes (30 percent)
• Stampede gravelly loam, 2 to 8 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid, 15 to 30 percent slopes (10 percent)
• Inclusion 2: Crooked Creek silty clay loam, 0 to 2

percent slopes, frequently flooded (2 percent)
• Inclusion 3: Crooked Creek silty clay loam, drained, 0 to 2 percent slopes, rarely flooded (2 percent)
• Inclusion 4: Welch silt loam, 2 to 8 percent slopes (1 percent)

Characteristics of the Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess
Slope range: 4 to 15 percent
Elevation: 6,300 to 6,500 feet
Dominant present vegetation: Big sagebrush, Thurber needlegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 21 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 21 to 41 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 60 inches
Texture: Extremely gravelly sand
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 5.0 to 7.3 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.37; T value—4; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Donna Soil

Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 6,300 to 6,500 feet
Dominant present vegetation: Low sagebrush, Thurber needlegrass, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 10 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 10 to 23 inches
Texture: Clay
Structure: Prismatic
Consistence: Extremely hard, extremely firm
Reaction: Neutral

Depth: 23 to 33 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Depth: 33 to 60 inches
Texture: Stratified extremely gravelly sandy loam to gravelly sandy clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none

Permeability: Very slow
Available water capacity: 3.7 to 4.2 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 8 percent
Elevation: 6,300 to 6,500 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 11 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Idaho fescue

Inclusion 2
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass, sedge

Inclusion 3
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Gochea soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Donna soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Stampede soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs

(nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Gochea Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope, frost action
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Rooting depth, slope, erodes easily
Terraces and diversions: Slope, erodes easily, too sandy

Suitability and Limitations of the Donna Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Moderate—cemented pan, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Moderate—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Stampede Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—small stones, too clayey
Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Gochea soil—4e, irrigated, 6c, nonirrigated; Donna soil—7s, nonirrigated; Stampede soil—4e, irrigated, 6s, nonirrigated
Range site: Gochea soil—025X014N; Donna soil—025X018N; Stampede soil—025X014N; Inclusion 1—025X027N; Inclusion 2—025X005N; Inclusion 3—025X003N; Inclusion 4—025X003N

780—Cowgil-Linkup-Rock outcrop association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Cowgil very cobbly sandy loam, 15 to 50 percent slopes (60 percent)
• Linkup gravelly clay loam, 4 to 15 percent slopes (15 percent)
• Rock outcrop (15 percent)
Contrasting inclusions:
• Inclusion 1: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic, 4 to 15 percent slopes (5 percent)
• Inclusion 2: Xerollic Camborthids, loamy-skeletal, mixed, mesic, 4 to 15 percent slopes (5 percent)

Characteristics of the Cowgil Soil

Classification: Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite or welded tuff
Slope range: 15 to 50 percent
Elevation: 5,900 to 6,100 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 5
Percent cobbles on the surface: 10
Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very cobbly sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 30 inches
Texture: Very gravelly sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 30 to 61 inches
Texture: Very cobbly loamy sand
Structure: Single grained
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.0 to 3.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.10; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Linkup Soil

Classification: Lithic Xerollic Haplargids, clayey, montmorillonitic, frigid
Position on landscape: Crests of hills
Parent material: Residuum and colluvium derived from welded tuff or rhyolite
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,100 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 25

Depth: 0 to 3 inches
Texture: Gravelly clay loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 8 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 8 to 16 inches
Texture: Gravelly clay
Structure: Subangular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 16 to 20 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 2.7 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Rock Outcrop

Position on landscape: Crests and side slopes of hills
Elevation: 5,900 to 6,100 feet
Distinctive present vegetation: None

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Concave crests and foot slopes of hills
Distinctive present vegetation: Low sagebrush, Sandberg bluegrass
Inclusion 2
Classification: Xerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Convex foot slopes of hills
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Cowgil soil for named elements: Wild

herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Linkup soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Cowgil Soil for Various Uses and Practices

Range seeding: Poor—too arid, large stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Linkup Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, hard to pack, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock, low strength
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Cowgil soil—7s, nonirrigated; Linkup soil—7s, nonirrigated; Rock outcrop—8s, nonirrigated
Range site: Cowgil soil—025X019N; Linkup soil—025X018N; Rock outcrop—none; Inclusion 1—025X018N; Inclusion 2—025X019N

810—Nirac-Izod-Izod, very steep association

Map Unit Setting

Position on landscape: Hills, mountains

Composition

Major components:
• Nirac gravelly silt loam, 30 to 75 percent slopes (45 percent)
• Izod very gravelly loam, 15 to 50 percent slopes (25 percent)
• Izod extremely gravelly loam, 50 to 75 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Xeric Torriorthents, loamy-skeletal, mixed (calcareous), mesic, 15 to 30 percent slopes (7 percent)
• Inclusion 2: Porrone very gravelly loam, 30 to 50 percent slopes (4 percent)
• Inclusion 3: Rock outcrop (3 percent)
• Inclusion 4: Welch silt loam, 2 to 4 percent slopes (1 percent)

Characteristics of the Nirac Soil

Classification: Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Slightly concave, north- and east-facing side slopes of hills and mountains
Parent material: Residuum and colluvium derived from limestone and influenced by loess
Slope range: 30 to 75 percent
Elevation: 5,300 to 7,200 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 14 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 14 to 25 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 2.8 to 4.8 inches
Water-supplying capacity: 7.5 to 12 inches
Runoff: Rapid

Hydrologic group: C
Erosion factors (surface layer): K value—.28; T value—2; wind erodibility group—5
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Convex side slopes of hills and mountains
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 5,300 to 7,200 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Very Steep Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Convex side slopes of hills and mountains
Parent material: Residuum and colluvium derived from limestone
Slope range: 50 to 75 percent
Elevation: 5,300 to 7,200 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 3 inches
Texture: Extremely gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 to 1.0 inch
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xeric Torriorthents, loamy-skeletal, mixed (calcareous), mesic
Position on landscape: Sightly convex, south- and west-facing side slopes of hills and mountains
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Durixerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Concave, south- and west-facing side slopes of hills and mountains
Distinctive present vegetation: Big sagebrush, bottlebrush squirreltail
Inclusion 3
Position on landscape: Crests and side slopes of hills and mountains
Distinctive present vegetation: None
Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills and mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Nirac soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the very steep Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Nirac Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Izod Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Very Steep Izod Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Nirac soil—7e, nonirrigated; both Izod soils—7s, nonirrigated
Range site: Nirac soil—025X012N; both Izod soils—024X030N; Inclusion 1—025X015N; Inclusion 2—025X019N; Inclusion 3—none; Inclusion 4—025X003N

813—Spilock-Gochea-Chiara association

Map Unit Setting

Position on landscape: Fan piedmont remnants, low hills

Composition

Major components:
- Spilock very gravelly loam, 15 to 50 percent slopes (40 percent)
- Gochea silt loam, 8 to 15 percent slopes (30 percent)
- Chiara silt loam, 4 to 15 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Izod very gravelly loam, 30 to 50 percent slopes (4 percent)
- Inclusion 2: Grina loam, 15 to 30 percent slopes (4 percent)
- Inclusion 3: Kelk silt loam, 8 to 15 percent slopes (2 percent)

Characteristics of the Spilock Soil

Classification: Xerollic Paleorthids, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Alluvium derived from limestone and conglomerate
Slope range: 15 to 50 percent
Elevation: 5,400 to 5,800 feet
Dominant present vegetation: Black sagebrush, Utah juniper

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 45

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 10 to 30 inches
Texture: Indurated hardpan
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 8 to 14 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.6 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gochea Soil

Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave side slopes of low hills in the higher areas
Parent material: Mixed alluvium influenced by loess
Slope range: 8 to 15 percent
Elevation: 5,600 to 5,800 feet
Dominant present vegetation: Mountain big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 8 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 8 to 20 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline

Depth: 20 to 47 inches
Texture: Cobble sandy loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 47 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 7.3 to 8.3 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.43; T value—3; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,400 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 to 14 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Upper side slopes of hills
Distinctive present vegetation: Black sagebrush, Indian ricegrass

Inclusion 2
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Lower side slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper

Inclusion 3
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Lower, concave side slopes of fan piedmont remnants and the adjacent inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Spilock soil for named elements: Wild herbaceous plants (nonirrigated)—poor; coniferous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Gochea soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Chiara soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Spilock Soil for Woodland
Site index for common trees: Utah juniper—25
Most important native understory plants: Black sagebrush, Thurber needlegrass

Suitability and Limitations of the Spilock Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—cemented pan, slope
Topsoil: Poor—cemented pan, small stones, slope
Daily cover for landfill: Poor—cemented pan, slope
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—cemented pan, slope
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gochea Soil for Various Uses and Practices
Range seeding: Fair—too arid

Roadfill: Poor—thin layer
Topsoil: Poor—area reclaim, small stones
Daily cover for landfill: Fair—depth to rock, large stones, slope
Shallow excavations: Moderate—slope
Local roads and streets: Moderate—slope, frost action, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Chiara Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Spilock soil—7s, nonirrigated; Gochea soil—6c, nonirrigated; Chiara soil—7s, nonirrigated
Range site: Spilock soil—025X060N; Gochea soil—025X014N; Chiara soil—025X019N; Inclusion 1—024X030N; Inclusion 2—025X059N; Inclusion 3—025X019N

814—Denay-Siri-Bobs association

Map Unit Setting

Position on landscape: Hills, fan piedmont remnants

Composition

Major components:
• Denay very gravelly loam, 30 to 50 percent slopes (35 percent)
• Siri very gravelly loam, 30 to 50 percent slopes (30 percent)
• Bobs gravelly loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: McIvey very gravelly loam, 15 to 50 percent slopes (6 percent)
• Inclusion 2: Donna gravelly loam, 4 to 15 percent slopes (5 percent)
• Inclusion 3: Crooked Creek clay loam, 0 to 2 percent slopes (2 percent)
• Inclusion 4: Xeric Torriorthents, loamy-skeletal, mixed, mesic, shallow, 30 to 50 percent slopes (2 percent)

Characteristics of the Denay Soil

Classification: Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex, north-facing side slopes of hills
Parent material: Colluvium derived from limestone and influenced by loess
Slope range: 30 to 50 percent
Elevation: 5,800 to 6,500 feet
Dominant present vegetation: Big sagebrush, serviceberry, Sandberg bluegrass, basin wildrye

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 95 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 10
Percent pebbles on the surface: 45

Depth: 0 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 15 to 60 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 5.4 to 6.8 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Siri Soil

Classification: Xerollic Calciorthids, loamy-skeletal, mixed, frigid
Position on landscape: South-facing side slopes of hills
Parent material: Residuum and colluvium derived from limestone and influenced by loess
Slope range: 30 to 50 percent
Elevation: 5,800 to 6,500 feet
Dominant present vegetation: Antelope bitterbrush, serviceberry, cheatgrass

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 65

Depth: 0 to 6 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 57 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 57 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.1 to 5.0 inches
Water-supplying capacity: 9 to 10.5 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.10; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bobs Soil

Classification: Aridic Petrocalcic Palexerolls, loamy, carbonatic, frigid, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Limestone alluvium influenced by loess
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,500 feet
Dominant present vegetation: Big sagebrush, serviceberry, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 40

Depth: 0 to 13 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 to 19 inches
Texture: Gravelly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 to 29 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of hills and fan piedmont remnants
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 2
Classification: Abruptic Aridic Durixerolls, very fine, montmorillonitic, frigid
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Low sagebrush, Idaho fescue
Inclusion 3
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 4
Classification: Xeric Torriorthents, loamy-skeletal, mixed, mesic, shallow
Position on landscape: Side slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Denay soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Siri soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bobs soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Denay Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Siri Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bobs Soil for Various Uses and Practices
Range seeding: Poor—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Denay, Siri, and Bobs soils—7s, nonirrigated
Range site: Denay soil—025X012N; Siri soil—025X009N; Bobs soil—025X014N; Inclusion 1—025X012N; Inclusion 2—025X018N; Inclusion 3—025X003N; Inclusion 4—025X059N

832—Alburz-Alburz Variant association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Alburz loam, 0 to 2 percent slopes (45 percent)
• Alburz Variant loam, 0 to 4 percent slopes, frequently flooded (40 percent)
Contrasting inclusions:
• Inclusion 1: Welsum loam, 0 to 2 percent slopes (6 percent)
• Inclusion 2: Woofus loam, 0 to 2 percent slopes (5 percent)
• Inclusion 3: Alburz Variant loam, 0 to 4 percent slopes, occasionally flooded (3 percent)
• Inclusion 4: Welch silt loam, 0 to 2 percent slopes (1 percent)

Characteristics of the Alburz Soil

Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,400 to 6,400 feet
Dominant present vegetation: Nevada bluegrass, sedge

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 20 inches
Texture: Stratified gravelly coarse sandy loam to gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 20 to 60 inches
Texture: Stratified extremely gravelly loamy coarse sand to extremely gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 36 inches
Flooding: Frequency—frequent; duration—very brief to long; months—April and May
Permeability: Moderately rapid
Available water capacity: 3.3 to 5.1 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Alburz Variant Soil

Classification: Typic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Natural levees on the flood plains
Parent material: Mixed alluvium
Slope range: 0 to 4 percent
Elevation: 5,400 to 6,400 feet
Dominant present vegetation: Nevada bluegrass, timothy, quaking aspen, cottonwood

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 12 inches
Texture: Loam
Structure: Granular
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 12 to 20 inches
Texture: Gravelly sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 20 to 60 inches
Texture: Very cobbly sand
Structure: Single grained
Consistence: Loose
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—brief; months—February through May
Permeability: Moderately rapid
Available water capacity: 3.2 to 3.8 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), frigid
Position on landscape: Flood plains
Distinctive present vegetation: Nevada bluegrass, sedge
Inclusion 2
Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Wildrye, inland saltgrass
Inclusion 3
Classification: Typic Haplaquolls sandy-skeletal, mixed, frigid
Position on landscape: Natural levees on the flood

plains adjacent to the slightly entrenched part of stream channels
Distinctive present vegetation: Cottonwood

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position of landscape: Flood plains
Distinctive present vegetation: Alpine timothy

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Alburz soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Alburz Variant soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—fair

Suitability and Limitations of the Alburz Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—wetness
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—flooding
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, wetness
Sand: Improbable source—small stones
Gravel: Probable source
Drainage: Flooding, large stones, cutbanks cave
Irrigation: Wetness, droughty, rooting depth
Terraces and diversions: Large stones, erodes easily, wetness

Suitability of the Alburz Variant Soil for Woodland
Site index for common trees: Cottonwood—80
Most important native understory plants: Wiregrass, sedge

Suitability and Limitations of the Alburz Variant Soil for Various Uses and Practices
Range seeding: Fair—droughty
Roadfill: Fair—large stones, wetness
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—flooding
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Flooding, large stones
Irrigation: Large stones, wetness, droughty
Terraces and diversions: Large stones, erodes easily, wetness

Interpretive Groups

Capability classification: Alburz soil—4w, irrigated, 6w, nonirrigated; Alburz Variant soil—5w, irrigated and nonirrigated
Range site: Alburz soil—025X005N; Alburz Variant soil—025X053N; Inclusion 1—025X005N; Inclusion 2—025X001N; Inclusion 3—025X053N; Inclusion 4—025X006N

834—Alburz-Welch association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
- Alburz loam, 0 to 2 percent slopes (55 percent)
- Welch silt loam, 0 to 2 percent slopes (35 percent)

Contrasting inclusions:
- Inclusion 1: Sonoma silt loam, 0 to 2 percent slopes (5 percent)
- Inclusion 2: Welsum loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Alburz Soil

Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 6,100 to 6,400 feet
Dominant present vegetation: Nevada bluegrass, streambank wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Subangular blocky

Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 20 inches
Texture: Stratified gravelly coarse sandy loam to gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 20 to 60 inches
Texture: Stratified extremely gravelly loamy coarse sand to extremely gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 36 inches
Flooding: Frequency—occasional; duration—very brief to long; months—April and May
Permeability: Moderately rapid
Available water capacity: 3.3 to 5.1 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Welch Soil

Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 6,100 to 6,400 feet
Dominant present vegetation: Basin big sagebrush, rubber rabbitbrush

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 61 inches
Texture: Stratified sandy loam to silty clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 48 to 72 inches
Flooding: Frequency—rare
Permeability: Moderately slow
Available water capacity: 9.6 to 12 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), frigid
Position on landscape: Flood plains
Distinctive present vegetation: Nevada bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Alburz soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Welch soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—poor

Suitability and Limitations of the Alburz Soil for Various Uses and Practices
Range seeding: Good

Roadfill: Fair—wetness
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—flooding
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, wetness
Sand: Improbable source—small stones
Gravel: Probable source
Drainage: Flooding, large stones, cutbanks cave
Irrigation: Wetness, droughty, rooting depth
Terraces and diversions: Large stones, erodes easily, wetness

Suitability and Limitations of the Welch Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Poor—low strength
Topsoil: Fair—small stones
Daily cover for landfill: Fair—too clayey
Shallow excavations: Moderate—wetness
Local roads and streets: Severe—low strength, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Slight
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Favorable
Terraces and diversions: Favorable

Interpretive Groups

Capability classification: Alburz soil—4w, irrigated, 6w, nonirrigated; Welch soil—2w, irrigated, 6w, nonirrigated
Range site: Alburz soil—025X006N; Welch soil—025X003N; Inclusion 1—025X003N; Inclusion 2—025X006N

835—Alburz-Ocala association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Alburz loam, 0 to 2 percent slopes (45 percent)
• Ocala silt loam, 0 to 2 percent slopes (45 percent)
Contrasting inclusions:
• Inclusion 1: Ocala very fine sandy loam, 0 to 2 percent slopes (8 percent)
• Inclusion 2: Bloor silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Alburz Soil

Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Flood plains adjacent to stream channels
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,400 feet
Dominant present vegetation: Willow, silver sagebrush, Nevada bluegrass, slender wheatgrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 7 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 20 inches
Texture: Stratified gravelly coarse sandy loam to gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 20 to 60 inches
Texture: Stratified extremely gravelly loamy coarse sand to extremely gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 18 to 36 inches
Flooding: Frequency—occasional; duration—very brief to long; months—April and May
Permeability: Moderately rapid
Available water capacity: 3.3 to 5.1 inches
Water-supplying capacity: 12 to 19 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.37; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Ocala Soil

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Parent material: Mixed alluvium influenced by volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,400 feet
Dominant present vegetation: Black greasewood, rubber rabbitbrush, basin wildrye, inland saltgrass

Climatic Data

Average annual precipitation: About 7 inches
Average annual air temperature: About 50 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 20 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 20 to 50 inches
Texture: Silt loam
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Depth: 50 to 60 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 4 to 8 mmhos per cm
Sodicity (SAR): 13 to 46

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 36 to 42 inches
Flooding: Frequency—occasional; duration—brief to long; months—March through June
Permeability: Slow
Available water capacity: 11 to 13 inches
Water-supplying capacity: 8 to 13 inches
Runoff: Very slow
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: High

Contrasting Inclusions

Inclusion 1

Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, inland saltgrass

Inclusion 2

Classification: Durixerollic Natrargids, fine-silty, mixed, mesic
Position on landscape: Higher areas on the flood plains
Distinctive present vegetation: Black greasewood, inland saltgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Alburz soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Ocala soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—fair; shallow water areas—fair

Suitability and Limitations of the Alburz Soil for Various Uses and Practices

Range seeding: Good
Roadfill: Fair—wetness
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, too sandy, small stones
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—flooding
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, wetness
Sand: Improbable source—small stones
Gravel: Probable source
Drainage: Flooding, large stones, cutbanks cave
Irrigation: Wetness, droughty, rooting depth
Terraces and diversions: Large stones, erodes easily, wetness

Suitability and Limitations of the Ocala Soil for Various Uses and Practices

Range seeding: Poor—excess salts, excess sodium, too crusty

Roadfill: Fair—low strength, shrink-swell potential
Topsoil: Poor—excess sodium
Daily cover for landfill: Poor—excess sodium
Shallow excavations: Moderate—wetness, flooding
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Slight
Embankments, dikes, and levees: Severe—piping, excess sodium
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, erodes easily, flooding
Terraces and diversions: Erodes easily, percs slowly

Interpretive Groups

Capability classification: Alburz and Ocala soils—4w, irrigated, 6w, nonirrigated
Range site: Alburz soil—025X006N; Ocala soil—024X007N; Inclusion 1—024X008N; Inclusion 2—024X007N

839—Woofus-Tweba-Devilsgait association

Map Unit Setting

Position on landscape: Flood plains

Composition

Major components:
• Woofus loam, 0 to 2 percent slopes (40 percent)
• Tweba very fine sandy loam, 0 to 2 percent slopes (30 percent)
• Devilsgait silt loam, gravelly substratum, 0 to 2 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Woofus silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Sonoma silt loam, 0 to 2 percent slopes (4 percent)
• Inclusion 3: Woofus silty clay loam, 0 to 2 percent slopes (3 percent)
• Inclusion 4: Ocala silt loam, 0 to 2 percent slopes (3 percent)

Characteristics of the Woofus Soil

Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Natural levees on the flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Wildrye, Nevada bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 8 inches
Texture: Loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 8 to 30 inches
Texture: Stratified loam to silty clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified loamy fine sand to gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 24 inches
Flooding: Frequency—frequent; duration—brief; months—March through June
Permeability: Moderately slow
Available water capacity: 9.0 to 9.5 inches
Water-supplying capacity: 10 to 13 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.32; T value—3; wind erodibility group—4L
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Characteristics of the Tweba Soil

Classification: Aeric Fluvaquents, coarse-loamy, mixed (calcareous), mesic
Position on landscape: Higher areas on the flood plains
Parent material: Mixed alluvium
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet

Dominant present vegetation: Wildrye, Nevada bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 19 inches
Texture: Very fine sandy loam
Structure: Prismatic
Consistence: Hard, friable
Reaction: Very strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 19 to 34 inches
Texture: Fine sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Very strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 34 to 60 inches
Texture: Stratified very fine sandy loam to loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 12 to 18 inches
Flooding: Frequency—frequent; duration—very brief to brief; months—February through June
Permeability: Moderate
Available water capacity: 6.0 to 8.6 inches
Water-supplying capacity: 10 to 13 inches
Runoff: Very slow
Hydrologic group: D
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Devilsgait Soil

Classification: Cumulic Haplaquolls, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 0 to 2 percent
Elevation: 5,300 to 5,600 feet
Dominant present vegetation: Wildrye, Nevada bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 100 days

Typical Profile

Depth: 0 to 13 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 13 to 42 inches
Texture: Stratified silt loam to silty clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 42 to 54 inches
Texture: Stratified gravelly silt loam to silty clay loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 54 to 63 inches
Texture: Extremely gravelly coarse sand
Structure: Single grained
Consistence: Loose
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: 0 to 18 inches
Flooding: Frequency—frequent; duration—long; months—March through June
Permeability: Moderately slow
Available water capacity: 10 to 11.5 inches
Water-supplying capacity: 10 to 13 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.37; T value—4; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: High

Contrasting Inclusions

Inclusion 1
Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 2
Classification: Aeric Fluvaquents, fine-silty, mixed (calcareous), mesic
Position on landscape: Flood plains adjacent to fan piedmont remnants
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 3
Classification: Fluvaquentic Haplaquolls, fine-loamy over sandy or sandy-skeletal, mixed (calcareous), mesic
Position on landscape: Slightly concave areas on the flood plains
Distinctive present vegetation: Basin big sagebrush, wildrye

Inclusion 4
Classification: Aeric Halaquepts, fine-silty, mixed (calcareous), mesic
Position on landscape: Alluvial flats
Distinctive present vegetation: Black greasewood, basin wildrye, alkali sacaton

Major Uses

Current uses: Livestock grazing, wildlife habitat, hayland, pasture
Suitability of the Woofus soil for named elements: Grain and seed crops (irrigated)—very poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—good; shallow water areas—fair
Suitability of the Tweba soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair
Suitability of the Devilsgait soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—good; shallow water areas—fair

Suitability and Limitations of the Woofus Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Fair—wetness
Topsoil: Fair—area reclaim, small stones
Daily cover for landfill: Poor—seepage, too sandy, wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, flooding, frost action
Pond reservoir areas: Severe—seepage
Embankments, dikes, and levees: Severe—seepage, piping, wetness
Sand: Probable source
Gravel: Probable source
Drainage: Flooding, frost action, cutbanks cave
Irrigation: Wetness, rooting depth, flooding
Terraces and diversions: Wetness, too sandy

Suitability and Limitations of the Tweba Soil for Various Uses and Practices
Range seeding: Fair—excess salts
Roadfill: Fair—wetness
Topsoil: Good
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—piping, wetness
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Devilsgait Soil for Various Uses and Practices
Range seeding: Good
Roadfill: Poor—wetness
Topsoil: Poor—wetness
Daily cover for landfill: Poor—wetness
Shallow excavations: Severe—cutbanks cave, wetness
Local roads and streets: Severe—low strength, wetness, flooding
Pond reservoir areas: Moderate—seepage
Embankments, dikes, and levees: Severe—wetness
Sand: Probable source
Gravel: Probable source
Drainage: Flooding, frost action
Irrigation: Wetness, erodes easily, flooding
Terraces and diversions: Erodes easily, wetness

Interpretive Groups

Capability classification: Woofus soil—5w, irrigated and nonirrigated; Tweba soil—6w, nonirrigated; Devilsgait soil—5w, irrigated and nonirrigated
Range site: Woofus soil—025X001N; Tweba soil—025X001N; Devilsgait soil—025X001N; Inclusion 1—025X003N; Inclusion 2—024X006N; Inclusion 3—025X001N; Inclusion 4—024X007N

840—Ninemile-Quarz-Rock outcrop association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Ninemile gravelly loam, 8 to 15 percent slopes (40 percent)
• Quarz very gravelly loam, 8 to 15 percent slopes (30 percent)
• Rock outcrop (15 percent)
Contrasting inclusions:
• Inclusion 1: Yuko gravelly silt loam, 30 to 50 percent slopes (5 percent)
• Inclusion 2: Welch silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 3: McIvey silt loam, 15 to 30 percent slopes (5 percent)

Characteristics of the Ninemile Soil

Classification: Lithic Argixerolls, clayey, montmorillonitic, frigid
Position on landscape: Crests and slightly concave side slopes of hills
Parent material: Residuum and colluvium derived from rhyolite or welded tuff
Slope range: 8 to 15 percent
Elevation: 6,200 to 7,000 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 5 to 12 inches
Texture: Clay
Structure: Subangular blocky
Consistence: Hard, very firm
Reaction: Mildly alkaline

Depth: 12 to 16 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 2.0 to 2.4 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Quarz Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly convex side slopes of hills
Parent material: Residuum and colluvium derived from welded tuff or rhyolite
Slope range: 8 to 15 percent
Elevation: 6,200 to 7,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 26 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 26 to 30 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.5 to 3.1 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Rock Outcrop

Position on landscape: Crests and side slopes of hills
Elevation: 6,200 to 7,000 feet
Distinctive present vegetation: None

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Lower, convex, south-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 3
Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Concave, north-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Ninemile soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Quarz soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Ninemile Soil for Various Uses and Practices
Range seeding: Poor—droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock, low strength
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Quarz Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Ninemile soil—7s, nonirrigated; Quarz soil—7s, nonirrigated; Rock outcrop—8s, nonirrigated
Range site: Ninemile soil—025X017N; Quarz soil—025X014N; Rock outcrop—none; Inclusion 1—025X015N; Inclusion 2—025X003N; Inclusion 3—025X012N

851—Loomis-Izod association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Loomis very cobbly loam, 15 to 30 percent slopes (45 percent)
• Izod very gravelly loam, 15 to 50 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (7 percent)
• Inclusion 2: Vanwyper very cobbly loam, 15 to 50 percent slopes (3 percent)
• Inclusion 3: Quarz very gravelly loam, 15 to 30 percent slopes (3 percent)
• Inclusion 4: Linkup very gravelly loam, 8 to 15 percent slopes (2 percent)

Characteristics of the Loomis Soil

Classification: Lithic Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from conglomerate
Slope range: 15 to 30 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Black sagebrush, Thurber needlegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 7 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 11 inches
Texture: Very cobbly clay
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 11 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 8 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.0 to 1.9 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 50 percent
Elevation: 5,300 to 5,700 feet
Dominant present vegetation: Black sagebrush, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Inclusion 2
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Lower, slightly concave side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 3
Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Upper, slightly concave side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 4
Classification: Lithic Xerollic Haplargids, clayey, montmorillonitic, frigid
Position on landscape: Upper part of the crests of hills
Distinctive present vegetation: Low sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Loomis soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Loomis Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Izod Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Loomis and Izod soils—7s, nonirrigated
Range site: Loomis soil—024X030N; Izod soil—024X030N; Inclusion 1—none; Inclusion 2—025X015N; Inclusion 3—025X009N; Inclusion 4—025X018N

852—Loomis-Vanwyper-Norfork association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Loomis very cobbly loam, 4 to 15 percent slopes (35 percent)
• Vanwyper gravelly loam, 15 to 30 percent slopes (30 percent)
• Norfork very cobbly silt loam, 2 to 8 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Dewar loam, 0 to 4 percent slopes (10 percent)
• Inclusion 2: Bilbo cobbly loam, 0 to 2 percent slopes (5 percent)

Characteristics of the Loomis Soil

Classification: Lithic Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Slightly convex summits and upper side slopes of hills
Parent material: Residuum and colluvium derived from andesite and rhyolite
Slope range: 4 to 15 percent
Elevation: 5,900 to 6,100 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very cobbly loam
Structure: Platy
Consistence: Soft, very friable

Reaction: Neutral

Depth: 2 to 7 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 7 to 11 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 11 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 8 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.0 to 1.9 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of hills
Parent material: Residuum and colluvium derived from andesite and rhyolite
Slope range: 15 to 30 percent
Elevation: 5,700 to 6,100 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail, Thurber needlegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: .1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 10 inches
Texture: Gravely loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 10 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 25 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.3 to 3.5 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Norfork Soil

Classification: Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Slightly concave summits of hills
Parent material: Colluvium derived from andesite and influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,700 to 6,100 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 2 inches
Texture: Very cobbly silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 12 inches
Texture: Gravelly silty clay

Structure: Prismatic
Consistence: Hard, very friable
Reaction: Mildly alkaline

Depth: 12 to 24 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Strongly alkaline

Depth: 24 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: 21 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.7 to 2.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durargids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Inset fan remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Loomis soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Norfork soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Loomis Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Vanwyper Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, hard to pack, large stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—hard to pack, large stones
Sand: Improbable source—excess fines, large stones
Gravel: Improbable source—excess fines, large stones

Suitability and Limitations of the Norfork Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, large stones
Roadfill: Poor—depth to rock
Topsoil: Poor—cemented pan, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock, cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Loomis soil—7s, nonirrigated; Vanwyper soil—7e, nonirrigated; Norfork soil—7s, nonirrigated
Range site: Loomis soil—024X030N; Vanwyper soil—025X019N; Norfork soil—024X030N; Inclusion 1—025X019N; Inclusion 2—025X019N

862—Loncan-Hapgood-Cleavage association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
- Loncan very gravelly loam, 30 to 75 percent slopes (40 percent)
- Hapgood very gravelly loam, 30 to 50 percent slopes (30 percent)
- Cleavage extremely gravelly loam, 15 to 50 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Tusel gravelly loam, 30 to 50 percent slopes (5 percent)
- Inclusion 2: Hackwood very gravelly loam, 15 to 30 percent slopes (3 percent)
- Inclusion 3: Entic Cryumbrepts, loamy-skeletal, mixed, 30 to 50 percent slopes (2 percent)

Characteristics of the Loncan Soil

Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Lower, concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from shale, chert, or welded tuff
Slope range: 30 to 75 percent
Elevation: 7,500 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 14 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 14 to 31 inches
Texture: Extremely cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 21 to 38 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 3.1 inches
Water-supplying capacity: 7.0 to 10 inches
Runoff: Very rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hapgood Soil

Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Upper, concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from shale, chert, or welded tuff
Slope range: 30 to 50 percent
Elevation: 7,500 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, Idaho fescue, mountain brome, Columbia needlegrass

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 8 inches
Texture: Very gravelly loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 8 to 31 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Slightly acid

Depth: 31 to 42 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Slightly acid

Depth: 42 to 46 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 3.8 to 4.8 inches
Water-supplying capacity: 12 to 15 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.17; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from shale, chert, or welded tuff
Slope range: 15 to 50 percent
Elevation: 7,000 to 8,000 feet
Dominant present vegetation: Black sagebrush, low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Extremely gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth, north-facing side slopes of mountains
Distinctive present vegetation: Snowberry, Idaho fescue
Inclusion 2
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Upper, concave, north-facing side slopes of mountains
Distinctive present vegetation: Quaking aspen
Inclusion 3
Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Upper, concave, north-facing side slopes of mountains
Distinctive present vegetation: Letterman needlegrass, lupine

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Loncan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hapgood soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Loncan Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hapgood Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—area reclaim, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Loncan, Hapgood, and Cleavage soils—7s, nonirrigated
Range site: Loncan soil—025X012N; Hapgood soil—025X004N; Cleavage soil—025X024N; Inclusion 1—025X010N; Inclusion 2—025X065N; Inclusion 3—025X028N

881—Kleckner-Fulstone-Stampede association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Kleckner cobbly loam, 4 to 15 percent slopes (35 percent)
- Fulstone gravelly loam, 2 to 15 percent slopes (35 percent)
- Stampede loam, 4 to 15 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Welch silt loam, 0 to 2 percent slopes (7 percent)
- Inclusion 2: Linkup cobbly loam, 4 to 15 percent slopes (3 percent)

Characteristics of the Kleckner Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 9 inches
Texture: Cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 25 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 25 to 41 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 41 to 63 inches
Texture: Loam
Structure: Massive
Consistence: Hard, friable
Reaction: Mildly alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 8.4 inches
Water-supplying capacity: 10 to 12 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate

Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Fulstone Soil

Classification: Abruptic Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Lower parts of the smooth summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 15 percent
Elevation: 6,000 to 6,200 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 51 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 3 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 19 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 to 34 inches
Texture: Indurated hardpan
Consistence: Extremely hard, extremely firm

Depth: 34 to 57 inches
Texture: Extremely gravelly sandy clay
Structure: Massive
Consistence: Hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 14 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 2.8 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Stampede Soil

Classification: Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 11 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 11 to 35 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 35 to 45 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Soil and Water Features

Depth to a hardpan: 20 to 36 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 4.2 to 4.9 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D

Erosion factors (surface layer): K value—.37; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Inclusion 2
Classification: Lithic Xerollic Haplargids, clayey, montmorillonitic, frigid
Position on landscape: Convex, north-facing side slopes of low hills
Distinctive present vegetation: Low sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Kleckner soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Fulstone soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Stampede soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Kleckner Soil for Various Uses and Practices
Range seeding: Fair—large stones
Roadfill: Fair—large stones, shrink-swell potential
Topsoil: Poor—small stones
Daily cover for landfill: Fair—small stones, slope
Shallow excavations: Moderate—too clayey, large stones, slope
Local roads and streets: Moderate—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—piping, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Fulstone Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan, shrink-swell potential
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Stampede Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, shrink-swell potential, low strength
Topsoil: Poor—too clayey
Daily cover for landfill: Poor—cemented pan, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, hard to pack
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Kleckner soil—7s, nonirrigated; Fulstone soil—7s, nonirrigated; Stampede soil—6s, nonirrigated
Range site: Kleckner soil—025X014N; Fulstone soil—025X018N; Stampede soil—025X014N; Inclusion 1—025X003N; Inclusion 2—025X018N

912—Tuffo-Yuko-Tuffo, moderately steep association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Tuffo fine sandy loam, 4 to 15 percent slopes (50 percent)
• Yuko very gravelly loam, 8 to 15 percent slopes (25 percent)
• Tuffo fine sandy loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Xerollic Camborthids, loamy-skeletal, mixed, mesic, 2 to 4 percent slopes (4 percent)
• Inclusion 2: Dacker silt loam, 2 to 8 percent slopes (4 percent)

• Inclusion 3: Crooked Creek silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Tuffo Soil

Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Convex side slopes of fan piedmont remnants
Parent material: Residuum derived from tuff or tuffaceous sandstone
Slope range: 4 to 15 percent
Elevation: 6,000 to 6,400 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 3 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 11 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.1 to 1.4 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—3
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Residuum derived from tuff or tuffaceous sandstone
Slope range: 8 to 15 percent
Elevation: 6,000 to 6,400 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 50

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.17; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low

Potential for frost action: Moderate

Characteristics of the Moderately Steep Tuffo Soil

Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Convex side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff or tuffaceous sandstone
Slope range: 15 to 30 percent
Elevation: 6,000 to 6,400 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, Sandberg bluegrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 3 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 11 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.1 to 1.4 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Lower, concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Slightly convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Inset fans
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Tuffo soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
*Suitability of the moderately steep Tuffo soil for named elements:*Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Tuffo Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, frost action
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Yuko Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock

Local roads and streets: Moderate—depth to rock, slope, frost action
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Moderately Steep Tuffo Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Tuffo soils and the Yuko soil—7s, nonirrigated
Range site: Both Tuffo soils—025X019N; Yuko soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X003N

913—Tuffo-Yuko-Vanwyper association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Tuffo fine sandy loam, 15 to 30 percent slopes (40 percent)
• Yuko gravelly sandy loam, 15 to 30 percent slopes (25 percent)
• Vanwyper very cobbly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Rock outcrop (5 percent)
• Inclusion 2: Tuffo fine sandy loam, 30 to 50 percent slopes (4 percent)
• Inclusion 3: Gance very gravelly loam, 4 to 15 percent slopes (3 percent)
• Inclusion 4: Enko loam, 2 to 8 percent slopes (3 percent)

Characteristics of the Tuffo Soil

Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Convex side slopes of hills
Parent material: Residuum derived from tuffaceous sandstone
Slope range: 15 to 30 percent
Elevation: 5,400 to 6,300 feet
Dominant present vegetation: Big sagebrush, cheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 3 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 11 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.1 to 1.4 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Smooth side slopes of hills
Parent material: Residuum derived from tuffaceous sandstone
Slope range: 15 to 30 percent
Elevation: 5,400 to 6,300 feet
Dominant present vegetation: Big sagebrush, rabbitbrush, Sandberg bluegrass, cheatgrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 35

Depth: 0 to 2 inches
Texture: Gravelly sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 5.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—4
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Vanwyper Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Slightly concave side slopes of hills
Parent material: Residuum and colluvium derived from tuff
Slope range: 15 to 30 percent
Elevation: 5,400 to 6,300 feet
Dominant present vegetation: Big sagebrush, cheatgrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 45 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 2
Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 8 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 8 to 39 inches
Texture: Very cobbly clay
Structure: Angular blocky
Consistence: Very hard, very firm
Reaction: Mildly alkaline

Depth: 39 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6.5 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—2; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Position on landscape: Side slopes of hills
Distinctive present vegetation: None

Inclusion 2
Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Convex side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic

Position on landscape: Upper, convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Tuffo soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Vanwyper soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Tuffo Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Yuko Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope

920—Bullump-Gando-Tusel association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Bullump very gravelly loam, 30 to 50 percent slopes (45 percent)
• Gando very gravelly loam, 15 to 30 percent slopes (25 percent)
• Tusel gravelly loam, 30 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Hackwood gravelly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 2: Rock outcrop (5 percent)
• Inclusion 3: Inpendence very gravelly loam, 30 to 50 percent slopes (3 percent)
• Inclusion 4: Welch silt loam, 2 to 8 percent slopes (2 percent)

Characteristics of the Bullump Soil

Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Smooth, south-facing side slopes of mountains
Parent material: Colluvium derived from shale, chert, and quartzite with a component of loess
Slope range: 30 to 50 percent
Elevation: 7,600 to 8,200 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, serviceberry, Sandberg bluegrass

Climatic Data
Average annual precipitation: About 15 inches
Average annual air temperature: About 43 degrees F

Frost-free period: About 80 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 35

Depth: 0 to 23 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 23 to 54 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 54 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.3 to 5.2 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gando Soil

Classification: Lithic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of mountains
Parent material: Residuum and colluvium derived from shale, chert, or quartzite
Slope range: 15 to 30 percent
Elevation: 7,900 to 8,200 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Idaho fescue, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 85 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 45

Depth: 0 to 9 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 17 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 17 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.2 to 1.7 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tusel Soil

Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from shale, chert, or quartzite
Slope range: 30 to 50 percent
Elevation: 7,600 to 8,200 feet
Dominant present vegetation: Mountain big sagebrush, antelope bitterbrush, serviceberry, Idaho fescue

Climatic Data

Average annual precipitation: About 17 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 70 days

Typical Profile

Depth: 0 to 19 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 19 to 45 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 45 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.2 to 6.3 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.20; T value—3; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Lower, concave, north-facing side slopes of mountains
Distinctive present vegetation: Quaking aspen, mountain brome

Inclusion 2
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Inclusion 3
Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Upper, concave, north-facing side slopes of mountains
Distinctive present vegetation: Quaking aspen

Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bullump soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gando soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tusel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Bullump Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gando Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tusel Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Lower, concave, north-facing side slopes of mountains
Distinctive present vegetation: Snowberry, mountain brome

Inclusion 2
Classification: Argic Pachic Cryoborolls, loamy-skeletal, mixed
Position on landscape: Smooth, north-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, Idaho fescue

Inclusion 3
Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Upper, concave, north-facing side slopes of mountains
Distinctive present vegetation: Letterman needlegrass, tailcup lupine

Inclusion 4
Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Mid or upper, concave, north-facing side slopes of mountains
Distinctive present vegetation: Quaking aspen

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bullump soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tusel soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Bullump Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—depth to rock, thin layer, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope

Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices

Range seeding: Poor—small stones, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—area reclaim, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—large stones, thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Tusel Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Bullump, Cleavage, and Tusel soils—7s, nonirrigated
Range site: Bullump soil—025X016N; Cleavage soil—025X024N; Tusel soil—025X004N; Inclusion 1—025X004N; Inclusion 2—025X010N; Inclusion 3—025X028N; Inclusion 4—025X002N

925—Bullump-Quarz-Gando association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Bullump gravelly loam, 30 to 50 percent slopes (40 percent)
• Quarz very gravelly loam, 30 to 50 percent slopes (30 percent)
• Gando very gravelly loam, 15 to 30 percent slopes (15 percent)

Contrasting inclusions:
• Inclusion 1: Pachic Haploxerolls, loamy-skeletal, mixed, frigid, 15 to 30 percent slopes (8 percent)
• Inclusion 2: Sumine very gravelly loam, 30 to 50 percent slopes (5 percent)
• Inclusion 3: Chen gravelly loam, 8 to 15 percent slopes (1 percent)
• Inclusion 4: Rock outcrop (1 percent)

Characteristics of the Bullump Soil

Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Upper, concave, north-facing side slopes of mountains
Parent material: Colluvium derived from chert, shale, and quartzite with a component of loess
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,600 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Idaho fescue, mountain brome

Climatic Data

Average annual precipitation: About 15 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 80 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 23 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 23 to 54 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 54 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 5.6 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Medium
Hydrologic group: B

Erosion factors (surface layer): K value—.20; T value—3; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Quarz Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Upper, convex, south-facing side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite, shale, or quartzite
Slope range: 30 to 50 percent
Elevation: 6,600 to 7,600 feet
Dominant present vegetation: Mountain big sagebrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 26 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 26 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.5 to 3.1 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Gando Soil

Classification: Lithic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Crests and upper, convex side slopes of mountains
Parent material: Residuum and colluvium derived from chert, quartzite, and rhyolite
Slope range: 15 to 30 percent
Elevation: 6,600 to 7,600 feet
Dominant present vegetation: Low sagebrush, black sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 16 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 85 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 45

Depth: 0 to 9 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 9 to 17 inches
Texture: Extremely gravelly loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 17 to 22 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.2 to 1.7 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Pachic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Lower, concave, north-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, basin wildrye
Inclusion 2
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Lower, concave, south-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 3
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave crests of mountains
Distinctive present vegetation: Low sagebrush, Idaho fescue
Inclusion 4
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bullump soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Quarz soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gando soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Bullump Soil for Various Uses and Practices
Range seeding: Poor—erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Quarz Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gando Soil for Various Uses and Practices
Range seeding: Poor—droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Bullump soil—7e, nonirrigated; Quarz soil—7s, nonirrigated; Gando soil—7s, nonirrigated
Range site: Bullump soil—025X016N; Quarz soil—025X009N; Gando soil—025X024N; Inclusion 1—025X029N; Inclusion 2—025X009N; Inclusion 3—025X017N; Inclusion 4—none

926—Bullump-Pernty-Cleavage association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Bullump very gravelly loam, 30 to 50 percent slopes (35 percent)
• Pernty very gravelly loam, 15 to 30 percent slopes (30 percent)
• Cleavage very cobbly loam, 8 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Hackwood loam, 4 to 15 percent slopes (7 percent)
• Inclusion 2: Entic Cryumbrepts, loamy-skeletal, mixed, 15 to 30 percent slopes (3 percent)
• Inclusion 3: Rock outcrop (3 percent)

• Inclusion 4: Crooked Creek silt loam, 0 to 2 percent slopes (2 percent)

Characteristics of the Bullump Soil

Classification: Pachic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: South- and west-facing side slopes of mountains
Parent material: Colluvium derived from rhyolite and influenced by loess
Slope range: 30 to 50 percent
Elevation: 6,500 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, serviceberry, Idaho fescue

Climatic Data

Average annual precipitation: About 15 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 80 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 35

Depth: 0 to 23 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Soft, very friable
Reaction: Neutral

Depth: 23 to 54 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 54 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 40 to 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 3.3 to 5.2 inches
Water-supplying capacity: 10 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—3; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Pernty Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: North- and east-facing side slopes of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 15 to 30 percent
Elevation: 6,500 to 8,000 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, serviceberry, Idaho fescue

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 2 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 18 inches
Texture: Very cobbly clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 18 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.4 to 1.8 inches
Water-supplying capacity: 6.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cleavage Soil

Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid

Position on landscape: Crests of mountains
Parent material: Residuum and colluvium derived from rhyolite
Slope range: 8 to 30 percent
Elevation: 6,500 to 8,000 feet
Dominant present vegetation: Low sagebrush, black sagebrush, antelope bitterbrush, bluegrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 6 inches
Texture: Very cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 6 to 15 inches
Texture: Very gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 15 to 19 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 14 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.6 to 1.9 inches
Water-supplying capacity: 8.5 to 11 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.10; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Pachic Cryoborolls, fine-loamy, mixed
Position on landscape: Lower, north-facing side slopes of mountains
Distinctive present vegetation: Quaking aspen

Inclusion 2
Classification: Entic Cryumbrepts, loamy-skeletal, mixed
Position on landscape: Upper, concave, north-facing side slopes of mountains
Distinctive present vegetation: Letterman needlegrass, tailcup lupine

Inclusion 3
Position on landscape: Crests and side slopes of mountains
Distinctive present vegetation: None

Inclusion 4
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Nevada bluegrass, alpine timothy

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Bullump soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Pernty soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cleavage soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Bullump Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Pernty Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cleavage Soil for Various Uses and Practices
Range seeding: Poor—droughty, large stones

Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Bullump, Pernty, and Cleavage soils—7s, nonirrigated
Range site: Bullump soil—025X016N; Pernty soil—025X012N; Cleavage soil—025X024N; Inclusion 1—025X065N; Inclusion 2—025X028N; Inclusion 3—none; Inclusion 4—025X006N

970—Izod, steep-Wedekind-Izod association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Izod very gravelly loam, 30 to 50 percent slopes (40 percent)
• Wedekind coarse sandy loam, 30 to 50 percent slopes (30 percent)
• Izod very gravelly loam, 15 to 30 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Eboda loam, 15 to 30 percent slopes (7 percent)
• Inclusion 2: Wedekind coarse sandy loam, 50 to 75 percent slopes (5 percent)
• Inclusion 3: Pachic Haploxerolls, loamy-skeletal, mixed, frigid, 30 to 50 percent slopes (3 percent)

Characteristics of the Steep Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 30 to 50 percent
Elevation: 5,100 to 6,000 feet
Dominant present vegetation: Black sagebrush, bluebunch wheatgrass, Sandburg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wedekind Soil

Classification: Aridic Argixerolls, loamy, mixed, mesic, shallow
Position on landscape: Convex side slopes of hills
Parent material: Residuum derived from rhyolite or andesite
Slope range: 30 to 50 percent
Elevation: 5,100 to 6,000 feet
Dominant present vegetation: Big sagebrush, antelope bitterbrush, bluebunch wheatgrass, Indian ricegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent stones and boulders on the surface: 1
Percent cobbles on the surface: 5
Percent pebbles on the surface: 5

Depth: 0 to 2 inches
Texture: Coarse sandy loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral

Depth: 2 to 12 inches
Texture: Sandy clay loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 12 to 42 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.0 to 2.3 inches
Water-supplying capacity: 6.5 to 9.0 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—3
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Crests and convex side slopes of mountains
Parent material: Residuum and colluvium derived from limestone
Slope range: 15 to 30 percent
Elevation: 5,100 to 6,000 feet
Dominant present vegetation: Black sagebrush, bluebunch wheatgrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Slightly concave, north- and east-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, Idaho fescue

Inclusion 2
Classification: Aridic Argixerolls, loamy, mixed, mesic, shallow
Position on landscape: Convex side slopes of hills
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Pachic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north- and east-facing side slopes of hills
Distinctive present vegetation: Basin wildrye, Idaho fescue

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the steep Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Wedekind soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability of the Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Steep Izod Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Wedekind Soil for Various Uses and Practices

Range seeding: Poor—droughty, erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Izod Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Both Izod soils—7s, nonirrigated; Wedekind soil—7e, nonirrigated
Range site: Both Izod soils—024X030N; Wedekind soil—025X021N; Inclusion 1—025X027N; Inclusion 2—025X021N; Inclusion 3—025X029N

971—Izod-Porrone association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Izod very gravelly loam, 30 to 50 percent slopes (50 percent)
- Porrone very gravelly loam, 30 to 50 percent slopes (35 percent)

Contrasting inclusions:
- Inclusion 1: Nirac very gravelly loam, 30 to 50 percent slopes (4 percent)
- Inclusion 2: Rock outcrop (4 percent)
- Inclusion 3: Cleavage extremely gravelly loam, 30 to 50 percent slopes (4 percent)
- Inclusion 4: Sumine very gravelly loam, 30 to 50 percent slopes (3 percent)

Characteristics of the Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 30 to 50 percent
Elevation: 5,200 to 6,300 feet
Dominant present vegetation: Black sagebrush, Indian ricegrass, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate

Available water capacity: 0.5 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Porrone Soil

Classification: Durixerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Concave, south- and west-facing side slopes of hills
Parent material: Colluvium derived from limestone and influenced by loess
Slope range: 30 to 50 percent
Elevation: 5,200 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 35

Depth: 0 to 18 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 18 to 65 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 4.1 to 4.9 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Calcixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north- and east-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, antelope bitterbrush, Idaho fescue
Inclusion 2
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None
Inclusion 3
Classification: Lithic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex side slopes of mountains
Distinctive present vegetation: Black sagebrush, low sagebrush, Idaho fescue
Inclusion 4
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, south- and west-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Porrone soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Izod Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—depth to rock, slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Porrone Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Izod and Porrone soils—7s, nonirrigated
Range site: Izod soil—024X030N; Porrone soil—025X019N; Inclusion 1—025X012N; Inclusion 2—none; Inclusion 3—025X024N; Inclusion 4—025X009N

972—Izod-Porrone-Chiara association

Map Unit Setting

Position on landscape: Hills, fan piedmont remnants

Composition

Major components:
• Izod very gravelly loam, 4 to 15 percent slopes (35 percent)
• Porrone very gravelly loam, 30 to 50 percent slopes (30 percent)
• Chiara very fine sandy loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Samor very cobbly loam, 15 to 50 percent slopes (8 percent)
• Inclusion 2: Spilock very gravelly loam, 15 to 50 percent slopes (4 percent)
• Inclusion 3: Rock outcrop (2 percent)
• Inclusion 4: Puett sandy loam, 15 to 50 percent slopes (1 percent)

Characteristics of Izod the Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Crests and upper, convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 4 to 15 percent
Elevation: 5,500 to 5,800 feet
Dominant present vegetation: Black sagebrush, Sandberg bluegrass, basin wildrye, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 inch to 1.1 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Porrone Soil

Classification: Durixerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Slightly concave side slopes of hills
Parent material: Colluvium derived from limestone and influenced by volcanic ash
Slope range: 30 to 50 percent
Elevation: 5,100 to 5,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Thurber needlegrass, basin wildrye

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 2
Percent pebbles on the surface: 35

Depth: 0 to 18 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 18 to 65 inches
Texture: Very gravelly sandy loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 4.1 to 4.9 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,100 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, bluebunch wheatgrass, Thurber needlegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Very fine sandy loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 to 14 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—3
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Lithic Xerollic Calciorthids, loamy-skeletal, mixed, mesic
Position on landscape: Lower, convex side slopes of hills
Distinctive present vegetation: Big sagebrush, Utah juniper

Inclusion 2
Classification: Xerollic Paleorthids, loamy-skeletal, carbonatic, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Black sagebrush, Utah juniper

Inclusion 3
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Inclusion 4

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of hills or fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Izod soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Porrone soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Chiara soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Izod Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, small stones
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—depth to rock
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Porrone Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Chiara Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Izod, Porrone, and Chiara soils—7s, nonirrigated
Range site: Izod soil—024X030N; Porrone soil—025X019N; Chiara soil—025X019N; Inclusion 1—025X059N; Inclusion 2—025X060N; Inclusion 3—none; Inclusion 4—025X025N

973—Izod, extremely gravelly-Izod-Rock outcrop association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Izod extremely gravelly loam, 30 to 75 percent slopes (35 percent)
- Izod very gravelly loam, 4 to 15 percent slopes (30 percent)
- Rock outcrop (20 percent)

Contrasting inclusions:
- Inclusion 1: Samor very gravelly loam, 30 to 50 percent slopes (5 percent)
- Inclusion 2: Porrone very gravelly loam, 30 to 50 percent slopes (5 percent)
- Inclusion 3: Chiara loam, 4 to 15 percent slopes (3 percent)
- Inclusion 4: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic, 4 to 30 percent slopes (2 percent)

Characteristics of the Extremely Gravelly Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Upper, convex side slopes of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 30 to 75 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Black sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 3 inches
Texture: Extremely gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches
Texture: Very gravelly loam
Structure: Massive
Consistence: Soft, very friable
Reaction: Moderately alkaline

Depth: 13 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 7 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 0.5 to 1.0 inch
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Izod Soil

Classification: Lithic Xeric Torriorthents, loamy-skeletal, carbonatic, mesic
Position on landscape: Crests of hills
Parent material: Residuum and colluvium derived from limestone
Slope range: 4 to 15 percent
Elevation: 5,100 to 6,200 feet
Dominant present vegetation: Black sagebrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 3 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline

Depth: 3 to 13 inches

Capability classification: Both Izod soils—7s, nonirrigated; Rock outcrop—8s, nonirrigated
Range site: Both Izod soils—024X030N; Rock outcrop—none; Inclusion 1—025X059N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X059N

990—Eboda-Hart Camp-Cotant association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
- Eboda loam, 4 to 15 percent slopes (45 percent)
- Hart Camp gravelly loam, 4 to 15 percent slopes (25 percent)
- Cotant cobbly loam, 4 to 15 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Sumine very gravelly loam, 30 to 50 percent slopes (7 percent)
- Inclusion 2: Vanwyper very cobbly loam, 15 to 30 percent slopes (6 percent)
- Inclusion 3: Hussa loam, 0 to 2 percent slopes (1 percent)
- Inclusion 4: Rock outcrop (1 percent)

Characteristics of the Eboda Soil

Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Concave summits and side slopes of hills
Parent material: Loess over residuum derived from tuff
Slope range: 4 to 15 percent
Elevation: 6,100 to 6,900 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Sandberg bluegrass, basin wildrye

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 9 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 33 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 33 to 39 inches
Texture: Gravelly sandy clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 39 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 23 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 5.2 to 6.8 inches
Water-supplying capacity: 10.5 to 14 inches
Runoff: Medium
Hydrologic group: B
Erosion factors (surface layer): K value—.28; T value—2; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hart Camp Soil

Classification: Aridic Argixerolls, loamy, mixed, frigid, shallow
Position on landscape: Slightly convex summits and side slopes of hills
Parent material: Residuum derived from tuff
Slope range: 4 to 15 percent
Elevation: 6,100 to 6,900 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass, basin wildrye

Climatic Data

Average annual precipitation: About 11 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 20

Depth: 0 to 7 inches
Texture: Gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 7 to 11 inches
Texture: Gravelly sandy clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 11 to 24 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 2.2 to 2.6 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Slow
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Cotant Soil

Classification: Aridic Argixerolls, clayey, montmorillonitic, frigid, shallow
Position on landscape: Slightly concave summits and side slopes of hills
Parent material: Residuum derived from tuff
Slope range: 4 to 15 percent
Elevation: 6,100 to 6,900 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 10
Percent pebbles on the surface: 15

Depth: 0 to 3 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 3 to 19 inches
Texture: Clay
Structure: Prismatic
Consistence: Hard, very firm
Reaction: Mildly alkaline

Depth: 19 to 31 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 12 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.5 to 3.0 inches

Water-supplying capacity: 7.5 to 10 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Upper, south-facing side slopes of hills
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Lower, south-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 3
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 4
Position on landscape: Crests and side slopes of hills
Distinctive present vegetation: None

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Eboda soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hart Camp soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Cotant soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Eboda Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Moderate—depth to rock, slope
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hart Camp Soil for Various Uses and Practices
Range seeding: Poor—droughty
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, frost action
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Cotant Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock, too clayey, hard to pack
Shallow excavations: Severe—depth to rock
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Eboda soil—6c, nonirrigated; Hart Camp soil—7s, nonirrigated; Cotant soil—7s, nonirrigated

992—Eboda-Loncan-Leevan association

Map Unit Setting

Position on landscape: Mountains

Composition

Major components:
• Eboda gravelly loam, 15 to 30 percent slopes (40 percent)
• Loncan very gravelly loam, 30 to 50 percent slopes (25 percent)

• Leevan cobbly loam, 15 to 30 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Sumine gravelly loam, 15 to 50 percent slopes (9 percent)
• Inclusion 2: Hussa loam, 0 to 4 percent slopes (3 percent)
• Inclusion 3: Rock outcrop (2 percent)
• Inclusion 4: Crooked Creek silty clay loam, 0 to 2 percent slopes (1 percent)

Characteristics of the Eboda Soil

Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Slightly concave side slopes of mountains
Parent material: Loess over residuum derived from shale, sandstone, or conglomerate
Slope range: 15 to 30 percent
Elevation: 6,000 to 7,200 feet
Dominant present vegetation: Big sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 13 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 9 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 33 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 33 to 39 inches
Texture: Gravelly sandy clay loam
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Neutral

Depth: 39 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 23 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.9 to 6.8 inches
Water-supplying capacity: 10.5 to 14 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Loncan Soil

Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, or conglomerate
Slope range: 30 to 50 percent
Elevation: 6,000 to 7,200 feet
Dominant present vegetation: Mountain big sagebrush, snowberry, Idaho fescue, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 14 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 14 to 31 inches
Texture: Extremely cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 21 to 38 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 3.1 inches
Water-supplying capacity: 6.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—7

Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Leevan Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Smooth and convex, north- and east-facing side slopes of mountains
Parent material: Residuum and colluvium derived from shale, sandstone, or conglomerate
Slope range: 15 to 30 percent
Elevation: 6,000 to 7,200 feet
Dominant present vegetation: Low sagebrush, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 20
Percent pebbles on the surface: 20

Depth: 0 to 5 inches
Texture: Cobbly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 5 to 9 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 9 to 14 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 14 to 24 inches
Texture: Very gravelly clay
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Mildly alkaline

Depth: 24
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 3.8 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, loamy-skeletal, mixed, frigid
Position on landscape: Convex, south-facing side slopes of mountains
Distinctive present vegetation: Mountain big sagebrush, bluebunch wheatgrass
Inclusion 2
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Adjacent to the entrenched part of stream channels in narrow drainageways in the mountains
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 3
Position on landscape: Side slopes of mountains
Distinctive present vegetation: None
Inclusion 4
Classification: Cumulic Haplaquolls, fine, montmorillonitic, frigid
Position on landscape: Narrow drainageways in the mountains
Distinctive present vegetation: Tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Eboda soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Loncan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Leevan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Eboda Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones, slope

Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Loncan Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Leevan Soil for Various Uses and Practices

Range seeding: Fair—droughty, large stones
Roadfill: Poor—depth to rock, shrink-swell potential
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Eboda soil—6e, nonirrigated; Loncan soil—7s, nonirrigated; Leevan soil—7s, nonirrigated
Range site: Eboda soil—025X027N; Loncan soil—025X012N; Leevan soil—025X017N; Inclusion 1—025X009N; Inclusion 2—025X003N; Inclusion 3—none; Inclusion 4—025X005N

993—Eboda-Quarz-Loncan association

Map Unit Setting

Position on landscape: Hills

Composition

Major components:
• Eboda gravelly loam, 15 to 30 percent slopes (40 percent)
• Quarz very gravelly loam, 30 to 50 percent slopes (30 percent)
• Loncan very gravelly loam, 30 to 50 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Eboda gravelly loam, 30 to 50 percent slopes (5 percent)
• Inclusion 2: Rock outcrop (5 percent)
• Inclusion 3: Hussa loam, drained, 2 to 8 percent slopes (3 percent)
• Inclusion 4: Alburz very gravelly loam, drained, 2 to 8 percent slopes (2 percent)

Characteristics of the Eboda Soil

Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Lower, smooth, north-facing side slopes of hills
Parent material: Loess over residuum derived from shale, sandstone, or conglomerate
Slope range: 15 to 30 percent
Elevation: 5,900 to 6,300 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 20

Depth: 0 to 9 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 9 to 33 inches
Texture: Clay loam
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Neutral

Depth: 33 to 39 inches
Texture: Gravelly sandy clay loam
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 39 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 23 to 40 inches
Depth to a seasonal high water table: More than 60 inches

Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.9 to 6.8 inches
Water-supplying capacity: 10.5 to 14 inches
Runoff: Rapid
Hydrologic group: B
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—6
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Quarz Soil

Classification: Aridic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: South-facing side slopes of hills
Parent material: Residuum and colluvium derived from shale, sandstone, or conglomerate
Slope range: 30 to 50 percent
Elevation: 5,900 to 6,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, basin wildrye

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 4 to 26 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 26 to 30 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 20 to 40 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.5 to 3.1 inches
Water-supplying capacity: 7.5 to 8.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—2; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Low

Characteristics of the Loncan Soil

Classification: Aridic Haploxerolls, loamy-skeletal, mixed, frigid
Position on landscape: Concave, north-facing side slopes of hills
Parent material: Residuum and colluvium derived from shale, sandstone, or conglomerate
Slope range: 30 to 50 percent
Elevation: 5,900 to 6,800 feet
Dominant present vegetation: Mountain big sagebrush, Thurber needlegrass, Idaho fescue

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 42 degrees F
Frost-free period: About 90 days

Typical Profile

Depth: 0 to 14 inches
Texture: Very gravelly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 14 to 31 inches
Texture: Extremely cobbly loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 31 inches
Texture: Unweathered bedrock

Soil and Water Features

Depth to bedrock: 21 to 38 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.6 to 3.1 inches
Water-supplying capacity: 6.5 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.10; T value—2; wind erodibility group—7
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low

Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aridic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Upper, smooth, north-facing side slopes of hills
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 2
Position on landscape: Side slopes of hills
Distinctive present vegetation: None
Inclusion 3
Classification: Fluvaquentic Haplaquolls, fine-loamy, mixed (calcareous), frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 4
Classification: Fluvaquentic Haplaquolls, sandy-skeletal, mixed, frigid
Position on landscape: Narrow drainageways on hills
Distinctive present vegetation: Basin big sagebrush, basin wildrye

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Eboda soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Quarz soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Loncan soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Eboda Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—depth to rock, low strength
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Quarz Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, too clayey, small stones
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer, large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Loncan Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—small stones, slope
Daily cover for landfill: Poor—depth to rock, small stones, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Eboda soil—6e, nonirrigated; Quarz soil—7s, nonirrigated; Loncan soil—7s, nonirrigated
Range site: Eboda soil—025X027N; Quarz soil—025X009N; Loncan soil—025X012N; Inclusion 1—025X012N; Inclusion 2—none; Inclusion 3—025X003N; Inclusion 4—025X003N

1230—Fulstone-Hunnton association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Fulstone gravelly loam, 2 to 8 percent slopes (45 percent)
• Hunnton loam, 4 to 15 percent slopes (40 percent)
Contrasting inclusions:
• Inclusion 1: Welch silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Short Creek cobbly loam, 15 to 50 percent slopes (5 percent)
• Inclusion 3: Aridic Argixerolls, fine, montmorillonitic, frigid, 15 to 30 percent slopes (4 percent)
• Inclusion 4: Welch silt loam, 0 to 2 percent slopes, frequently flooded (1 percent)

Characteristics of the Fulstone Soil

Classification: Abruptic Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 8 percent
Elevation: 5,200 to 6,200 feet
Dominant present vegetation: Low sagebrush, Nevada bluegrass, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 51 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 3 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 19 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 to 34 inches
Texture: Indurated hardpan
Consistence: Extremely hard, extremely firm

Depth: 34 to 57 inches
Texture: Extremely gravelly sandy clay
Structure: Massive
Consistence: Hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 14 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 2.8 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: medium
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Hunnton Soil

Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,200 to 6,200 feet
Dominant present vegetation: Big sagebrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 6 inches
Texture: Loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 6 to 14 inches
Texture: Clay loam
Structure: Massive
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 14 to 28 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 28 to 42 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Very hard, very firm
Reaction: Strongly alkaline

Depth: 42 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Hard, very friable
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to a seasonal high water table: 20 to 40 inches

Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.4 to 5.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains next to the entrenched part of stream channels
Distinctive present vegetation: Basin big sagebrush, basin wildrye
Inclusion 2
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: South-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 3
Classification: Aridic Argixerolls, fine, montmorillonitic, frigid
Position on landscape: North-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass
Inclusion 4
Classification: Cumulic Haplaquolls fine-loamy, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Fulstone soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Hunnton soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Fulstone Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan, shrink-swell potential
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Hunnton Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, seepage, small stones
Shallow excavations: Severe—cemented pan, cutbanks cave
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source
Drainage: Deep to water
Irrigation: Percs slowly, cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Interpretive Groups

Capability classification: Fulstone soil—7s, nonirrigated; Hunnton soil—4e, irrigated, 6s, nonirrigated
Range site: Fulstone soil—025X018N; Hunnton soil—025X019N; Inclusion 1—025X003N; Inclusion 2—025X015N; Inclusion 3—025X014N; Inclusion 4—025X005N

1231—Fulstone-Dacker-Wieland association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Fulstone gravelly loam, 2 to 15 percent slopes (50 percent)
- Dacker silt loam, 4 to 15 percent slopes (20 percent)
- Wieland gravelly loam, 4 to 15 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Hunnton silt loam, 2 to 8 percent slopes (5 percent)
- Inclusion 2: Gance very gravelly loam, 15 to 30 percent slopes (5 percent)

Characteristics of the Fulstone Soil

Classification: Abruptic Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Slightly convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 15 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 51 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 3 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 19 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 to 34 inches
Texture: Indurated hardpan
Consistence: Extremely hard, extremely firm

Depth: 34 to 57 inches
Texture: Extremely gravelly sandy clay
Structure: Massive
Consistence: Hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 14 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 2.8 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,600 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.7 to 9.2 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Inclusion 2
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat

Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Fulstone soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Fulstone Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan, shrink-swell potential
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Dacker Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Fulstone soil—7s, nonirrigated; Dacker soil—4e, irrigated, 6s, nonirrigated; Wieland soil—6s, nonirrigated
Range site: Fulstone soil—025X018N; Dacker soil—025X019N; Wieland soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N

1232—Fulstone-Dacker-Yuko association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Fulstone gravelly loam, 4 to 15 percent slopes (55 percent)
• Dacker silt loam, 4 to 15 percent slopes (20 percent)
• Yuko very gravelly sandy loam, 4 to 15 percent slopes (15 percent)
Contrasting inclusions:
• Inclusion 1: Wieland silt loam, 4 to 15 percent slopes (5 percent)
• Inclusion 2: Zevadez silt loam, 4 to 15 percent slopes (5 percent)

Characteristics of the Fulstone Soil

Classification: Abruptic Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Slightly convex summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Low sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 51 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 15

Depth: 0 to 3 inches
Texture: Gravelly loam
Structure: Platy

Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 19 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 to 34 inches
Texture: Indurated hardpan
Consistence: Extremely hard, extremely firm

Depth: 34 to 57 inches
Texture: Extremely gravelly sandy clay
Structure: Massive
Consistence: Hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 14 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 2.8 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.20; T value—1; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very firm
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Yuko Soil

Classification: Xerollic Haplargids, loamy, mixed, mesic, shallow

Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff and tuffaceous sandstone
Slope range: 4 to 15 percent
Elevation: 5,800 to 6,300 feet
Dominant present vegetation: Wyoming big sagebrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 50

Depth: 0 to 2 inches
Texture: Very gravelly sandy loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 2 to 6 inches
Texture: Clay loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Neutral

Depth: 6 to 8 inches
Texture: Clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 8 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 6 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 1.5 to 1.8 inches
Water-supplying capacity: 5.0 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.05; T value—1; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Inclusion 2
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Sandberg bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Fulstone soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Yuko soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Fulstone Soil for Various Uses and Practices

Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan, shrink-swell potential
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Dacker Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones

Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Suitability and Limitations of the Yuko Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, small stones
Roadfill: Poor—depth to rock
Topsoil: Poor—depth to rock, small stones
Daily cover for landfill: Poor—depth to rock
Shallow excavations: Severe—depth to rock
Local roads and streets: Moderate—depth to rock, slope, frost action
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Fulstone soil—7s, nonirrigated; Dacker soil—4e, irrigated, 6s, nonirrigated; Yuko soil—7s, nonirrigated
Range site: Fulstone soil—025X018N; Dacker soil—025X019N; Yuko soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N

1234—Fulstone-Igdell-McIvey association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Fulstone very cobbly silt loam, 2 to 8 percent slopes (35 percent)
• Igdell gravelly silt loam, 2 to 8 percent slopes (30 percent)
• McIvey very cobbly loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Aquic Argixerolls, clayey-skeletal, montmorillonitic, frigid, 2 to 8 percent slopes (4 percent)
• Inclusion 2: Chen very cobbly loam, 4 to 15 percent slopes (4 percent)
• Inclusion 3: Short Creek very cobbly loam, 15 to 30 percent slopes (4 percent)
• Inclusion 4: Welch silt loam, 0 to 2 percent slopes (3 percent)

Characteristics of the Fulstone Soil

Classification: Abruptic Xerollic Durargids, clayey, montmorillonitic, mesic, shallow
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 2 to 8 percent
Elevation: 6,300 to 7,400 feet
Dominant present vegetation: Low sagebrush, bottlebrush squirreltail

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 51 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 15
Percent pebbles on the surface: 20

Depth: 0 to 3 inches
Texture: Very cobbly silt loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Neutral

Depth: 3 to 19 inches
Texture: Clay
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 19 to 34 inches
Texture: Indurated hardpan
Consistence: Extremely hard, extremely firm

Depth: 34 to 57 inches
Texture: Extremely gravelly sandy clay
Structure: Massive
Consistence: Hard, firm
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to a hardpan: 14 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.4 to 2.8 inches
Water-supplying capacity: 7.5 to 9.0 inches
Runoff: Medium

Hydrologic group: D
Erosion factors (surface layer): K value—.15; T value—1; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Igdell Soil

Classification: Abruptic Aridic Durixerolls, fine, montmorillonitic, frigid
Position on landscape: Slightly convex side slopes of fan piedmont remnants
Parent material: Loess cap over mixed alluvium
Slope range: 2 to 8 percent
Elevation: 6,300 to 7,400 feet
Dominant present vegetation: Low sagebrush, Idaho fescue, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 12 inches
Average annual air temperature: About 44 degrees F
Frost-free period: About 90 days

Typical Profile

Percent pebbles on the surface: 30

Depth: 0 to 17 inches
Texture: Gravelly silt loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Neutral

Depth: 17 to 38 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Mildly alkaline

Depth: 38 to 39 inches
Texture: Gravelly clay loam
Structure: Subangular blocky
Consistence: Hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 39 to 40 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 40 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Very slow
Available water capacity: 2.3 to 4.3 inches
Water-supplying capacity: 7.5 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the McIvey Soil

Classification: Typic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave side slopes of fan piedmont remnants
Parent material: Mixed alluvium
Slope range: 4 to 15 percent
Elevation: 6,300 to 7,400 feet
Dominant present vegetation: Mountain big sagebrush, serviceberry, bluebunch wheatgrass

Climatic Data

Average annual precipitation: About 14 inches
Average annual air temperature: About 43 degrees F
Frost-free period: About 90 days

Typical Profile

Percent stones and boulders on the surface: 5
Percent cobbles on the surface: 30
Percent pebbles on the surface: 25

Depth: 0 to 18 inches
Texture: Very cobbly loam
Structure: Angular blocky
Consistence: Slightly hard, friable
Reaction: Neutral

Depth: 18 to 23 inches
Texture: Very gravelly clay loam
Structure: Prismatic
Consistence: Very hard, very firm
Reaction: Neutral

Depth: 23 to 62 inches
Texture: Extremely cobbly clay
Structure: Angular blocky
Consistence: Hard, firm
Reaction: Neutral

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none

Permeability: Very slow
Available water capacity: 5.1 to 7.3 inches
Water-supplying capacity: 9 to 14 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.17; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Aquic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Slightly concave side slopes of fan piedmont remnants
Distinctive present vegetation: Tufted hairgrass, sedge
Inclusion 2
Classification: Lithic Argixerolls, clayey-skeletal, montmorillonitic, frigid
Position on landscape: Lower side slopes of hills
Distinctive present vegetation: Low sagebrush, Idaho fescue
Inclusion 3
Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, frigid
Position on landscape: South- and west-facing side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass
Inclusion 4
Classification: Cumulic Haplaquolls, fine-loamy, mixed, frigid
Position on landscape: Flood plains
Distinctive present vegetation: Tufted hairgrass, sedge

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Fulstone soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Igdell soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the McIvey soil for named elements: Wild herbaceous plants (nonirrigated)—good; shrubs (nonirrigated)—good

Suitability and Limitations of the Fulstone Soil for Various Uses and Practices
Range seeding: Poor—rooting depth, large stones
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan, small stones, area reclaim
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan, shrink-swell potential
Pond reservoir areas: Severe—cemented pan
Embankments, dikes, and levees: Severe—seepage
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Igdell Soil for Various Uses and Practices
Range seeding: Poor—rooting depth
Roadfill: Poor—cemented pan, low strength, shrink-swell potential
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, too clayey, hard to pack
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the McIvey Soil for Various Uses and Practices
Range seeding: Poor—large stones
Roadfill: Fair—low strength, large stones
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—too clayey, small stones
Shallow excavations: Moderate—too clayey, large stones, slope
Local roads and streets: Moderate—low strength, slope, frost action
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—large stones
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Fulstone, Igdell, and McIvey soils—7s, nonirrigated
Range site: Fulstone soil—025X018N; Igdell soil—025X017N; McIvey soil—025X012N; Inclusion 1—025X005N; Inclusion 2—025X017N; Inclusion 3—025X015N; Inclusion 4—025X005N

1270—Wieland-Dacker-Puett association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Wieland very gravelly loam, 15 to 30 percent slopes (45 percent)
- Dacker silt loam, 2 to 8 percent slopes (25 percent)
- Puett sandy loam, 15 to 50 percent slopes (20 percent)

Contrasting inclusions:
- Inclusion 1: Zevadez sandy loam, 4 to 15 percent slopes (4 percent)
- Inclusion 2: Kelk silt loam, 0 to 2 percent slopes (3 percent)
- Inclusion 3: Gance very cobbly loam, 15 to 30 percent slopes (3 percent)

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.5 to 9.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.20; T value—5; wind erodibility group—8
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic
Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,900 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive

Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Puett Soil

Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff or tuffaceous sandstone
Slope range: 15 to 50 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Wyoming big sagebrush, black sagebrush, Indian ricegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 47 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 5

Depth: 0 to 2 inches
Texture: Sandy loam

Structure: Platy
Consistence: Soft, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 2 to 11 inches
Texture: Sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 11 to 15 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 10 to 20 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.9 to 2.3 inches
Water-supplying capacity: 6.0 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.28; T value—1; wind erodibility group—3
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Foot slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat

Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor
Suitability of the Puett soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Fair—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—low strength, slope, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Dacker Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Suitability and Limitations of the Puett Soil for Various Uses and Practices
Range seeding: Poor—too arid, droughty
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—seepage, piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Interpretive Groups

Capability classification: Wieland soil—6s, nonirrigated; Dacker soil—3e, irrigated, 6s, nonirrigated; Puett soil—7e, nonirrigated
Range site: Wieland soil—025X019N; Dacker soil—025X019N; Puett soil—025X025N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N

1271—Wieland-Enko association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Wieland silt loam, 2 to 8 percent slopes (50 percent)
• Enko silt loam, 2 to 8 percent slopes (35 percent)
Contrasting inclusions:
• Inclusion 1: Bunky silt loam, 4 to 15 percent slopes (5 percent)
• Inclusion 2: Zevadez silt loam, 8 to 15 percent slopes (4 percent)
• Inclusion 3: Chiara silt loam, 2 to 4 percent slopes (4 percent)
• Inclusion 4: Wieland silt loam, 15 to 30 percent slopes (2 percent)

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable

Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.5 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.55; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Enko Soil

Classification: Durixerollic Camborthids, coarse-loamy, mixed, mesic
Position on landscape: Slightly concave summits and side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,200 to 5,800 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Granular
Consistence: Soft, very friable
Reaction: Neutral
Salinity: 0 to 4 mmhos per cm

Depth: 4 to 18 inches
Texture: Loam
Structure: Prismatic
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 18 to 25 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 25 to 60 inches
Texture: Sandy loam
Structure: Massive
Consistence: Hard, firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.6 to 8.8 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—5; wind erodibility group—5
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1

Classification: Haploxerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Smooth side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, bluegrass

Inclusion 2
Classification: Durixerollic Haplargids, fine-loamy, mixed, mesic
Position on landscape: Slightly concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, bluegrass
Inclusion 3
Classification: Durixerollic Haplargids, loamy, mixed, mesic, shallow
Position on landscape: Slightly convex summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, bluegrass
Inclusion 4
Classification: Xerollic Durargids, fine, montmorillonitic, mixed, mesic
Position on landscape: Slightly concave side slopes of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, bluegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Enko soil for named elements: Grain and seed crops (irrigated)—good; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Erodes easily, percs slowly

Suitability and Limitations of the Enko Soil for Various Uses and Practices
Range seeding: Fair—too arid, excess salts
Roadfill: Good
Topsoil: Fair—small stones, thin layer
Daily cover for landfill: Good
Shallow excavations: Slight
Local roads and streets: Moderate—frost action
Pond reservoir areas: Moderate—seepage, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope
Terraces and diversions: Erodes easily

Interpretive Groups

Capability classification: Wieland soil—3e, irrigated, 6s, nonirrigated; Enko soil—3e, irrigated, 6s, nonirrigated
Range site: Wieland soil—025X019N; Enko soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N; Inclusion 4—025X019N

1272—Wieland-Gance-Dacker association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Wieland gravelly loam, 4 to 15 percent slopes (40 percent)
• Gance very gravelly loam, 15 to 30 percent slopes (25 percent)
• Dacker silt loam, 2 to 8 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Kelk silt loam, 0 to 2 percent slopes (5 percent)
• Inclusion 2: Hunnton silt loam, 2 to 8 percent slopes (5 percent)
• Inclusion 3: Puett gravelly sandy loam, 15 to 30 percent slopes (5 percent)

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.7 to 9.2 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Gance Soil

Classification: Durixerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Side slopes of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 15 to 30 percent
Elevation: 5,700 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Percent cobbles on the surface: 5
Percent pebbles on the surface: 40

Depth: 0 to 4 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 29 inches
Texture: Very gravelly clay
Structure: Angular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 29 to 68 inches
Texture: Extremely gravelly sandy loam
Structure: Massive
Consistence: Hard, brittle
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 1.8 to 6.4 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—5; wind erodibility group—8
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Characteristics of the Dacker Soil

Classification: Xerollic Durargids, fine-loamy, mixed, mesic

Position on landscape: Summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 2 to 8 percent
Elevation: 5,900 to 6,200 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 49 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 7 inches
Texture: Silt loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Neutral

Depth: 7 to 16 inches
Texture: Silty clay loam
Structure: Subangular blocky
Consistence: Hard, friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 16 to 25 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 25 to 31 inches
Texture: Silt loam
Structure: Massive
Consistence: Slightly hard, very friable
Reaction: Moderately alkaline
Salinity: 4 to 8 mmhos per cm

Depth: 31 to 52 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 20 to 35 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately slow
Available water capacity: 4.0 to 6.0 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.43; T value—2; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: Moderate
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durixerollic Camborthids, fine-silty, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 3
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Wyoming big sagebrush, black sagebrush, Indian ricegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Gance soil for named elements: Wild herbaceous plants (nonirrigated)—fair; wetland plants—fair
Suitability of the Dacker soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—good; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—poor; shallow water areas—very poor

Suitability and Limitations of the Wieland Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope

Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Gance Soil for Various Uses and Practices

Range seeding: Poor—small stones
Roadfill: Fair—large stones, slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Severe—seepage, large stones
Sand: Improbable source—small stones
Gravel: Probable source

Suitability and Limitations of the Dacker Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Poor—cemented pan, low strength
Topsoil: Poor—small stones
Daily cover for landfill: Poor—cemented pan, small stones
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—low strength
Pond reservoir areas: Moderate—seepage, cemented pan, slope
Embankments, dikes, and levees: Severe—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Cemented pan, erodes easily

Interpretive Groups

Capability classification: Wieland soil—6s, nonirrigated; Gance soil—7s, nonirrigated; Dacker soil—3e, irrigated, 6s, nonirrigated
Range site: Wieland soil—025X019N; Gance soil—025X019N; Dacker soil—025X019N; Inclusion 1—025X019N; Inclusion 2—025X019N; Inclusion 3—025X025N

1273—Wieland-Bilbo-Tustell association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Wieland gravelly loam, 4 to 15 percent slopes (45 percent)
• Bilbo gravelly loam, 15 to 50 percent slopes (20 percent)
• Tustell very gravelly loam, 8 to 15 percent slopes (20 percent)
Contrasting inclusions:
• Inclusion 1: Xerollic Camborthids, loamy-skeletal, mixed, mesic, 30 to 75 percent slopes (7 percent)
• Inclusion 2: Connel gravelly sandy loam, 0 to 4 percent slopes (4 percent)
• Inclusion 3: Bioya gravelly loam, 2 to 8 percent slopes (4 percent)

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth side slopes of partial ballenas
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,300 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 5.7 to 9.2 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.32; T value—5; wind erodibility group—6
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Bilbo Soil

Classification: Xerollic Haplargids, clayey-skeletal, montmorillonitic, mesic
Position on landscape: Convex, south- and west-facing side slopes of partial ballenas
Parent material: Mixed alluvium
Slope range: 15 to 50 percent
Elevation: 5,300 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 60

Depth: 0 to 4 inches
Texture: Gravelly loam
Structure: Platy
Consistence: Soft, very friable
Reaction: Mildly alkaline

Depth: 4 to 22 inches
Texture: Very gravelly clay
Structure: Prismatic
Consistence: Hard, firm
Reaction: Neutral

Depth: 22 to 60 inches
Texture: Extremely gravelly loamy sand
Structure: Massive
Consistence: Loose
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 2.2 to 3.2 inches
Water-supplying capacity: 6.5 to 9.0 inches
Runoff: Rapid
Hydrologic group: C
Erosion factors (surface layer): K value—.24; T value—5; wind erodibility group—6
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—moderate
Potential for frost action: Low

Characteristics of the Tustell Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Slightly convex side slopes of partial ballenas
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 8 to 15 percent
Elevation: 5,300 to 6,000 feet
Dominant present vegetation: Big sagebrush, Douglas rabbitbrush, Sandberg bluegrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Very gravelly loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 19 inches
Texture: Gravelly clay
Structure: Angular blocky
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 19 to 30 inches
Texture: Gravelly loam

Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 30 to 60 inches
Texture: Stratified very gravelly loamy sand to gravelly loamy fine sand
Structure: Massive
Consistence: Hard, firm
Reaction: Strongly alkaline
Salinity: 0 to 4 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 3.7 to 5.7 inches
Water-supplying capacity: 7.5 to 9.5 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.15; T value—3; wind erodibility group—7
Hazard of erosion: By water—slight; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Low

Contrasting Inclusions

Inclusion 1
Classification: Xerollic Camborthids, loamy-skeletal, mixed, mesic
Position on landscape: Slightly concave, north- and east-facing side slopes of partial ballenas
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 2
Classification: Durixerollic Camborthids, coarse-loamy over sandy or sandy-skeletal, mixed, mesic
Position on landscape: Inset fans
Distinctive present vegetation: Big sagebrush, Thurber needlegrass
Inclusion 3
Classification: Xerollic Durorthids, fine-loamy, mixed, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Suitability of the Wieland soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Bilbo soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair
Suitability of the Tustell soil for named elements: Wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair

Suitability and Limitations of the Wieland Soil for Various Uses and Practices
Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Bilbo Soil for Various Uses and Practices
Range seeding: Fair—too arid, droughty, erodes easily
Roadfill: Poor—slope
Topsoil: Poor—small stones, area reclaim, slope
Daily cover for landfill: Poor—seepage, small stones, slope
Shallow excavations: Severe—cutbanks cave, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Suitability and Limitations of the Tustell Soil for Various Uses and Practices
Range seeding: Poor—small stones
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—seepage, small stones
Shallow excavations: Severe—cutbanks cave
Local roads and streets: Moderate—slope
Pond reservoir areas: Severe—seepage, slope
Embankments, dikes, and levees: Severe—seepage
Sand: Probable source
Gravel: Probable source

Interpretive Groups

Capability classification: Wieland soil—6s, nonirrigated; Bilbo soil—7e, nonirrigated; Tustell soil—7s, nonirrigated
Range site: Wieland soil—025X019N; Bilbo soil—025X015N; Tustell soil—025X019N; Inclusion 1—

025X019N; Inclusion 2—025X019N; Inclusion 3—025X019N

1274—Wieland-Tuffo-Chiara association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
- Wieland loam, 4 to 15 percent slopes (40 percent)
- Tuffo fine sandy loam, 30 to 50 percent slopes (30 percent)
- Chiara silt loam, 2 to 15 percent slopes (15 percent)

Contrasting inclusions:
- Inclusion 1: Gochea gravelly loam, bedrock substratum, 15 to 30 percent slopes (5 percent)
- Inclusion 2: Soughe very gravelly loam, 15 to 50 percent slopes (5 percent)
- Inclusion 3: Hunnton loam, 2 to 15 percent slopes (3 percent)
- Inclusion 4: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow, 15 to 50 percent slopes (2 percent)

Characteristics of the Wieland Soil

Classification: Durixerollic Haplargids, fine, montmorillonitic, mesic
Position on landscape: Smooth summits of fan piedmont remnants
Parent material: Mixed alluvium influenced by loess and volcanic ash
Slope range: 4 to 15 percent
Elevation: 5,500 to 5,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 5 inches
Texture: Loam
Structure: Platy
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline
Salinity: 0 to 2 mmhos per cm

Depth: 5 to 26 inches
Texture: Gravelly clay
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 4 mmhos per cm

Depth: 26 to 52 inches
Texture: Gravelly sandy clay loam
Structure: Prismatic
Consistence: Very hard, firm
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Depth: 52 to 60 inches
Texture: Loam
Structure: Massive
Consistence: Very hard, friable
Reaction: Moderately alkaline
Salinity: 0 to 8 mmhos per cm

Soil and Water Features

Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Slow
Available water capacity: 6.0 to 9.4 inches
Water-supplying capacity: 8 to 10 inches
Runoff: Medium
Hydrologic group: C
Erosion factors (surface layer): K value—.49; T value—5; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: High
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Characteristics of the Tuffo Soil

Classification: Xeric Torriorthents, ashy, nonacid, mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Parent material: Residuum derived from tuff or tuffaceous sandstone
Slope range: 30 to 50 percent
Elevation: 5,100 to 5,800 feet
Dominant present vegetation: Douglas rabbitbrush, spiny hopsage, littleleaf horsebrush

Climatic Data

Average annual precipitation: About 10 inches
Average annual air temperature: About 46 degrees F
Frost-free period: About 110 days

Typical Profile

Percent pebbles on the surface: 10

Depth: 0 to 3 inches
Texture: Fine sandy loam
Structure: Platy
Consistence: Soft, very friable

Reaction: Mildly alkaline

Depth: 3 to 11 inches
Texture: Very fine sandy loam
Structure: Subangular blocky
Consistence: Slightly hard, very friable
Reaction: Mildly alkaline

Depth: 11 inches
Texture: Weathered bedrock

Soil and Water Features

Depth to bedrock: 4 to 14 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderately rapid
Available water capacity: 1.1 to 1.4 inches
Water-supplying capacity: 5 to 7.5 inches
Runoff: Rapid
Hydrologic group: D
Erosion factors (surface layer): K value—.24; T value—1; wind erodibility group—3
Hazard of erosion: By water—high; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—moderate; to concrete—low
Potential for frost action: Moderate

Characteristics of the Chiara Soil

Classification: Xerollic Durorthids, loamy, mixed, mesic, shallow
Position on landscape: Slightly convex summits of fan piedmont remnants
Parent material: Loess influenced by volcanic ash over mixed alluvium
Slope range: 2 to 15 percent
Elevation: 5,600 to 5,800 feet
Dominant present vegetation: Big sagebrush, bluebunch wheatgrass, cheatgrass

Climatic Data

Average annual precipitation: About 9 inches
Average annual air temperature: About 48 degrees F
Frost-free period: About 110 days

Typical Profile

Depth: 0 to 4 inches
Texture: Silt loam
Structure: Platy
Consistence: Slightly hard, friable
Reaction: Neutral
Salinity: 0 to 2 mmhos per cm

Depth: 4 to 10 inches
Texture: Silt loam
Structure: Subangular blocky
Consistence: Hard, firm
Reaction: Moderately alkaline
Salinity: 2 to 4 mmhos per cm

Depth: 10 inches
Texture: Indurated hardpan
Structure: Massive
Consistence: Extremely hard, extremely firm
Reaction: Moderately alkaline

Soil and Water Features

Depth to a hardpan: 10 to 20 inches
Depth to bedrock: More than 60 inches
Depth to a seasonal high water table: More than 60 inches
Flooding: Frequency—none
Permeability: Moderate
Available water capacity: 1.7 to 2.0 inches
Water-supplying capacity: 5 to 6.5 inches
Runoff: Medium
Hydrologic group: D
Erosion factors (surface layer): K value—.55; T value—1; wind erodibility group—5
Hazard of erosion: By water—moderate; by wind—slight
Shrink-swell potential: Low
Corrosivity: To steel—high; to concrete—low
Potential for frost action: Moderate

Contrasting Inclusions

Inclusion 1
Classification: Durargidic Argixerolls, fine-loamy, mixed, frigid
Position on landscape: Slightly concave, north- and east-facing side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 2
Classification: Lithic Xerollic Haplargids, loamy-skeletal, mixed, mesic
Position on landscape: Side slopes of fan piedmont remnants with a rock core
Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Inclusion 3
Classification: Xerollic Durargids, fine, montmorillonitic, mesic
Position on landscape: Slightly concave summits of fan piedmont remnants
Distinctive present vegetation: Big sagebrush, Thurber needlegrass

Inclusion 4
Classification: Xeric Torriorthents, loamy, mixed (calcareous), mesic, shallow
Position on landscape: Side slopes of fan piedmont remnants with a rock core

Distinctive present vegetation: Big sagebrush, bluebunch wheatgrass

Major Uses

Current uses: Livestock grazing, wildlife habitat
Potential foreseeable uses: Hayland, pasture, cropland
Suitability of the Wieland soil for named elements: Grain and seed crops (irrigated)—fair; domestic grasses and legumes (irrigated)—fair; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor
Suitability of the Tuffo soil for named elements: Wild herbaceous plants (nonirrigated)—poor; shrubs (nonirrigated)—poor
Suitability of the Chiara soil for named elements: Grain and seed crops (irrigated)—poor; domestic grasses and legumes (irrigated)—poor; wild herbaceous plants (nonirrigated)—fair; shrubs (nonirrigated)—fair; wetland plants—very poor; shallow water areas—very poor

Suitability and Limitations of the Wieland Soil for Various Uses and Practices

Range seeding: Fair—too arid
Roadfill: Good
Topsoil: Poor—small stones, area reclaim
Daily cover for landfill: Poor—small stones
Shallow excavations: Moderate—too clayey, slope
Local roads and streets: Severe—low strength, shrink-swell potential
Pond reservoir areas: Severe—slope
Embankments, dikes, and levees: Moderate—thin layer
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Percs slowly, slope, erodes easily
Terraces and diversions: Slope, erodes easily, percs slowly

Suitability and Limitations of the Tuffo Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty, erodes easily
Roadfill: Poor—depth to rock, slope
Topsoil: Poor—depth to rock, small stones, slope
Daily cover for landfill: Poor—depth to rock, slope
Shallow excavations: Severe—depth to rock, slope
Local roads and streets: Severe—slope
Pond reservoir areas: Severe—depth to rock, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines

Suitability and Limitations of the Chiara Soil for Various Uses and Practices

Range seeding: Poor—too arid, droughty
Roadfill: Poor—cemented pan
Topsoil: Poor—cemented pan
Daily cover for landfill: Poor—cemented pan
Shallow excavations: Severe—cemented pan
Local roads and streets: Severe—cemented pan
Pond reservoir areas: Severe—cemented pan, slope
Embankments, dikes, and levees: Severe—piping
Sand: Improbable source—excess fines
Gravel: Improbable source—excess fines
Drainage: Deep to water
Irrigation: Cemented pan, slope
Terraces and diversions: Slope, cemented pan, erodes easily

Interpretive Groups

Capability classification: Wieland soil—4e, irrigated, 6s, nonirrigated; Tuffo soil—7s, nonirrigated; Chiara soil—4e, irrigated, 7s, nonirrigated
Range site: Wieland soil—025X019N; Tuffo soil—025X015N; Chiara soil—025X019N; Inclusion 1—025X014N; Inclusion 2—025X015N; Inclusion 3—025X019N; Inclusion 4—025X021N

1276—Wieland-Chiara-Puett association

Map Unit Setting

Position on landscape: Fan piedmont remnants

Composition

Major components:
• Wieland loam, 4 to 15 percent slopes (35 percent)
• Chiara silt loam, 2 to 8 percent slopes (30 percent)
• Puett gravelly sandy loam, 4 to 15 percent slopes (20 percent)
Contrasting inclusions:
