# Soil Survey of Colville Indian Reservation, Washington, Parts of Ferry and Okanogan Counties

# How to Use This Soil Survey

## General Soil Map

The general soil map, which is a color map, shows the survey area divided into groups of associated soils called general soil map units. This map is useful in broad planning for the use and management of large areas.

To find information about your area of interest, locate that area on the map, identify the name of the map unit in the area on the color-coded map legend, then refer to the section **General Soil Map Units** for a general description of the soils in your area.

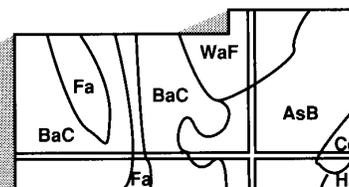

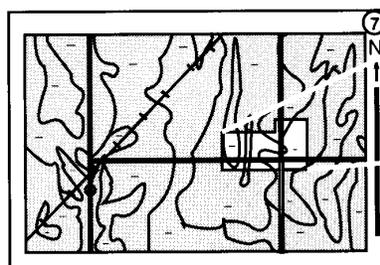

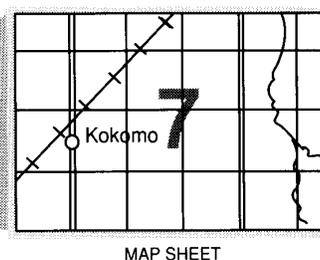

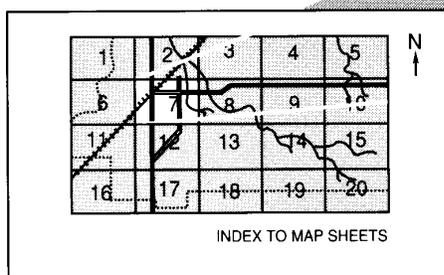

## Detailed Soil Maps

The detailed soil maps can be useful in planning the use and management of small areas.

To find information about your area of interest, locate that area on the **Index to Map Sheets**. Note the number of the map sheet and turn to that sheet.

Locate your area of interest on the map sheet. Note the map unit symbols that are in that area. Turn to the **Contents**, which lists the map units by symbol and name and shows the page where each map unit is described.

The **Contents** shows which table has data on a specific land use for each detailed soil map unit. Also see the **Contents** for sections of this publication that may address your specific needs.

NOTE: Map unit symbols in a soil survey may consist only of numbers or letters, or they may be a combination of numbers and letters.

---

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (formerly the Soil Conservation Service) has leadership for the Federal part of the National Cooperative Soil Survey.

Major fieldwork for this soil survey was completed in 1985. Soil names and descriptions were approved in 1987. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 1987. Tables 4, 5, 7, and 12 through 22 were generated in 2001 from the most current data stored in the National Soil Information System (NASIS) database. The properties and criteria used to develop the soil interpretations and ratings in tables 6, 8, and 9 were developed by local resource specialists. These criteria and ratings have not been reviewed or approved by the National Cooperative Soil Survey. For more information on these interpretations, criteria, and ratings, contact the resource specialists at the headquarters of the Colville Confederated Tribes. Tables 10 and 11 were developed locally from data collected during the survey.

This survey was made cooperatively by the Natural Resources Conservation Service and the Bureau of Indian Affairs; Colville Confederated Tribes; and Washington State University, Agriculture Research Center. The survey is part of the technical assistance furnished to the Colville Confederated Tribes and the Ferry County and Okanogan County Conservation Districts.

Since the publication of this survey, more information on soil properties may have been collected, new interpretations developed, or existing interpretive criteria modified. The most current soil information and interpretations for this survey are in the Field Office Technical Guide (FOTG) at the local Natural Resources Conservation Service field office. The soil maps in this publication are in digital form. The digitizing of the maps is in accordance with the Soil Survey Geographic (SSURGO) database standards. The digital SSURGO-certified maps are considered the official maps for the survey area and are part of the FOTG at the local Natural Resources Conservation Service field office.

Soil maps in this survey may be copied without permission. Enlargement of these maps, however, could cause misunderstanding of the detail of mapping. If enlarged, maps do not show the small areas of contrasting soils that could have been shown at a larger scale.

The United States Department of Agriculture (USDA) prohibits discrimination in all of its programs on the basis of race, color, national origin, gender, religion, age, disability, political beliefs, sexual orientation, and marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotope, etc.) should contact the USDA's TARGET Center at 202-720-2600 (voice or TDD).

---

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326W, Whitten Building, 14th and Independence Avenue SW, Washington, DC 20250-9410, or call 202-720-5964 (voice or TDD). USDA is an equal opportunity provider and employer.

**Cover:** View of the southern extent of the Okanogan Highlands, from Cache Creek Road. Owhi Flat is in foreground.

# Foreword

---

This soil survey contains information that affects land use planning in this survey area. It contains predictions of soil behavior for selected land uses. The survey also highlights soil limitations, improvements needed to overcome the limitations, and the impact of selected land uses on the environment.

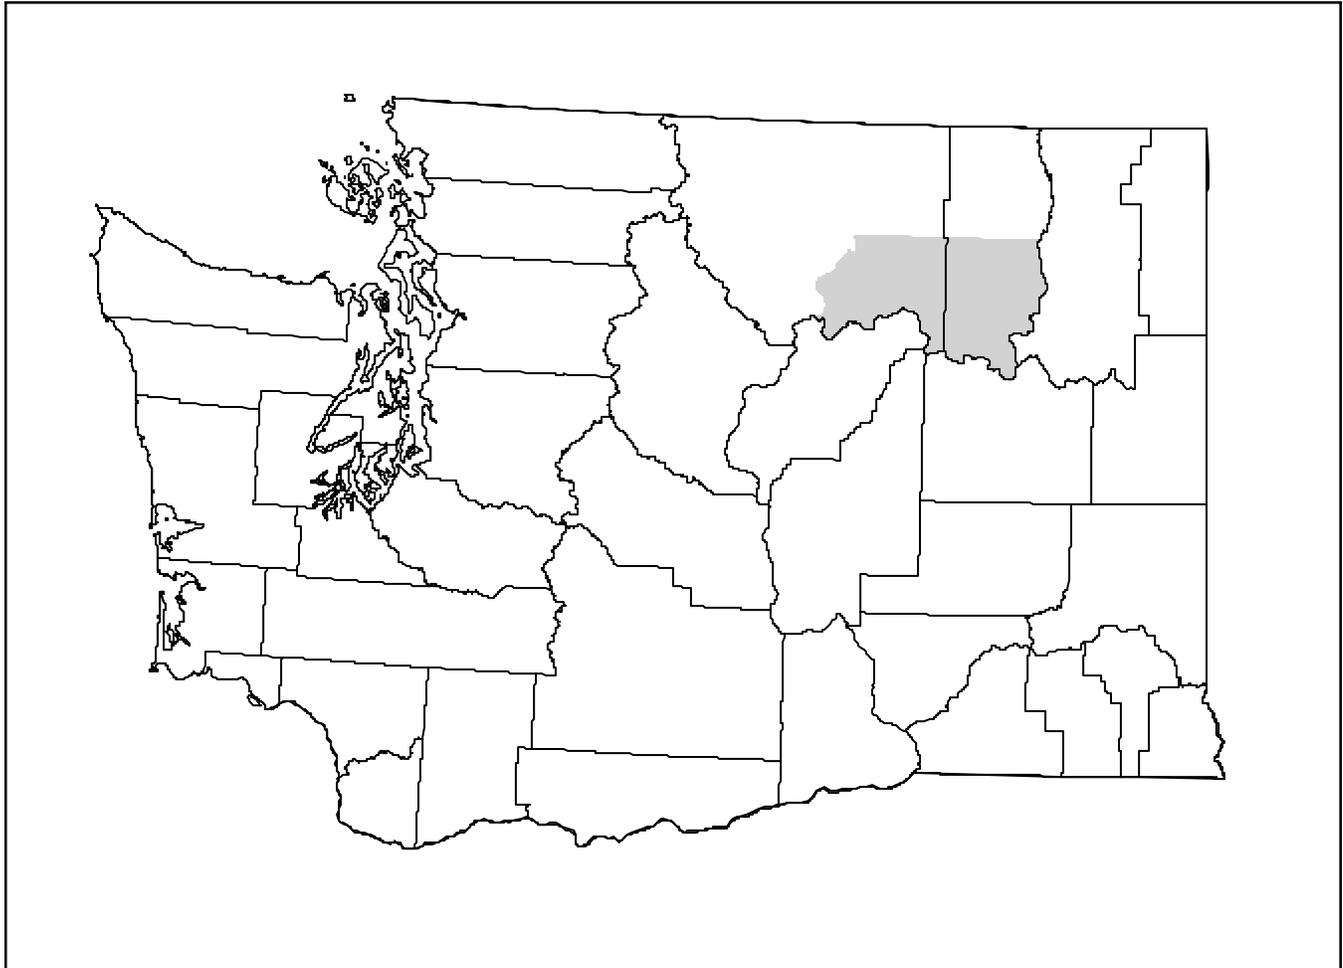

This soil survey is designed for many different users. Farmers, ranchers, foresters, and agronomists can use it to evaluate the potential of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the survey to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the survey to help them understand, protect, and enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. The information in this report is intended to identify soil properties that are used in making various land use or land treatment decisions. Statements made in this report are intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are shallow to bedrock. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. Broad areas of soils are shown on the general soil map. The location of each soil is shown on the detailed soil maps. Each soil in the survey area is described. Information on specific uses is given for each soil. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

Location of Colville Indian Reservation in Washington.

# Soil Survey of Colville Indian Reservation, Washington, Parts of Ferry and Okanogan Counties

---

By Steven B. Campbell and Terry L. Aho, Natural Resources Conservation Service

Soils described and mapped by Steven B. Campbell, Steven G. Rolph, Charles S. Natsuhara, Sanderson Page, Joseph T. DeFrancesco, Thomas A. Fait, Vern E. Beiel, Terry L. Aho, Dale L. Olson, and Norman Donaldson, Natural Resources Conservation Service, and Walter C. Hunner, Colville Confederated Tribes

Forest productivity assistance provided by Timothy Leadingham, Bureau of Indian Affairs, and Michael Cloughesy and Valerie Dillon, Colville Confederated Tribes

Range and forest understory assistance provided by Marc A. Pointel and Kevin J. Hanley, Natural Resources Conservation Service, and Brian W. Frith, Colville Confederated Tribes

United States Department of Agriculture, Natural Resources Conservation Service, in cooperation with the Department of the Interior, Bureau of Indian Affairs; Colville Confederated Tribes; and Washington State University, Agriculture Research Center

COLVILLE INDIAN RESERVATION is in the north-central part of Washington. The total area is about 2,127 square miles, or 1,361,232 acres. About 902,450 acres are forestland, 436,105 acres are rangeland, 15,775 acres are nonirrigated cropland, 5,540 acres are irrigated cropland, and 1,360 acres are residential, commercial, or industrial land (USDI, 1981). The total population of the area is about 7,400, of which about 52 percent are Indian tribal members. The principal towns are Nespelem (tribal headquarters), Inchelium, East Omak, Keller, and Coulee Dam.

The survey area is bordered on the east and south by the Columbia River, on the west by the Okanogan River, and on the north by the township line common to townships 34 and 35, north of the Oregon baseline. It is approximately 70 miles across the survey area from east to west and 24 to 43 miles from north to south.

Soil scientists have identified about 178 different kinds of soils in the survey area. These soils vary in texture, depth, rock fragment content, and natural drainage. The soils on hills and mountains are suited mainly to timber production, livestock grazing, wildlife

habitat, and recreation. The soils on terraces and plateaus are suited to these uses as well as cropland and building site development.

## General Nature of the Survey Area

This section provides general information about the survey area. It discusses history and development, physiography and relief, geology, drainage and water supply, and climate.

## History and Development

Prior to the 1850's, nomadic Indian tribes that subsisted by following seasonal sources of food occupied the survey area. They gathered roots and berries in spring, fished for salmon in summer, and hunted for game in fall. The people of these tribes belonged to the Plateau Culture (Raufer, 1966).

The first contact the Indians had with other people was with the fur traders and trappers in the late 1700's. In 1811 the American Fur Company established the first trading post at Fort Okanogan, on the Columbia River near the mouth of the Okanogan

River. Relations with the traders and trappers began to alter the nomadic culture of the Indians.

In the 1830's, Jesuit missionaries came to the area and established missions and schools. The missionaries often acted as intermediaries to maintain peace between the Indians and the other inhabitants.

In the 1840's, miners, lumbermen, and others came into the area in increasing numbers, further encroaching on the Indians' territory. This created conflicts, but they generally were less serious than in other areas because of the peaceful nature of the local tribes and the efforts by the Jesuit missionaries to maintain peace.

The original Colville Indian Reservation, which was 2.8 million acres, was established by an executive order by President Grant in 1872. The reservation boundaries changed many times over the next 20 years. The present boundaries, which encompass 1.36 million acres, were established in 1892. The Colville Confederated Tribes now consist of 11 bands—the Colville, Entiat/Chelan, Lake, Methow, Moses/Columbia, Nespelam, Nez Perce, Okanogan, Palouse (Palus), San Poil, and Wenatchee.

In 1905, each tribal member received an allotment of 80 acres. The remaining reservation land, except that reserved for timber production and mining, was opened for settlement by non-Indians. Legislation to restore reservation land to tribal ownership was approved in 1956, which returned 818,000 acres to the confederated tribes.

Timber production is the main economic enterprise in the survey area. The average harvest is 120 million board feet of sawlogs per year. House logs, posts and poles, and firewood are also important products of the timber industry.

Livestock production is also significant to the local economy. About 71 percent of the survey area is used for grazing, supporting approximately 13,000 head of cattle annually.

Nonirrigated grain production is the largest agricultural land use. The main irrigated crops are hay, pasture, and orchard fruit and some small grain and corn.

## Physiography and Relief

Most of the survey area is in the Okanogan Highland geographic province. The remainder, which includes the Okanogan Plateau, or Timentwa Flats, in the southwestern part of the survey area, is in the Columbia Plateau geographic province. The lowest elevation, 780 feet, is at the mouth of the Okanogan River, and the highest elevation, 6,774 feet, is at the summit of Moses Mountain.

The portion of the Okanogan Highlands in the survey area is composed of two major north-south mountain ranges—the Kettle River Range and the Nespelam Range. Parts of these ranges were glaciated during the last major glacial advance. The topography in the glaciated areas is characterized by smooth, rounded mountain summits with exposed bedrock. These areas are gently sloping to steep and have weakly developed drainage patterns. The nonglaciated areas, in contrast, have narrow ridges, are sloping to very steep, and have well-developed drainage patterns.

The Kettle River Range, in the eastern part of the survey area, forms the divide between the Columbia River to the east and south and the Sanpoil River to the west. The highest peak in this range is Grizzly Mountain, with an elevation of 6,397 feet. Other prominent peaks include Cody Butte (4,764 feet), South Seventeen Mile Mountain (5,174 feet), Lynx Mountain (5,709 feet), Gold Mountain (4,686 feet), Whitestone Ridge (4,762 feet), and Johnny George Mountain (4,090 feet).

The Nespelam Range, in the central part of the survey area, forms the divide between the Sanpoil River to the east and the Columbia and Okanogan Rivers to the south and west, respectively. The highest point in this range is Moses Mountain, with an elevation of 6,774 feet. Other prominent peaks include Little Moses Mountain (5,963 feet), Omak Mountain (5,749 feet), Strawberry Mountain (5,855 feet), Keller Butte (4,831 feet), and Central Peak (4,781 feet).

The Okanogan Plateau, in the southwestern part of the survey area, represents the northernmost extension of the Columbia Plateau. Elevation ranges from 2,000 to 2,900 feet. The Okanogan Plateau is nearly level to gently sloping and is dotted by many small lakes and ponds that resulted from the glaciation.

Flood plains and terraces of recent alluvium and higher terraces of glacial outwash and glacial lake sediment flank the rivers and most of the major creeks.

## Geology

The geology of the survey area is varied. The oldest rocks, which are metamorphic and sedimentary, are known as the Covada Group (Pardee, 1918). They consist mainly of phyllite, schist, quartzite, graywacke, shale, and limestone. These rocks are interbedded in a complex pattern.

The next oldest and most extensive rocks are granitic rocks of the Colville Batholith, which are throughout the survey area. The dominant rock types

are quartz monzonite, granite, granodiorite, quartz diorite, and diorite (Colville Confederated Tribes Geology Department Staff, 1984).

Volcanic rocks and related rocks form an extensive area in the central part of the survey area. These are known as the Sanpoil Volcanics, the O'Brien Creek Formation, and their intrusive equivalent, the Scatter Creek Rhyodacite (Staat, 1964). These rocks are mainly rhyodacite, andesite, and quartz latite.

The Okanogan Plateau, in the southwestern part of the survey area, was formed by Columbia River basalt flows. These are the youngest rocks in the area.

During the last glacial advance, about 75 percent of the survey area was covered by the Cordilleran Ice Sheet (Richmond and others, 1965). As a result, deposits of glacial till, outwash, and lake sediment cover much of the area.

Many soils in the survey area have a surface mantle of volcanic ash or have a component of volcanic ash as a result of the volcanic eruptions of Glacier Peak (12,000 years ago) and Mount Mazama (7,500 years ago) (Fryxell, 1965). Many of the soils also have a component of loess.

More detailed information on the geology of the survey area is given under the heading "Formation of the Soils."

## Drainage and Water Supply

The survey area is entirely within the Columbia River Watershed. Major tributaries include the Okanogan River, which forms the western boundary of the area; the Nespelem River, in the central part; and the Sanpoil River, in the east-central part. A number of secondary streams, including Hall, Stranger, Wilmont, and Ninemile Creeks, flow into the Columbia River where it forms the eastern boundary of the survey area.

Omak Lake, the largest lake, is in the western part of the survey area. It has a total area of about 3,350 acres. It is the largest saline lake in Washington. Other major lakes include North Twin, South Twin, Round, McGinnis, Buffalo, Owhi, Goose, and Soap Lakes. Numerous small saline lakes are on the Okanogan Plateau, in the southwestern part of the survey area.

Three dams in the vicinity of the survey area—Grand Coulee, Chief Joseph, and Wells Dams—impound the Columbia River. Franklin Roosevelt Lake, created by Grand Coulee Dam, makes up part of the southern border and all of the eastern border of the survey area. Rufus Woods Lake, the Chief Joseph Dam impoundment, makes up the remainder of the southern boundary. Wells Dam impounds the Columbia River along the southwestern boundary of

the survey area, and it impounds the lower part of the Okanogan River to about the town of Monse.

Surface runoff from all of the interior streams totals about 417,000 acre-feet per year (USDI, 1979). High flow occurs during March through June. The Sanpoil River, the largest interior stream in the survey area, has an average flow of about 230 cubic feet per second, but the flow drops substantially during August and September. Many of the smaller streams are dry or nearly dry in summer and early in fall.

Streams provide about 60 percent of the 16,000 acre-feet of water used for irrigation (Harkness and others, 1974). The Columbia and Okanogan Rivers are the principal sources of surface irrigation water. Secondary sources include the Nespelem River and Hall, Kartar, and Stranger Creeks. The remaining 40 percent of irrigation water is provided by groundwater wells throughout the survey area.

## Climate

Prepared by the Natural Resources Conservation Service, National Water and Climate Center, Portland, Oregon.

Thunderstorm days, relative humidity, percent sunshine, and wind information are estimated from data recorded at the First Order station in Spokane, Washington.

Table 1 gives data on temperature and precipitation for the survey area as recorded at the Nespelem 2 S station in the period 1961 to 1990. Table 2 shows probable dates of the first freeze in fall and the last freeze in spring. Table 3 provides data on length of the growing season.

In winter, the average temperature is 27.4 degrees F and the average daily minimum temperature is 18.6 degrees. The lowest temperature on record, which occurred at Nespelem on January 30, 1950, is -33 degrees. In summer, the average temperature is 66.9 degrees and the average daily maximum temperature is 85.0 degrees. The highest recorded temperature, which occurred at Nespelem on August 4, 1961, is 110 degrees.

Growing degree days are shown in table 1. They are equivalent to "heat units." During the month, growing degree days accumulate by the amount that the average temperature each day exceeds a base temperature (40 degrees F). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze in spring and the first freeze in fall.

The average annual precipitation at Nespelem is about 13.2 inches. Of this, 2.8 inches, or 21 percent, usually falls in June through September. The growing

season for most crops falls within this period. The average annual precipitation in the survey area ranges from 12 inches along the Columbia River to nearly 28 inches in the higher lying areas in the northeastern part of the area. The heaviest 1-day rainfall during the period of record was 2.20 inches at Nespelem on July 6, 1958. Thunderstorms occur on about 10 days each year, and most occur in May through August.

The average seasonal snowfall is about 24.1 inches at Nespelem, but the average seasonal snowfall is higher, commonly 40 to 50 inches or more, in the higher lying areas in the northeastern part of the survey area. The greatest snow depth at any one time during the period of record was 21 inches at Nespelem on February 8, 1949. On the average, 22 days of the year have at least 1 inch of snow on the ground at Nespelem. The heaviest 1-day snowfall on record was 10.8 inches on December 8, 1971.

The average relative humidity in midafternoon is about 50 percent (78 percent in January and 26 percent in July). Humidity is higher at night, and the average at dawn is about 76 percent (85 percent in January and 62 percent in July). The sun shines 76 percent of the time possible in summer and 32 percent in winter. The prevailing wind is from the northeast in November through January and from the south the rest of the year. Average windspeed is highest, about 10 miles per hour, in March and April.

## How This Survey Was Made

This survey was made to provide information about the soils and miscellaneous areas in the survey area. The information includes a description of the soils and miscellaneous areas and their location and a discussion of their suitability, limitations, and management for specified uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They dug many holes to study the soil profile, which is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

The soils and miscellaneous areas in the survey area are in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind

of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept or model of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses. Soil scientists interpret the data from these analyses as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are

assembled from other sources, such as research information, production records, and field experience of specialists.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table

within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

# General Soil Map Units

---

The general soil map in this publication shows broad areas that have a distinctive pattern of soils, relief, and drainage. Each map unit on the general soil map is a unique natural landscape. Typically, it consists of one or more major soils or miscellaneous areas and some minor soils or miscellaneous areas. It is named for the major soils or miscellaneous areas. The components of one map unit can occur in another but in a different pattern.

The general soil map can be used to compare the suitability of large areas for general land uses. Areas of suitable soils can be identified on the map. Likewise, areas where the soils are not suitable can be identified.

Because of its small scale, the map is not suitable for planning the management of a farm or field or for selecting a site for a road or building or other structure. The soils in any one map unit differ from place to place in slope, depth, drainage, and other characteristics that affect management.

## Range Soils on Terraces and Dunes

*Number of map units:* 2

*Percentage of survey area:* 11 percent

*Slope range:* Nearly level to very steep

*Native vegetation:* Grasses, forbs, and shrubs

*Elevation:* 800 to 3,000 feet

*Average annual precipitation:* 9 to 15 inches

*Average annual air temperature:* 47 to 51 degrees F

*Frost-free period:* 110 to 180 days

*Parent material:* Glacial outwash, eolian sand, and glacial lake sediment with a component of loess

*Depth class:* Moderately deep and very deep

*Drainage class:* Excessively drained, somewhat excessively drained, and well drained

*Major uses:* Livestock grazing, irrigated cropland, irrigated orchards at the lower elevations, nonirrigated cropland, and building site development

## 1. Quincy-Skaha-Pogue

*Very deep, excessively drained and somewhat excessively drained, nearly level to very steep soils that formed in glacial outwash and eolian sand with a component of loess; on terraces, terrace escarpments, alluvial fans, and dunes*

### Setting

*Location in survey area:* Along the Columbia and Okanogan Rivers, in the southern and western parts of the area

*Slope range:* 0 to 65 percent

*Major vegetation:* Needleandthread, bluebunch wheatgrass, antelope bitterbrush, big sagebrush, and threetip sagebrush

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Percentage of survey area:* 7 percent

### Quincy Soils

*Position on landscape:* Terraces, terrace escarpments, alluvial fans, and dunes

*Parent material:* Glacial outwash and eolian sand

*Typical profile:*

Surface layer—loamy fine sand

Upper part of substratum—loamy fine sand and loamy sand

Lower part of substratum—coarse sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

### Skaha Soils

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash

*Typical profile:*

Surface layer—loamy sand

Upper part of substratum—gravelly loamy sand

Lower part of substratum—very gravelly and extremely gravelly coarse sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

### **Pogue Soils**

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash with a component of loess in the upper part

*Typical profile:*

Surface layer—fine sandy loam

Subsoil—fine sandy loam

Substratum—very gravelly loamy coarse sand and extremely gravelly sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

### **Minor Soils**

Aeneas, Cashmere, Ellisforde, Elvedere, Farrell, Peshastin, Strat, and Winchester soils on terraces and terrace escarpments; Beverly, Cashmont, and Logy soils on alluvial fans; Gooseflats soils in swales; and Okanogan soils on flood plains

### **Major Uses**

Livestock grazing, irrigated cropland and orchards, nonirrigated cropland, and building site development

## **2. Owhi-Ewall-Nespelem**

*Very deep and moderately deep, well drained and excessively drained, nearly level to very steep soils that formed in glacial outwash, eolian sand, and glacial lake sediment with a component of loess; on terraces, terrace escarpments, and dunes*

### **Setting**

*Location in survey area:* Mainly in the south-central and western parts of the area

*Slope range:* 0 to 60 percent

*Major vegetation:* Bluebunch wheatgrass, Idaho fescue, needleandthread, threetip sagebrush, and antelope bitterbrush

*Elevation:* 1,200 to 3,000 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Percentage of survey area:* 4 percent

### **Owhi Soils**

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash with a component of loess in the upper part

*Typical profile:*

Surface layer—loam

Subsoil—gravelly loam

Substratum—extremely gravelly coarse sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Ewall Soils**

*Position on landscape:* Terraces, terrace escarpments, and dunes

*Parent material:* Glacial outwash and eolian sand

*Typical profile:*

Surface layer—loamy fine sand

Substratum—sand and gravelly sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

### **Nespelem Soils**

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial lake sediment with a mantle of loess

*Typical profile:*

Surface layer—silt loam

Upper part of subsoil—hardpan

Lower part of subsoil—calcareous silt loam

*Depth class:* Moderately deep (20 to 40 inches to a hardpan)

*Drainage class:* Well drained

### **Minor Soils**

Fivelakes, Haley, Hobohill, Picard, Poween, and Winthrop soils on terraces and terrace escarpments; Ahtanum soils on flood plains; Conconully and Disautel soils on hills and mountains; Emdent soils in swales; Rebecca soils on alluvial fans, and Wannacott soils on plateaus

### **Major Uses**

Livestock grazing, nonirrigated cropland, and building site development

## Range Soils on Glaciated Hills and Plateaus

*Number of map units:* 3

*Percentage of survey area:* 17 percent

*Slope range:* Nearly level to very steep

*Native vegetation:* Grasses, forbs, and shrubs

*Elevation:* 800 to 3,000 feet

*Average annual precipitation:* 9 to 16 inches

*Average annual air temperature:* 47 to 51 degrees F

*Frost-free period:* 110 to 180 days

*Parent material:* Glacial till and material weathered from granitic rock and basalt with a mantle or component of loess and volcanic ash

*Depth class:* Very shallow to deep

*Drainage class:* Well drained

*Major uses:* Livestock grazing, nonirrigated cropland, wildlife habitat, and building site development

### 3. Malott-Rock outcrop-Couleedam

*Deep and shallow, well drained, nearly level to very steep soils that formed in glacial till and colluvium derived from granitic rock with a mantle or component of loess, and Rock outcrop; on glaciated hills*

#### Setting

*Location in survey area:* Along the Columbia and Okanogan Rivers, in the south-central and western parts of the area

*Slope range:* 0 to 70 percent

*Major vegetation:* Bluebunch wheatgrass, Sandberg bluegrass, needleandthread, Wyeth eriogonum, big sagebrush, threetip sagebrush, and antelope bitterbrush

*Elevation:* 800 to 2,200 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Percentage of survey area:* 6 percent

#### Malott Soils

*Position on landscape:* Glaciated hills

*Parent material:* Glacial till with a mantle of loess

*Typical profile:*

Surface layer—very fine sandy loam  
Upper part of subsoil—very fine sandy loam  
Middle part of subsoil—gravelly sandy loam  
Lower part of subsoil—hardpan

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

#### Rock Outcrop

*Kind of rock:* Granitic rock and gneiss

#### Couleedam Soils

*Position on landscape:* Glaciated hills

*Parent material:* Colluvium derived from granitic rock with a component of loess

*Typical profile:*

Surface layer—very stony sandy loam

Subsoil—very gravelly sandy loam

Bedrock—hard granite

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

#### Minor Soils

Cashmere, Farrell, and Peshastin soils on terraces and terrace escarpments; Heytou, Roosevelt, Soaplake, and Stubblefield soils on hills and mountains; and Cashmont soils on alluvial fans

#### Major Uses

Livestock grazing and wildlife habitat, and nonirrigated cropland on the Malott soils

### 4. Timentwa-Bakeoven

*Deep and very shallow, well drained, nearly level to very steep soils that formed in basaltic glacial till and material weathered from basalt with a mantle or component of loess and volcanic ash; on glaciated plateaus*

#### Setting

*Location in survey area:* Basalt plateau in the southwestern part of the area

*Slope range:* 0 to 65 percent

*Major vegetation:* Bluebunch wheatgrass, Idaho fescue, Sandberg bluegrass, and threetip sagebrush

*Elevation:* 1,800 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Percentage of survey area:* 5 percent

#### Timentwa Soils

*Position on landscape:* Glaciated plateaus

*Parent material:* Basaltic glacial till with a mantle of loess and volcanic ash

*Typical profile:*

Surface layer—loam

Upper part of subsoil—gravelly loam

Middle part of subsoil—cobble sandy loam

Lower part of subsoil—hardpan

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

### **Bakeoven Soils**

*Position on landscape:* Glaciated plateaus

*Parent material:* Material weathered from basalt with a component of loess

*Typical profile:*

Surface layer—very cobbly silt loam

Subsoil—very cobbly silt loam

Bedrock—basalt

*Depth class:* Very shallow (4 to 10 inches to bedrock)

*Drainage class:* Well drained

### **Minor Components**

Achimín soils on hills and mountains; Colockum, Duleylake, and Emdent soils in swales; Haley, Nespelem, and Picard soils on terraces and terrace escarpments; and Rock outcrop

### **Major Uses**

Nonirrigated cropland and building site development on the Timentwa soils, and livestock grazing

## **5. Conconully-Rock outcrop-Swakane**

*Moderately deep and shallow, well drained, nearly level to very steep soils that formed in glacial till and material weathered from granitic rock with a component of loess and volcanic ash, and Rock outcrop; on glaciated hills*

### **Setting**

*Location in survey area:* Mainly in the south-central and western parts of the area (fig. 1)

*Slope range:* 3 to 70 percent

*Major vegetation:* Bluebunch wheatgrass, Idaho fescue, Sandberg bluegrass, threetip sagebrush, antelope bitterbrush

*Elevation:* 1,400 to 3,000 feet

*Average annual precipitation:* 12 to 16 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Percentage of survey area:* 6 percent

### **Conconully Soils**

*Position on landscape:* Footslopes and backslopes of

glaciated hills

*Parent material:* Glacial till with a component of loess and volcanic ash

*Typical profile:*

Surface layer—stony fine sandy loam

Subsoil—gravelly fine sandy loam

Substratum—dense glacial till

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

### **Rock Outcrop**

*Kind of rock:* Granitic rock and gneiss

### **Swakane Soils**

*Position on landscape:* Ridges, shoulders, and backslopes of glaciated hills

*Parent material:* Material weathered from granitic rock with a component of loess and volcanic ash

*Typical profile:*

Surface layer—cobble loam

Substratum—extremely gravelly sandy loam

Bedrock—hard granite

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

### **Minor Soils**

Achimín, Disautel, Ginnis, Tyee, Vanbrunt, and Wynhoff soils on hills and mountains, Colockum soils in swales, Rebecca soils on alluvial fans, and Cumulic Haploxerolls along drainageways

### **Major Uses**

Livestock grazing, and nonirrigated cropland on the Conconully soils

## **Range Soils on Nonglaciated Hills**

*Number of map units:* 1

*Percentage of survey area:* 3 percent

*Slope range:* Nearly level to very steep

*Native vegetation:* Grasses, forbs, and shrubs

*Elevation:* 1,400 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Parent material:* Material weathered from granitic rock with a component of loess

*Depth class:* Shallow and moderately deep

*Drainage class:* Well drained

*Major uses:* Livestock grazing and wildlife habitat, and nonirrigated cropland on the moderately deep soils

Figure 1.—Typical area of general soil map unit 5. Conconully soils are in foreground and on midslopes in background, Cumulic Haploxerolls are in center along the drainageway, and Swakane soils and Rock outcrop are on the steeper slopes in background.

## 6. Tyee-Ginnis-Morical

*Shallow and moderately deep, well drained, nearly level to very steep soils that formed in material weathered from granitic rock with a component of loess; on nonglaciated hills*

### **Setting**

*Location in survey area:* Mainly in the south-central part of the area (fig. 2)

*Slope range:* 5 to 65 percent

*Major vegetation:* Bluebunch wheatgrass, Idaho fescue, arrowleaf balsamroot, silky lupine, threetip sagebrush, and antelope bitterbrush

*Elevation:* 1,400 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Percentage of survey area:* 3 percent

### **Tyee Soils**

*Position on landscape:* Summits, shoulders, and backslopes of hills

*Parent material:* Material weathered from granitic rock with a component of loess

*Typical profile:*

Surface layer—gravelly loam

Subsoil—gravelly loam

Bedrock—weathered granite

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

Figure 2.—Typical area of general soil map unit 6. Morical soils are on north-facing slopes in foreground, and Tyee and Ginnis soils are on south-facing slopes in background.

### ***Ginnis Soils***

*Position on landscape:* Footslopes, backslopes, and shoulders of hills

*Parent material:* Material weathered from granitic rock with a component of loess

*Typical profile:*

Surface layer—loam

Upper part of subsoil—gravelly loam

Lower part of subsoil—gravelly sandy loam

Bedrock—weathered granite

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### ***Morical Soils***

*Position on landscape:* Summits, shoulders, and backslopes of hills

*Parent material:* Material weathered from

granitic rock with a component of loess

*Typical profile:*

Surface layer—silt loam

Subsoil—loam

Bedrock—weathered granite

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Minor Soils**

Anders, Bakeoven, and Badge soils on plateaus and Broadax, Swakane, and Wynhoff soils on hills and mountains

### **Major Uses**

Livestock grazing, nonirrigated cropland on the moderately deep soils, and wildlife habitat

## **Forest Soils on Terraces**

*Number of map units:* 3

*Percentage of survey area:* 11 percent

*Slope range:* Nearly level to very steep

*Native vegetation:* Coniferous trees, grasses, forbs, and shrubs

*Elevation:* 1,300 to 4,800 feet

*Average annual precipitation:* 15 to 25 inches

*Average annual air temperature:* 42 to 48 degrees F

*Frost-free period:* 90 to 130 days

*Parent material:* Glacial lake sediment, glacial outwash, and glaciofluvial sediment with a component or mantle of volcanic ash and loess

*Depth class:* Very deep

*Drainage class:* Moderately well drained, well drained, and somewhat excessively drained

*Major uses:* Timber production, livestock grazing, nonirrigated and irrigated cropland, and building site development

## **7. Phoebe-Garrison-Cedonia**

*Very deep, well drained, nearly level to very steep soils that formed in glacial lake sediment and glacial outwash with a component of loess and volcanic ash; on terraces and terrace escarpments*

### **Setting**

*Location in survey area:* Mainly along the Columbia and Sanpoil Rivers, in the eastern and south-central parts of the area

*Slope range:* 0 to 65 percent

*Major vegetation:* Ponderosa pine, Douglas-fir, common snowberry, white spiraea, blue wildrye, and Idaho fescue

*Elevation:* 1,300 to 2,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

*Percentage of survey area:* 4 percent

### **Phoebe Soils**

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash with a component of loess and volcanic ash

*Typical profile:*

Surface layer—fine sandy loam

Subsoil—sandy loam

Substratum—loamy sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Garrison Soils**

*Position on landscape:* Terraces

*Parent material:* Glacial outwash with a component of loess and volcanic ash

*Typical profile:*

Surface layer—loam

Subsoil—gravelly loam over very gravelly sandy loam

Substratum—very gravelly and extremely gravelly coarse sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Cedonia Soils**

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial lake sediment with a component of loess and volcanic ash

*Typical profile:*

Surface layer—silt loam

Subsoil—silt loam

Substratum—calcareous silt loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Minor Soils**

Bisbee, Bong, Dart, Hallcreek, Hodgson, Hunters, Inchelium, Lakesol, Narcisse, Scala, Spens, and Springdale soils on terraces and terrace escarpments, Coxlake soils on flood plains, and Bernhill soils on hills and mountains

### **Major Uses**

Timber production, livestock grazing, nonirrigated cropland, irrigated cropland, and building site development

## 8. Wapal-Parmenter-Stapaloop

*Very deep, somewhat excessively drained and well drained, nearly level to very steep soils that formed in glacial outwash and glaciofluvial sediment with a component or mantle of volcanic ash and loess; on terraces and terrace escarpments*

### Setting

*Location in survey area:* Terraces throughout the northern part of the area

*Slope range:* 0 to 65 percent

*Major vegetation:* Douglas-fir, ponderosa pine, western larch, pinegrass, common snowberry, and kinnikinnick

*Elevation:* 1,600 to 4,800 feet

*Average annual precipitation:* 15 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Percentage of survey area:* 3 percent

### Wapal Soils

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash with a minor component of volcanic ash and loess

*Typical profile:*

Surface layer—gravelly sandy loam

Subsoil—gravelly sandy loam

Substratum—very gravelly coarse sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

### Parmenter Soils

*Position on landscape:* Kame terraces and outwash terraces

*Parent material:* Glacial outwash with a mantle of volcanic ash

*Typical profile:*

Surface layer—silt loam

Subsoil—stony silt loam

Substratum—very stony loamy sand over extremely cobbly coarse sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### Stapaloop Soils

*Position on landscape:* Terraces

*Parent material:* Glaciofluvial sediment with a minor component of loess and volcanic ash

*Typical profile:*

Surface layer—fine sandy loam

Subsoil—fine sandy loam

Substratum—fine sandy loam over very fine sandy loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### Minor Soils

Goddard, Karamin, Kiehl, Sacheen, and Scrabblers soils on terraces and terrace escarpments, Sanpoil soils on flood plains, and Torboy soils on hills and mountains

### Major Uses

Timber production, livestock grazing, and building site development

## 9. Kiehl-Kewach-Martella

*Very deep, moderately well drained and well drained, nearly level to very steep soils that formed in glacial lake sediment and glacial outwash with a mantle of volcanic ash and loess; on terraces and terrace escarpments*

### Setting

*Location in survey area:* Mainly on terraces in the northern and eastern parts of the area

*Slope range:* 0 to 65 percent

*Major vegetation:* Douglas-fir, ponderosa pine, western larch, grand fir, mallow ninebark, pinegrass, common snowberry, and longtube twinflower

*Elevation:* 1,300 to 4,000 feet

*Average annual precipitation:* 15 to 25 inches

*Average annual air temperature:* 42 to 45 degrees F

*Frost-free period:* 90 to 120 days

*Percentage of survey area:* 4 percent

### Kiehl Soils

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam

Subsoil—silt loam

Substratum—extremely gravelly loamy coarse sand over extremely gravelly coarse sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### Kewach Soils

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial lake sediment with a thin mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam

Upper part of subsoil—silt loam

Lower part of subsoil—silty clay loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

### **Martella Soils**

*Position on landscape:* Terraces

*Parent material:* Glacial lake sediment with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam

Upper part of subsoil—silt loam

Lower part of subsoil—silty clay loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

### **Minor Soils**

Aits, Apex, Neuske, and Stapaloop soils on hills and mountains, Hadenecreek, Karamin, Ret, and Scrabblers soils on terraces and terrace escarpments, Cubcreek and Sanpoil soils on flood plains, and Jimcreek soils in swales

### **Major Uses**

Timber production, livestock grazing, nonirrigated cropland, building site development

## **Forest Soils on Glaciated Hills and Mountains**

*Number of map units:* 5

*Percentage of survey area:* 30 percent

*Slope range:* Nearly level to very steep

*Native vegetation:* Coniferous trees, grasses, forbs, and shrubs

*Elevation:* 1,500 to 5,700 feet

*Average annual precipitation:* 14 to 25 inches

*Average annual air temperature:* 42 to 48 degrees F

*Frost-free period:* 90 to 130 days

*Parent material:* Glacial till and material weathered from granitic, metamorphic, and volcanic rock with a mantle or component of volcanic ash and loess

*Depth class:* Very deep to shallow

*Drainage class:* Well drained

*Major uses:* Timber production, livestock grazing, and wildlife habitat

## **10. Donovan-Republic-Vanbrunt**

*Moderately deep and very deep, well drained, nearly level to very steep soils that formed in glacial till and material weathered from granitic rock with a component of loess and volcanic ash; on glaciated hills and mountains*

### **Setting**

*Location in survey area:* Mainly in the west-central and northwestern parts of the area

*Slope range:* 3 to 65 percent

*Major vegetation:* Ponderosa pine, Douglas-fir on northerly aspects, common snowberry, antelope bitterbrush, pinegrass, bluebunch wheatgrass, and Idaho fescue

*Elevation:* 1,500 to 4,400 feet

*Average annual precipitation:* 14 to 20 inches

*Average annual air temperature:* 42 to 48 degrees F

*Frost-free period:* 90 to 130 days

*Percentage of survey area:* 6 percent

### **Donavan Soils**

*Position on landscape:* Dominantly south-facing toeslopes, footslopes, and backslopes of hills and mountains

*Parent material:* Glacial till with a component of loess and volcanic ash

*Typical profile:*

Surface layer—loam

Subsoil—gravelly loam

Substratum—dense glacial till

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

### **Republic Soils**

*Position on landscape:* Dominantly north-facing toeslopes and backslopes of hills and mountains

*Parent material:* Glacial till with a component of loess and volcanic ash

*Typical profile:*

Surface layer—loam

Subsoil—gravelly loam

Substratum—gravelly sandy loam over very gravelly sandy loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Vanbrunt Soils**

*Position on landscape:* Ridges and dominantly south-facing shoulders and backslopes of mountains

*Parent material:* Material weathered from granitic rock with a component of loess and volcanic ash

*Typical profile:*

Surface layer—very stony sandy loam  
Subsoil—extremely cobbly sandy loam  
Substratum—very cobbly sandy loam  
Bedrock—granitic rock

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Minor Components**

Apex, Johntom, Mineral, Northstar, Swakane, and Whitestone soils on hills and mountains; Kartar, Hudnut, and Lostcreek soils on terraces and terrace escarpments; Goldlake soils in swales; and Rock outcrop

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## **11. Raisio-Borgeau-Stevens**

*Moderately deep and very deep, well drained, nearly level to very steep soils that formed in glacial till and material weathered from metamorphic rock with a component of loess and volcanic ash; on glaciated hills and mountains*

### **Setting**

*Location in survey area:* Mainly in the extreme eastern and northeastern parts of the area

*Slope range:* 0 to 65 percent

*Major vegetation:* Widely spaced ponderosa pine, bluebunch wheatgrass, Idaho fescue, common snowberry, and rose

*Elevation:* 1,600 to 4,700 feet

*Average annual precipitation:* 15 to 22 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

*Percentage of survey area:* 4 percent

### **Raisio Soils**

*Position on landscape:* Dominantly south-facing ridges, shoulders, and backslopes of hills and mountains

*Parent material:* Material weathered from metamorphic rock with a component of loess and volcanic ash

*Typical profile:*

Surface layer—channery loam  
Subsoil—very channery loam  
Bedrock—phyllite

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Borgeau Soils**

*Position on landscape:* Dominantly south-facing backslopes and footslopes of hills

*Parent material:* Glacial till and colluvium derived from metamorphic rock with a component of loess and volcanic ash

*Typical profile:*

Surface layer—loam  
Subsoil—very gravelly loam  
Substratum—very gravelly loam over extremely gravelly loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Stevens Soils**

*Position on landscape:* Toeslopes, footslopes, and backslopes of hills

*Parent material:* Glacial till with a component of loess and volcanic ash

*Typical profile:*

Surface layer—silt loam  
Subsoil—silt loam  
Substratum—dense glacial till

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

### **Minor Soils**

Dehart, Donavan, Republic, Rufus, and Scoap soils on hills and mountains

### **Major Uses**

Livestock grazing and wildlife habitat

## **12. Nevine-Merkel-Mineral**

*Moderately deep, well drained, gently sloping to very steep soils that formed in glacial till and material weathered from granitic rock with a mantle or component of volcanic ash and loess; on glaciated hills and mountains*

### **Setting**

*Location in survey area:* Dominantly in the northern half of the area

*Slope range:* 5 to 65 percent

*Major vegetation:* Douglas-fir, ponderosa pine, western larch, pinegrass, mallow ninebark, creambush oceanspray, and pachystima

*Elevation:* 2,000 to 5,300 feet  
*Average annual precipitation:* 16 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days  
*Percentage of survey area:* 12 percent

### **Nevine Soils**

*Position on landscape:* Dominantly north-facing toeslopes, footslopes, and backslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash

*Typical profile:*

Surface layer—silt loam  
 Subsoil—loam  
 Substratum—dense glacial till

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

### **Merkel Soils**

*Position on landscape:* Dominantly south-facing toeslopes, footslopes, and backslopes of hills and mountains

*Parent material:* Granitic glacial till with a component of loess and volcanic ash in the upper part

*Typical profile:*

Surface layer—sandy loam  
 Subsoil—gravelly sandy loam  
 Substratum—dense glacial till

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

### **Mineral Soils**

*Position on landscape:* Ridges and dominantly south-facing shoulders and backslopes of mountains

*Parent material:* Colluvium and glacial till derived from granitic rock with a component of loess and volcanic ash in the upper part

*Typical profile:*

Surface layer—stony loam  
 Subsoil—very gravelly loam  
 Substratum—very stony sandy loam  
 Bedrock—granitic rock

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Minor Components**

Apex, Barnellcreek, Capoose, Koepke, Louploup, Republic, and Stepstone soils on hills and

mountains; Lostcreek soils on terraces and terrace escarpments; Rock outcrop; and Rubble land

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## **13. Elbowlake-Oxerine-Aits**

*Moderately deep to very deep, well drained, nearly level to very steep soils that formed in glacial till and material weathered from metasedimentary and metamorphic rock with a mantle of volcanic ash and loess; on glaciated hills and mountains*

### **Setting**

*Location in survey area:* Mainly in the extreme northeastern and east-central parts of the area

*Slope range:* 0 to 65 percent

*Major vegetation:* Douglas-fir, western larch, grand fir, ponderosa pine, mallow ninebark, creambush oceanspray, pinegrass, and longtube twinflower

*Elevation:* 2,000 to 5,700 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 45 degrees F

*Frost-free period:* 90 to 120 days

*Percentage of survey area:* 3 percent

### **Elbowlake Soils**

*Position on landscape:* Backslopes, footslopes, and toeslopes of hills and mountains

*Parent material:* Volcanic ash over glacial till derived dominantly from metasedimentary rock

*Typical profile:*

Surface layer—silt loam  
 Subsoil—silt loam over very gravelly loam  
 Substratum—dense glacial till

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

### **Oxerine Soils**

*Position on landscape:* Backslopes, shoulders, and ridges of hills and mountains

*Parent material:* Material weathered from metamorphic rock with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam  
 Subsoil—channery silt loam over very channery loam

Substratum—very channery loam

Bedrock—phyllite

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Aits Soils**

*Position on landscape:* Backslopes, footslopes, and toeslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam

Subsoil—silt loam over gravelly loam

Substratum—dense glacial till

*Depth class:* Moderately deep to very deep (20 to 60 inches or more to dense glacial till)

*Drainage class:* Well drained

### **Minor Soils**

Apex, Barnellcreek, Hartill, Inkler, Koepke, Raisio, Republic, Rufus, and Scoap soils on hills and mountains and Kiehl soils on terraces and terrace escarpments

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## **14. Inkler-Baldknob-Thout**

*Very deep, shallow, and moderately deep, well drained, gently sloping to very steep soils that formed in glacial till and material weathered from volcanic rock with a component of volcanic ash and loess; on glaciated hills and mountains*

### **Setting**

*Location in survey area:* Mainly flanking both sides of the Sanpoil River Valley, in the north-central part of the area

*Slope range:* 5 to 70 percent

*Major vegetation:* Douglas-fir, ponderosa pine, pinegrass, bluebunch wheatgrass, Idaho fescue, common snowberry, and mallow ninebark

*Elevation:* 2,000 to 4,200 feet

*Average annual precipitation:* 15 to 25 inches

*Average annual air temperature:* 42 to 46 degrees F

*Frost-free period:* 90 to 120 days

*Percentage of survey area:* 5 percent

### **Inkler Soils**

*Position on landscape:* Backslopes, footslopes, and toeslopes of hills and mountains

*Parent material:* Glacial till and colluvium derived from

volcanic rock with a component of volcanic ash and loess in the upper part

*Typical profile:*

Surface layer—gravelly silt loam

Subsoil—gravelly silt loam over gravelly loam

Substratum—very gravelly loam over very gravelly sandy loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Baldknob Soils**

*Position on landscape:* Glacially scoured summits, shoulders, and backslopes of hills and mountains

*Parent material:* Material weathered from volcanic rock and some glacial till with a component of volcanic ash and loess

*Typical profile:*

Surface layer—very stony loam

Subsoil—very gravelly loam over extremely gravelly loam

Bedrock—rhyodacite

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

### **Thout Soils**

*Position on landscape:* Summits, shoulders, and backslopes of hills and mountains

*Parent material:* Material weathered from volcanic rock with some glacial till and a minor component of volcanic ash and loess

*Typical profile:*

Surface layer—gravelly loam

Subsoil—very gravelly loam

Bedrock—rhyodacite

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Minor Components**

Lithic Xerorthents, Nevine, Northstar, Johntom, and Scoap soils, and Xerochrepts on hills and mountains; Rock outcrop; and Rubble land

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## **Forest Soils on Nonglaciated Hills and Mountains**

*Number of map units:* 5

*Percentage of survey area:* 22 percent

*Slope range:* Nearly level to very steep

*Native vegetation:* Coniferous trees, grasses, forbs, and shrubs

*Elevation:* 1,600 to 5,700 feet

*Average annual precipitation:* 14 to 25 inches

*Average annual air temperature:* 41 to 48 degrees F

*Frost-free period:* 90 to 130 days

*Parent material:* Material weathered from granitic, metamorphic, or volcanic rock with a component or mantle of volcanic ash and loess

*Depth class:* Shallow to very deep

*Drainage class:* Well drained

*Major uses:* Timber production, livestock grazing, and wildlife habitat

## 15. Spokane-Skanid-Dinkelman

*Shallow to deep, well drained, gently sloping to very steep soils that formed in material weathered from granitic rock with a component of loess and volcanic ash; on nonglaciated hills and mountains*

### **Setting**

*Location in survey area:* Mainly in granitic areas in the south-central and southern parts of the area

*Slope range:* 5 to 65 percent

*Major vegetation:* Ponderosa pine, Douglas-fir, Idaho fescue, bluebunch wheatgrass, pinegrass, antelope bitterbrush, and common snowberry

*Elevation:* 1,700 to 4,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 48 degrees F

*Frost-free period:* 90 to 130 days

*Percentage of survey area:* 7 percent

### **Spokane Soils**

*Position on landscape:* Summits and dominantly south-facing shoulders, backslopes, and footslopes of hills and mountains

*Parent material:* Material weathered from granitic rock with a component of loess and volcanic ash

*Typical profile:*

Surface layer—loam

Subsoil—sandy loam

Substratum—gravelly coarse sandy loam over gravelly loamy coarse sand

Bedrock—weathered granitic rock

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Skanid Soils**

*Position on landscape:* Ridges, summits, and

dominantly south-facing shoulders and backslopes of hills and mountains

*Parent material:* Material weathered from granitic rock with a minor component of loess and volcanic ash

*Typical profile:*

Surface layer—gravelly sandy loam

Substratum—very gravelly coarse sandy loam

Bedrock—weathered granitic rock

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

### **Dinkelman Soils**

*Position on landscape:* Dominantly north-facing shoulders, backslopes, and footslopes of hills and mountains

*Parent material:* Material weathered from granitic rock with a component of volcanic ash and loess

*Typical profile:*

Surface layer—gravelly loam

Subsoil—gravelly sandy loam

Bedrock—weathered granitic rock

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

### **Minor Soils**

Bearspring, Centralpeak, Georgecreek, Hellgate, Swakane, Vanbrunt, and Whitestone soils on hills and mountains and Reardan soils on plateaus

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## 16. Oxerine-Raisio-Rufus

*Moderately deep and shallow, well drained, moderately sloping to very steep soils that formed in material weathered from metamorphic rock with a component or mantle of volcanic ash and loess; on nonglaciated hills and mountains*

### **Setting**

*Location in survey area:* Mainly in the southeastern part of the area

*Slope range:* 5 to 65 percent

*Major vegetation:* Ponderosa pine, bluebunch wheatgrass, and Idaho fescue with Douglas-fir, mallow ninebark, creambush oceanspray, and pinegrass on the north-facing slopes

*Elevation:* 1,900 to 5,700 feet

*Average annual precipitation:* 15 to 25 inches

*Average annual air temperature:* 42 to 48 degrees F

*Frost-free period:* 90 to 130 days  
*Percentage of survey area:* 3 percent

### **Oxerine Soils**

*Position on landscape:* Dominantly north-facing backslopes and shoulders of hills and mountains

*Parent material:* Material weathered from metamorphic rock with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam

Subsoil—channery silt loam

Substratum—very channery loam

Bedrock—phyllite

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Raisio Soils**

*Position on landscape:* Dominantly south-facing ridges, shoulders, and backslopes of hills and mountains

*Parent material:* Material weathered from metamorphic rock with a component of volcanic ash and loess

*Typical profile:*

Surface layer—channery loam

Subsoil—very channery loam

Bedrock—phyllite

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Rufus Soils**

*Position on landscape:* Dominantly south-facing ridges, shoulders, and backslopes of hills and mountains

*Parent material:* Material weathered from metamorphic rock with a component of volcanic ash and loess

*Typical profile:*

Upper part of surface layer—channery loam

Lower part of surface layer—very channery loam

Bedrock—schist

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

### **Minor Soils**

Dehart, Wells creek, and Wilmont soils on hills

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## **17. Inkler-Northstar-Johntom**

*Very deep, moderately deep, and shallow, well drained, gently sloping to very steep soils that formed in material weathered from volcanic rock with a component of loess and volcanic ash; on nonglaciated hills and mountains*

### **Setting**

*Location in survey area:* Mainly flanking the Sanpoil River Valley, in the south-central part of the area (fig. 3)

*Slope range:* 5 to 65 percent

*Major vegetation:* Ponderosa pine, bluebunch wheatgrass, and Idaho fescue on southerly aspects and Douglas-fir, mallow ninebark, and pinegrass on northerly aspects

*Elevation:* 1,600 to 4,200 feet

*Average annual precipitation:* 14 to 25 inches

*Average annual air temperature:* 42 to 47 degrees F

*Frost-free period:* 90 to 130 days

*Percentage of survey area:* 3 percent

### **Inkler Soils**

*Position on landscape:* Dominantly north-facing backslopes, footslopes, and toeslopes of hills and mountains

*Parent material:* Material weathered from volcanic rock with a component of volcanic ash and loess

*Typical profile:*

Surface layer—gravelly silt loam

Subsoil—gravelly silt loam over gravelly loam

Substratum—very gravelly loam over very gravelly sandy loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Northstar Soils**

*Position on landscape:* Dominantly south-facing ridges, shoulders, and backslopes of hills and mountains

*Parent material:* Material weathered from volcanic rock with a component of loess and volcanic ash

*Typical profile:*

Surface layer—gravelly loam

Subsoil—very gravelly loam

Substratum—extremely cobbly loam

Figure 3.—Typical area of general soil map unit 17. Northstar and Johntom soils are on the sparsely forested ridges and south-facing slopes, and Inkler soils are on the more densely forested north-facing slopes. Ralsen soils are on the nonforested meadow in foreground.

Bedrock—rhyodacite  
*Depth class:* Moderately deep (20 to 40 inches to bedrock)  
*Drainage class:* Well drained

#### **Johntom Soils**

*Position on landscape:* Dominantly south-facing ridges, shoulders, and upper backslopes of hills and mountains

*Parent material:* Material weathered from volcanic rock with a component of loess and volcanic ash  
*Typical profile:*  
 Surface layer—stony loam  
 Substratum—extremely gravelly coarse sandy loam  
 Bedrock—rhyodacite  
*Depth class:* Shallow (10 to 20 inches to bedrock)  
*Drainage class:* Well drained

### **Minor Components**

Baldknob, Louiecreek, Scoap, and Thout soils on hills and mountains; Rock outcrop; and Rubble land

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## **18. Centralpeak-Ohscow-Mineral**

*Moderately deep and very deep, well drained, gently sloping to very steep soils that formed in material weathered from granitic rock with a mantle or component of volcanic ash and loess; on nonglaciaded mountains*

### **Setting**

*Location in survey area:* Mainly in the south-central and eastern parts of the area

*Slope range:* 5 to 65 percent

*Major vegetation:* Douglas-fir, ponderosa pine, western larch, grand fir, mallow ninebark, creambush oceanspray, pinegrass, and longtube twinflower

*Elevation:* 2,000 to 5,300 feet

*Average annual precipitation:* 16 to 25 inches

*Average annual air temperature:* 41 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Percentage of survey area:* 7 percent

### **Centralpeak Soils**

*Position on landscape:* Ridges, shoulders, backslopes, and footslopes of mountains

*Parent material:* Material weathered from granitic rock with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—loam

Subsoil—loam over coarse sandy loam

Substratum—gravelly loamy coarse sand

Bedrock—weathered granitic rock

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Ohscow Soils**

*Position on landscape:* Footslopes and backslopes of mountains

*Parent material:* Material weathered from granitic rock with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam

Subsoil—silt loam over very gravelly sandy loam

Substratum—very cobbly sandy loam over very cobbly loamy sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Mineral Soils**

*Position on landscape:* Dominantly south-facing ridges, shoulders, and backslopes of mountains

*Parent material:* Material weathered from granitic rock with a component of loess and volcanic ash

*Typical profile:*

Surface layer—stony loam

Subsoil—very gravelly loam

Substratum—very stony sandy loam

Bedrock—granitic rock

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Minor Soils**

Bearspring, Brusher, Canteen, Dinkelman, Friedlander, Skanid, and Spokane soils on hills and mountains and Sclope soils in swales

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## **19. Wells creek-Wilmont-Henneway**

*Very deep and deep, well drained, nearly level to very steep soils that formed in material weathered from metamorphic rock with a mantle or component of volcanic ash and loess; on nonglaciaded hills and mountains*

### **Setting**

*Location in survey area:* Mainly in the east-central part of the area

*Slope range:* 0 to 65 percent

*Major vegetation:* Douglas-fir, western larch, grand fir, ponderosa pine, mallow ninebark, creambush oceanspray, pinegrass, and longtube twinflower

*Elevation:* 2,000 to 3,700 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 41 to 45 degrees F

*Frost-free period:* 90 to 120 days

*Percentage of survey area:* 2 percent

### **Wells creek Soils**

*Position on landscape:* Dominantly south-facing toeslopes, footslopes, and backslopes of hills and mountains

*Parent material:* Material weathered from metamorphic rock with a small component of loess and volcanic ash

*Typical profile:*

Surface layer—very channery loam  
Subsoil—extremely cobbly silt loam over extremely channery loam  
Substratum—extremely channery loam

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Wilmont Soils**

*Position on landscape:* Dominantly north-facing toeslopes, footslopes, and backslopes of hills and mountains

*Parent material:* Material weathered from metamorphic rock with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam  
Subsoil—very channery sandy loam  
Substratum—extremely channery loamy sand over extremely channery sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Henneway Soils**

*Position on landscape:* Toeslopes and footslopes of hills and mountains

*Parent material:* Material weathered from metamorphic rock with a mantle of volcanic ash and loess

*Typical profile:*

Surface layer—silt loam  
Upper part of subsoil—silt loam  
Lower part of subsoil—silty clay loam over channery silty clay loam and channery clay loam  
Bedrock—phyllite

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

### **Minor Soils**

Buhrig (shaly substratum), Hartill, Ozerine, Raisio, Renha, and Rufus soils on hills and mountains

### **Major Uses**

Timber production, livestock grazing, and wildlife habitat

## **Forest Soils on High Mountains**

*Number of map units:* 1

*Percentage of survey area:* 6 percent

*Slope range:* 0 to 70 percent

*Native vegetation:* Coniferous trees, shrubs, forbs, and grasses

*Elevation:* 3,000 to 6,800 feet

*Average annual precipitation:* 20 to 35 inches

*Average annual air temperature:* 37 to 41 degrees F

*Frost-free period:* 70 to 100 days

*Parent material:* Glacial till, material weathered from granitic rock, and glacial outwash with a mantle of volcanic ash

*Depth class:* Moderately deep and very deep

*Drainage class:* Well drained

*Major uses:* Timber production, wildlife habitat, and limited livestock grazing

## **20. Manley-Resner-Moses**

*Moderately deep and very deep, well drained, gently sloping to very steep soils that formed in glacial till, material weathered from granitic rock, and glacial outwash with a mantle of volcanic ash; on high mountains*

### **Setting**

*Location in survey area:* Mainly in the northern part of the area

*Slope range:* 0 to 70 percent

*Major vegetation:* Subalpine fir, western larch, Douglas-fir, lodgepole pine, black mountain huckleberry, pachystima, longtube twinflower, and pinegrass

*Elevation:* 3,000 to 6,800 feet

*Average annual precipitation:* 20 to 35 inches

*Average annual air temperature:* 37 to 41 degrees F

*Frost-free period:* 70 to 100 days

*Percentage of survey area:* 6 percent

### **Manley Soils**

*Position on landscape:* Footslopes and backslopes of mountains

*Parent material:* Glacial till with a mantle of volcanic ash

*Typical profile:*

Surface layer—silt loam  
Subsoil—silt loam  
Substratum—dense glacial till

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

### **Resner Soils**

*Position on landscape:* Toeslopes and footslopes of mountains, terraces, and terrace escarpments

*Parent material:* Glacial outwash and ablation till with a mantle of volcanic ash

*Typical profile:*

Surface layer—loam

Subsoil—loam

Substratum—very gravelly loamy sand over extremely gravelly loamy sand

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

### **Moses Soils**

*Position on landscape:* Footslopes, backslopes, and summits of mountains

*Parent material:* Material weathered from granitic rock with a mantle of volcanic ash

*Typical profile:*

Surface layer—silt loam

Subsoil—very gravelly coarse sandy loam

Substratum—very gravelly coarse sandy loam

Bedrock—weathered granitic rock

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

### **Minor Soils**

Buhrig, Codylake, Mineral, Nevine, Togo, and Tunkcreek soils on hills and mountains and Lynxcreek and Sitdown soils on terraces and terrace escarpments

### **Major Uses**

Timber production, wildlife habitat, and limited livestock grazing

## **Broad Land Use Considerations**

The soils in this survey area vary widely in their potential for major land uses. Approximately 66 percent of the area is forestland.

General soil map units 7, 10, 11, 15, and 17 are the warmest, driest forested soils in the area. Ponderosa pine is the dominant tree species, and Douglas-fir is a minor species. Competition from shrubs and grasses and high seedling mortality as a result of low annual precipitation and high summer temperatures are major management concerns. Forest productivity is low on the soils in these units. Most areas of these units have high potential for grazing.

General soil map units 8, 9, 12, 13, 14, 16, 18, and 19 include forested soils that are cooler and receive more moisture than those mentioned in the previous paragraph. Douglas-fir, western larch, grand fir, ponderosa pine, and lodgepole pine are examples of trees that grow on these units. Many of the soils in

these units have a mantle of volcanic ash, which is susceptible to compaction, puddling, and displacement by timber harvesting equipment. Proper timing and planning of logging activities is important to minimize the damage. Competition from shrubs and pinegrass can be severe. Forest productivity is moderate to high. The potential for grazing is low to moderate, depending on the successional stage and ecological unit.

The soils in general soil map unit 20 are the coldest and receive the most moisture of all of the forested soils in the survey area. Subalpine fir, Douglas-fir, western larch, and lodgepole pine are examples of trees that grow on this unit. Engelmann spruce and whitebark pine grow at the highest elevations. The soils in this unit have a mantle of volcanic ash, which is susceptible to compaction, puddling, and displacement by timber harvesting equipment. Proper timing and planning of logging operations help to minimize the damage. Invasion by shrubs and grasses following logging can interfere with regeneration. Forest productivity is moderate to high. The potential for grazing is low, except in recently logged areas.

Approximately 32 percent of the survey area is used as rangeland. General soil map units 1 and 3 receive 9 to 12 inches of precipitation annually. Forage production on these units is low because of the low annual precipitation and the limited available water capacity. The hazard of wind erosion can be severe in areas that have been overgrazed and highly disturbed. General soil map units 2, 4, 5, and 6 receive 12 to 15 inches of precipitation annually. Forage production on these units is higher than on units 1 and 3. The steepness of slope limits livestock distribution.

Approximately 1.2 percent of the survey area is used as nonirrigated cropland, of which most is in general soil map units 2 and 4 but minor amounts are in units 3, 5, 6, and 7. The main crops grown are winter wheat, spring wheat, and barley, and they generally are grown in rotation with summer fallow. The main limitations for nonirrigated crops are the low annual precipitation and the hazard of water erosion. Wind erosion is a hazard on the soils that have a sandy loam surface layer.

Approximately 0.4 percent of the survey area is used as irrigated cropland. Most of this cropland is in general soil map unit 1, but minor amounts are in units 2, 7, 8, and 9. The main crops grown are orchard fruit, small grain, and hay and pasture. The main limitations for irrigated crops are the hazards of wind and water erosion and the limited available water capacity.

Areas of general soil map units 2 and 7 below an elevation of about 1,800 feet are suited to orchards.

Aspect and air drainage should be considered when selecting sites for orchards. These map units are also used for irrigated small grain and hay and pasture. When designing irrigation systems, special consideration is needed for soils that have restricted permeability, such as those of the Cedonia and Nespelem series.

General soil map units 8 and 9 are suited to irrigated hay and pasture. The Kewach soils are limited by a restricted water intake rate and moderately slow permeability, and the Kiehl and Wapal soils are limited by the restricted available water capacity and rapid or very rapid permeability.

Some areas of general soil map units 1, 2, 7, 8, and 9 are used for building site development. Many of the soils in these units have very rapid permeability, including the Ewall, Garrison, Owhi, Pogue, Quincy, Skaha, and Wapal soils. The very rapid permeability limits filtering of septic tank effluent, which is a concern in highly populated areas or in areas that

have groundwater at a shallow depth. The Cedonia, Kewach, Martella, and Nespelem soils have restricted permeability that limits percolation of septic tank effluent. The Kewach and Martella soils have a seasonal high water table, which should be considered in the design of dwellings and septic tank filter systems.

Because of their proximity to the major rivers and lakes, general soil map units 1, 2, 7, 8, and 9 have the highest potential for use as campgrounds and for water sports such as boating, fishing, and swimming. The potential for recreational use varies considerably, depending on the intensity of use and the properties of the soils.

General soil map units 10 through 20 have good potential for hiking, backpacking, and horseback riding because of the mountainous topography that has high esthetic value. These units also are well suited to cross-country skiing. Snowpack in most years is reliable, and there is an extensive network of roads.

## Detailed Soil Map Units

---

The map units delineated on the detailed soil maps in this survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and potential of a unit for specific uses. They also can be used to plan the management needed for those uses.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some inclusions that belong to taxonomic classes other than those of the major soils.

Most included soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, inclusions. They may or may not be mentioned in a particular map unit description. Other inclusions, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, inclusions. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. The contrasting inclusions are mentioned in the map unit descriptions. A few areas of inclusions may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of inclusions in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives the principal hazards and limitations to be considered in planning for specific uses.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Aits silt loam, dry, 20 to 40 percent slopes, is a phase of the Aits series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes or associations.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Bakeoven-Timentwa-Rock outcrop complex, 0 to 30 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map

units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Centralpeak loams association, 5 to 20 percent slopes, is an example.

This survey includes *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Table 4 gives the acreage and proportionate extent of each map unit. Other tables give properties of the soils and the limitations, capabilities, and potentials for many uses. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

## 1—Achimín silt loam, 0 to 8 percent slopes

### Composition

*Achimín soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Toeslopes of foothills and depressions on till plains

*Parent material:* Loess overlying siltstone residuum

*Slope range:* 0 to 8 percent

*Elevation:* 1,500 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 18 inches—brown silt loam

*Upper part of subsoil:*

18 to 34 inches—yellowish brown and dark yellowish brown silty clay loam

*Lower part of subsoil:*

34 to 60 inches—yellowish brown and pale yellow, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

## Contrasting Inclusions

- Colockum soils
- Soils that have a dark surface layer that is more than 20 inches thick and have less clay in the subsoil
- Soils that are moderately well drained
- Soils that have a hardpan at a depth of 20 to 40 inches
- Conconully soils
- Timentwa soils
- Emdent soils

## Major Uses

Livestock grazing, nonirrigated cropland, wildlife habitat, watershed, and recreation

## Use and Management

### Livestock grazing

- There are no significant limitations for management of this soil for this use.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by water erosion and steepness of slope.

## 2—Achimín-Calcic Pachic Haploxerolls complex, 3 to 30 percent slopes

### Composition

*Achimín soil and similar soils:* 60 percent

*Calcic Pachic Haploxerolls and similar soils:* 30 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Achimín—toeslopes, footslopes, and backslopes of foothills; Calcic Pachic Haploxerolls—closed depressions

*Parent material:* Achimín—loess overlying siltstone residuum; Calcic Pachic Haploxerolls—loess-influenced slope alluvium

*Slope range:* Achimín—8 to 30 percent; Calcic Pachic Haploxerolls—3 to 20 percent

*Elevation:* 1,500 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

#### Achimín

*Surface layer:*

0 to 18 inches—brown silt loam

*Upper part of subsoil:*

18 to 34 inches—yellowish brown and dark yellowish brown silty clay loam

*Lower part of subsoil:*

34 to 60 inches—yellowish brown and pale yellow, calcareous silt loam

**Reference Profile****Calcic Pachic Haploxerolls***Surface layer:*

0 to 24 inches—very dark grayish brown and brown silt loam

*Upper part of subsoil:*

24 to 36 inches—pale brown silt loam

*Middle part of subsoil:*

36 to 42 inches—brown fine sandy loam

*Lower part of subsoil:*

42 to 60 inches—yellowish brown and light yellowish brown, calcareous fine sandy loam

**Soil Properties and Qualities**

*Depth class:* Achimin—very deep (more than 60 inches); Calcic Pachic Haploxerolls—very deep (more than 60 inches) or deep (40 to 60 inches to bedrock)

*Drainage class:* Achimin—well drained; Calcic Pachic Haploxerolls—moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in February through July (see “Water Features” table)

*Salinity:* Calcic Pachic Haploxerolls—very slightly saline between depths of 42 and 60 inches

**Contrasting Inclusions**

- Soils that are 20 to 40 inches deep to basalt
- Soils that have a bouldery surface
- Soils that have a hardpan at a depth of 20 to 40 inches
- Emdent soils
- Colockum soils
- Conconully soils
- Rock outcrop

**Major Uses**

Livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Livestock grazing**

- The Achimin soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The Calcic Pachic Haploxerolls have a high water table at certain times of the year that limits use of the soils.
- The Calcic Pachic Haploxerolls are too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

**Irrigated cropland**

- If this unit is used for irrigated crops, it is limited by steepness of slope and water erosion and by wetness of the Calcic Pachic Haploxerolls.

**3—Aeneas fine sandy loam, 0 to 5 percent slopes****Composition**

*Aeneas soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

**Setting**

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 0 to 5 percent

*Elevation:* 800 to 1,900 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

**Typical Profile***Surface layer:*

0 to 10 inches—grayish brown fine sandy loam

*Subsoil:*

10 to 27 inches—pale brown fine sandy loam

*Substratum:*

27 to 60 inches—light brownish gray and multicolored sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight;  
woodland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Ellisforde soils
- Cashmere and Farrell soils
- Cashmont soils
- Pogue soils
- Skaha soils
- Strat soils

### Major Uses

Livestock grazing, irrigated orchards, irrigated cropland, irrigated hay and pasture, nonirrigated cropland, wildlife habitat, recreation, watershed, and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion.

## 4—Aeneas fine sandy loam, 5 to 10 percent slopes

### Composition

*Aeneas soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Glacial outwash with loess in the upper part  
*Slope range:* 5 to 10 percent  
*Elevation:* 800 to 1,900 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
0 to 10 inches—grayish brown fine sandy loam

*Subsoil:*  
10 to 27 inches—pale brown fine sandy loam

*Substratum:*  
27 to 60 inches—light brownish gray and multicolored sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Ellisforde soils
- Quincy soils
- Cashmere and Farrell soils
- Skaha soils
- Pogue soils
- Cashmont soils
- Strat soils

### Major Uses

Livestock grazing; nonirrigated cropland; irrigated cropland, orchards, and hay and pasture; recreation; watershed; wildlife habitat; and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

## 5—Ahtanum silt loam, 0 to 3 percent slopes

### Composition

*Ahtanum soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Flood plains and depressional areas, including backswamps of streams

*Parent material:* Alluvium derived from volcanic ash and loess

*Slope range:* 0 to 3 percent

*Elevation:* 1,100 to 2,800 feet

*Average annual precipitation:* 10 to 14 inches

*Average annual air temperature:* 47 to 51 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown, calcareous silt loam

*Upper part of subsoil:*

12 to 24 inches—light brownish gray, calcareous silt loam

24 to 25 inches—light brownish gray hardpan

*Lower part of subsoil:*

25 to 60 inches—light gray and gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to a hardpan)

*Drainage class:* Somewhat poorly drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Very slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Moderate

*Water table:* Present in November through August (see “Water Features” table)

*Salinity:* Moderate from the surface to a depth of 60 inches

### Contrasting Inclusions

- Poween soils
- Gooseflats soils
- Nespelem soils

### Major Uses

Livestock grazing and wildlife habitat

### Use and Management

#### Livestock grazing

- The soil is affected by salt. If the range is in poor condition, salts concentrate on the bare surface as a result of evaporation.
- Reseeding is very difficult. Only salt-tolerant species should be used.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by rooting depth, wetness, and excess salts.

## 6—Aits silt loam, dry, 5 to 20 percent slopes

### Composition

*Aits soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Toeslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 4 inches—yellowish brown silt loam

*Upper part of subsoil:*

4 to 13 inches—light yellowish brown silt loam

*Lower part of subsoil:*

13 to 27 inches—pale brown gravelly loam

*Substratum:*

27 to 60 inches—yellowish brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Kiehl soils

- Newbell soils
- Republic soils
- Elbowlake soils
- Koepke soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

*Management consideration:*

- Accumulated snow can bend or break small trees.

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 7—Aits silt loam, dry, 20 to 40 percent slopes

### Composition

*Aits soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 4 inches—yellowish brown silt loam

*Upper part of subsoil:*

4 to 13 inches—light yellowish brown silt loam

*Lower part of subsoil:*

13 to 27 inches—pale brown gravelly loam

*Substratum:*

27 to 60 inches—yellowish brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Very rapid or rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Kiehl soils
- Newbell soils
- Republic soils
- Elbowlake soils
- Koepke soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

## 8—Aits silt loam, sandy substratum, 0 to 8 percent slopes

### Composition

*Aits soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

## Setting

*Position on landscape:* Stream terraces and valley bottoms

*Parent material:* Alluvium derived from glacial till with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 0 to 8 percent

*Elevation:* 2,000 to 2,300 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

## Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 4 inches—brown silt loam

*Upper part of subsoil:*

4 to 12 inches—pale brown gravelly loam

*Lower part of subsoil:*

12 to 33 inches—very pale brown gravelly sandy loam

*Upper part of substratum:*

33 to 42 inches—very pale brown gravelly sandy loam

*Lower part of substratum:*

42 to 60 inches—light brownish gray very gravelly sand

## Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over moderately rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

## Contrasting Inclusions

- Kiehl soils
- Soils that are somewhat poorly drained or moderately well drained
- Parmenter soils

## Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch and western redcedar—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 9—Anders silt loam, 0 to 8 percent slopes

### Composition

*Anders soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Plateaus

*Parent material:* Loess

*Slope range:* 0 to 8 percent

*Elevation:* 1,900 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 14 inches—grayish brown and brown silt loam

*Subsoil:*

14 to 23 inches—brown gravelly silt loam

*Bedrock:*

23 to 27 inches—basalt

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Bakeoven soils
- Olical soils
- Broadax soils
- Soils that have bedrock at a depth of 10 to 20 inches

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by water erosion, steepness of slope, and rooting depth.

## 10—Andic Cryaquepts, 0 to 3 percent slopes

### Composition

*Andic Cryaquepts and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Depressional areas in moraines and mountains  
*Parent material:* Alluvium mixed with volcanic ash  
*Slope range:* 0 to 3 percent  
*Elevation:* 3,000 to 5,000 feet  
*Average annual precipitation:* 20 to 30 inches  
*Average annual air temperature:* 40 to 42 degrees F  
*Frost-free period:* 80 to 100 days

### Reference Profile

*Organic mat on surface:* 1 inch thick  
*Upper part of surface layer:*  
0 to 9 inches—grayish brown silt loam  
*Lower part of surface layer:*  
9 to 17 inches—gray fine sandy loam

### Subsoil:

17 to 22 inches—grayish brown, gleyed gravelly sandy loam

### Substratum:

22 to 60 inches—stratified gray loamy sand over multicolored extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Poorly drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—none or slight

*Water table:* Present in December through August (see “Water Features” table)

### Contrasting Inclusions

- Borosaprists
- Cryofluvents
- Manley and Resner soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, wildlife habitat, and wetland wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Engelmann spruce, subalpine fir, and lodgepole pine—readily; Douglas-fir and western larch—periodically  
*Limitations for planting:* None

## 11—Annum silt loam, 8 to 25 percent slopes

### Composition

*Annum soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Broad summits and shoulders of hills

*Parent material:* Residuum derived from granitic rock with a mantle of loess

*Slope range:* 8 to 25 percent

*Elevation:* 2,400 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 12 inches—dark grayish brown and grayish brown silt loam

*Upper part of subsoil:*

12 to 24 inches—brown and yellowish brown silt loam

*Lower part of subsoil:*

24 to 46 inches—strong brown clay loam

*Substratum:*

46 to 53 inches—light yellowish brown, calcareous gravelly sandy loam

*Bedrock:*

53 to 63 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Morical soils
- Ginnis soils
- Broadax soils

### Major Uses

Livestock grazing, nonirrigated cropland, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 12—Annum silt loam, 8 to 25 percent north slopes

### Composition

*Annum soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* North- and east-facing shoulders of hills

*Parent material:* Residuum derived from granitic rock with a mantle of loess

*Slope range:* 8 to 25 percent

*Elevation:* 2,400 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 15 inches—grayish brown silt loam

*Upper part of subsoil:*

15 to 24 inches—light yellowish brown silt loam

*Lower part of subsoil:*

24 to 45 inches—light yellowish brown sandy clay loam

*Substratum:*

45 to 54 inches—pale brown, calcareous gravelly loam

*Bedrock:*

54 to 64 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Morical soils
- Ginnis soils
- Broadax soils

### Major Uses

Livestock grazing, nonirrigated cropland, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

### 13—Annum silt loams complex, 8 to 25 percent slopes

#### Composition

*Annum, north slopes, soil and similar soils:* 45 percent  
*Annum, south slopes, soil and similar soils:* 40 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Annum, north slopes—north- and east-facing shoulders of hills; Annum, south slopes—summits and south- and west-facing shoulders of hills  
*Parent material:* Residuum derived from granitic rock with a mantle of loess  
*Slope range:* 8 to 25 percent  
*Elevation:* 2,400 to 3,200 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

#### Typical Profile

##### Annum, north slopes

*Surface layer:*

0 to 15 inches—grayish brown silt loam

*Upper part of subsoil:*

15 to 24 inches—light yellowish brown silt loam

*Lower part of subsoil:*

24 to 45 inches—light yellowish brown sandy clay loam

*Substratum:*

45 to 54 inches—pale brown, calcareous gravelly loam

*Bedrock:*

54 to 64 inches—weathered granitic rock

##### Annum, south slopes

*Surface layer:*

0 to 12 inches—dark grayish brown and grayish brown silt loam

*Upper part of subsoil:*

12 to 24 inches—brown and yellowish brown silt loam

*Lower part of subsoil:*

24 to 46 inches—strong brown clay loam

*Substratum:*

46 to 53 inches—light yellowish brown, calcareous gravelly sandy loam

*Bedrock:*

53 to 63 inches—weathered granitic rock

#### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

#### Contrasting Inclusions

- Morical soils
- Ginnis soils
- Broadax soils

#### Major Uses

Livestock grazing, nonirrigated cropland, recreation, watershed, and wildlife habitat

#### Use and Management

##### Livestock grazing

- The soils in this unit are too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soils in this unit are too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

##### Irrigated cropland

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope and water erosion.

## 14—Apex silt loam, 5 to 20 percent slopes

### Composition

*Apex soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 46 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 3 inches—dark brown silt loam

*Upper part of subsoil:*

3 to 13 inches—brown and yellowish brown silt loam

*Lower part of subsoil:*

13 to 30 inches—pale brown gravelly loam

*Substratum:*

30 to 60 inches—brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Nevine and Newbell soils
- Goddard and Kiehl soils
- Inkler soils
- Republic soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 15—Apex silt loam, 20 to 40 percent slopes

### Composition

*Apex soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 46 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 3 inches—dark brown silt loam

*Upper part of subsoil:*

3 to 13 inches—brown and yellowish brown silt loam

*Lower part of subsoil:*

13 to 30 inches—pale brown gravelly loam

*Substratum:*

30 to 60 inches—brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow  
*Available water capacity:* High  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Nevine and Newbell soils
- Goddard and Kiehl soils
- Inkler soils
- Republic soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

## 16—Apex silt loam, 40 to 65 percent slopes

### Composition

*Apex soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 40 to 65 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 46 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 3 inches—dark brown silt loam

*Upper part of subsoil:*  
3 to 13 inches—yellowish brown silt loam

*Lower part of subsoil:*  
13 to 30 inches—pale brown gravelly loam

*Substratum:*  
30 to 60 inches—brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Nevine and Newbell soils
- Goddard and Kiehl soils
- Inkler soils
- Republic soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitation for planting:* Steepness of slope

## 17—Apex loam, dry, 5 to 20 percent slopes

### Composition

*Apex soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 3,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 46 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—grayish brown loam

*Upper part of subsoil:*

3 to 12 inches—brown loam

*Lower part of subsoil:*

12 to 27 inches—very pale brown gravelly sandy loam

*Substratum:*

27 to 60 inches—brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Mineral soils
- Stapaloop soils
- Nevine soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 18—Apex loam, dry, 20 to 40 percent slopes

### Composition

*Apex soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains

*Parent material:* Glacial till with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 3,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 46 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—grayish brown loam

*Upper part of subsoil:*

3 to 12 inches—brown loam

*Lower part of subsoil:*

12 to 27 inches—very pale brown gravelly sandy loam

*Substratum:*

27 to 60 inches—brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)  
*Drainage class:* Well drained  
*Permeability:* Moderate over slow  
*Available water capacity:* High  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Mineral soils
- Stapaloop soils
- Nevine soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily  
*Limitations for planting:* None

## 19—Apex loam, dry, 40 to 65 percent slopes

### Composition

*Apex soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains  
*Parent material:* Glacial till with a mantle of volcanic ash  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,000 to 3,800 feet  
*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 46 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 3 inches—grayish brown loam  
*Upper part of subsoil:*  
 3 to 12 inches—brown loam  
*Lower part of subsoil:*  
 12 to 27 inches—very pale brown gravelly sandy loam  
*Substratum:*  
 27 to 60 inches—brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)  
*Drainage class:* Well drained  
*Permeability:* Moderate over slow  
*Available water capacity:* High  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Mineral soils
- Stapaloop soils
- Donavan and Republic soils
- Inkler and Nevine soils
- Merkel soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily  
*Limitation for planting:* Steepness of slope

## 20—Aquic Xerofluvents, cool, 0 to 3 percent slopes

### Composition

*Aquic Xerofluvents and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Flood plains and low stream terraces

*Parent material:* Alluvium underlain by reworked glacial outwash in some areas

*Slope range:* 0 to 3 percent

*Elevation:* 1,600 to 4,000 feet

*Average annual precipitation:* 18 to 23 inches

*Average annual air temperature:* 43 to 46 degrees F

*Frost-free period:* 90 to 120 days

### Reference Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—grayish brown silt loam

*Upper part of substratum:*

3 to 15 inches—yellowish brown fine sandy loam

*Lower part of substratum:*

15 to 60 inches—stratified extremely gravelly coarse sand to silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained and somewhat poorly drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in January through July (see “Water Features” table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in February through May

### Contrasting Inclusions

- Sanpoil soils

### Major Uses

Timber production, livestock grazing, wildlife habitat,

wetland wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Western larch and Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this unit is used for irrigated crops, it is limited by wetness.

## 21—Aquic Xerofluvents, moist, 0 to 3 percent slopes

### Composition

*Aquic Xerofluvents and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Flood plains and stream terraces

*Parent material:* Alluvium underlain by glacial outwash in some areas

*Slope range:* 0 to 3 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 43 to 46 degrees F

*Frost-free period:* 90 to 120 days

### Reference Profile

*Surface layer:*

0 to 5 inches—grayish brown sandy loam

*Substratum:*

5 to 15 inches—grayish brown very gravelly coarse sand

15 to 25 inches—light gray sand

25 to 35 inches—light gray silt loam

35 to 40 inches—light brownish gray very gravelly loamy sand

40 to 52 inches—light brownish gray gravelly loamy sand

52 to 60 inches—brown very gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Moderately well drained and somewhat poorly drained  
*Permeability:* Moderately rapid over rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight; forestland—slight  
*Hazard of wind erosion (bare surface):* Severe  
*Water table:* Present in January through July (see “Water Features” table)  
*Frequency, duration, and period of flooding:* Occasional, brief periods in February through May

### Contrasting Inclusions

- Sanpoil soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, wildlife habitat, and wetland wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Western redcedar, Douglas-fir, and grand fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this unit is used for irrigated crops, it is limited by wetness.

## 22—Aquic Xerofluvents, warm, 0 to 3 percent slopes

### Composition

*Aquic Xerofluvents and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Flood plains and low stream terraces

*Parent material:* Alluvium underlain by reworked glacial outwash in some areas  
*Slope range:* 0 to 3 percent  
*Elevation:* 1,300 to 2,500 feet  
*Average annual precipitation:* 14 to 18 inches  
*Average annual air temperature:* 46 to 49 degrees F  
*Frost-free period:* 100 to 130 days

### Reference Profile

*Organic mat on surface:* 1.5 inches thick  
*Surface layer:* 0 to 15 inches—brown fine sandy loam  
*Upper part of substratum:* 15 to 43 inches—yellowish brown fine sandy loam  
*Lower part of substratum:* 43 to 60 inches—stratified extremely gravelly coarse sand to silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Moderately well drained and somewhat poorly drained  
*Permeability:* Moderately rapid over rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very slow  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight; forestland—slight  
*Hazard of wind erosion (bare surface):* Severe  
*Water table:* Present in January through July (see “Water Features” table)  
*Frequency, duration, and period of flooding:* Occasional, brief periods in February through May

### Contrasting Inclusions

- Soils that are frequently flooded
- Soils that are poorly drained or very poorly drained
- Riverwash

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this unit is used for irrigated crops, it is limited by wetness.

**23—Badge very stony silt loam, 25 to 65 percent slopes****Composition**

*Badge soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Footslopes and backslopes of plateau escarpments

*Parent material:* Colluvium derived from basalt mixed with loess

*Slope range:* 25 to 65 percent

*Elevation:* 1,500 to 2,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 51 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Stones cover 3 to 15 percent

**Typical Profile**

*Surface layer:*

0 to 10 inches—dark grayish brown very stony silt loam

*Upper part of subsoil:*

10 to 23 inches—yellowish brown very gravelly clay loam

*Lower part of subsoil:*

23 to 38 inches—brown very stony clay loam

*Substratum:*

38 to 60 inches—light yellowish brown extremely cobbly silt loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Bakeoven soils
- Soils that have basalt at a depth of 10 to 40 inches
- Timentwa soils
- Rubble land
- Rock outcrop

**Major Uses**

Livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Livestock grazing**

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices.
- Livestock tend to concentrate in the less steep areas of the unit.

**24—Badge-Rubble land complex, 25 to 65 percent slopes****Composition**

*Badge soil and similar soils:* 65 percent

*Rubble land:* 20 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Footslopes and backslopes of plateau escarpments

*Parent material:* Colluvium derived from basalt mixed with loess

*Slope range:* 25 to 65 percent

*Elevation:* 1,600 to 2,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 51 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Badge—stones cover 3 to 15 percent

**Badge Soil****Typical Profile**

*Surface layer:*

0 to 10 inches—dark grayish brown very stony silt loam

*Upper part of subsoil:*

10 to 23 inches—yellowish brown very gravelly clay loam

*Lower part of subsoil:*

23 to 38 inches—brown very stony clay loam

*Substratum:*

38 to 60 inches—light yellowish brown extremely cobbly silt loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

**Rubble Land**

*Description of areas:* Unconsolidated basalt gravel, cobbles, stones, and boulders

**Contrasting Inclusions**

- Bakeoven soils
- Timentwa soils
- Soils that have basalt at a depth of 20 to 40 inches
- Rock outcrop

**Major Uses**

Livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Livestock grazing**

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices.
- Livestock tend to concentrate in the less steep areas of the unit.

**25—Badland**

This map unit consists of moderately steep to very steep, barren terrace escarpments dissected by many intermittent drainageways. Slopes range from 25 to 100 percent or more. The geologic material consists of highly eroded glacial lake sediment and loamy glaciofluvial material. Runoff is very rapid, and the hazard of water erosion is very severe. This unit supports little, if any, vegetation because of the rate of erosion. Included in this unit are small areas that support a very sparse cover of big sagebrush, bluebunch wheatgrass, and forbs.

**26—Bakeoven very cobbly silt loam, 2 to 25 percent slopes****Composition**

*Bakeoven soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Plateaus

*Parent material:* Residuum and colluvium derived from basalt mixed with loess

*Slope range:* 2 to 25 percent

*Elevation:* 1,800 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Typical Profile**

*Surface layer:*

0 to 3 inches—brown very cobbly silt loam

*Subsoil:*

3 to 7 inches—brown very cobbly silt loam

*Bedrock:*

7 to 11 inches—basalt

**Soil Properties and Qualities**

*Depth class:* Very shallow (4 to 10 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 4 to 10 inches

*Runoff:* Slow

*Hazard of water erosion:* Rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Soils that have bedrock at a depth of 10 to 20 inches
- Anders soils
- Olical soils
- Timentwa soils
- Rock outcrop

**Major Uses**

Livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Livestock grazing**

- The soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the

frostline, ponds are not feasible, and seeding and brush management are not practical.

## **27—Bakeoven-Olical complex, 0 to 30 percent slopes**

### **Composition**

*Bakeoven soil and similar soils:* 60 percent

*Olical soil and similar soils:* 25 percent

*Contrasting inclusions:* 15 percent

### **Setting**

*Position on landscape:* Bakeoven—basalt plateaus;

Olical—mounds on basalt plateaus that have patterned ground topography

*Parent material:* Bakeoven—residuum and colluvium derived from basalt mixed with loess; Olical—loess mixed with material weathered from basalt

*Slope range:* 0 to 30 percent

*Elevation:* 2,300 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### **Typical Profile**

#### **Bakeoven**

*Surface layer:*

0 to 3 inches—brown very cobbly silt loam

*Subsoil:*

3 to 7 inches—brown very cobbly silt loam

*Bedrock:*

7 to 11 inches—basalt

#### **Olical**

*Surface layer:*

0 to 15 inches—brown silt loam

*Upper part of subsoil:*

15 to 23 inches—light yellowish brown silt loam

*Middle part of subsoil:*

23 to 38 inches—light yellowish brown, calcareous gravelly silt loam

*Lower part of subsoil:*

38 to 51 inches—light yellowish brown, calcareous gravelly loam

*Bedrock:*

51 to 55 inches—basalt

### **Soil Properties and Qualities**

*Depth class:* Bakeoven—very shallow (4 to 10 inches

to bedrock); Olical—deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Bakeoven—very low;

Olical—high

*Potential rooting depth:* Bakeoven—4 to 10 inches;

Olical—40 to 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion on rangeland:* Bakeoven—slight; Olical—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### **Contrasting Inclusions**

- Rock outcrop
- Soils that have bedrock at a depth of 10 to 20 inches
- Anders soils that have bedrock at a depth of 20 to 40 inches

### **Major Uses**

Livestock grazing, wildlife habitat, watershed, and recreation

### **Use and Management**

#### **Livestock grazing**

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The Bakeoven soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.
- The Olical soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- The Olical soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## **28—Bakeoven-Timentwa-Rock outcrop complex, 0 to 30 percent slopes**

### **Composition**

*Bakeoven soil and similar soils:* 40 percent

*Timentwa soil and similar soils:* 30 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

### **Setting**

*Position on landscape:* Bakeoven—glacially scoured areas on basalt plateaus; Timentwa—glacial till plains and moraines on basalt plateaus

*Parent material:* Bakeoven—residuum and colluvium

derived from basalt mixed with loess; Timentwa—glacial till derived mainly from basalt with a mantle of loess and volcanic ash

*Slope range:* Bakeoven—0 to 30 percent; Timentwa—0 to 25 percent

*Elevation:* 2,200 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 140 days

### **Bakeoven Soil**

#### **Typical profile**

*Surface layer:*

0 to 3 inches—brown very cobbly silt loam

*Subsoil:*

3 to 7 inches—brown very cobbly silt loam

*Bedrock:*

7 to 11 inches—basalt

#### **Soil properties and qualities**

*Depth class:* Very shallow (4 to 10 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 4 to 10 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### **Timentwa Soil**

#### **Typical profile**

*Surface layer:*

0 to 18 inches—dark grayish brown and grayish brown loam

*Upper part of subsoil:*

18 to 28 inches—brown gravelly loam

*Middle part of subsoil:*

28 to 41 inches—pale brown gravelly loam

*Lower part of subsoil:*

41 to 56 inches—light brownish gray and pale brown, calcareous cobbly sandy loam

*Substratum:*

56 to 60 inches—light brownish gray hardpan

#### **Soil properties and qualities**

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### **Rock Outcrop**

*Kind of rock:* Basalt

### **Contrasting Inclusions**

- Soils that are similar to the Timentwa soil but are moderately well drained
- Soils that have bedrock at a depth of 10 to 40 inches
- Soils that have a very gravelly subsoil
- Emdent soils
- Soils that have a hardpan at a depth of 20 to 40 inches
- Soils that have a bouldery or very bouldery surface

### **Major Uses**

Livestock grazing, recreation, watershed, and wildlife habitat

### **Use and Management**

#### **Livestock grazing**

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The Bakeoven soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

## **29—Baldknob-Thout, dry-Rock outcrop complex, 5 to 20 percent slopes**

### **Composition**

*Baldknob soil and similar soils:* 40 percent

*Thout soil and similar soils:* 25 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

### **Setting**

*Position on landscape:* Shoulders and ridges of mountains

*Parent material:* Residuum and colluvium derived from rhyodacite and quartz latite with some glacial till and a component of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 2,200 to 4,200 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 46 degrees F  
*Frost-free period:* 90 to 120 days  
*Rock fragments on surface:* Baldknob—stones cover  
 3 to 15 percent

### **Baldknob Soil**

#### **Typical profile**

*Surface layer:*  
 0 to 4 inches—brown very stony loam

*Upper part of subsoil:*  
 4 to 9 inches—brown very gravelly loam

*Lower part of subsoil:*  
 9 to 14 inches—yellowish brown extremely gravelly  
 loam

*Bedrock:*  
 14 to 18 inches—rhyodacite

#### **Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Slight or moderate

*Hazard of wind erosion (bare surface):* Slight

*Snowpack:* More than 1 foot—December through  
 March; more than 3 feet—none

### **Thout Soil**

#### **Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
 0 to 4 inches—grayish brown gravelly loam

*Subsoil:*  
 4 to 26 inches—pale brown very gravelly loam

*Bedrock:*  
 26 to 30 inches—rhyodacite

#### **Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to  
 bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Slight or moderate

*Hazard of wind erosion (bare surface):* Slight

*Snowpack:* More than 1 foot—December through  
 March; more than 3 feet—none

### **Rock Outcrop**

*Kind of rock:* Rhyodacite and quartz latite

#### **Contrasting Inclusions**

- Inkler and Nevine soils
- Soils that have bedrock at a depth of 40 to 60 inches
- Lithic Xerochrepts
- Johntom and Northstar soils

#### **Major Uses**

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### **Use and Management**

##### **Livestock grazing**

- The soils in this unit are too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### **30—Baldknob-Thout, dry-Rock outcrop complex, 20 to 65 percent slopes**

#### **Composition**

*Baldknob soil and similar soils:* 40 percent

*Thout soil and similar soils:* 25 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Backslopes and shoulders of hills and mountains

*Parent material:* Residuum and colluvium derived from rhyodacite and quartz latite with some glacial till and a component of loess and volcanic ash

*Slope range:* 20 to 65 percent

*Elevation:* 2,200 to 4,200 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 46 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Baldknob—stones cover  
 3 to 15 percent

### **Baldknob Soil**

#### **Typical profile**

*Surface layer:*  
 0 to 4 inches—brown very stony loam

*Upper part of subsoil:*

4 to 9 inches—brown very gravelly loam

*Lower part of subsoil:*

9 to 14 inches—yellowish brown extremely gravelly loam

*Bedrock:*

14 to 18 inches—rhyodacite

**Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium to very rapid

*Hazard of water erosion:* Moderate to very severe

*Hazard of wind erosion (bare surface):* Slight

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

**Thout Soil****Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown gravelly loam

*Subsoil:*

4 to 26 inches—pale brown very gravelly loam

*Bedrock:*

26 to 30 inches—rhyodacite

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium to very rapid

*Hazard of water erosion:* Moderate to very severe

*Hazard of wind erosion (bare surface):* Slight

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

**Rock Outcrop**

*Kind of rock:* Rhyodacite and quartz latite

**Contrasting Inclusions**

- Inkler and Nevine soils
- Soils that have bedrock at a depth of 40 to 60 inches

- Lithic Xerochrepts
- Johntom and Northstar soils

**Major Uses**

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Livestock grazing**

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soils in this unit are too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

**31—Barnellcreek silt loam, 5 to 15 percent slopes****Composition**

*Barnellcreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Footslopes and toeslopes of mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 5 to 15 percent

*Elevation:* 3,200 to 4,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 26 inches—grayish brown and brown silt loam

*Subsoil:*

26 to 42 inches—yellowish brown gravelly sandy loam

*Substratum:*

42 to 60 inches—light gray dense glacial till that crushes to very gravelly sandy loam

**Soil Properties and Qualities**

*Depth class:* Deep (40 to 60 inches to dense glacial till)

*Drainage class:* Moderately well drained

*Permeability:* Moderate over slow

*Available water capacity:* High  
*Effective rooting depth:* 40 to 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Present in January through May (see “Water Features” table)

### Contrasting Inclusions

- Koepke soils
- Republic soils
- Louploup soils
- Nevine soils
- Ret soils

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine, western larch, and Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 32—Bearspring loam, 20 to 40 percent slopes

### Composition

*Bearspring soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains  
*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash  
*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,500 feet  
*Average annual precipitation:* 15 to 20 inches  
*Average annual air temperature:* 43 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
 0 to 12 inches—grayish brown and brown loam

*Upper part of subsoil:*  
 12 to 22 inches—pale brown gravelly loam

*Lower part of subsoil:*  
 22 to 35 inches—pale brown very gravelly sandy loam

*Upper part of substratum:*  
 35 to 50 inches—light yellowish brown very cobbly sandy loam

*Lower part of substratum:*  
 50 to 60 inches—light yellowish brown very gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Dinkelman soils
- Mineral soils
- Ohscow and Canteen soils
- Soils that have a very stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine—periodically

*Limitations for planting:* None

**33—Bearspring cobbly loam, 40 to 65 percent slopes****Composition**

*Bearspring soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 40 to 65 percent

*Elevation:* 1,900 to 4,600 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 43 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 6 inches—grayish brown cobbly loam

*Lower part of surface layer:*

6 to 11 inches—brown gravelly loam

*Upper part of subsoil:*

11 to 19 inches—pale brown gravelly loam

*Lower part of subsoil:*

19 to 27 inches—pale brown very gravelly sandy loam

*Upper part of substratum:*

27 to 50 inches—pale brown very cobbly sandy loam

*Lower part of substratum:*

50 to 60 inches—light yellowish brown extremely gravelly coarse sandy loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

**Contrasting Inclusions**

- Dinkelman soils
- Mineral soils
- Ohscow and Canteen soils
- Soils that have a very stony surface

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

**34—Bernhill loam, dry, 0 to 5 percent slopes****Composition**

*Bernhill soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Ground moraines and till plains

*Parent material:* Glacial till, including glacial lake sediment mixed with volcanic ash and loess

*Slope range:* 0 to 5 percent

*Elevation:* 1,500 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown loam

*Upper part of subsoil:*

4 to 14 inches—pale brown loam

*Subsurface layer:*

14 to 27 inches—light gray loam

*Lower part of subsoil:*

27 to 36 inches—light yellowish brown clay loam

*Substratum:*

36 to 60 inches—light gray gravelly sandy loam

**Soil Properties and Qualities***Depth class:* Very deep (more than 60 inches)*Drainage class:* Well drained*Permeability:* Moderate*Available water capacity:* Very high*Potential rooting depth:* More than 60 inches*Runoff:* Slow*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none*Hazard of water erosion:* Cropland—slight;  
forestland—slight*Hazard of wind erosion (bare surface):* Slight**Contrasting Inclusions**

- Glenrose and Hunters soils
- Donavan soils
- Cedonia soils

**Major Uses**

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting***Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable**Silviculture***Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically*Limitations for planting:* None**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by water erosion.

**35—Bernhill loam, dry, 5 to 20 percent slopes****Composition***Bernhill soil and similar soils:* 80 percent*Contrasting inclusions:* 20 percent**Setting***Position on landscape:* Till plains, ground moraines, and toeslopes of hills*Parent material:* Glacial till derived from mixed sources, including glacial lake sediment with volcanic ash and loess*Slope range:* 5 to 20 percent*Elevation:* 1,500 to 3,000 feet*Average annual precipitation:* 15 to 18 inches*Average annual air temperature:* 45 to 48 degrees F*Frost-free period:* 100 to 130 days**Typical Profile***Organic mat on surface:* 1 inch thick*Surface layer:*

0 to 4 inches—grayish brown loam

*Upper part of subsoil:*

4 to 14 inches—pale brown loam

*Subsurface layer:*

14 to 27 inches—light gray loam

*Lower part of subsoil:*

27 to 36 inches—light yellowish brown clay loam

*Substratum:*

36 to 60 inches—light gray gravelly sandy loam

**Soil Properties and Qualities***Depth class:* Very deep (more than 60 inches)*Drainage class:* Well drained*Permeability:* Moderate*Available water capacity:* Very high*Potential rooting depth:* More than 60 inches*Runoff:* Medium or rapid*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate*Hazard of wind erosion (bare surface):* Slight**Contrasting Inclusions**

- Hudnut soils
- Donavan soils
- Neuske soils
- Apex soils
- Republic soils

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 36—Beverly gravelly loamy sand, 2 to 25 percent slopes

### Composition

*Beverly soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Alluvial fans

*Parent material:* Recent alluvium

*Slope range:* 2 to 25 percent

*Elevation:* 800 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 6 inches—brown gravelly loamy sand

*Upper part of substratum:*

6 to 17 inches—pale brown gravelly loamy sand

*Middle part of substratum:*

17 to 31 inches—pale brown very gravelly sand

*Lower part of substratum:*

31 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

*Frequency of flooding:* Rare

### Contrasting Inclusions

- Quincy soils
- Pogue soils
- Aeneas soils
- Strat soils
- Cashmere soils
- Cashmont soils

### Major Uses

Livestock grazing, irrigated hay and pasture, irrigated orchards, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration.

## 37—Bisbee loamy fine sand, warm, 0 to 20 percent slopes

### Composition

*Bisbee soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Sandy glacial outwash locally reworked by wind

*Slope range:* 0 to 20 percent

*Elevation:* 1,400 to 3,400 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown loamy fine sand

*Upper part of substratum:*

5 to 40 inches—pale brown and very pale brown loamy fine sand

*Lower part of substratum:*  
40 to 60 inches—light gray loamy fine sand

### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight to severe;  
forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Severe

### **Contrasting Inclusions**

- Sacheen soils
- Hudnut soils
- Scala soils
- Karamin soils
- Springdale soils

### **Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### **Use and Management**

#### **Timber Production**

#### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### **Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

#### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and fast infiltration.

## **38—Bisbee loamy fine sand, warm, 20 to 40 percent slopes**

### **Composition**

*Bisbee soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### **Setting**

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Sandy glacial outwash locally reworked by wind

*Slope range:* 20 to 40 percent

*Elevation:* 1,400 to 3,400 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### **Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown loamy fine sand

*Upper part of substratum:*

5 to 40 inches—pale brown and very pale brown loamy fine sand

*Lower part of substratum:*

40 to 60 inches—light gray loamy fine sand

### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Severe

### **Contrasting Inclusions**

- Sacheen soils
- Hudnut soils
- Scala soils
- Karamin soils
- Springdale soils that have a very gravelly sand substratum

### **Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### **Use and Management**

#### **Timber Production**

#### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### **Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

### 39—Boesel fine sandy loam, 0 to 3 percent slopes

#### Composition

*Boesel soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Stream terraces and flood plains

*Parent material:* Alluvium

*Slope range:* 0 to 3 percent

*Elevation:* 1,600 to 3,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Upper part of surface layer:*

0 to 13 inches—dark brown fine sandy loam

*Lower part of surface layer:*

13 to 20 inches—brown fine sandy loam

*Upper part of substratum:*

20 to 29 inches—brown gravelly loamy sand

*Lower part of substratum:*

29 to 60 inches—brown very gravelly loamy sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight; forestland—none or slight

*Hazard of wind erosion (bare surface):* Moderate

*Water table:* Present in February through May (see “Water Features” table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in February through May

#### Contrasting Inclusions

- Cubcreek soils
- Soils that are very gravelly sand below a depth of about 14 inches
- Aquic Xerofluvents and Ret soils

#### Major Uses

*Current uses:* Timber production, livestock grazing,

nonirrigated hay and pasture, watershed, wildlife habitat, and recreation

*Potential uses:* Nonirrigated cropland, irrigated cropland, and irrigated hay and pasture

#### Use and Management

##### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

##### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wind erosion and droughtiness.

### 40—Bong sandy loam, 0 to 30 percent slopes

#### Composition

*Bong soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash mixed with a minor component of loess

*Slope range:* 0 to 30 percent

*Elevation:* 1,500 to 3,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 8 inches—dark grayish brown sandy loam

*Upper part of subsoil:*

8 to 17 inches—yellowish brown sandy loam

*Lower part of subsoil:*

17 to 24 inches—light yellowish brown gravelly loamy coarse sand

*Substratum:*

24 to 60 inches—light yellowish brown sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight to severe;  
 forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Donavan soils
- Springdale soils
- Hudnut soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

• If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and wind erosion.

## 41—Bong sandy loam, 30 to 70 percent slopes

### Composition

*Bong soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash mixed with a minor component of loess  
*Slope range:* 30 to 70 percent

*Elevation:* 1,500 to 3,700 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 46 to 48 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 8 inches—dark grayish brown sandy loam  
*Upper part of subsoil:*  
 8 to 17 inches—yellowish brown sandy loam  
*Lower part of subsoil:*  
 17 to 24 inches—light yellowish brown gravelly loamy coarse sand  
*Substratum:*  
 24 to 60 inches—light yellowish brown sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Donavan soils
- Springdale soils
- Hudnut soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically  
*Limitation for planting:* Steepness of slope

## 42—Bong sandy loam, cool, 0 to 8 percent slopes

### Composition

*Bong soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with a minor component of loess

*Slope range:* 0 to 8 percent

*Elevation:* 1,500 to 3,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 46 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 13 inches—grayish brown and brown sandy loam

*Subsoil:*

13 to 21 inches—pale brown sandy loam

*Upper part of substratum:*

21 to 33 inches—light yellowish brown gravelly loamy coarse sand

*Lower part of substratum:*

33 to 60 inches—light yellowish brown sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Garrison soils
- Bisbee soils
- Springdale soils
- Hudnut soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and wind erosion.

## 43—Borgeau loam, 8 to 30 percent slopes

### Composition

*Borgeau soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of foothills

*Parent material:* Glacial till and colluvium derived from metamorphic rock mixed with a component of loess and volcanic ash

*Slope range:* 8 to 30 percent

*Elevation:* 1,700 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 9 inches—very dark grayish brown loam

*Subsoil:*

9 to 17 inches—brown very gravelly loam

*Upper part of substratum:*

17 to 34 inches—light yellowish brown very gravelly loam

*Lower part of substratum:*

34 to 60 inches—light yellowish brown extremely gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Raisio soils
- Rufus soils
- Stevens soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 44—Borgeau loam, 30 to 65 percent slopes

### Composition

*Borgeau soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills  
*Parent material:* Glacial till and colluvium derived from metamorphic rock mixed with a component of loess and volcanic ash  
*Slope range:* 30 to 65 percent  
*Elevation:* 1,700 to 3,000 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 48 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 9 inches—very dark grayish brown loam  
*Subsoil:*  
 9 to 17 inches—brown very gravelly loam

*Upper part of substratum:*  
 17 to 34 inches—light yellowish brown very gravelly loam

*Lower part of substratum:*  
 34 to 60 inches—light yellowish brown extremely gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Hazard of water erosion:* Rangeland—severe or very severe

### Contrasting Inclusions

- Raisio soils
- Stevens soils that are thick and have fewer rock fragments in the substratum
- Rock outcrop

### Major Uses

*Current uses:* Livestock grazing, recreation, watershed, and wildlife habitat  
*Potential use:* Timber production

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

## 45—Borgeau-Rock outcrop complex, 30 to 65 percent slopes

### Composition

*Borgeau soil and similar soils:* 55 percent  
*Rock outcrop:* 25 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and shoulders of hills  
*Parent material:* Glacial till and colluvium derived from metamorphic rock mixed with a component of loess and volcanic ash  
*Slope range:* 30 to 65 percent

*Elevation:* 1,700 to 3,000 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 48 degrees F  
*Frost-free period:* 100 to 130 days

### **Borgeau Soil**

#### **Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 9 inches—very dark grayish brown loam

*Subsoil:*  
9 to 17 inches—dark brown very gravelly loam

*Upper part of substratum:*  
17 to 34 inches—light yellowish brown very gravelly loam

*Lower part of substratum:*  
34 to 60 inches—light yellowish brown extremely gravelly loam

#### **Soil properties and qualities**

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Hazard of water erosion:* Rangeland—severe or very severe

#### **Rock Outcrop**

*Kind of rock:* Phyllite, schist, slate, and graywacke

#### **Contrasting Inclusions**

- Raisio soils
- Rufus soils
- Stevens soils

#### **Major Uses**

*Current uses:* Livestock grazing, recreation, watershed, and wildlife habitat  
*Potential use:* Timber production

#### **Use and Management**

##### **Livestock grazing**

• This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

## **46—Borosaprists, 0 to 2 percent slopes**

### **Composition**

*Borosaprists and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### **Setting**

*Position on landscape:* Lake basins, and depressions in till plains, ground moraines, and terraces

*Parent material:* Decomposed organic material over alluvium or glacial lake sediment

*Slope range:* 0 to 2 percent

*Elevation:* 2,800 to 5,000 feet

*Average annual precipitation:* 17 to 30 inches

*Average annual air temperature:* 41 to 44 degrees F

*Frost-free period:* 80 to 100 days

### **Reference Profile**

*Surface tier:*  
0 to 8 inches—grayish brown mucky peat

*Subsurface tier:*  
8 to 18 inches—very dark gray muck

*Surface layer:*  
18 to 34 inches—very dark brown silt loam

*Upper part of substratum:*  
34 to 44 inches—light brownish gray silt loam

*Lower part of substratum:*  
44 to 55 inches—light gray fine sandy loam

*Bottom tier:*  
55 to 60 inches—black muck

### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Very poorly drained  
*Permeability:* Moderate  
*Available water capacity:* Very high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Poned for long periods in February through May  
*Hazard of water erosion:* None  
*Water table:* Present in January through December (see “Water Features” table)

### **Contrasting Inclusions**

- Andic Cryaquepts and Sanpoil soils
- Aquic Xerofluvents, Cryofluvents, and Ret soils

### **Major Uses**

Wetland wildlife habitat (fig. 4) and watershed

Figure 4.—Area of Borosaprists, 0 to 2 percent slopes, that supports emergent wetland vegetation. Wells creek soils are on forested mountainside in background.

**47—Bossburg muck, 0 to 2 percent slopes**

**Composition**

*Bossburg soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

**Setting**

*Position on landscape:* Backswamps of flood plains, and depressions

*Parent material:* Alluvium derived from volcanic ash  
*Slope range:* 0 to 2 percent  
*Elevation:* 1,600 to 2,800 feet  
*Average annual precipitation:* 12 to 18 inches  
*Average annual air temperature:* 45 to 49 degrees F  
*Frost-free period:* 100 to 150 days

**Typical Profile**

*Upper part of surface layer:*  
 0 to 6 inches—dark gray muck

*Lower part of surface layer:*  
6 to 13 inches—gray silt loam

*Upper part of substratum:*  
13 to 29 inches—light gray and white silt loam

*Middle part of substratum:*  
29 to 45 inches—light gray fine sandy loam

*Lower part of substratum:*  
45 to 60 inches—white very fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Very poorly drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Pondered

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Cropland—none;  
forestland—none

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in January through December  
(see “Water Features” table)

*Frequency, duration, and period of flooding:* Frequent,  
long periods in February through May

### Contrasting Inclusions

- Soils that are calcareous in the surface layer
- Narcisse and Poween soils
- Emdent soils
- Soils that are sandy below a depth of about 25 inches

### Major Uses

Nonirrigated hay and pasture, wetland wildlife habitat,  
livestock grazing, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
tracked equipment—suitable during the short  
periods when the soil is dry; cable yarding—  
suitable

#### Silviculture

*Potential for natural regeneration:* Quaking aspen,  
paper birch, and thinleaf alder—readily

*Limitation for planting:* Seasonal high water table

## 48—Broadax silt loam, dry, 0 to 8 percent slopes

### Composition

*Broadax soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Broad summits of hills and  
plateaus

*Parent material:* Loess

*Slope range:* 0 to 8 percent

*Elevation:* 2,500 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*  
0 to 11 inches—grayish brown silt loam

*Upper part of subsoil:*  
11 to 17 inches—brown silt loam

*Middle part of subsoil:*  
17 to 38 inches—yellowish brown, calcareous silt loam

*Lower part of subsoil:*  
38 to 60 inches—yellowish brown, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or  
moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Annum soils
- Morical soils
- Anders soils

### Major Uses

Nonirrigated cropland, livestock grazing, recreation,  
watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope.

**49—Broadax silt loam, dry, 8 to 15 percent slopes****Composition**

*Broadax soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Broad summits of hills and plateaus

*Parent material:* Loess

*Slope range:* 8 to 15 percent

*Elevation:* 2,500 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Typical Profile**

*Surface layer:*

0 to 11 inches—grayish brown silt loam

*Upper part of subsoil:*

11 to 17 inches—brown silt loam

*Middle part of subsoil:*

17 to 38 inches—yellowish brown, calcareous silt loam

*Lower part of subsoil:*

38 to 60 inches—yellowish brown, calcareous silt loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—moderate; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Annum soils
- Morical soils
- Anders soils

**Major Uses**

Nonirrigated cropland, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Livestock grazing**

- There are no significant limitations for management of this soil for this use.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**50—Brusher silt loam, 20 to 40 percent slopes****Composition**

*Brusher soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Footslopes of mountains

*Parent material:* Volcanic ash over highly weathered colluvium and residuum derived from granitic and porphyritic volcanic rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,300 to 4,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 3 inches—grayish brown silt loam

*Upper part of subsoil:*

3 to 9 inches—yellowish brown silt loam

*Subsurface layer:*

9 to 14 inches—light yellowish brown loam

*Middle part of subsoil:*

14 to 24 inches—yellowish brown and light yellowish brown loam

*Lower part of subsoil:*

24 to 50 inches—brown clay loam

*Substratum:*

50 to 60 inches—multicolored gravelly coarse sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—very severe; forestland—severe or very severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Moscow soils
- Soils that do not have volcanic ash in the surface layer
- Friedlander soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

## 51—Brusher silt loam, moist, 5 to 35 percent slopes

### Composition

*Brusher soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Concave footslopes and toeslopes of mountains

*Parent material:* Volcanic ash over highly weathered residuum, colluvium, and valley fill derived from granitic and porphyritic volcanic rock

*Slope range:* 5 to 35 percent

*Elevation:* 2,600 to 4,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 5 inches thick

*Surface layer:*  
0 to 5 inches—grayish brown and brown silt loam

*Upper part of subsoil:*  
5 to 17 inches—pale brown silt loam

*Middle part of subsoil:*  
17 to 37 inches—pale brown and yellowish brown loam and sandy loam  
37 to 51 inches—very pale brown sandy loam

*Lower part of subsoil:*  
51 to 56 inches—pale brown loam

*Substratum:*  
56 to 60 inches—multicolored gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate to very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Aquic Xerofluvents
- Centralpeak and Moscow soils
- Canteen soils
- Dinkelman soils
- Soils that are somewhat poorly drained or poorly drained

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**52—Brusher silt loam, warm, 0 to 20 percent slopes****Composition**

*Brusher soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Toeslopes of mountains  
*Parent material:* Volcanic ash over highly weathered colluvium and residuum derived from granitic and porphyritic volcanic rock  
*Slope range:* 0 to 20 percent  
*Elevation:* 2,300 to 3,600 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 43 to 45 degrees F  
*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*  
 0 to 3 inches—grayish brown silt loam

*Upper part of subsoil:*  
 3 to 9 inches—yellowish brown silt loam

*Subsurface layer:*  
 9 to 14 inches—light yellowish brown loam

*Middle part of subsoil:*  
 14 to 24 inches—yellowish brown and light yellowish brown loam

*Lower part of subsoil:*  
 24 to 50 inches—brown clay loam

*Substratum:*  
 50 to 60 inches—multicolored gravelly coarse sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* High  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow to rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Centralpeak soils
- Soils that do not have volcanic ash in the surface layer
- Friedlander soils

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically  
*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**53—Brusher silt loam, warm, 20 to 40 percent slopes****Composition**

*Brusher soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Footslopes of mountains  
*Parent material:* Volcanic ash over highly weathered colluvium and residuum derived from granitic and porphyritic volcanic rock  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,300 to 3,600 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 43 to 45 degrees F  
*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*  
 0 to 3 inches—grayish brown silt loam

*Upper part of subsoil:*  
 3 to 9 inches—yellowish brown silt loam

*Subsurface layer:*

9 to 14 inches—light yellowish brown loam

*Middle part of subsoil:*

14 to 24 inches—yellowish brown and light yellowish brown loam

*Lower part of subsoil:*

24 to 50 inches—brown clay loam

*Substratum:*

50 to 60 inches—multicolored gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Centralpeak soils
- Soils that do not have volcanic ash in the surface layer
- Friedlander soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

## 54—Buhrig very stony loam, 20 to 40 percent slopes

### Composition

*Buhrig soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges, shoulders, and backslopes of mountains

*Parent material:* Residuum and colluvium derived from granitic rock, gneiss, and quartzite with a mantle of volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 4,000 to 6,500 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

*Rock fragments on surface:* Stones cover 3 to 15 percent

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 7 inches—light yellowish brown very stony loam

*Subsoil:*

7 to 18 inches—light yellowish brown very cobbly loam

*Substratum:*

18 to 32 inches—light yellowish brown very cobbly sandy loam

*Bedrock:*

32 to 36 inches—gneiss

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate

### Contrasting Inclusions

- Codylake soils
- Manley soils
- Mineral soils
- Pole soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Subalpine fir—readily; Douglas-fir and lodgepole pine—periodically

*Limitation for planting:* Rock fragments in the soil

### 55—Buhrig very stony loam, 40 to 65 percent slopes

#### Composition

*Buhrig soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Colluvium derived from granitic rock, gneiss, and quartzite with a mantle of volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 4,000 to 6,500 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

*Rock fragments on surface:* Stones cover 3 to 15 percent

#### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 7 inches—light yellowish brown very stony loam

*Subsoil:*

7 to 18 inches—light yellowish brown very cobbly loam

*Substratum:*

18 to 32 inches—light yellowish brown very cobbly sandy loam

*Bedrock:*

32 to 36 inches—gneiss

#### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—severe

### Contrasting Inclusions

- Codylake soils
- Manley soils
- Mineral soils
- Pole soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Subalpine fir—readily; Douglas-fir and lodgepole pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

### 56—Buhrig silt loam, shaly substratum, 30 to 65 percent slopes

#### Composition

*Buhrig soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Shoulders and backslopes of mountains

*Parent material:* Residuum and colluvium derived from metasedimentary rock with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 30 to 65 percent

*Elevation:* 4,000 to 4,700 feet

*Average annual precipitation:* 22 to 25 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—yellowish brown silt loam

*Subsoil:*

4 to 13 inches—light yellowish brown silt loam

*Upper part of substratum:*

13 to 20 inches—pale brown extremely flaggy loam

*Lower part of substratum:*

20 to 31 inches—pale brown extremely channery loam

*Bedrock:*

31 to 35 inches—graywacke

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Hartill soils
- Wilmont soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Grand fir and subalpine fir—readily; Douglas-fir and western larch—periodically

## 57—Buhrig-Rock outcrop complex, 20 to 40 percent slopes

### Composition

*Buhrig soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges, shoulders, and backslopes of mountains

*Parent material:* Residuum and colluvium derived from granitic rock, gneiss, and quartzite with a mantle of volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 4,000 to 6,500 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

*Rock fragments on surface:* Buhrig—stones cover 3 to 15 percent

### Buhrig Soil

#### Typical profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 7 inches—light yellowish brown very stony loam

*Subsoil:*

7 to 18 inches—light yellowish brown very cobbly loam

*Substratum:*

18 to 32 inches—light yellowish brown very cobbly sandy loam

*Bedrock:*

32 to 36 inches—gneiss

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate

## Rock Outcrop

*Kind of rock:* Granitic rock, gneiss, diorite, and quartzite

### Contrasting Inclusions

- Codylake soils
- Manley soils
- Mineral soils
- Pole soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Subalpine fir—readily; Douglas-fir and lodgepole pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

## 58—Buhrig-Rock outcrop complex, 40 to 65 percent slopes

### Composition

*Buhrig soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Colluvium derived from granitic rock, gneiss, and quartzite with a mantle of volcanic ash

*Slope range:* 40 to 65 percent

*Elevation:* 4,000 to 6,500 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

*Rock fragments on surface:* Stones cover 3 to 15 percent

## Buhrig Soil

### Typical profile

*Surface layer:*

0 to 7 inches—light yellowish brown very stony loam

*Subsoil:*

7 to 18 inches—light yellowish brown very cobbly loam

*Substratum:*

18 to 32 inches—light yellowish brown very cobbly sandy loam

*Bedrock:*

32 to 36 inches—gneiss

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—severe

## Rock Outcrop

*Kind of rock:* Granitic rock, gneiss, diorite, and quartzite

### Contrasting Inclusions

- Codylake soils
- Manley soils
- Mineral soils
- Pole soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Subalpine fir—

readily; Douglas-fir and lodgepole pine—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

## 59—Canteen silt loam, 20 to 40 percent slopes

### Composition

*Canteen soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and backslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a mantle of volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 2,100 to 4,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 13 inches—pale brown loam

*Middle part of subsoil:*

13 to 21 inches—very pale brown sandy loam

*Lower part of subsoil:*

21 to 34 inches—very pale brown coarse sandy loam

*Substratum:*

34 to 45 inches—very pale brown loamy coarse sand

*Bedrock:*

45 to 55 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Ohscow soils
- Centralpeak soils
- Codylake soils
- Mineral soils
- Dinkelman soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and lodgepole pine—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

## 60—Canteen silt loam, 40 to 65 percent slopes

### Composition

*Canteen soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 2,100 to 4,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 13 inches—pale brown loam

*Middle part of subsoil:*

13 to 21 inches—very pale brown sandy loam

*Lower part of subsoil:*

21 to 34 inches—very pale brown coarse sandy loam

*Substratum:*

34 to 45 inches—very pale brown loamy coarse sand

*Bedrock:*

45 to 55 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Ohscow soils
- Centralpeak soils
- Codylake soils
- Mineral soils
- Dinkelman soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and lodgepole pine—readily; ponderosa pine and western larch—periodically

*Limitation for planting:* Steepness of slope

## 61—Canteen silt loam, cool, 20 to 40 percent slopes

### Composition

*Canteen soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and backslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a mantle of volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 2,500 to 4,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 41 to 43 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 5 inches—pale brown silt loam

*Upper part of subsoil:*

5 to 14 inches—light yellowish brown silt loam

*Lower part of subsoil:*

14 to 27 inches—pale brown sandy loam

*Substratum:*

27 to 50 inches—very pale brown and light yellowish brown gravelly loamy sand

*Bedrock:*

50 to 60 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe or very severe

### Contrasting Inclusions

- Ohscow soils
- Centralpeak and Moscow soils
- Codylake soils
- Mineral soils

### Major Uses

*Current uses:* Timber production, livestock grazing, watershed, and wildlife habitat

*Potential use:* Nonirrigated hay and pasture

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

## 62—Canteen silt loam, cool, 40 to 65 percent slopes

### Composition

*Canteen soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a mantle of volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 2,500 to 4,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 41 to 43 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 5 inches—pale brown silt loam

*Upper part of subsoil:*

5 to 14 inches—light yellowish brown silt loam

*Lower part of subsoil:*

14 to 27 inches—pale brown sandy loam

*Substratum:*

27 to 50 inches—very pale brown and light yellowish brown gravelly loamy sand

*Bedrock:*

50 to 60 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and

February

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Ohscow soils
- Centralpeak soils
- Codylake soils
- Mineral soils

### Major Uses

Timber production, livestock grazing, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine and western larch—periodically

*Limitation for planting:* Steepness of slope

## 63—Capoose silt loam, 20 to 40 percent slopes

### Composition

*Capoose soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders and backslopes of mountains

*Parent material:* Volcanic ash mantle over colluvium and glacial till derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 3,000 to 4,800 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 5 inches thick

*Surface layer:*

0 to 2 inches—brown silt loam

*Upper part of subsoil:*

2 to 7 inches—yellowish brown silt loam

*Middle part of subsoil:*

7 to 17 inches—light yellowish brown loam

*Lower part of subsoil:*

17 to 25 inches—light yellowish brown very gravelly sandy loam

*Substratum:*

25 to 35 inches—very pale brown extremely gravelly sandy loam

*Bedrock:*

35 to 39 inches—granitic rock

**Soil Properties and Qualities***Depth class:* Moderately deep (20 to 40 inches to bedrock)*Drainage class:* Well drained*Permeability:* Moderate*Available water capacity:* Moderate*Potential rooting depth:* 20 to 40 inches*Runoff:* Medium or rapid*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and December*Hazard of water erosion:* Forestland—moderate or severe**Contrasting Inclusions**

## 65—Capoose-Rock outcrop complex, 20 to 40 percent slopes

### Composition

*Capoose soil and similar soils:* 65 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Shoulders and backslopes of mountains

*Parent material:* Volcanic ash mantle over colluvium and glacial till derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 3,000 to 4,800 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Capoose Soil

#### Typical profile

*Organic mat on surface:* 5 inches thick

*Surface layer:*

0 to 2 inches—brown silt loam

*Upper part of subsoil:*

2 to 7 inches—yellowish brown silt loam

*Middle part of subsoil:*

7 to 17 inches—light yellowish brown loam

*Lower part of subsoil:*

17 to 25 inches—light yellowish brown very gravelly sandy loam

*Substratum:*

25 to 35 inches—very pale brown extremely gravelly sandy loam

*Bedrock:*

35 to 39 inches—granitic rock

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate or severe

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Mineral soils
- Pole soils
- Nevine soils
- Soils that have a very stony surface

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitation for planting:* Rock outcrop

## 66—Capoose-Rock outcrop complex, 40 to 65 percent slopes

### Composition

*Capoose soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of mountains  
*Parent material:* Volcanic ash mantle over colluvium and glacial till derived from granitic rock  
*Slope range:* 40 to 65 percent  
*Elevation:* 3,000 to 4,800 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Capoose Soil

#### Typical profile

*Organic mat on surface:* 5 inches thick  
*Surface layer:*  
 0 to 2 inches—brown silt loam  
*Upper part of subsoil:*  
 2 to 7 inches—yellowish brown silt loam  
*Middle part of subsoil:*  
 7 to 17 inches—light yellowish brown loam  
*Lower part of subsoil:*  
 17 to 25 inches—light yellowish brown very gravelly sandy loam  
*Substratum:*  
 25 to 35 inches—very pale brown extremely gravelly sandy loam  
*Bedrock:*  
 35 to 39 inches—granitic rock

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Mineral soils
- Pole soils
- Nevine soils

- Soils that have a very stony surface

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically  
*Limitations for planting:* Rock outcrop and steepness of slope

### 67—Cashmere fine sandy loam, 0 to 5 percent slopes

#### Composition

*Cashmere soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces  
*Parent material:* Glaciofluvial material with a component of loess  
*Slope range:* 0 to 5 percent  
*Elevation:* 800 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

#### Typical Profile

*Surface layer:*  
 0 to 10 inches—grayish brown fine sandy loam  
*Subsoil:*  
 10 to 36 inches—brown and pale brown fine sandy loam  
*Upper part of substratum:*  
 36 to 46 inches—pale brown sandy loam  
*Lower part of substratum:*  
 46 to 60 inches—pale brown fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight;  
 rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Farrell soils
- Pogue soils
- Aeneas soils
- Cashmont soils
- Malott soils
- Quincy soils

### Major Uses

Irrigated orchards, irrigated cropland, irrigated hay and pasture, nonirrigated cropland, livestock grazing, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion.

## 68—Cashmere fine sandy loam, 5 to 10 percent slopes

### Composition

*Cashmere soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Glaciofluvial material with a component of loess  
*Slope range:* 5 to 10 percent  
*Elevation:* 800 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
 0 to 10 inches—grayish brown fine sandy loam

*Subsoil:*  
 10 to 36 inches—brown and pale brown fine sandy loam

*Upper part of substratum:*  
 36 to 46 inches—pale brown sandy loam

*Lower part of substratum:*  
 46 to 60 inches—pale brown fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight;  
 rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Farrell soils
- Pogue soils
- Aeneas soils
- Cashmont soils
- Malott soils
- Quincy soils

### Major Uses

Irrigated orchards, irrigated cropland, irrigated hay and pasture, nonirrigated cropland, livestock grazing, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion and steepness of slope.

## 69—Cashmere fine sandy loam, 10 to 25 percent slopes

### Composition

*Cashmere soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glaciofluvial material with a component of loess  
*Slope range:* 10 to 25 percent  
*Elevation:* 800 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
 0 to 10 inches—grayish brown fine sandy loam

*Subsoil:*  
 10 to 36 inches—brown and pale brown fine sandy loam

*Upper part of substratum:*  
 36 to 46 inches—pale brown sandy loam

*Lower part of substratum:*  
 46 to 60 inches—pale brown fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—moderate; rangeland—moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Farrell soils
- Pogue soils
- Aeneas soils
- Cashmont soils
- Quincy soils

### Major Uses

Irrigated orchards, irrigated cropland, irrigated hay and pasture, nonirrigated cropland, livestock grazing, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion and steepness of slope.

## 70—Cashmere fine sandy loam, 25 to 50 percent slopes

### Composition

*Cashmere soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glaciofluvial material with a component of loess  
*Slope range:* 25 to 50 percent  
*Elevation:* 800 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
 0 to 10 inches—grayish brown fine sandy loam

*Subsoil:*  
 10 to 36 inches—brown and pale brown fine sandy loam

*Upper part of substratum:*  
 36 to 46 inches—pale brown sandy loam

*Lower part of substratum:*  
 46 to 60 inches—pale brown fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Rangeland—moderate or severe  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Farrell soils
- Pogue soils
- Aeneas soils
- Cashmont soils
- Malott soils
- Quincy soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction, range seeding, or brush management using ground equipment.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 71—Cashmont gravelly sandy loam, fan, 3 to 15 percent slopes

### Composition

*Cashmont soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Alluvial fans  
*Parent material:* Alluvium mixed with loess  
*Slope range:* 3 to 15 percent  
*Elevation:* 850 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
0 to 19 inches—dark grayish brown gravelly sandy loam

*Upper part of subsoil:*  
19 to 30 inches—brown gravelly coarse sandy loam

*Lower part of subsoil:*  
30 to 38 inches—yellowish brown gravelly sandy loam

*Substratum:*  
38 to 60 inches—very pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Moderate  
*Frequency of flooding:* Rare

### Contrasting Inclusions

- Soils that have a stony surface
- Aeneas soils
- Logy soils
- Pogue soils
- Skaha soils
- Quincy soils

### Major Uses

Livestock grazing, irrigated hay and pasture, irrigated orchards, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope.

## 72—Cashmont gravelly sandy loam, fan, 15 to 30 percent slopes

### Composition

*Cashmont soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Alluvial fans  
*Parent material:* Alluvium mixed with loess  
*Slope range:* 15 to 30 percent  
*Elevation:* 850 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
0 to 19 inches—dark grayish brown gravelly sandy loam

*Upper part of subsoil:*  
19 to 30 inches—brown gravelly coarse sandy loam

*Lower part of subsoil:*  
30 to 38 inches—yellowish brown gravelly sandy loam

*Substratum:*  
38 to 60 inches—very pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium  
*Hazard of water erosion:* Cropland—moderate; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Soils that have a stony surface
- Aeneas soils that have a sandy substratum
- Logy soils
- Pogue soils
- Skaha soils
- Quincy soils

### Major Uses

Livestock grazing, irrigated hay and pasture and orchards, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope.

## 73—Cedonia silt loam, 0 to 5 percent slopes

### Composition

*Cedonia soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash  
*Slope range:* 0 to 5 percent  
*Elevation:* 1,300 to 2,500 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 48 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
0 to 2 inches—grayish brown silt loam  
*Upper part of subsoil:*  
2 to 24 inches—light brownish gray silt loam  
*Lower part of subsoil:*  
24 to 40 inches—light gray silt loam  
*Substratum:*  
40 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Very high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight; forestland—slight  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Bisbee soils
- Phoebe soils
- Donovan soils
- Hodgson soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland and hay and pasture, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by water erosion.

**74—Cedonia silt loam, 5 to 15 percent slopes****Composition**

*Cedonia soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Terraces

*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash

*Slope range:* 5 to 15 percent

*Elevation:* 1,300 to 2,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 2 inches—grayish brown silt loam

*Upper part of subsoil:*

2 to 24 inches—light brownish gray silt loam

*Lower part of subsoil:*

24 to 40 inches—light gray silt loam

*Substratum:*

40 to 60 inches—light gray, calcareous silt loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Bisbee soils

- Phoebe soils
- Donavan soils
- Hodgson soils

**Major Uses**

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, recreation, watershed, wildlife habitat, and building site development

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**75—Cedonia silt loam, 15 to 30 percent slopes****Composition**

*Cedonia soil and similar soils:* 75 percent

*Contrasting inclusions:* 25 percent

**Setting**

*Position on landscape:* Terrace escarpments

*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash

*Slope range:* 15 to 30 percent

*Elevation:* 1,300 to 2,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 2 inches—grayish brown silt loam

*Upper part of subsoil:*

2 to 24 inches—light brownish gray silt loam

*Lower part of subsoil:*

24 to 50 inches—light gray silt loam

*Substratum:*  
50 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Very high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none  
*Hazard of water erosion:* Cropland—severe;  
forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Spokane soils
- Bisbee soils
- Donavan soils
- Hodgson soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 76—Cedonia silt loam, 30 to 65 percent slopes

### Composition

*Cedonia soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent  
*Elevation:* 1,300 to 2,500 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 48 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 2 inches—grayish brown silt loam

*Upper part of subsoil:*  
2 to 24 inches—light brownish gray silt loam

*Lower part of subsoil:*  
24 to 50 inches—light gray silt loam

*Substratum:*  
50 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Very high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none  
*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Donavan soils
- Lakesol soils
- Hodgson soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically  
*Limitation for planting:* Steepness of slope

## 77—Centralpeak loams association, 5 to 20 percent slopes

### Composition

*Centralpeak soil and similar soils:* 45 percent  
*Centralpeak soil, warm, and similar soils:* 40 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges and shoulders of mountains  
*Parent material:* Granitic residuum and colluvium with a mantle of volcanic ash and loess  
*Slope range:* 5 to 20 percent  
*Elevation:* 2,200 to 4,500 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

#### Centralpeak

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 6 inches—brown loam  
*Upper part of subsoil:*  
 6 to 16 inches—light yellowish brown loam  
*Lower part of subsoil:*  
 16 to 21 inches—brown gravelly coarse sandy loam  
*Substratum:*  
 21 to 25 inches—brown gravelly loamy coarse sand  
*Bedrock:*  
 25 to 35 inches—weathered granitic rock

#### Centralpeak, warm

*Organic mat on the surface:* 2 inches thick  
*Surface layer:*  
 0 to 4 inches—dark grayish brown loam  
*Upper part of subsoil:*  
 4 to 12 inches—yellowish brown loam  
*Lower part of the subsoil:*  
 12 to 20 inches—light yellowish brown coarse sandy loam  
*Substratum:*  
 20 to 29 inches—light olive brown gravelly loamy coarse sand  
*Bedrock:*  
 29 to 39 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Ohscow soils
- Dinkelman soils
- Mineral soils
- Spokane soils
- Codylake soils
- Skanid soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration (Centralpeak):*  
 Douglas fir—readily; ponderosa pine and western larch—periodically  
*Potential for natural regeneration (Centralpeak, warm):*  
 Douglas-fir, ponderosa pine, and lodgepole pine—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If the soils in this unit are used for irrigated crops, they are limited by rooting depth, steepness of slope, and water erosion.

## 78—Centralpeak loams association, 20 to 40 percent slopes

### Composition

*Centralpeak soil and similar soils:* 45 percent

*Centralpeak soil, warm, and similar soils:* 40 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains

*Parent material:* Granitic residuum and colluvium with a mantle of volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 2,200 to 4,500 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

#### Centralpeak

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 6 inches—brown loam

*Upper part of subsoil:*

6 to 16 inches—light yellowish brown loam

*Lower part of subsoil:*

16 to 21 inches—brown gravelly coarse sandy loam

*Substratum:*

21 to 25 inches—brown gravelly loamy coarse sand

*Bedrock:*

25 to 35 inches—weathered granitic rock

#### Centralpeak, warm

*Organic mat on the surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—dark grayish brown loam

*Upper part of subsoil:*

4 to 12 inches—yellowish brown loam

*Lower part of the subsoil:*

12 to 20 inches—light yellowish brown coarse sandy loam

*Substratum:*

20 to 29 inches—light olive brown gravelly loamy coarse sand

*Bedrock:*

29 to 39 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

### Contrasting Inclusions

- Ohscow soils
- Dinkelman soils
- Mineral soils
- Spokane soils
- Codylake soils
- Skanid soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration (Centralpeak):*

Douglas-fir—readily; ponderosa pine and western larch—periodically

*Potential for natural regeneration (Centralpeak, warm):*

Douglas-fir, ponderosa pine, and lodgepole pine—periodically

*Limitations for planting:* None

### 79—Centralpeak loams association, 40 to 65 percent slopes

#### Composition

*Centralpeak soil and similar soils:* 45 percent

*Centralpeak soil, warm, and similar soils:* 40 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Footslopes and backslopes of hills and mountains

*Parent material:* Granitic residuum and colluvium with a mantle of volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 2,200 to 4,500 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

## Typical Profile

### Centralpeak

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 6 inches—brown loam

*Upper part of subsoil:*

6 to 16 inches—light yellowish brown loam

*Lower part of subsoil:*

16 to 21 inches—brown gravelly coarse sandy loam

*Substratum:*

21 to 25 inches—brown gravelly loamy coarse sand

*Bedrock:*

25 to 35 inches—weathered granitic rock

### Centralpeak, warm

*Organic mat on the surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—dark grayish brown loam

*Upper part of subsoil:*

4 to 12 inches—yellowish brown loam

*Lower part of the subsoil:*

12 to 20 inches—light yellowish brown coarse sandy loam

*Substratum:*

20 to 29 inches—light olive brown gravelly loamy coarse sand

*Bedrock:*

29 to 39 inches—weathered granitic rock

## Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

## Contrasting Inclusions

- Ohscow soils
- Dinkelman soils
- Mineral soils
- Spokane soils

- Codylake soils
- Skanid soils

## Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

### Silviculture

*Potential for natural regeneration (Centralpeak):*

Douglas-fir—readily; ponderosa pine and western larch—periodically

*Potential for natural regeneration (Centralpeak, warm):*

Douglas-fir, ponderosa pine, and lodgepole pine—periodically

*Limitation for planting:* Steepness of slope

## 80—Centralpeak loam, warm, 5 to 20 percent slopes

### Composition

*Centralpeak soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges, footslopes, and shoulders of mountains

*Parent material:* Colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess

*Slope range:* 5 to 20 percent

*Elevation:* 2,400 to 4,200 feet

*Average annual precipitation:* 16 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

## Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—dark grayish brown loam

*Upper part of subsoil:*

4 to 12 inches—yellowish brown loam

*Lower part of subsoil:*

12 to 20 inches—light yellowish brown coarse sandy loam

*Substratum:*

20 to 29 inches—light olive brown gravelly loamy coarse sand

*Bedrock:*

29 to 39 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Dinkelman and Canteen soils
- Skanid soils
- Mineral soils
- Spokane soils
- Soils that are sandy throughout
- Soils that have a stony or bouldery surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and lodgepole pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by rooting depth, steepness of slope, and water erosion.

## 81—Centralpeak loam, warm, 20 to 40 percent slopes

### Composition

*Centralpeak soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes, backslopes, and shoulders of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 2,400 to 4,200 feet

*Average annual precipitation:* 16 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—dark grayish brown loam

*Upper part of subsoil:*

4 to 12 inches—yellowish brown loam

*Lower part of subsoil:*

12 to 20 inches—light yellowish brown coarse sandy loam

*Substratum:*

20 to 29 inches—light olive brown gravelly loamy coarse sand

*Bedrock:*

29 to 39 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe

### Contrasting Inclusions

- Dinkelman and Canteen soils
- Skanid soils

- Mineral soils
- Spokane soils
- Soils that are sandy throughout
- Soils that have a stony or bouldery surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and lodgepole pine—periodically

*Limitations for planting:* None

## 82—Centralpeak loam, warm, 40 to 65 percent slopes

### Composition

*Centralpeak soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 2,400 to 4,200 feet

*Average annual precipitation:* 16 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—dark grayish brown loam

*Upper part of subsoil:*

4 to 12 inches—yellowish brown loam

*Lower part of subsoil:*

12 to 20 inches—light yellowish brown coarse sandy loam

*Substratum:*

20 to 29 inches—light olive brown gravelly loamy coarse sand

*Bedrock:*

29 to 39 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Dinkelman and Canteen soils
- Mineral soils
- Spokane and Skanid soils
- Soils that are sandy throughout
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and lodgepole pine—periodically

*Limitation for planting:* Steepness of slope

## 83—Centralpeak, warm-Brusher, moist complex, 5 to 30 percent slopes

### Composition

*Centralpeak soil and similar soils:* 65 percent

*Brusher soil and similar soils:* 20 percent

*Contrasting inclusions:* 15 percent

## Setting

*Position on landscape:* Centralpeak—footslopes and toeslopes of hills and mountains; Brusher—concave footslopes and toeslopes of hills and mountains

*Parent material:* Centralpeak—colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess; Brusher—volcanic ash over highly weathered colluvium, residuum, and valley fill derived from granitic rock

*Slope range:* 5 to 30 percent

*Elevation:* 2,600 to 3,400 feet

*Average annual precipitation:* 16 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

## Typical Profile

### Centralpeak

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—dark grayish brown loam

*Upper part of subsoil:*

4 to 12 inches—yellowish brown loam

*Lower part of subsoil:*

12 to 20 inches—light yellowish brown coarse sandy loam

*Substratum:*

20 to 29 inches—light olive brown gravelly loamy coarse sand

*Bedrock:*

29 to 39 inches—weathered granitic rock

### Brusher

*Organic mat on the surface:* 5 inches thick

*Surface layer:*

0 to 5 inches—grayish brown and brown silt loam

*Upper part of subsoil:*

5 to 17 inches—pale brown silt loam

*Middle part of subsoil:*

17 to 37 inches—pale brown and yellowish brown loam and sandy loam

37 to 51 inches—very pale brown sandy loam

*Lower part of the subsoil:*

51 to 56 inches—pale brown loam

*Substratum:*

56 to 60 inches—multicolored gravelly coarse sand

## Soil Properties and Qualities

*Depth class:* Centralpeak—moderately deep (20 to 40 inches to bedrock); Brusher—very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Centralpeak—moderate; Brusher—high

*Potential rooting depth:* Centralpeak—20 to 40 inches; Brusher—more than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

## Contrasting Inclusions

- Canteen and Dinkelman soils
- Soils that are somewhat poorly drained or poorly drained and are in dissected side drainageways (seep areas)
- Mineral soils
- Soils that have weathered granitic rock at a depth of 10 to 20 inches
- Soils that have a stony or very stony surface
- Aquic Xerofluvents

## Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration (Centralpeak):* Douglas-fir, ponderosa pine, and lodgepole pine—periodically

*Potential for natural regeneration (Brusher):* Douglas-fir, grand fir, and western larch—readily

*Limitations for planting:* None

### Irrigated Cropland

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope and water erosion and by rooting depth of the Centralpeak soil.

## 84—Centralpeak-Rock outcrop association, 30 to 65 percent slopes

### Composition

*Centralpeak soil and similar soils:* 35 percent  
*Centralpeak soil, warm, and similar soils:* 30 percent  
*Rock outcrop:* 20 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders and backslopes of mountains  
*Parent material:* Colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess  
*Slope range:* 30 to 65 percent  
*Elevation:* 2,200 to 4,500 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Centralpeak Soil

#### Typical profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 6 inches—brown loam  
*Upper part of subsoil:*  
 6 to 16 inches—light yellowish brown loam  
*Lower part of subsoil:*  
 16 to 21 inches—brown gravelly coarse sandy loam  
*Substratum:*  
 21 to 25 inches—brown gravelly loamy coarse sand  
*Bedrock:*  
 25 to 35 inches—weathered granitic rock

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—severe or very severe

## Centralpeak Soil, Warm

### Typical profile

*Organic mat on the surface:* 2 inches thick  
*Surface layer:*  
 0 to 4 inches—dark grayish brown loam  
*Upper part of subsoil:*  
 4 to 12 inches—yellowish brown loam  
*Lower part of the subsoil:*  
 12 to 20 inches—light yellowish brown coarse sandy loam  
*Substratum:*  
 20 to 29 inches—light olive brown gravelly loamy coarse sand  
*Bedrock:*  
 29 to 39 inches—weathered granitic rock

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—severe or very severe

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Ohscow soils
- Dinkelman soils
- Mineral soils
- Spokane soils
- Codylake soils
- Skanid soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of

slope and use results in excessive soil damage and erosion; cable yarding—suitable

### Silviculture

*Potential for natural regeneration (Centralpeak):*

Douglas-fir—readily; ponderosa pine and western larch—periodically

*Potential for natural regeneration (Centralpeak, warm):*

Douglas-fir, ponderosa pine, and lodgepole pine—periodically

*Limitations for planting:* Steepness of slope and Rock outcrop

## 85—Chumstick-Rock outcrop complex, 5 to 20 percent slopes

### Composition

*Chumstick soil and similar soils:* 60 percent

*Rock outcrop:* 25 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges and shoulders of mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 3,500 to 5,000 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Chumstick—stones cover 3 to 15 percent

### Chumstick Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 7 inches—dark grayish brown very stony loam

*Subsoil:*

7 to 12 inches—brown very cobbly sandy loam

*Bedrock:*

12 to 16 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Mineral and Capoose soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Merkel soils
- Soils that have an extremely stony or extremely bouldery surface

### Major Uses

Timber production, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsuitable because of surface stones and Rock outcrop; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

## 86—Chumstick-Rock outcrop complex, 20 to 65 percent slopes

### Composition

*Chumstick soil and similar soils:* 50 percent

*Rock outcrop:* 35 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders and backslopes of mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with volcanic ash and loess

*Slope range:* 20 to 65 percent

*Elevation:* 3,500 to 5,000 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days  
*Rock fragments on surface:* Chumstick—stones and boulders cover 3 to 15 percent

### **Chumstick Soil**

#### **Typical profile**

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 7 inches—dark grayish brown very stony loam  
*Subsoil:*  
 7 to 12 inches—brown very cobbly sandy loam  
*Bedrock:*  
 12 to 16 inches—granitic rock

#### **Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Very low  
*Potential rooting depth:* 10 to 20 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—none  
*Hazard of water erosion:* Forestland—moderate or severe

### **Rock Outcrop**

*Kind of rock:* Granitic rock

#### **Contrasting Inclusions**

- Mineral and Capoose soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Merkel soils
- Soils that have an extremely stony or extremely bouldery surface

### **Major Uses**

Timber production, wildlife habitat, watershed, recreation, and livestock grazing

### **Use and Management**

#### **Timber Production**

#### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### **Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

### **87—Codylake loam, 5 to 20 percent slopes**

#### **Composition**

*Codylake soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

#### **Setting**

*Position on landscape:* Ridges and shoulders of mountains  
*Parent material:* Volcanic ash over colluvium and residuum derived from granitic rock  
*Slope range:* 5 to 20 percent  
*Elevation:* 4,200 to 6,000 feet  
*Average annual precipitation:* 20 to 30 inches  
*Average annual air temperature:* 38 to 41 degrees F  
*Frost-free period:* 80 to 100 days

#### **Typical Profile**

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 5 inches—yellowish brown loam  
*Upper part of subsoil:*  
 5 to 13 inches—yellowish brown loam  
*Lower part of subsoil:*  
 13 to 24 inches—light yellowish brown gravelly fine sandy loam  
*Substratum:*  
 24 to 43 inches—light yellowish brown gravelly sandy loam  
*Bedrock:*  
 43 to 53 inches—weathered granitic rock

#### **Soil Properties and Qualities**

*Depth class:* Deep (40 to 60 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* 40 to 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March  
*Hazard of water erosion:* Forestland—slight or moderate

#### **Contrasting Inclusions**

- Resner soils

- Moses soils
- Buhrig soils
- Mineral soils
- Manley soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, lodgepole pine, and subalpine fir—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 88—Codylake loam, 20 to 40 percent slopes

### Composition

*Codylake soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Ridges and backslopes of mountains

*Parent material:* Volcanic ash over colluvium and residuum derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 4,200 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—yellowish brown loam

*Upper part of subsoil:*

5 to 13 inches—yellowish brown loam

*Lower part of subsoil:*

13 to 24 inches—light yellowish brown gravelly fine sandy loam

*Substratum:*

24 to 43 inches—light yellowish brown gravelly sandy loam

*Bedrock:*

43 to 53 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Resner soils
- Moses soils
- Buhrig soils
- Mineral soils
- Manley soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, lodgepole pine, and subalpine fir—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

## 89—Codylake loam, 40 to 65 percent slopes

### Composition

*Codylake soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Backslopes and shoulders of mountains

*Parent material:* Volcanic ash over colluvium and residuum derived from granitic rock

*Slope range:* 40 to 65 percent

*Elevation:* 4,200 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—yellowish brown loam

*Upper part of subsoil:*

5 to 13 inches—yellowish brown loam

*Lower part of subsoil:*

13 to 24 inches—light yellowish brown gravelly fine sandy loam

*Substratum:*

24 to 43 inches—light yellowish brown gravelly sandy loam

*Bedrock:*

43 to 53 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Moses soils
- Buhrig soils
- Mineral and Centralpeak soils
- Manley soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, lodgepole pine, and subalpine fir—readily; western larch and lodgepole pine—periodically

*Limitation for planting:* Steepness of slope

### 90—Colockum loam, 8 to 15 percent slopes

#### Composition

*Colockum soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Depressions areas on till plains and toeslopes of moraines

*Parent material:* Glacial till with a mantle of loess

*Slope range:* 8 to 15 percent

*Elevation:* 1,900 to 2,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

#### Typical Profile

*Surface layer:*

0 to 10 inches—dark grayish brown loam

*Upper part of subsoil:*

10 to 24 inches—yellowish brown clay loam

*Middle part of subsoil:*

24 to 38 inches—yellowish brown gravelly clay loam

*Lower part of subsoil:*

38 to 60 inches—light yellowish brown, calcareous gravelly loam

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Hazard of water erosion:* Cropland—moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have a stony or bouldery surface
- Emdent soils
- Achimin soils
- Timentwa and Conconully soils

### Major Uses

Livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 91—Colockum stony loam, 3 to 25 percent slopes

### Composition

*Colockum soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toeslopes and footslopes of moraines

*Parent material:* Glacial till with a mantle of loess

*Slope range:* 3 to 25 percent

*Elevation:* 1,900 to 2,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*

0 to 11 inches—dark brown stony loam

*Upper part of subsoil:*

11 to 22 inches—yellowish brown silty clay loam

*Middle part of subsoil:*

22 to 36 inches—olive yellow loam

*Lower part of subsoil:*

36 to 46 inches—brownish yellow, calcareous silty clay loam

46 to 60 inches—yellow, calcareous gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow to rapid

*Hazard of water erosion:* Cropland—slight to severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Emdent soils
- Achimin soils
- Timentwa and Conconully soils
- Soils that do not have a layer of lime accumulation
- Badge soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and water erosion.

## 92—Colockum bouldery loam, 25 to 65 percent slopes

### Composition

*Colockum soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and backslopes of moraines

*Parent material:* Glacial till with a mantle of loess

*Slope range:* 25 to 65 percent

*Elevation:* 1,900 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Boulders and stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*

0 to 10 inches—dark grayish brown bouldery loam

*Subsurface layer:*

10 to 14 inches—very pale brown gravelly clay loam

*Upper part of subsoil:*

14 to 33 inches—yellowish brown cobbly clay loam

*Lower part of subsoil:*

33 to 60 inches—light yellowish brown, calcareous gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Hazard of water erosion:* Rangeland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Achimin soils
- Timentwa and Conconully soils
- Badge soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

• This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

## 93—Conconully fine sandy loam, 8 to 15 percent slopes

### Composition

*Conconully soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Undulating ground moraines on foothills

*Parent material:* Glacial till mixed with a component of loess and volcanic ash

*Slope range:* 8 to 15 percent

*Elevation:* 1,600 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 15 inches—grayish brown fine sandy loam

*Upper part of subsoil:*

15 to 21 inches—pale brown fine sandy loam

*Lower part of subsoil:*

21 to 35 inches—yellowish brown gravelly fine sandy loam

*Substratum:*

35 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—moderate; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a very gravelly or very cobbly substratum
- Haley and Hobohill soils
- Ewall soils
- Soils that have a stony or bouldery surface
- Nespelem soils

### Major Uses

Livestock grazing, irrigated hay and pasture, nonirrigated cropland, building site development, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond

installation unless special liners or sealants are used to reduce seepage.

#### **Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by wind erosion, steepness of slope, and rooting depth.

### **94—Conconully fine sandy loam, 15 to 30 percent slopes**

#### **Composition**

*Conconully soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Ground moraines on foothills

*Parent material:* Glacial till mixed with a component of loess and volcanic ash

*Slope range:* 15 to 30 percent

*Elevation:* 1,600 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

#### **Typical Profile**

*Surface layer:*

0 to 15 inches—grayish brown fine sandy loam

*Upper part of subsoil:*

15 to 21 inches—pale brown fine sandy loam

*Lower part of subsoil:*

21 to 35 inches—yellowish brown gravelly fine sandy loam

*Substratum:*

35 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

#### **Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—moderate

*Hazard of wind erosion (bare surface):* Severe

#### **Contrasting Inclusions**

- Soils that have a very gravelly or very cobbly substratum

- Haley and Hobohill soils
- Ewall soils
- Soils that have a stony or bouldery surface

#### **Major Uses**

Livestock grazing, nonirrigated cropland, watershed, wildlife habitat, and recreation

#### **Use and Management**

##### **Livestock grazing**

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### **95—Conconully stony fine sandy loam, 3 to 25 percent slopes**

#### **Composition**

*Conconully soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Ground moraines on foothills

*Parent material:* Glacial till mixed with a component of loess and volcanic ash

*Slope range:* 3 to 25 percent

*Elevation:* 1,600 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Stones and boulders cover 0.1 to 3.0 percent

#### **Typical Profile**

*Surface layer:*

0 to 9 inches—brown stony fine sandy loam

*Subsoil:*

9 to 32 inches—yellowish brown gravelly fine sandy loam

*Substratum:*

32 to 60 inches—yellowish brown dense glacial till that crushes to gravelly fine sandy loam

#### **Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Cropland—slight to severe;  
 rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Soils that have a very gravelly subsoil or substratum
- Haley and Hobohill soils
- Soils that have a very stony or very bouldery surface

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and rooting depth.

## 96—Conconully stony fine sandy loam, 25 to 65 percent slopes

### Composition

*Conconully soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Ground moraines on foothills with southerly aspects (fig. 5)  
*Parent material:* Glacial till mixed with a component of loess and volcanic ash  
*Slope range:* 25 to 65 percent  
*Elevation:* 1,600 to 2,900 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*  
 0 to 9 inches—brown stony fine sandy loam

*Subsoil:*  
 9 to 32 inches—yellowish brown gravelly fine sandy loam

*Substratum:*  
 32 to 60 inches—yellowish brown dense glacial till that crushes to gravelly fine sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over slow  
*Available water capacity:* Moderately high  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Rangeland—moderate or severe  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Soils that have a very gravelly subsoil or substratum
- Haley and Hobohill soils that have a sandy substratum
- Soils that have a very stony or very bouldery surface
- Swakane and Tyee soils that are 10 to 20 inches deep to bedrock
- Rock outcrop
- Rubble land

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 97—Conconully stony fine sandy loam, 25 to 65 percent north slopes

### Composition

*Conconully soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

Figure 5.—Southerly exposure of Conconully stony fine sandy loam, 25 to 65 percent slopes. The ecological site (Dry Loamy, 9-15 PZ) is in good condition.

### Setting

*Position on landscape:* Ground moraines on foothills with northerly aspects  
*Parent material:* Glacial till mixed with a component of loess and volcanic ash  
*Slope range:* 25 to 65 percent  
*Elevation:* 1,600 to 2,900 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*  
 0 to 12 inches—grayish brown stony fine sandy loam  
*Subsoil:*  
 12 to 21 inches—light yellowish brown gravelly fine sandy loam  
*Substratum:*  
 21 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over slow  
*Available water capacity:* Moderately high  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Rangeland—moderate or severe  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Soils that have a very gravelly subsoil or substratum
- Haley and Hobohill soils
- Soils that have a very stony or very bouldery surface
- Swakane and Tye soils

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 98—Conconully bouldery fine sandy loam, 5 to 30 percent slopes

### Composition

*Conconully soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ground moraines on foothills  
*Parent material:* Glacial till mixed with a component of loess and volcanic ash  
*Slope range:* 5 to 30 percent  
*Elevation:* 1,600 to 2,900 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days  
*Rock fragments on surface:* Boulders and stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*  
 0 to 10 inches—grayish brown bouldery fine sandy loam  
*Subsoil:*  
 10 to 25 inches—pale brown gravelly fine sandy loam  
*Substratum:*  
 25 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over slow  
*Available water capacity:* Moderately high  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Soils that have a very gravelly subsoil or substratum
- Haley and Hobohill soils
- Soils that have a very stony or very bouldery surface

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and rooting depth.

## 99—Conconully-Bakeoven complex, 3 to 25 percent slopes

### Composition

*Conconully soil and similar soils:* 50 percent

*Bakeoven soil and similar soils:* 35 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Conconully—ground moraines on plateaus; Bakeoven—glacially scoured plateaus

*Parent material:* Conconully—glacial till mixed with a component of loess and volcanic ash; Bakeoven—residuum and colluvium derived from basalt mixed with loess

*Slope range:* 3 to 25 percent

*Elevation:* 2,000 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Conconully—stones cover 0.1 to 3.0 percent; Bakeoven—cobbles cover 35 to 50 percent

### Typical Profile

#### Conconully

*Surface layer:*

0 to 9 inches—brown stony fine sandy loam

*Subsoil:*

9 to 32 inches—yellowish brown gravelly fine sandy loam

*Substratum:*

32 to 60 inches—yellowish brown dense glacial till that crushes to gravelly fine sandy loam

#### Bakeoven

*Surface layer:*

0 to 3 inches—brown very cobbly silt loam

*Subsoil:*

3 to 7 inches—brown very cobbly silt loam

*Bedrock:*

7 to 11 inches—basalt

### Soil Properties and Qualities

*Depth class:* Conconully—moderately deep (20 to 40 inches to dense glacial till); Bakeoven—very shallow (4 to 10 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Conconully—moderately rapid over slow; Bakeoven—moderate

*Available water capacity:* Conconully—moderately high; Bakeoven—very low

*Effective rooting depth:* Conconully—20 to 40 inches; Bakeoven—4 to 10 inches

*Runoff:* Slow or medium

*Hazard of water erosion on rangeland:* Conconully—slight or moderate; Bakeoven—slight

*Hazard of wind erosion (bare surface):* Conconully—moderate; Bakeoven—slight

### Contrasting Inclusions

- Anders soils
- Soils that are 40 to 60 inches deep to basalt
- Emdent soils
- Rock outcrop

### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- The Bakeoven soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.
- The Conconully soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope, large stones, and rooting depth.

### 100—Conconully-Rock outcrop complex, 5 to 30 percent slopes

#### Composition

*Conconully soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Glacially scoured ridges and shoulders of hills

*Parent material:* Glacial till mixed with a component of loess and volcanic ash

*Slope range:* 5 to 30 percent

*Elevation:* 2,000 to 2,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Conconully—stones cover 3 to 15 percent

## Conconully Soil

### Typical profile

#### Surface layer:

0 to 7 inches—grayish brown very stony fine sandy loam

#### Subsoil:

7 to 21 inches—brown gravelly sandy loam

#### Substratum:

21 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium

*Hazard of water erosion:* Rangeland—moderate

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Granitic rock and gneiss

### Contrasting Inclusions

- Swakane soils
- Soils that are very gravelly and have granitic rock at a depth of 20 to 40 inches
- Donovan soils

### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 101—Conconully-Rock outcrop complex, 30 to 65 percent slopes

### Composition

*Conconully soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

## Setting

*Position on landscape:* Glacially scoured shoulders and backslopes of hills

*Parent material:* Glacial till mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 2,000 to 2,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Conconully—stones cover 3 to 15 percent

## Conconully Soil

### Typical profile

#### Surface layer:

0 to 7 inches—grayish brown very stony fine sandy loam

#### Subsoil:

7 to 21 inches—brown gravelly sandy loam

#### Substratum:

21 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Granitic rock and gneiss

### Contrasting Inclusions

- Swakane soils
- Soils that are very gravelly and have granitic rock at a depth of 20 to 40 inches
- Donovan soils

### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range

seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 102—Conconully-Swakane-Rock outcrop complex, 3 to 30 percent slopes

### Composition

*Conconully soil and similar soils:* 40 percent

*Swakane soil and similar soils:* 25 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Conconully—ground moraines on glacially scoured hills; Swakane—glacially scoured hills

*Parent material:* Conconully—glacial till mixed with a component of loess and volcanic ash; Swakane—residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* Conconully—3 to 25 percent; Swakane—3 to 30 percent

*Elevation:* 2,000 to 2,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Conconully—boulders and stones cover 0.1 to 3.0 percent; Swakane—stones cover 3 to 15 percent

### Conconully Soil

#### Typical profile

*Surface layer:*

0 to 10 inches—grayish brown bouldery fine sandy loam

*Subsoil:*

10 to 25 inches—pale brown gravelly fine sandy loam

*Substratum:*

25 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Slight or moderate

*Hazard of wind erosion (bare surface):* Moderate

### Swakane Soil

#### Typical profile

*Upper part of surface layer:*

0 to 7 inches—dark brown very stony loam

*Lower part of surface layer:*

7 to 11 inches—brown very gravelly loam

*Subsoil:*

11 to 14 inches—yellowish brown very cobbly loam

*Bedrock:*

14 to 18 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Effective rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Granitic rock and gneiss

### Contrasting Inclusions

- Soils that have bedrock at a depth of less than 10 inches
- Rubble land

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The Swakane soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.
- The Conconully soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### 103—Couleedam-Rock outcrop complex, 30 to 70 percent slopes

#### Composition

*Couleedam soil and similar soils:* 55 percent

*Rock outcrop:* 30 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Shoulders and backslopes of foothills

*Parent material:* Colluvium derived from granitic rock and gneiss mixed with loess

*Slope range:* 30 to 70 percent

*Elevation:* 1,000 to 2,200 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Couleedam—stones cover 3 to 15 percent

#### Couleedam Soil

#### Typical profile

*Upper part of surface layer:*

0 to 3 inches—brown very stony sandy loam

*Lower part of surface layer:*

3 to 8 inches—brown very cobbly sandy loam

*Subsoil:*

8 to 15 inches—pale brown very gravelly sandy loam

*Bedrock:*

15 to 19 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

#### Rock Outcrop

*Kind of rock:* Granitic rock and gneiss

#### Contrasting Inclusions

- Soils that are 4 to 10 inches deep to hard bedrock
- Roosevelt soils that are 20 to 40 inches deep to hard bedrock

- Malott soils that are deep and have fewer rock fragments
- Rubble land

#### Major Uses

Livestock grazing, watershed, and wildlife habitat

#### Use and Management

##### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 104—Coxlake silt loam, 0 to 3 percent slopes

#### Composition

*Coxlake soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Low stream terraces and flood plains

*Parent material:* Alluvium

*Slope range:* 0 to 3 percent

*Elevation:* 1,700 to 2,600 feet

*Average annual precipitation:* 12 to 16 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 140 days

#### Typical Profile

*Upper part of surface layer:*

0 to 6 inches—dark grayish brown silt loam

*Lower part of surface layer:*

6 to 29 inches—mottled, dark grayish brown silt loam

*Upper part of substratum:*

29 to 48 inches—light brownish gray silt loam and loam

*Lower part of substratum:*

48 to 60 inches—mottled, pale brown very gravelly sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat poorly drained

*Permeability:* Moderate

*Available water capacity:* High  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very slow  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Cropland—none or slight;  
 forestland—none or slight  
*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Present in November through August  
 (see “Water Features” table)  
*Frequency, duration, and period of flooding:*  
 Occasional, brief periods in February through May

### Contrasting Inclusions

- Ralsen soils
- Bossburg and Medisaprists
- Narcisse and Fivelakes soils

### Major Uses

Livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable during periods when the soil is dry; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Quaking aspen, thinleaf alder, and paper birch—readily; ponderosa pine and Douglas-fir—periodically

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wetness.

## 105—Cryofluvents, 0 to 8 percent slopes

### Composition

*Cryofluvents and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Narrow flood plains and low stream terraces along mountain streams  
*Parent material:* Alluvium mixed with volcanic ash  
*Slope range:* 0 to 8 percent  
*Elevation:* 2,800 to 4,800 feet  
*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 40 to 42 degrees F  
*Frost-free period:* 80 to 100 days

### Reference Profile

*Organic mat on surface:* 3 inches thick

*Upper part of surface layer:*  
 0 to 5 inches—brown loam

*Lower part of surface layer:*  
 5 to 12 inches—brown, stratified silt loam to sandy loam

*Upper part of substratum:*  
 12 to 21 inches—pale brown gravelly coarse sandy loam

*Middle part of substratum:*  
 21 to 30 inches—multicolored very gravelly coarse sand

*Lower part of substratum:*  
 30 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat poorly drained and moderately well drained

*Permeability:* Moderate over moderately rapid and rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—slight

*Water table:* Present in March through June (see “Water Features” table)

*Frequency, duration, and period of flooding:*  
 Occasional, brief periods in March through June

### Contrasting Inclusions

- Manley and Resner soils
- Andic Cryaquepts
- Soils that have a thick, dark-colored surface layer

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Engelmann spruce and subalpine fir—readily; Douglas-fir, western larch, and lodgepole pine—periodically

*Limitations for planting:* None

**106—Cubcreek fine sandy loam, 0 to 3 percent slopes****Composition**

*Cubcreek soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

**Setting**

*Position on landscape:* Stream terraces and flood plains

*Parent material:* Recent alluvium

*Slope range:* 0 to 3 percent

*Elevation:* 1,500 to 2,100 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Upper part of surface layer:*

0 to 10 inches—dark gray fine sandy loam

*Lower part of surface layer:*

10 to 19 inches—grayish brown and gray, stratified sandy loam to gravelly loamy sand

*Substratum:*

19 to 60 inches—mottled, light brownish gray and light gray, stratified loam to gravelly loamy fine sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderate over moderately rapid and rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight; forestland—none to slight

*Hazard of wind erosion (bare surface):* Moderate

*Water table:* Present in January through June (see “Water Features” table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in February through May

**Contrasting Inclusions**

- Boesel soils
- Aquic Xerofluvents and Ret soils
- Bong soils
- Soils that are very gravelly sand below a depth of about 12 inches

**Major Uses**

Timber production, livestock grazing, nonirrigated hay and pasture, watershed, wildlife habitat, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir—readily

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by wind erosion.

**107—Cumulic Haploxerolls, 3 to 10 percent slopes****Composition**

*Cumulic Haploxerolls and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Alluvial fans

*Parent material:* Alluvium

*Slope range:* 3 to 10 percent

*Elevation:* 1,700 to 2,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Reference Profile**

*Surface layer:*

0 to 30 inches—dark grayish brown gravelly loam

*Substratum:*

30 to 60 inches—dark brown gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Moderately well drained  
*Permeability:* Moderate over moderately rapid and rapid  
*Available water capacity:* High  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight  
*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Present in February through May (see “Water Features” table)

### Contrasting Inclusions

- Tye soils
- Ginnis and Morical soils
- Soils that are somewhat poorly drained
- Soils that have a cobbly surface layer

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This unit has a high water table at certain times of the year that limits use of the unit.
- This unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope.

## 108—Dart loamy sand, warm, 0 to 15 percent slopes

### Composition

*Dart soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Sandy glacial outwash  
*Slope range:* 0 to 15 percent  
*Elevation:* 1,400 to 2,800 feet  
*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*  
 0 to 3 inches—grayish brown loamy sand  
*Subsoil:*  
 3 to 14 inches—pale brown loamy sand  
*Upper part of substratum:*  
 14 to 32 inches—pale brown loamy sand  
*Lower part of substratum:*  
 32 to 60 inches—pale brown sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very slow or slow  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight  
*Hazard of wind erosion (bare surface):* Very severe

### Contrasting Inclusions

- Spens and Springdale soils
- Winthrop and Garrison soils
- Phoebe soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration.

### 109—Dart loamy coarse sand, warm, 30 to 65 percent slopes

#### Composition

*Dart soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terrace escarpments and backslopes of hills

*Parent material:* Sandy glacial outwash

*Slope range:* 30 to 65 percent

*Elevation:* 1,400 to 2,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Surface layer:*

0 to 8 inches—grayish brown loamy coarse sand

*Upper part of substratum:*

8 to 16 inches—light gray loamy sand

*Lower part of substratum:*

16 to 60 inches—light gray sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Severe

#### Contrasting Inclusions

- Spens and Springdale soils
- Bong soils
- Rock outcrop

#### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

#### Use and Management

##### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of

slope and use results in excessive soil damage and erosion; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Steepness of slope

### 110—Dart, warm-Springdale complex, 5 to 30 percent slopes

#### Composition

*Dart soil and similar soils:* 50 percent

*Springdale soil and similar soils:* 35 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Dissected outwash terraces and terrace escarpments

*Parent material:* Dart—sandy glacial outwash;  
Springdale soil—glacial outwash mixed with a component of loess and volcanic ash

*Slope range:* 5 to 30 percent

*Elevation:* 1,400 to 2,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

##### Dart

*Surface layer:*

0 to 3 inches—grayish brown loamy sand

*Subsoil:*

3 to 14 inches—pale brown loamy sand

*Upper part of substratum:*

14 to 32 inches—pale brown loamy sand

*Lower part of substratum:*

32 to 60 inches—pale brown sand

##### Springdale

*Organic mat on the surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown gravelly sandy loam

*Subsoil:*

4 to 11 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

11 to 17 inches—very pale brown gravelly sand

*Lower part of substratum:*

17 to 60 inches—multicolored extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Dart—rapid; Springdale—moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Dart—very severe; Springdale—moderate

### Contrasting Inclusions

- Phoebe soils
- Bong soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically  
*Limitations for planting:* Dart—none; Springdale—rock fragments in the soil

#### Irrigated Cropland

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope and droughtiness and by fast infiltration of the Dart soil.

### 111—Dart, warm-Springdale complex, 30 to 65 percent slopes

#### Composition

*Dart soil and similar soils:* 45 percent  
*Springdale soil and similar soils:* 40 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Dart—sandy glacial outwash;

Springdale—glacial outwash mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent  
*Elevation:* 1,400 to 2,800 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

#### Dart

*Surface layer:*  
0 to 5 inches—brown loamy sand  
*Upper part of substratum:*  
5 to 38 inches—light yellowish brown sand

*Lower part of substratum:*  
38 to 60 inches—multicolored coarse sand

#### Springdale

*Organic mat on the surface:* 1 inch thick

*Surface layer:*  
0 to 4 inches—grayish brown gravelly sandy loam

*Subsoil:*  
4 to 11 inches—pale brown gravelly sandy loam

*Upper part of substratum:*  
11 to 17 inches—very pale brown gravelly sand

*Lower part of substratum:*  
17 to 60 inches—multicolored extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Dart—rapid; Springdale—moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Dart—very severe; Springdale—severe

### Contrasting Inclusions

- Phoebe soils
- Bong soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Dart—steepness of slope; Springdale—rock fragments in the soil and steepness of slope

## 112—Dehart gravelly loam, 8 to 30 percent slopes

### Composition

*Dehart soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toe slopes, backslopes, and shoulders of hills

*Parent material:* Glacial till and colluvium derived from metamorphic rock mixed with a component of loess and volcanic ash

*Slope range:* 8 to 30 percent

*Elevation:* 1,700 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 7 inches—brown gravelly loam

*Subsoil:*

7 to 32 inches—pale brown very gravelly loam

*Substratum:*

32 to 60 inches—very pale brown very gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Springdale soils
- Raisio soils
- Hudnut soils
- Donavan soils
- Rock outcrop

### Use and Management

Timber production, livestock grazing, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

## 113—Dehart gravelly loam, 30 to 65 percent slopes

### Composition

*Dehart soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and shoulders of hills

*Parent material:* Glacial till and colluvium derived from metamorphic rock mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 1,700 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 7 inches—brown gravelly loam

*Subsoil:*

7 to 32 inches—pale brown very gravelly loam

*Substratum:*

32 to 60 inches—very pale brown very gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—severe

### Contrasting Inclusions

- Springdale soils
- Raisio soils
- Hudnut soils
- Donavan soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

## 114—Dehart-Phoebe, dry complex, 30 to 65 percent slopes

### Composition

*Dehart soil and similar soils:* 60 percent

*Phoebe soil, dry, and similar soils:* 25 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Dehart—backslopes of hills;

Phoebe—terrace escarpments

*Parent material:* Dehart—colluvium derived from glacial till and metamorphic rock mixed with a component of loess and volcanic ash; Phoebe—glacial till mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 17 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

#### Dehart

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 7 inches—brown gravelly loam

*Subsoil:*

7 to 32 inches—pale brown very gravelly loam

*Substratum:*

32 to 60 inches—very pale brown very gravelly loam

#### Phoebe

*Organic mat on the surface:* 1 inch thick

*Surface layer:*

0 to 16 inches—grayish brown fine sandy loam

*Upper part of subsoil:*

16 to 30 inches—yellowish brown gravelly fine sandy loam

*Lower part of the subsoil:*

30 to 39 inches—light olive brown gravelly sandy loam

*Substratum:*

39 to 60 inches—light olive brown loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Dehart—moderate; Phoebe—moderately rapid over very rapid

*Available water capacity:* Dehart—moderate; Phoebe—moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—severe

### Contrasting Inclusions

- Garrison soils
- Soils that have more clay in the subsoil
- Dart soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Steepness of slope

## 115—Dehart-Rock outcrop complex, 8 to 30 percent slopes

### Composition

*Dehart soil and similar soils:* 55 percent

*Rock outcrop:* 25 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Toeslopes and backslopes of hills

*Parent material:* Glacial till and colluvium derived from metamorphic rock mixed with a component of loess and volcanic ash

*Slope range:* 8 to 30 percent

*Elevation:* 1,700 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Dehart Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 8 inches—brown and grayish brown gravelly loam

*Subsoil:*

8 to 30 inches—pale brown very gravelly loam

*Substratum:*

30 to 60 inches—very pale brown very gravelly loam

### Soil properties and qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Phyllite, schist, slate, graywacke, and quartzite

### Contrasting Inclusions

- Springdale soils
- Raisio soils
- Rufus soils
- Hudnut soils
- Donovan soils
- Rubble land

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

## 116—Dehart-Rock outcrop complex, 30 to 65 percent slopes

### Composition

*Dehart soil and similar soils:* 50 percent

*Rock outcrop:* 30 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and shoulders of hills  
*Parent material:* Glacial till and colluvium derived from metamorphic rock mixed with a component of loess and volcanic ash  
*Slope range:* 30 to 65 percent  
*Elevation:* 1,700 to 3,000 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Dehart Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 8 inches—brown and grayish brown gravelly loam  
*Subsoil:*  
 8 to 30 inches—pale brown very gravelly loam  
*Substratum:*  
 30 to 60 inches—very pale brown very gravelly loam

#### Soil properties and qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Forestland—severe

### Rock Outcrop

*Kind of rock:* Phyllite, schist, graywacke, slate, and quartzite

### Contrasting Inclusions

- Springdale soils
- Raisio soils
- Rufus soils
- Hudnut soils
- Donavan soils
- Rubble land

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically  
*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

## 117—Dinkelman loam, 5 to 20 percent slopes

### Composition

*Dinkelman soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes of hills and mountains  
*Parent material:* Residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash in the upper part  
*Slope range:* 5 to 20 percent  
*Elevation:* 2,000 to 3,800 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 13 inches—grayish brown and brown loam  
*Upper part of subsoil:*  
 13 to 28 inches—light yellowish brown gravelly loam  
*Lower part of subsoil:*  
 28 to 39 inches—very pale brown gravelly sandy loam  
*Substratum:*  
 39 to 43 inches—very pale brown gravelly coarse sandy loam  
*Bedrock:*  
 43 to 53 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Bearspring soils
- Canteen soils
- Brushcreek soils
- Mineral soils
- Centralpeak soils
- Soils that have a very stony surface
- Spokane soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

### 118—Dinkelman loam, 20 to 40 percent slopes

#### Composition

*Dinkelman soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 3,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 13 inches—grayish brown and brown loam

*Upper part of subsoil:*

13 to 28 inches—light yellowish brown gravelly loam

*Lower part of subsoil:*

28 to 39 inches—very pale brown gravelly sandy loam

*Substratum:*

39 to 43 inches—very pale brown gravelly coarse sandy loam

*Bedrock:*

43 to 53 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Bearspring soils
- Canteen soils
- Brushcreek soils
- Mineral soils
- Centralpeak soils
- Soils that have a very stony surface
- Spokane soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

### 119—Dinkelman gravelly loam, 40 to 65 percent slopes

#### Composition

*Dinkelman soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 40 to 65 percent

*Elevation:* 2,000 to 3,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*

0 to 10 inches—grayish brown gravelly loam

*Lower part of surface layer:*

10 to 17 inches—brown gravelly sandy loam

*Subsoil:*

17 to 43 inches—light yellowish brown gravelly sandy loam

*Bedrock:*

43 to 53 inches—weathered granitic rock

#### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—severe or very severe

#### Contrasting Inclusions

- Bearspring soils
- Canteen soils
- Brushcreek soils
- Mineral soils
- Centralpeak soils
- Soils that have a very stony surface
- Spokane soils
- Rock outcrop

#### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* Steepness of slope

### 120—Disautel very fine sandy loam, 0 to 8 percent slopes

#### Composition

*Disautel soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Ground moraines on foothills

*Parent material:* Loess over glacial till

*Slope range:* 0 to 8 percent

*Elevation:* 1,600 to 2,400 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

#### Typical Profile

*Surface layer:*

0 to 15 inches—dark grayish brown and brown very fine sandy loam

*Upper part of subsoil:*

15 to 32 inches—pale brown very fine sandy loam

*Lower part of subsoil:*

32 to 60 inches—light gray, calcareous dense glacial till that crushes to very gravelly fine sandy loam

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

**Contrasting Inclusions**

- Soils that have a stony or very stony surface
- Nespelem soils
- Hobohill and Haley soils
- Owhi soils
- Poween soils

**Major Uses**

Livestock grazing, nonirrigated cropland, recreation, watershed, wildlife habitat, and building site development

**Use and Management****Livestock grazing**

- The depth to dense glacial till restricts pond development.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, wind erosion, and rooting depth.

**121—Disautel very fine sandy loam, 8 to 15 percent slopes****Composition**

*Disautel soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Ground moraines on foothills

*Parent material:* Loess over glacial till

*Slope range:* 8 to 15 percent

*Elevation:* 1,600 to 2,400 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Typical Profile***Surface layer:*

0 to 15 inches—dark grayish brown and brown very fine sandy loam

*Upper part of subsoil:*

15 to 32 inches—pale brown very fine sandy loam

*Lower part of subsoil:*

32 to 60 inches—light gray, calcareous dense glacial till that crushes to very gravelly fine sandy loam

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium

*Hazard of water erosion:* Cropland—moderate; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

**Contrasting Inclusions**

- Soils that have a stony or very stony surface
- Nespelem soils
- Hobohill and Haley soils
- Owhi soils
- Poween soils

**Major Uses**

Livestock grazing, nonirrigated cropland, recreation, watershed, and wildlife habitat

**Use and Management****Livestock grazing**

- There are no significant limitations for management of this soil for this use.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, wind erosion, and rooting depth.

**122—Disautel-Nespelem complex, 3 to 20 percent slopes****Composition**

*Disautel soil and similar soils:* 60 percent

*Nespelem soil and similar soils:* 30 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Disautel—ground moraines on foothills; Nespelem—terraces adjacent to foothills

*Parent material:* Disautel—loess over glacial till; Nespelem—loess over glacial lake sediment

*Slope range:* 3 to 20 percent

*Elevation:* 2,000 to 2,300 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

#### Disautel

*Surface layer:*

0 to 15 inches—dark grayish brown and brown very fine sandy loam

*Upper part of subsoil:*

15 to 32 inches—pale brown very fine sandy loam

*Lower part of subsoil:*

32 to 60 inches—light gray, calcareous dense glacial till that crushes to very gravelly fine sandy loam

#### Nespelem

*Surface layer:*

0 to 12 inches—grayish brown silt loam

*Upper part of subsoil:*

12 to 22 inches—pale brown silt loam

*Middle part of subsoil:*

22 to 24 inches—light brownish gray hardpan

*Lower part of subsoil:*

24 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Disautel—moderately deep (20 to 40 inches to dense glacial till); Nespelem—moderately deep (20 to 40 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Disautel—moderate over slow; Nespelem—moderate

*Available water capacity:* Disautel—high; Nespelem—moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Disautel—severe; Nespelem—slight

### Contrasting Inclusions

- Ewall soils
- Poween and Narcisse soils

### Major Uses

Livestock grazing, nonirrigated cropland, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- The depth to the hardpan in the Nespelem soil and the depth to dense glacial till in the Disautel soil restrict pond development. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### Irrigated cropland

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope, wind erosion, and rooting depth.

### 123—Disautel-Rock outcrop complex, 3 to 30 percent slopes

#### Composition

*Disautel soil and similar soils:* 50 percent

*Rock outcrop:* 30 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Ground moraines on foothills

*Parent material:* Loess over glacial till

*Slope range:* 3 to 30 percent

*Elevation:* 1,600 to 2,400 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

#### Disautel Soil

#### Typical profile

*Surface layer:*

0 to 15 inches—dark grayish brown and brown very fine sandy loam

*Upper part of subsoil:*

15 to 32 inches—pale brown very fine sandy loam

*Lower part of subsoil:*

32 to 60 inches—light gray, calcareous dense glacial till that crushes to very gravelly fine sandy loam

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Rock Outcrop

*Kind of rock:* Granite

### Contrasting Inclusions

- Soils that have a stony or bouldery surface
- Soils that have bedrock at a depth of 10 to 40 inches
- Nespelem soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

## 124—Donavan sandy loam, warm, 5 to 15 percent slopes

### Composition

*Donavan soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toeslopes and summits of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 5 to 15 percent

*Elevation:* 2,200 to 3,600 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*

0 to 9 inches—grayish brown sandy loam

*Lower part of surface layer:*

9 to 15 inches—pale brown sandy loam

*Subsoil:*

15 to 33 inches—light gray cobbly sandy loam

*Substratum:*

33 to 60 inches—white dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Nevine and Torboy soils
- Soils that are 40 to 60 inches deep to hard granitic rock
- Soils that are very gravelly
- Soils that have sand at a depth of about 30 inches
- Soils that have a stony surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, wind erosion, and rooting depth.

## 125—Donavan sandy loam, warm, 15 to 30 percent slopes

### Composition

*Donavan soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 15 to 30 percent

*Elevation:* 2,200 to 3,600 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*

0 to 9 inches—grayish brown sandy loam

*Lower part of surface layer:*

9 to 15 inches—pale brown sandy loam

*Subsoil:*

15 to 33 inches—light gray cobbly sandy loam

*Substratum:*

33 to 60 inches—white dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Aits and Republic soils
- Vanbrunt soils
- Soils that are very gravelly
- Soils that have sand at a depth of about 30 inches
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—moderate

*Limitations for planting:* None

### 126—Donavan bouldery sandy loam, warm, 5 to 20 percent slopes

#### Composition

*Donavan soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Toeslopes and summits of hills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 5 to 20 percent

*Elevation:* 1,500 to 3,600 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

*Rock fragments on surface:* Boulders and stones cover 0.1 to 3.0 percent

#### Typical Profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*

0 to 8 inches—grayish brown bouldery sandy loam

*Lower part of surface layer:*

8 to 15 inches—light brownish gray sandy loam

*Subsoil:*

15 to 36 inches—light gray cobbly sandy loam

*Substratum:*

36 to 60 inches—very pale brown dense glacial till that crushes to cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

### Contrasting Inclusions

- Vanbrunt soils
- Soils that are very gravelly
- Republic soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and large stones.

## 127—Donavan bouldery sandy loam, warm, 20 to 40 percent slopes

### Composition

*Donavan soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 20 to 40 percent

*Elevation:* 1,500 to 3,600 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

*Rock fragments on surface:* Boulders and stones cover 0.1 to 3.0 percent

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*

0 to 8 inches—grayish brown bouldery sandy loam

*Lower part of surface layer:*

8 to 15 inches—light brownish gray sandy loam

*Subsoil:*

15 to 36 inches—light gray cobbly sandy loam

*Substratum:*

36 to 60 inches—very pale brown dense glacial till that crushes to cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Vanbrunt soils
- Stapaloop soils
- Bernhill soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

## 128—Donavan loam, dry, 5 to 15 percent slopes

### Composition

*Donavan soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toeslopes of foothills and mountains, and till plains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 5 to 15 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 11 inches—dark grayish brown and brown loam

*Subsoil:*

11 to 21 inches—pale brown gravelly loam

*Substratum:*

21 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Goldlake soils
- Hudnut soils
- Northstar and Vanbrunt soils
- Apex and Republic soils

### Major Uses

Timber production, livestock grazing, nonirrigated hay (fig. 6), building site development, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and

tracked equipment—suitable; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 129—Donavan loam, dry, 15 to 30 percent slopes

### Composition

*Donavan soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Toeslopes and footslopes of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 15 to 30 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 11 inches—dark grayish brown and brown loam

*Subsoil:*

11 to 21 inches—pale brown gravelly loam

*Substratum:*

21 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

Figure 6.—Area of Donovan loam, dry, 5 to 15 percent slopes, used for hay production.

*Hazard of water erosion:* Cropland—moderate or severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Louiecreek and Whitestone soils
- Hudnut soils
- Northstar and Vanbrunt soils
- Apex and Republic soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, recreation, and watershed

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

### 130—Donavan loam, dry, 30 to 65 percent slopes

#### Composition

*Donavan soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

#### Setting

*Position on landscape:* Backslopes of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 30 to 65 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

#### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 11 inches—dark grayish brown loam

*Subsoil:*

11 to 21 inches—pale brown gravelly loam

*Substratum:*

21 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

#### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

#### Contrasting Inclusions

- Louiecreek and Whitestone soils
- Northstar and Vanbrunt soils
- Scoap soils
- Rock outcrop

#### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* Steepness of slope

### 131—Donavan bouldery loam, dry, 5 to 20 percent slopes

#### Composition

*Donavan soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

#### Setting

*Position on landscape:* Toeslopes and summits of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

*Rock fragments on surface:* Boulders and stones cover 0.1 to 3.0 percent

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown bouldery loam

*Lower part of surface layer:*

5 to 10 inches—brown gravelly sandy loam

*Subsoil:*

10 to 21 inches—light yellowish brown gravelly sandy loam

*Substratum:*

21 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

#### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained  
*Permeability:* Moderately rapid over slow  
*Available water capacity:* Moderately high  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Forestland—slight or moderate

### Contrasting Inclusions

- Republic soils
- Soils that have a very gravelly or very stony subsoil and substratum
- Northstar and Vanbrunt soils
- Rock outcrop

### Major Uses

*Current uses:* Timber production, livestock grazing, wildlife habitat, recreation, and watershed  
*Potential use:* Building site development

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and large stones.

## 132—Donavan bouldery loam, dry, 20 to 40 percent slopes

### Composition

*Donavan soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Footslopes of foothills and mountains  
*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part  
*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,000 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 120 days  
*Rock fragments on surface:* Boulders and stones cover 0.1 to 3.0 percent

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*  
 0 to 5 inches—dark grayish brown bouldery loam

*Lower part of surface layer:*  
 5 to 10 inches—brown gravelly sandy loam

*Subsoil:*  
 10 to 21 inches—light yellowish brown gravelly sandy loam

*Substratum:*  
 21 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Soils that have a very gravelly or very stony substratum
- Vanbrunt soils
- Republic soils
- Swakane soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically  
*Limitations for planting:* None

**133—Donavan, dry-Goldlake complex,  
0 to 15 percent slopes****Composition**

*Donavan soil and similar soils:* 55 percent  
*Goldlake soil and similar soils:* 30 percent  
*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Donovan—convex areas of ground moraines on foothills; Goldlake—concave areas of ground moraines on hills  
*Parent material:* Donovan—glacial till mixed with a component of loess and volcanic ash in the upper part; Goldlake—glacial till and slope alluvium mixed with a component of loess and volcanic ash  
*Slope range:* Donovan—5 to 15 percent; Goldlake—0 to 8 percent  
*Elevation:* 2,000 to 3,500 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

**Typical Profile****Donavan**

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 11 inches—dark grayish brown and brown loam  
*Subsoil:*  
 11 to 21 inches—pale brown gravelly loam  
*Substratum:*  
 21 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

**Goldlake**

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 22 inches—dark grayish brown and grayish brown silt loam  
*Upper part of subsoil:*  
 22 to 29 inches—pale brown gravelly loam  
*Lower part of subsoil:*  
 29 to 40 inches—very pale brown gravelly sandy loam

*Substratum:*

40 to 60 inches—very pale brown dense glacial till that crushes to gravelly coarse sandy loam

**Soil Properties and Qualities**

*Depth class:* Donovan—moderately deep (20 to 40 inches to dense glacial till); Goldlake—deep (40 to 60 inches to dense glacial till)  
*Drainage class:* Donovan—well drained; Goldlake—moderately well drained  
*Permeability:* Donovan—moderately rapid over slow; Goldlake—moderate over slow  
*Available water capacity:* Donovan—moderately high; Goldlake—high  
*Effective rooting depth:* Donovan—20 to 40 inches; Goldlake—40 to 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion (Donavan):* Cropland—slight or moderate; forestland—slight or moderate  
*Hazard of water erosion (Goldlake):* Cropland—slight or moderate; forestland—slight  
*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Goldlake—present in March through May (see “Water Features” table)

**Contrasting Inclusions**

- Soils that have a very gravelly subsoil and substratum
- Northstar soils
- Lostcreek soils

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

**Irrigated Cropland**

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope and rooting depth.

### 134—Donavan, dry-Northstar complex, 5 to 30 percent slopes

#### Composition

*Donavan soil and similar soils:* 50 percent

*Northstar soil and similar soils:* 30 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Donovan—toeslopes and footslopes of foothills and mountains; Northstar—summits and shoulders of hills and mountains

*Parent material:* Donovan—glacial till mixed with a component of loess and volcanic ash in the upper part; Northstar—residuum and colluvium derived from rhyodacite and quartz latite mixed with a component of loess and volcanic ash

*Slope range:* 5 to 30 percent

*Elevation:* 2,000 to 3,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

##### Donavan

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 11 inches—dark grayish brown and brown loam

*Subsoil:*

11 to 21 inches—pale brown gravelly loam

*Substratum:*

21 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

##### Northstar

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*

0 to 2 inches—grayish brown gravelly loam

*Lower part of surface layer:*

2 to 11 inches—grayish brown very gravelly loam

*Subsoil:*

11 to 18 inches—pale brown very gravelly loam

*Substratum:*

18 to 27 inches—pale brown extremely cobbly loam

*Bedrock:*

27 to 31 inches—rhyodacite

#### Soil Properties and Qualities

*Depth class:* Donovan—moderately deep (20 to 40

inches to dense glacial till); Northstar—moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Donovan—moderately rapid over slow; Northstar—moderate

*Available water capacity:* Donovan—moderately high; Northstar—low

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion:* Slight

#### Contrasting Inclusions

- Johntom soils
- Republic soils
- Louiecreek soils
- Rock outcrop

#### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### Use and Management

##### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration (Donavan):*

Ponderosa pine and Douglas-fir—periodically

*Potential for natural regeneration (Northstar):*

Ponderosa pine—periodically

*Limitations for planting:* None

##### Irrigated Cropland

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope and rooting depth and by droughtiness of the Northstar soil.

### 135—Donavan, warm-Rock outcrop complex, 5 to 20 percent slopes

#### Composition

*Donavan soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toeslopes and shoulders of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 5 to 20 percent

*Elevation:* 1,800 to 3,600 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

*Rock fragments on surface:* Donovan—boulders and stones cover 0.1 to 3.0 percent

### Donavan Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 8 inches—grayish brown bouldery sandy loam

*Lower part of surface layer:*

8 to 15 inches—light brownish gray sandy loam

*Subsoil:*

15 to 36 inches—light gray cobbly sandy loam

*Substratum:*

36 to 60 inches—very pale brown dense glacial till that crushes to cobbly sandy loam

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

#### Contrasting Inclusions

- Apex and Republic soils
- Vanbrunt soils
- Soils that are very gravelly
- Soils that have sand at a depth of about 30 inches

#### Major Uses

*Current uses:* Timber production, livestock grazing, watershed, wildlife habitat, and recreation

*Potential use:* Building site development

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock outcrop

### 136—Donavan, dry-Rock outcrop, 5 to 20 percent slopes

#### Composition

*Donavan soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Summits and shoulders of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

*Rock fragments on surface:* Donovan—boulders and stones cover 0.1 to 3.0 percent

### Donavan Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown bouldery loam

*Lower part of surface layer:*

5 to 10 inches—brown gravelly sandy loam

*Subsoil:*

10 to 21 inches—brownish yellow gravelly sandy loam

*Substratum:*

21 to 60 inches—brownish yellow and pale yellow dense glacial till that crushes to gravelly sandy loam

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

**Rock Outcrop**

*Kind of rock:* Granitic rock, rhyodacite, and metamorphic rock

**Contrasting Inclusions**

- Republic soils
- Soils that have a very gravelly or very stony subsoil and substratum
- Northstar and Vanbrunt soils
- Soils that have a sandy loam surface layer

**Major Uses**

*Current uses:* Timber production, livestock grazing, wildlife habitat, and watershed

*Potential use:* Building site development

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* Rock outcrop

**137—Donavan, dry-Rock outcrop complex, 20 to 40 percent slopes****Composition**

*Donavan soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Shoulders and backslopes of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

*Rock fragments on surface:* Donovan—boulders and stones cover 0.1 to 3.0 percent

**Donavan Soil****Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 10 inches—dark grayish brown bouldery loam

*Subsoil:*

10 to 21 inches—brownish yellow gravelly sandy loam

*Substratum:*

21 to 60 inches—brownish yellow and pale yellow dense glacial till that crushes to gravelly sandy loam

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

**Rock Outcrop**

*Kind of rock:* Granitic rock, rhyodacite, and metamorphic rock

**Contrasting Inclusions**

- Louiecreek and Scoap soils
- Vanbrunt and Northstar soils
- Swakane and Johntom soils
- Republic soils
- Lostcreek soils
- Soils that have a very stony surface

**Major Uses**

Timber production, livestock grazing, wildlife habitat, recreation, and watershed

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* Rock outcrop

### 138—Donavan, warm-Rock outcrop complex, 20 to 40 percent slopes

#### Composition

*Donavan soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Foothills and backslopes of foothills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 3,600 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

*Rock fragments on surface:* Donovan—boulders and stones cover 0.1 to 3.0 percent

#### Donavan Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 8 inches—grayish brown bouldery sandy loam

*Lower part of surface layer:*

8 to 15 inches—light brownish gray sandy loam

*Subsoil:*

15 to 36 inches—light gray cobbly sandy loam

*Substratum:*

36 to 60 inches—very pale brown dense glacial till that crushes to cobbly sandy loam

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

#### Rock Outcrop

*Kind of rock:* Granitic rock

#### Contrasting Inclusions

- Vanbrunt soils
- Republic and Stapaloop soils
- Soils that have a very gravelly subsoil or substratum

#### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

#### Use and Management

##### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock outcrop

### 139—Duleylake loam, 0 to 8 percent slopes

#### Composition

*Duleylake soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Basins on glacial till plains

*Parent material:* Alluvium mixed with loess

*Slope range:* 0 to 8 percent

*Elevation:* 2,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

#### Typical Profile

*Surface layer:*

0 to 17 inches—dark grayish brown and brown loam

*Upper part of subsoil:*

17 to 23 inches—yellowish brown loam  
23 to 31 inches—pale brown sandy loam

*Middle part of subsoil:*

31 to 37 inches—light brownish yellow, calcareous clay loam

*Lower part of subsoil:*

37 to 60 inches—very pale brown, calcareous silt loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in January through June (see “Water Features” table)

**Contrasting Inclusions**

- Soils that are somewhat poorly drained and poorly drained
- Timentwa soils
- Picard soils
- Emdent soils

**Major Uses**

Nonirrigated cropland, nonirrigated hay and pasture, livestock grazing, wildlife habitat, recreation, and watershed

**Use and Management****Livestock grazing**

- This soil has a high water table at certain times of the year that limits use of the soil.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and wetness.

**140—Elbowlake silt loam, 5 to 20 percent slopes****Composition**

*Elbowlake soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Toeslopes and footslopes of hills and mountains

*Parent material:* Volcanic ash over glacial till derived dominantly from metasedimentary rock

*Slope range:* 5 to 20 percent

*Elevation:* 2,100 to 4,100 feet

*Average annual precipitation:* 18 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 2 inches—brown silt loam

*Upper part of subsoil:*

2 to 15 inches—light yellowish brown silt loam

*Lower part of subsoil:*

15 to 20 inches—pale brown very gravelly loam

*Substratum:*

20 to 60 inches—light brownish gray dense glacial till that crushes to very channery sandy loam

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Inkler soils
- Hartill soils
- Kiehl soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir,

grand fir, and western larch—readily; lodgepole pine and western redcedar—periodically  
*Limitations for planting:* None

#### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by rooting depth, steepness of slope, and water erosion.

### **141—Elbowlake silt loam, 20 to 40 percent slopes**

#### **Composition**

*Elbowlake soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Backslopes and footslopes of hills and mountains

*Parent material:* Mantle of volcanic ash 14 to 20 inches thick over glacial till derived dominantly from metasedimentary rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,100 to 4,100 feet

*Average annual precipitation:* 18 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### **Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 2 inches—brown silt loam

*Upper part of subsoil:*

2 to 15 inches—light yellowish brown silt loam

*Lower part of subsoil:*

15 to 20 inches—pale brown very gravelly loam

*Substratum:*

20 to 60 inches—light brownish gray dense glacial till that crushes to very channery sandy loam

#### **Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe

*Hazard of wind erosion (bare surface):* Slight

#### **Contrasting Inclusions**

- Inkler soils
- Hartill soils
- Rock outcrop

#### **Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### **Silviculture**

*Potential for natural regeneration:* Douglas-fir, grand fir, and western larch—readily; lodgepole pine and western redcedar—periodically

*Limitations for planting:* None

### **142—Elbowlake silt loam, 40 to 65 percent slopes**

#### **Composition**

*Elbowlake soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

#### **Setting**

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Volcanic ash and loess over glacial till derived dominantly from metasedimentary rock

*Slope range:* 40 to 65 percent

*Elevation:* 2,100 to 4,100 feet

*Average annual precipitation:* 18 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### **Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 2 inches—brown silt loam

*Upper part of subsoil:*

2 to 15 inches—light yellowish brown silt loam

*Lower part of subsoil:*

15 to 20 inches—pale brown very gravelly loam

*Substratum:*

20 to 60 inches—light brownish gray dense glacial till that crushes to very channery sandy loam

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

**Contrasting Inclusions**

- Inkler soils
- Hartill soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, grand fir, and western larch—readily; lodgepole pine and western redcedar—periodically

*Limitation for planting:* Steepness of slope

**143—Elbowlake silt loam, warm, 5 to 20 percent slopes****Composition**

*Elbowlake soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Toeslopes and footslopes of hills and mountains

*Parent material:* Volcanic ash and loess over glacial till derived dominantly from metasedimentary rock

*Slope range:* 5 to 20 percent

*Elevation:* 2,100 to 4,100 feet

*Average annual precipitation:* 18 to 24 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—dark grayish brown silt loam

*Subsoil:*

5 to 20 inches—yellowish brown silt loam

*Substratum:*

20 to 60 inches—light yellowish brown dense glacial till that crushes to very gravelly loam

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Kiehl soils
- Apex soils
- Inkler soils
- Republic soils
- Hartill and Ozerine soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by rooting depth, steepness of slope, and water erosion.

## 144—Elbowlake silt loam, warm, 20 to 40 percent slopes

### Composition

*Elbowlake soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains

*Parent material:* Volcanic ash over glacial till derived dominantly from metasedimentary rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,100 to 4,100 feet

*Average annual precipitation:* 18 to 24 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 5 inches—dark grayish brown silt loam

*Subsoil:*

5 to 20 inches—yellowish brown silt loam

*Substratum:*

20 to 60 inches—light yellowish brown dense glacial till that crushes to very gravelly loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Inkler soils
- Republic soils
- Apex soils
- Hartill and Ozerine soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitations for planting:* None

## 145—Elbowlake silt loam, warm, 40 to 65 percent slopes

### Composition

*Elbowlake soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Volcanic ash mantle over glacial till derived dominantly from metasedimentary rock

*Slope range:* 40 to 65 percent

*Elevation:* 2,100 to 4,100 feet

*Average annual precipitation:* 18 to 24 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—dark grayish brown silt loam

*Subsoil:*

5 to 20 inches—yellowish brown silt loam

*Substratum:*

20 to 60 inches—light yellowish brown dense glacial till that crushes to very gravelly loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Inkler soils
- Oxerine and Hartill soils
- Apex soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitation for planting:* Steepness of slope

## 146—Ellisforde silt loam, 0 to 5 percent slopes

### Composition

*Ellisforde soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Loess over glacial lake sediment

*Slope range:* 0 to 5 percent

*Elevation:* 750 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown silt loam

*Subsoil:*

12 to 18 inches—light brownish gray silt loam

*Upper part of substratum:*

18 to 30 inches—pale brown silt loam

*Lower part of substratum:*

30 to 60 inches—very pale brown and pale brown, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

*Frequency of flooding:* Rare near mouth of Okanogan River; none in other areas

### Contrasting Inclusions

- Monse soils
- Aeneas soils
- Pogue soils
- Cashmere and Cashmont soils
- Quincy soils

### Major Uses

Pasture, livestock grazing, watershed, wildlife habitat, building site development, and recreation

### Use and Management

#### Livestock grazing

• There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

• If this soil is used for irrigated crops, it is limited by water erosion.

## 147—Ellisforde silt loam, 5 to 10 percent slopes

### Composition

*Ellisforde soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Loess over glacial lake sediment

*Slope range:* 5 to 10 percent

*Elevation:* 750 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown silt loam

*Subsoil:*

12 to 18 inches—light brownish gray silt loam

*Upper part of substratum:*

18 to 30 inches—pale brown silt loam

*Lower part of substratum:*

30 to 60 inches—very pale brown and pale brown, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Hazard of water erosion:* Cropland—moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Monse soils
- Aeneas soils
- Pogue soils
- Cashmere and Cashmont soils
- Quincy soils

### Major Uses

Nonirrigated and irrigated cropland, irrigated orchards, irrigated hay and pasture, livestock grazing, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 148—Ellisforde silt loam, 10 to 25 percent slopes

### Composition

*Ellisforde soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments

*Parent material:* Loess over glacial lake sediment

*Slope range:* 10 to 25 percent

*Elevation:* 750 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown silt loam

*Subsoil:*

12 to 18 inches—light brownish gray silt loam

*Upper part of substratum:*

18 to 30 inches—pale brown silt loam

*Lower part of substratum:*

30 to 60 inches—very pale brown and pale brown, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Aeneas soils
- Pogue soils
- Cashmere and Cashmont soils
- Quincy soils

### Major Uses

Livestock grazing, nonirrigated cropland, irrigated orchards, irrigated hay and pasture, watershed, recreation, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 149—Elvedere silt loam, 15 to 30 percent slopes

### Composition

*Elvedere soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Undulating terraces and terrace escarpments

*Parent material:* Glacial lake sediment

*Slope range:* 15 to 30 percent

*Elevation:* 1,100 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Subsurface layer:*

0 to 6 inches—light gray silt loam

*Upper part of subsoil:*

6 to 10 inches—pale brown and light gray silty clay loam

*Lower part of subsoil:*

10 to 60 inches—very pale brown, light gray, and white, calcareous silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Slow

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Hazard of water erosion:* Cropland—severe or very severe; rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Ellisforde soils
- Cashmere soils
- Winchester and Quincy soils
- Soils that have a stony or bouldery surface
- Leahy soils
- Soils that have been eroded, exposing unweathered lake sediment

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is clayey, which restricts pipeline installation.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and slow permeability.

## 150—Elvedere stony silt loam, 3 to 25 percent slopes

### Composition

*Elvedere soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Undulating terraces and terrace escarpments

*Parent material:* Glacial lake sediment

*Slope range:* 3 to 25 percent

*Elevation:* 1,100 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Stones and boulders cover 0.1 to 3.0 percent

### Typical Profile

*Subsurface layer:*

0 to 6 inches—light gray stony silt loam

*Upper part of subsoil:*

6 to 10 inches—pale brown and light gray silty clay loam

*Lower part of subsoil:*

10 to 60 inches—light gray and white, calcareous silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Slow

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or

severe; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Cashmere soils
- Quincy and Winchester soils
- Cashmont and Malott soils
- Leahy soils
- Soils that have been eroded, exposing unweathered lake sediment

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is clayey, which restricts pipeline installation.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and slow permeability.

## 151—Elvedere stony silt loam, 25 to 45 percent slopes

### Composition

*Elvedere soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial lake sediment  
*Slope range:* 25 to 45 percent  
*Elevation:* 1,100 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Stones and boulders cover 0.1 to 3.0 percent

### Typical Profile

*Subsurface layer:*  
 0 to 6 inches—light gray stony silt loam

*Upper part of subsoil:*  
 6 to 10 inches—pale brown and light gray silty clay loam

*Lower part of subsoil:*  
 10 to 60 inches—light gray and white, calcareous silty clay loam

## Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Slow  
*Available water capacity:* High  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid  
*Hazard of water erosion:* Rangeland—severe  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Quincy and Winchester soils
- Cashmont and Malott soils
- Soils that have been eroded, exposing unweathered lake sediment
- Soils that have a very stony surface

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, or brush management using ground equipment.
- The soil in this unit is clayey, which restricts pipeline installation.

## 152—Elvedere-Leahy silt loams complex, 0 to 15 percent slopes

### Composition

*Elvedere soil and similar soils:* 60 percent  
*Leahy soil and similar soils:* 30 percent (fig. 7)  
*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Undulating terraces  
*Parent material:* Glacial lake sediment  
*Slope range:* 0 to 15 percent  
*Elevation:* 1,100 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

#### Elvedere

*Subsurface layer:*  
 0 to 6 inches—light gray silt loam

Figure 7.—Alkali Bottom 9-15 PZ ecological site on the Leahy soil in an area of Elvedere-Leahy silt loams complex, 0 to 15 percent slopes. The dominant vegetation is basin wildrye and black greasewood.

*Upper part of subsoil:*

6 to 10 inches—pale brown and light gray silty clay loam

*Lower part of subsoil:*

10 to 60 inches—very pale brown, light gray, and white, calcareous silty clay loam

**Leahy**

*Subsurface layer:*

0 to 3 inches—light gray, calcareous silt loam

*Upper part of subsoil:*

3 to 10 inches—brown and light gray, calcareous silty clay

*Lower part of subsoil, and substratum:*

10 to 60 inches—light gray and very pale brown, calcareous silty clay loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Elvedere—well drained; Leahy—moderately well drained

*Permeability:* Elvedere—slow; Leahy—very slow

*Available water capacity:* Elvedere—high; Leahy—moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or

moderate; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface)*: Elvedere—slight; Leahy—moderate  
*Water table*: Leahy—present in February through April (see “Water Features” table)  
*Salinity*: Elvedere—nonsaline in the upper 10 inches and very slightly saline between depths of 10 and 60 inches; Leahy—slightly saline in the upper 3 inches and moderately saline to strongly saline between depths of 3 and 60 inches

### Contrasting Inclusions

- Ellisforde soils
- Cashmere soils
- Quincy and Winchester soils
- Soils that have a stony or bouldery surface
- Soils that have been eroded, exposing unweathered lake sediment

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- The soils in this unit are clayey, which restricts pipeline installation.
- The Leahy soil has a high water table at certain times of the year that limits use of the soil.
- The Leahy soil is affected by salt. If the range is in poor condition, salts concentrate on the bare surface as a result of evaporation. Reseeding is very difficult, and only salt-tolerant species should be used.

#### Irrigated cropland

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope, water erosion, and slow and very slow permeability.

## 153—Ement silt loam, 0 to 3 percent slopes

### Composition

*Ement soil and similar soils*: 80 percent  
*Contrasting inclusions*: 20 percent

### Setting

*Position on landscape*: Backswamps of streams and basin areas on till plains  
*Parent material*: Alluvium derived from volcanic ash and loess  
*Slope range*: 0 to 3 percent  
*Elevation*: 1,800 to 2,600 feet

*Average annual precipitation*: 12 to 15 inches  
*Average annual air temperature*: 47 to 49 degrees F  
*Frost-free period*: 110 to 150 days

### Typical Profile

#### Surface layer:

0 to 18 inches—grayish brown, calcareous silt loam

#### Upper part of subsoil:

18 to 26 inches—light brownish gray, calcareous silt loam

#### Lower part of subsoil:

26 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class*: Very deep (more than 60 inches)

*Drainage class*: Somewhat poorly drained

*Permeability*: Moderate

*Available water capacity*: Very high

*Potential rooting depth*: More than 60 inches

*Runoff*: Poned for long periods in February through May

*Hazard of water erosion*: Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface)*: Moderate

*Water table*: Present in January through December (see “Water Features” table)

*Salinity*: Slightly saline throughout

### Contrasting Inclusions

- Bossburg soils
- Nespelem soils
- Soils that are well drained and have rock fragments in the subsoil
- Ahtanum soils
- Poween soils

### Major Uses

Livestock grazing, wildlife habitat, watershed, and nonirrigated hay and pasture

### Use and Management

#### Livestock grazing

- This soil has a high water table at certain times of the year that limits use of the soil.
- This soil is affected by salt. If the range is in poor condition, salts concentrate on the bare surface as a result of evaporation. Reseeding is very difficult, and only salt-tolerant species should be used.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wetness.

## 154—Emdent silt loam, wet, 0 to 2 percent slopes

### Composition

*Emdent soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Basin areas on till plains and backswamps of streams

*Parent material:* Alluvium derived from volcanic ash and loess

*Slope range:* 0 to 2 percent

*Elevation:* 1,800 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 26 inches—dark gray and gray, calcareous silt loam

*Subsoil:*

26 to 36 inches—gray, calcareous silt loam

*Upper part of substratum:*

36 to 38 inches—light gray loam

*Lower part of substratum:*

38 to 60 inches—light brownish gray and white silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Poorly drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Pondered for long periods in March through May

*Hazard of water erosion:* Rangeland—none

*Hazard of wind erosion (bare surface):* Moderate

*Water table:* Present in January through December (see "Water Features" table)

*Frequency of flooding:* Rare

*Salinity:* Slightly saline in the upper 26 inches and very slightly saline between depths of 26 and 60 inches

### Contrasting Inclusions

- Bossburg soils
- Nespelem soils
- Soils that are well drained and have more rock fragments in the substratum
- Ahtanum soils
- Poween soils

### Major Uses

Livestock grazing, wildlife habitat, wetland wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This soil has a high water table at certain times of the year that limits use of the soil.
- This soil is affected by salt. If the range is in poor condition, salts concentrate on the bare surface as a result of evaporation. Reseeding is very difficult, and only salt-tolerant species should be used.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wetness.

## 155—Ewall coarse sand, 0 to 10 percent slopes

### Composition

*Ewall soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terraces that have dunelike relief (fig. 8)

*Parent material:* Sandy glacial outwash and eolian sand

*Slope range:* 0 to 10 percent

*Elevation:* 1,400 to 1,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 120 to 150 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 7 inches—grayish brown coarse sand

*Upper part of substratum:*

7 to 26 inches—light brownish gray coarse sand

*Lower part of substratum:*

26 to 60 inches—light gray coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

Figure 8.—Area of Ewall coarse sand, 0 to 10 percent slopes. The ecological site is ponderosa pine/antelope bitterbrush-Idaho fescue.

*Runoff:* Very slow

*Hazard of water erosion:* Cropland—slight;  
forestland—slight

*Hazard of wind erosion (bare surface):* Very severe

### Contrasting Inclusions

- Bong soils
- Phoebe and Picard soils
- Soils that have a loamy fine sand surface layer

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

*General management considerations:*

- The risk of displacement and erosion can be reduced by using low-pressure ground equipment and designated skid trails, avoiding logging during thawing in spring, and logging in areas covered with snow.
- Dustiness and degradation of the surface of roads can be reduced by watering, mulching, or surfacing.

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by fast infiltration, droughtiness, and steepness of slope.

**156—Ewall coarse sand, 10 to 25 percent slopes****Composition**

*Ewall soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Terraces that have dunelike relief

*Parent material:* Sandy glacial outwash and eolian sand

*Slope range:* 10 to 25 percent

*Elevation:* 1,400 to 1,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 120 to 150 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 7 inches—grayish brown coarse sand

*Upper part of substratum:*

7 to 26 inches—light brownish gray coarse sand

*Lower part of substratum:*

26 to 60 inches—light gray coarse sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Very severe

**Contrasting Inclusions**

- Bong soils
- Phoebe and Picard soils
- Dart soils

- Soils that have a loamy fine sand surface layer

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration.

**157—Ewall loamy fine sand, 0 to 10 percent slopes****Composition**

*Ewall soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

**Setting**

*Position on landscape:* Terraces

*Parent material:* Sandy glacial outwash

*Slope range:* 0 to 10 percent

*Elevation:* 1,300 to 3,000 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Typical Profile**

*Surface layer:*

0 to 13 inches—brown loamy fine sand

*Upper part of substratum:*

13 to 38 inches—pale brown sand

*Lower part of substratum:*

38 to 60 inches—pale brown gravelly sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight;  
forestland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Hobohill soils
- Picard soils
- Haley soils
- Conconully soils
- Owhi soils

### Major Uses

Wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion, steepness of slope, droughtiness, and fast infiltration.

## 158—Ewall loamy fine sand, 10 to 25 percent slopes

### Composition

*Ewall soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Sandy glacial outwash

*Slope range:* 10 to 25 percent

*Elevation:* 1,300 to 3,000 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 13 inches—brown loamy fine sand

*Upper part of substratum:*

13 to 38 inches—pale brown sand

*Lower part of substratum:*

38 to 60 inches—pale brown gravelly sand

## Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Hobohill soils
- Picard soils
- Haley soils
- Conconully soils
- Owhi soils
- Soils that are very gravelly throughout

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion, steepness of slope, droughtiness, and fast infiltration.

## 159—Ewall gravelly loamy sand, 30 to 60 percent slopes

### Composition

*Ewall soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments

*Parent material:* Sandy glacial outwash

*Slope range:* 30 to 60 percent

*Elevation:* 1,300 to 3,000 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*  
 0 to 7 inches—brown gravelly loamy sand

*Substratum:*  
 7 to 60 inches—multicolored gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium  
*Hazard of water erosion:* Rangeland—moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Hobohill soils
- Picard soils
- Conconully soils
- Fivelakes and Owhi soils
- Soils that are very gravelly throughout

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 160—Farrell fine sandy loam, 0 to 5 percent slopes

### Composition

*Farrell soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Glaciofluvial material mixed with loess  
*Slope range:* 0 to 5 percent  
*Elevation:* 850 to 1,500 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
 0 to 10 inches—brown fine sandy loam

*Upper part of subsoil:*  
 10 to 22 inches—pale brown fine sandy loam

*Lower part of subsoil:*  
 22 to 60 inches—pale brown and light brownish gray, calcareous fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a stony, bouldery, or very bouldery surface
- Aeneas soils
- Pogue soils
- Peshastin soils
- Rock outcrop

### Major Uses

Livestock grazing, nonirrigated cropland, irrigated orchards, irrigated hay and pasture, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion.

## 161—Farrell fine sandy loam, 5 to 10 percent slopes

### Composition

*Farrell soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glaciofluvial material mixed with loess

*Slope range:* 5 to 10 percent

*Elevation:* 850 to 1,500 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 10 inches—brown fine sandy loam

*Upper part of subsoil:*

10 to 22 inches—pale brown fine sandy loam

*Lower part of subsoil:*

22 to 60 inches—pale brown and light brownish gray, calcareous fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a stony, bouldery, or very bouldery surface
- Aeneas soils
- Pogue soils
- Peshastin soils
- Rock outcrop

### Major Uses

Livestock grazing, nonirrigated cropland, irrigated orchards, irrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond

installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

## 162—Farrell fine sandy loam, 10 to 25 percent slopes

### Composition

*Farrell soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glaciofluvial material mixed with loess

*Slope range:* 10 to 25 percent

*Elevation:* 1,000 to 1,500 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 10 inches—brown fine sandy loam

*Upper part of subsoil:*

10 to 22 inches—pale brown fine sandy loam

*Lower part of subsoil:*

22 to 60 inches—pale brown and light brownish gray, calcareous fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a stony, bouldery, or very bouldery surface
- Aeneas soils
- Pogue soils
- Peshastin soils
- Rock outcrop

## Use and Management

### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

## 163—Farrell very bouldery fine sandy loam, 0 to 20 percent slopes

### Composition

*Farrell soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glaciofluvial material mixed with loess

*Slope range:* 0 to 20 percent

*Elevation:* 1,000 to 1,500 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Boulders and stones cover 3 to 15 percent

### Typical Profile

*Surface layer:*

0 to 8 inches—brown very bouldery fine sandy loam

*Upper part of subsoil:*

8 to 22 inches—pale brown fine sandy loam

*Middle part of subsoil:*

22 to 40 inches—light yellowish brown and light brownish gray, calcareous sandy loam

*Lower part of subsoil:*

40 to 60 inches—light yellowish brown, calcareous fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Moderate

## Contrasting Inclusions

- Aeneas soils
- Pogue soils
- Peshastin soils
- Rock outcrop

## Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and large stones.

## 164—Fivelakes extremely bouldery sandy loam, 30 to 50 percent slopes

### Composition

*Fivelakes soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Dissected outwash terrace escarpments

*Parent material:* Glacial outwash mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 30 to 50 percent

*Elevation:* 1,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Boulders and stones cover 15 to 50 percent

### Typical Profile

*Surface layer:*

0 to 10 inches—brown extremely bouldery sandy loam

*Subsoil:*

10 to 28 inches—pale brown very gravelly sandy loam

*Upper part of substratum:*  
28 to 38 inches—pale brown very gravelly loamy coarse sand

*Lower part of substratum:*  
38 to 60 inches—pale brown extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium  
*Hazard of water erosion:* Rangeland—moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that are very cobbly or very gravelly sand below a depth of about 10 inches
- Conconully soils that have a gravelly sandy loam subsoil and substratum
- Hobohill soils that have a sandy substratum and have fewer rock fragments
- Soils that have bedrock at a depth of 40 to 60 inches

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, or brush management using ground equipment.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 165—Fivelakes fine sandy loam, moist, 0 to 5 percent slopes

### Composition

*Fivelakes soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Glacial outwash terraces  
*Parent material:* Glacial outwash mixed with a component of loess and volcanic ash in the upper part  
*Slope range:* 0 to 5 percent

*Elevation:* 1,800 to 2,500 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*  
0 to 10 inches—dark brown fine sandy loam

*Upper part of subsoil:*  
10 to 14 inches—pale brown gravelly sandy loam

*Lower part of subsoil:*  
14 to 30 inches—pale brown very gravelly sandy loam

*Substratum:*  
30 to 60 inches—pale brown extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Moderately well drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe  
*Water table:* Present in March and April (see “Water Features” table)  
*Frequency of flooding:* Rare

### Contrasting Inclusions

- Ralsen soils
- Coxlake soils
- Aquic Xerofluvents

### Major Uses

Irrigated hay and pasture, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil has a high water table at certain times of the year that limits use of the soil.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion and droughtiness.

## 166—Fivelakes stony loam, 0 to 25 percent slopes

### Composition

*Fivelakes soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces

*Parent material:* Glacial outwash mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 0 to 25 percent

*Elevation:* 1,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*

0 to 4 inches—dark grayish brown stony loam

*Lower part of surface layer:*

4 to 12 inches—dark grayish brown gravelly loam

*Upper part of subsoil:*

12 to 20 inches—yellowish brown cobbly loam

*Lower part of subsoil:*

20 to 32 inches—brown very cobbly sandy loam

*Substratum:*

32 to 60 inches—multicolored extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Haley and Picard soils
- Soils that have an extremely bouldery surface
- Soils that are very gravelly sand throughout

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

## Use and Management

### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and droughtiness.

## 167—Fivelakes stony loam, 30 to 65 percent slopes

### Composition

*Fivelakes soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Dissected outwash terrace escarpments

*Parent material:* Glacial outwash with loess in the upper part

*Slope range:* 30 to 65 percent

*Elevation:* 1,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*

0 to 4 inches—dark grayish brown stony loam

*Lower part of surface layer:*

4 to 12 inches—dark grayish brown gravelly loam

*Upper part of subsoil:*

12 to 20 inches—yellowish brown cobbly loam

*Lower part of subsoil:*

20 to 32 inches—brown very cobbly sandy loam

*Substratum:*

32 to 60 inches—multicolored extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have bedrock at a depth of 20 to 60 inches
- Haley and Picard soils
- Rock outcrop

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 168—Fivelakes extremely bouldery loam, 0 to 30 percent slopes

### Composition

*Fivelakes soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces

*Parent material:* Glacial outwash mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 0 to 30 percent

*Elevation:* 1,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Boulders and stones cover 15 to 50 percent

### Typical Profile

*Upper part of surface layer:*

0 to 4 inches—grayish brown extremely bouldery loam

*Lower part of surface layer:*

4 to 12 inches—grayish brown very bouldery loam

*Upper part of subsoil:*

12 to 18 inches—light yellowish brown very stony loam

*Lower part of subsoil:*

18 to 30 inches—light yellowish brown very stony sandy loam

*Substratum:*

30 to 60 inches—multicolored extremely cobbly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have a stony surface
- Haley and Picard soils
- Soils that are very gravelly sand throughout

### Major Uses

Livestock grazing, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If the soil in this unit is used for irrigated crops, it is limited by steepness of slope, large stones, and droughtiness.

## 169—Friedlander silt loam, 0 to 20 percent slopes

### Composition

*Friedlander soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of hills and mountains

*Parent material:* Mantle of loess and volcanic ash over

residuum and some colluvium derived from  
granitic and metamorphic rock

*Slope range:* 0 to 20 percent

*Elevation:* 2,400 to 4,000 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 3 inches—grayish brown silt loam

*Upper part of subsoil:*

3 to 8 inches—pale brown silt loam

*Subsurface layer:*

8 to 23 inches—very pale brown loam

*Lower part of subsoil:*

23 to 60 inches—brown silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow and slow

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through  
March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or  
severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Brusher and Henneway soils
- Dinkelman soils
- Centralpeak soils

### Major Uses

Timber production, livestock grazing, wildlife habitat,  
watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
tracked equipment—suitable; cable yarding—  
suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and

ponderosa pine—readily; western larch and  
lodgepole pine—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and moderately slow and slow permeability.

## 170—Friedlander silt loam, 20 to 40 percent slopes

### Composition

*Friedlander soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Backslopes and footslopes of  
mountains

*Parent material:* Mantle of loess and volcanic ash over  
residuum and some colluvium derived from  
granitic and metamorphic rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,400 to 4,000 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 3 inches—grayish brown silt loam

*Upper part of subsoil:*

3 to 8 inches—pale brown silt loam

*Subsurface layer:*

8 to 23 inches—very pale brown loam

*Lower part of subsoil:*

23 to 60 inches—brown silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow and slow

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through  
March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very  
severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Brusher and Henneway soils
- Dinkelman soils
- Centralpeak soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

## 171—Friedlander silt loam, dry, 0 to 20 percent slopes

### Composition

*Friedlander soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of hills and mountains

*Parent material:* Mantle of loess and volcanic ash over residuum and some colluvium derived from granitic rock

*Slope range:* 0 to 20 percent

*Elevation:* 2,400 to 2,700 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 3 inches—grayish brown silt loam

*Upper part of subsoil:*

3 to 8 inches—pale brown silt loam

*Subsurface layer:*

8 to 23 inches—very pale brown loam

*Lower part of subsoil:*

23 to 60 inches—brown silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow and slow

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Brusher and Georgetcreek soils
- Centralpeak soils
- Dinkelman soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and moderately slow and slow permeability.

## 172—Garrison loam, 0 to 5 percent slopes

### Composition

*Garrison soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces

*Parent material:* Glacial outwash mixed with a

component of loess and volcanic ash in the upper part

*Slope range:* 0 to 5 percent

*Elevation:* 1,600 to 2,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 12 inches—dark grayish brown loam

*Upper part of subsoil:*

12 to 18 inches—brown gravelly loam

*Lower part of subsoil:*

18 to 28 inches—yellowish brown very gravelly sandy loam

*Upper part of substratum:*

28 to 41 inches—pale brown very gravelly coarse sand

*Lower part of substratum:*

41 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Hallcreek soils
- Springdale soils
- Soils that have a stony or very stony surface
- Phoebe soils

### Major Uses

Timber production, nonirrigated and irrigated hay and pasture, livestock grazing, building site development, wildlife habitat, recreation, and watershed

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by droughtiness.

## 173—Garrison loam, 5 to 15 percent slopes

### Composition

*Garrison soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces

*Parent material:* Glacial outwash mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 5 to 15 percent

*Elevation:* 1,600 to 2,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 12 inches—dark grayish brown loam

*Upper part of subsoil:*

12 to 18 inches—brown gravelly loam

*Lower part of subsoil:*

18 to 28 inches—yellowish brown very gravelly sandy loam

*Upper part of substratum:*

28 to 41 inches—pale brown very gravelly coarse sand

*Lower part of substratum:*

41 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Hallcreek soils
- Springdale soils
- Soils that have a stony or very stony surface
- Phoebe soils

### Major Uses

Timber production, nonirrigated and irrigated hay and pasture, livestock grazing, building site development, wildlife habitat, recreation, and watershed

### Use and Management

#### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

## 174—Garrison gravelly loam, 15 to 30 percent slopes

### Composition

*Garrison soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terrace escarpments

*Parent material:* Glacial outwash mixed with a

component of loess and volcanic ash in the upper part

*Slope range:* 15 to 30 percent

*Elevation:* 1,700 to 2,100 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 0.5 inch thick

*Surface layer:*

0 to 14 inches—dark grayish brown gravelly loam

*Subsoil:*

14 to 24 inches—yellowish brown very gravelly loam

*Substratum:*

24 to 60 inches—multicolored very gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Springdale soils
- Phoebe and Donovan soils
- Soils that have a stony or very stony surface
- Hallcreek soils

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, wildlife habitat, recreation, and watershed

### Use and Management

#### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

### **175—Georgecreek silt loam, 5 to 20 percent slopes**

#### **Composition**

*Georgecreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Summits and shoulders of hills

*Parent material:* Residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 1,800 to 3,400 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### **Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 11 inches—grayish brown and brown silt loam

*Upper part of subsoil:*

11 to 19 inches—light yellowish brown loam

*Middle part of subsoil:*

19 to 35 inches—light yellowish brown clay loam

*Lower part of subsoil:*

35 to 53 inches—light yellowish brown clay loam

*Substratum:*

53 to 58 inches—light yellowish brown loam

*Bedrock:*

58 to 68 inches—weathered granitic rock

#### **Soil Properties and Qualities**

*Depth class:* Deep (40 to 60 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

#### **Contrasting Inclusions**

- Soils that are 20 to 40 inches deep to highly weathered granitic rock
- Spokane soils
- Friedlander soils
- Dinkelman soils

#### **Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### **Silviculture**

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

##### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

### **176—Georgecreek silt loam, 20 to 40 percent slopes**

#### **Composition**

*Georgecreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Shoulders and backslopes of hills

*Parent material:* Residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 3,400 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### **Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 11 inches—grayish brown and brown silt loam

*Upper part of subsoil:*

11 to 19 inches—light yellowish brown loam

*Middle part of subsoil:*

19 to 35 inches—light yellowish brown clay loam

*Lower part of subsoil:*

35 to 53 inches—light yellowish brown clay loam

*Substratum:*

53 to 58 inches—light yellowish brown loam

*Bedrock:*

58 to 68 inches—weathered granitic rock

**Soil Properties and Qualities***Depth class:* Deep (40 to 60 inches to weathered bedrock)*Drainage class:* Well drained*Permeability:* Moderate*Available water capacity:* High*Potential rooting depth:* 40 to 60 inches*Runoff:* Rapid or very rapid*Snowpack:* More than 1 foot—January and February; more than 3 feet—none*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe*Hazard of wind erosion (bare surface):* Slight**Contrasting Inclusions**

- Soils that are 20 to 40 inches deep to highly weathered granitic rock
- Spokane soils
- Vanbrunt soils
- Phoebe soils

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 178—Georgecreek silt loam, warm, 20 to 40 percent slopes

### Composition

*Georgecreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders and backslopes of hills

*Parent material:* Residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 3,400 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*  
0 to 8 inches—brown silt loam

*Lower part of surface layer:*  
8 to 12 inches—brown loam

*Upper part of subsoil:*  
12 to 26 inches—pale brown and very pale brown clay loam

*Middle part of subsoil:*  
26 to 45 inches—yellowish brown and light yellowish brown clay loam

*Lower part of subsoil:*  
45 to 55 inches—light yellowish brown gravelly loam

*Bedrock:*  
55 to 65 inches—weathered granitic rock

## Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that are 20 to 40 inches deep to highly weathered granitic rock
- Spokane soils
- Vanbrunt soils
- Phoebe soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

## 179—Ginnis stony sandy loam, 30 to 65 percent slopes

### Composition

*Ginnis soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills

*Parent material:* Colluvium and residuum derived from granitic rock mixed with loess

*Slope range:* 30 to 65 percent

*Elevation:* 1,400 to 1,800 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*  
 0 to 8 inches—grayish brown stony sandy loam

*Lower part of surface layer:*  
 8 to 18 inches—grayish brown sandy loam

*Subsoil:*  
 18 to 24 inches—yellowish brown coarse sandy loam

*Bedrock:*  
 24 to 34 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Conconully soils
- Tyee soils
- Swakane soils
- Rock outcrop

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 180—Ginnis loam, 15 to 35 percent slopes

### Composition

*Ginnis soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Foothills, backslopes, and shoulders of hills

*Parent material:* Residuum and colluvium derived from granitic rock mixed with loess

*Slope range:* 15 to 35 percent

*Elevation:* 1,500 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*  
 0 to 10 inches—grayish brown loam

*Upper part of subsoil:*  
 10 to 22 inches—brown gravelly loam

*Lower part of subsoil:*  
 22 to 31 inches—pale brown gravelly sandy loam

*Bedrock:*  
 31 to 41 inches—weathered granite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Tyee soils
- Morical soils
- Annum soils
- Soils that are very gravelly below a depth of about 20 inches
- Soils that have a stony or cobbly surface
- Rock outcrop

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

## Use and Management

### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too shallow for pond construction.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 181—Ginnis loam, 15 to 35 percent north slopes

### Composition

*Ginnis soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* North- and east-facing footslopes, backslopes, and shoulders of hills

*Parent material:* Residuum and colluvium derived from granitic rock mixed with loess

*Slope range:* 15 to 35 percent

*Elevation:* 1,500 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 18 inches—dark grayish brown and grayish brown loam

*Subsoil:*

18 to 23 inches—pale brown gravelly loam

*Bedrock:*

23 to 33 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Tyee soils

- Morical soils
- Annum soils
- Soils that have a stony surface

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

## Use and Management

### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too shallow for pond construction.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 182—Ginnis loams complex, 15 to 35 percent slopes

### Composition

*Ginnis soil and similar soils:* 50 percent

*Ginnis soil, north slopes, and similar soils:* 40 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Ginnis—south- and west-facing footslopes, backslopes, and shoulders of hills; Ginnis, north slopes—north- and east-facing footslopes, backslopes, and shoulders of hills

*Parent material:* Residuum and colluvium derived from granitic rock mixed with loess

*Slope range:* 15 to 35 percent

*Elevation:* 1,500 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

#### Ginnis

*Surface layer:*

0 to 10 inches—grayish brown loam

*Upper part of subsoil:*

10 to 22 inches—brown gravelly loam

*Lower part of subsoil:*

22 to 31 inches—pale brown gravelly sandy loam

*Bedrock:*

31 to 41 inches—weathered granitic rock

**Ginnis, north slopes***Surface layer:*

0 to 18 inches—dark grayish brown and grayish brown loam

*Subsoil:*

18 to 23 inches—pale brown gravelly loam

*Bedrock:*

23 to 33 inches—weathered granitic rock

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Tyee soils
- Morical soils
- Annum soils
- Soils that are very gravelly below a depth of about 20 inches
- Soils that have a stony or cobbly surface
- Rock outcrop

**Major Uses**

Livestock grazing, watershed, wildlife habitat, and recreation

**Use and Management****Livestock grazing**

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soils in this unit are too shallow for pond construction.
- The soils in this unit are too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

**183—Ginnis cobbly loams complex,  
15 to 35 percent slopes****Composition**

*Ginnis soil and similar soils:* 50 percent

*Ginnis soil, north slopes, and similar soils:* 35 percent  
*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Ginnis—south- and west-facing footslopes, backslopes, and shoulders of hills; Ginnis, north slopes—north- and east-facing footslopes, backslopes, and shoulders of hills

*Parent material:* Residuum and colluvium derived from granitic rock mixed with loess

*Slope range:* 15 to 35 percent

*Elevation:* 1,500 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Typical Profile****Ginnis***Surface layer:*

0 to 9 inches—grayish brown cobbly loam

*Upper part of subsoil:*

9 to 16 inches—pale brown loam

*Lower part of subsoil:*

16 to 22 inches—very pale brown loam

*Bedrock:*

22 to 32 inches—weathered granitic rock

**Ginnis, north slopes***Upper part of surface layer:*

0 to 12 inches—dark grayish brown cobbly loam

*Lower part of surface layer:*

12 to 19 inches—grayish brown loam

*Subsoil:*

19 to 30 inches—pale brown gravelly sandy loam

*Bedrock:*

30 to 40 inches—weathered granitic rock

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Tyee soils

- Morical soils
- Annum soils
- Soils that are very gravelly below a depth of about 20 inches
- Soils that have a stony surface
- Rock outcrop

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soils in this unit are too shallow for pond construction.
- The soils in this unit are too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 184—Ginnis-Conconully complex, 5 to 30 percent slopes

### Composition

*Ginnis soil and similar soils:* 50 percent

*Conconully soil and similar soils:* 30 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Toeslopes and footslopes of hills

*Parent material:* Ginnis—residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash; Conconully—glacial till mixed with a component of loess and volcanic ash

*Slope range:* 5 to 30 percent

*Elevation:* 1,400 to 2,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Ginnis—none;

Conconully—stones cover 0.1 to 3.0 percent

### Typical Profile

#### Ginnis

*Surface layer:*

0 to 10 inches—grayish brown loam

*Upper part of subsoil:*

10 to 22 inches—brown gravelly loam

*Lower part of subsoil:*

22 to 31 inches—pale brown gravelly sandy loam

*Bedrock:*

31 to 41 inches—weathered granitic rock

#### Conconully

*Surface layer:*

0 to 13 inches—grayish brown stony fine sandy loam

*Subsoil:*

13 to 33 inches—light yellowish brown gravelly fine sandy loam

*Substratum:*

33 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Ginnis—moderately deep (20 to 40 inches to weathered bedrock); Conconully—moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Ginnis—moderate; Conconully—moderately rapid over slow

*Available water capacity:* Ginnis—moderate; Conconully—moderately slow

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Ginnis—slight; Conconully—moderate

### Contrasting Inclusions

- Soils that are very gravelly or very cobbly
- Tye soils
- Soils that have a bouldery or very bouldery surface
- Morical soils
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soils in this unit are too shallow for pond construction.
- The soils in this unit are too permeable for

successful pond installation unless special liners or sealants are used to reduce seepage.

### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope and rooting depth and by large stones on the Conconully soil.

## 185—Ginnis-Conconully complex, 30 to 65 percent slopes

### Composition

*Ginnis soil and similar soils:* 50 percent

*Conconully soil and similar soils:* 30 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Shoulders, backslopes, and footslopes of hills

*Parent material:* Ginnis—residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash;  
Conconully—glacial till mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 1,600 to 2,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Ginnis—none;  
Conconully—stones cover 0.1 to 3.0 percent

### Typical Profile

#### Ginnis

*Surface layer:*

0 to 10 inches—grayish brown loam

*Upper part of subsoil:*

10 to 22 inches—brown gravelly loam

*Lower part of subsoil:*

22 to 31 inches—pale brown gravelly sandy loam

*Bedrock:*

31 to 41 inches—weathered granitic rock

#### Conconully

*Surface layer:*

0 to 12 inches—grayish brown stony fine sandy loam

*Subsoil:*

12 to 21 inches—light yellowish brown gravelly fine sandy loam

*Substratum:*

21 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Ginnis—moderately deep (20 to 40 inches to weathered bedrock); Conconully—moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Ginnis—moderate; Conconully—moderately rapid over slow

*Available water capacity:* Ginnis—moderate;  
Conconully—moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Ginnis—slight;  
Conconully—moderate

### Contrasting Inclusions

- Soils that are very gravelly or very cobbly
- Tyee soils
- Soils that have a very bouldery surface
- Morical soils
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The Ginnis soil is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soils in this unit are too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 186—Ginnis-Rock outcrop complex, 30 to 65 percent slopes

### Composition

*Ginnis soil and similar soils:* 70 percent

*Rock outcrop:* 10 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Shoulders and backslopes of hills  
*Parent material:* Residuum and colluvium derived from granitic rock mixed with loess  
*Slope range:* 30 to 65 percent  
*Elevation:* 1,900 to 3,000 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Ginnis Soil

#### Typical profile

*Upper part of surface layer:*  
 0 to 8 inches—grayish brown stony sandy loam

*Lower part of surface layer:*  
 8 to 18 inches—grayish brown gravelly sandy loam

*Subsoil:*  
 18 to 24 inches—yellowish brown gravelly sandy loam

*Bedrock:*  
 24 to 34 inches—weathered granitic rock

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Severe

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Soils that are very gravelly or very cobbly
- Tyee soils
- Swakane soils

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

## Use and Management

### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 187—Glenrose silt loam, 8 to 15 percent slopes

### Composition

*Glenrose soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toeslopes of foothills

*Parent material:* Glacial till mixed with a component of loess and volcanic ash

*Slope range:* 8 to 15 percent

*Elevation:* 1,300 to 2,900 feet

*Average annual precipitation:* 17 to 20 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*

0 to 16 inches—dark grayish brown, grayish brown, and brown silt loam

*Subsurface layer:*

16 to 27 inches—pale brown loam

*Upper part of subsoil:*

27 to 39 inches—very pale brown loam

*Lower part of subsoil:*

39 to 60 inches—very pale brown gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Cedonia soils
- Donavan and Phoebe soils
- Stevens soils
- Dehart and Borgeau soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, building site development, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 188—Glenrose silt loam, 15 to 30 percent slopes

### Composition

*Glenrose soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and shoulders of foothills  
*Parent material:* Glacial till mixed with a component of loess and volcanic ash  
*Slope range:* 15 to 30 percent  
*Elevation:* 1,300 to 2,900 feet  
*Average annual precipitation:* 17 to 20 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*  
 0 to 16 inches—dark grayish brown, grayish brown, and brown silt loam

*Subsurface layer:*  
 16 to 27 inches—pale brown loam

*Upper part of subsoil:*  
 27 to 39 inches—very pale brown loam

*Lower part of subsoil:*  
 39 to 60 inches—very pale brown gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Cedonia soils
- Donavan and Phoebe soils
- Stevens soils
- Dehart and Borgeau soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 189—Goddard silt loam, 0 to 20 percent slopes

### Composition

*Goddard soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Glacial outwash with a mantle of volcanic ash  
*Slope range:* 0 to 20 percent  
*Elevation:* 2,000 to 3,900 feet  
*Average annual precipitation:* 16 to 19 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 3 inches—grayish brown silt loam  
*Upper part of subsoil:*  
 3 to 10 inches—pale brown silt loam  
*Lower part of subsoil:*  
 10 to 18 inches—pale brown gravelly sandy loam  
*Upper part of substratum:*  
 18 to 30 inches—pale brown very gravelly loamy sand  
*Lower part of substratum:*  
 30 to 60 inches—multicolored very gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Parmenter and Stepstone soils
- Wapal soils
- Sacheen soils
- Torboy soils
- Stapaloo soils
- Nevine soils
- Scrabblers soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and lodgepole pine—readily; western larch—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

### 190—Goddard silt loam, 20 to 40 percent slopes

#### Composition

*Goddard soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces and terrace escarpments  
*Parent material:* Glacial outwash with a mantle of volcanic ash  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,000 to 3,900 feet  
*Average annual precipitation:* 16 to 19 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 3 inches—grayish brown silt loam  
*Upper part of subsoil:*  
 3 to 10 inches—pale brown silt loam  
*Lower part of subsoil:*  
 10 to 18 inches—pale brown gravelly sandy loam  
*Upper part of substratum:*  
 18 to 30 inches—pale brown very gravelly loamy sand  
*Lower part of substratum:*  
 30 to 60 inches—multicolored very gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained  
*Permeability:* Moderate over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe  
*Hazard of wind erosion:* Slight

### Contrasting Inclusions

- Parmenter and Stepstone soils
- Wapal soils
- Sacheen soils
- Torboy soils
- Stapaloo soils
- Nevine soils
- Scrabblers soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and lodgepole pine—readily; western larch—periodically

*Limitations for planting:* None

## 191—Goddard silt loam, 40 to 65 percent slopes

### Composition

*Goddard soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash with a mantle of volcanic ash  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,000 to 3,900 feet  
*Average annual precipitation:* 16 to 19 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 3 inches—grayish brown silt loam  
*Upper part of subsoil:*  
 3 to 10 inches—pale brown silt loam  
*Lower part of subsoil:*  
 10 to 18 inches—pale brown gravelly sandy loam  
*Upper part of substratum:*  
 18 to 30 inches—pale brown very gravelly loamy sand  
*Lower part of substratum:*  
 30 to 60 inches—multicolored very gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Wapal soils
- Sacheen soils
- Torboy soils
- Nevine soils
- Scrabblers soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and lodgepole pine—readily; western larch—periodically  
*Limitation for planting:* Steepness of slope

## 192—Goldlake silt loam, 0 to 8 percent slopes

### Composition

*Goldlake soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Swales and draws of glaciated foothills

*Parent material:* Glacial till mixed with loess, volcanic ash, and slope alluvium in the upper part

*Slope range:* 0 to 8 percent

*Elevation:* 2,000 to 3,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 22 inches—dark grayish brown and grayish brown silt loam

*Upper part of subsoil:*

22 to 29 inches—pale brown gravelly loam

*Lower part of subsoil:*

29 to 40 inches—very pale brown gravelly sandy loam

*Substratum:*

40 to 60 inches—mottled, very pale brown dense glacial till that crushes to gravelly coarse sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Moderately well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in March through May (see “Water Features” table)

### Contrasting Inclusions

- Donovan soils
- Soils that are very gravelly below a depth of about 20 inches
- Republic and Lostcreek soils
- Soils that are somewhat poorly drained

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and rooting depth.

## 193—Gooseflats fine sandy loams complex, 0 to 2 percent slopes

### Composition

*Gooseflats soil, somewhat poorly drained, and similar soils:* 55 percent

*Gooseflats soil, moderately well drained, and similar soils:* 30 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Swells in draws and valley flats (fig. 9)

*Parent material:* Alluvium derived from glacial outwash

*Slope range:* 0 to 2 percent

*Elevation:* 800 to 2,400 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

Figure 9.—Area of Gooseflats fine sandy loams complex, 0 to 2 percent slopes, in foreground. Swakane soils are on hills in background.

### Typical Profile

#### Gooseflats, somewhat poorly drained

*Surface layer:*

0 to 7 inches—grayish brown, calcareous fine sandy loam

*Upper part of subsoil:*

7 to 30 inches—light brownish gray, calcareous loamy fine sand

*Lower part of subsoil:*

30 to 41 inches—light gray, calcareous fine sand

41 to 48 inches—light gray hardpan

*Substratum:*

48 to 60 inches—light gray, calcareous fine sand

#### Gooseflats, moderately well drained

*Upper part of surface layer:*

0 to 7 inches—grayish brown, calcareous fine sandy loam

*Lower part of surface layer:*

7 to 10 inches—grayish brown, calcareous loamy fine sand

*Upper part of subsoil:*

10 to 28 inches—light brownish gray, calcareous loamy fine sand

*Lower part of subsoil:*

28 to 60 inches—light gray, calcareous loamy fine sand and fine sand

### Soil Properties and Qualities

*Depth class:* Gooseflats, somewhat poorly drained—deep (40 to 60 inches to a hardpan); Gooseflats, moderately well drained—very deep (more than 60 inches)

*Permeability:* Moderately rapid

*Available water capacity:* Low

*Potential rooting depth:* Gooseflats, somewhat poorly drained—40 to 60 inches; Gooseflats, moderately well drained—more than 60 inches

*Runoff:* Gooseflats, somewhat poorly drained—ponded for long periods in March and April; Gooseflats, moderately well drained—slow

*Hazard of water erosion:* Rangeland—slight; cropland—slight

*Hazard of wind erosion (bare surface):* Severe

*Water table:* Present in January through May (see “Water Features” table)

*Salinity:* Strongly saline in the upper 7 inches and moderately saline between depths of 7 and 60 inches

### Contrasting Inclusions

- Soils that are fine sandy loam throughout
- Soils that have a sandy surface layer
- Ratlake soils
- Emdent soils
- Quincy soils

### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- The soils in this unit have a high water table at certain times of the year that limits use of the soils.
- The soils in this unit have limited available soil moisture. Seeding is not recommended.
- The soils in this unit are affected by salt. If the range is in poor condition, salts concentrate on the bare surface as a result of evaporation. Reseeding is very difficult, and only salt-tolerant species should be used.

### Irrigated cropland

- If the soils in this unit are used for irrigated crops, they are limited by wind erosion and wetness.

## 194—Growden channery silt loam, 20 to 50 percent slopes

### Composition

*Growden soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* South-facing backslopes of mountains

*Parent material:* Residuum and colluvium derived from schist, quartzite, and granitic gneiss with a mantle of loess and volcanic ash

*Slope range:* 20 to 50 percent

*Elevation:* 5,500 to 6,500 feet

*Average annual precipitation:* 25 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Upper part of surface layer:*

0 to 4 inches—dark grayish brown channery silt loam

*Lower part of surface layer:*

4 to 10 inches—brown flaggy silt loam

*Upper part of subsoil:*

10 to 16 inches—yellowish brown very channery silt loam

*Lower part of subsoil:*

16 to 22 inches—light yellowish brown very flaggy silt loam

*Substratum:*

22 to 60 inches—very pale brown extremely flaggy sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Togo soils
- Buhrig soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Subalpine fir and lodgepole pine—readily; Douglas-fir and western larch—periodically

*Limitation for planting:* Rock fragments in the soil

### 195—Haden creek silt loam, 0 to 8 percent slopes

#### Composition

*Haden creek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Glacial lake terraces and basins

*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash

*Slope range:* 0 to 8 percent

*Elevation:* 1,700 to 3,600 feet

*Average annual precipitation:* 16 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 110 days

#### Typical Profile

*Surface layer:*

0 to 13 inches—grayish brown silt loam

*Upper part of subsoil:*

13 to 32 inches—pale brown and pale yellow silt loam

*Middle part of subsoil:*

32 to 40 inches—pale yellow, calcareous silty clay loam

*Lower part of subsoil:*

40 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in January through May (see “Water Features” table)

### Contrasting Inclusions

- Martella soils
- Ret soils
- Sanpoil soils

### Major Uses

Nonirrigated cropland, nonirrigated hay and pasture, watershed, and wildlife habitat

### Use and Management

#### Nonirrigated cropland

- If this soil is used for nonirrigated crops, it is limited by a short frost-free period, water erosion, depth to the calcareous subsoil, moderately slow permeability, a moderately slow water intake rate, susceptibility to compaction, and soil wetness.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wetness, steepness of slope, and water erosion.

### 196—Haley fine sandy loam, 0 to 5 percent slopes

#### Composition

*Haley soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 0 to 5 percent

*Elevation:* 1,500 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown fine sandy loam

*Subsoil:*

12 to 28 inches—pale brown fine sandy loam

*Upper part of substratum:*

28 to 40 inches—brown and pale brown loamy sand

*Lower part of substratum:*

40 to 60 inches—multicolored sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Ewall soils
- Fivelakes and Owhi soils
- Nespelem soils
- Disautel and Conconully soils
- Poween soils

### Major Uses

Livestock grazing, nonirrigated cropland, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion.

## 197—Haley fine sandy loam, 5 to 10 percent slopes

### Composition

*Haley soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 5 to 10 percent

*Elevation:* 1,500 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown fine sandy loam

*Subsoil:*

12 to 28 inches—pale brown fine sandy loam

*Upper part of substratum:*

28 to 40 inches—brown and pale brown loamy sand

*Lower part of substratum:*

40 to 60 inches—multicolored sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Ewall soils
- Fivelakes and Owhi soils
- Nespelem soils
- Disautel and Conconully soils

### Major Uses

Livestock grazing, nonirrigated cropland, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

## 198—Haley fine sandy loam, 10 to 25 percent slopes

### Composition

*Haley soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 10 to 25 percent

*Elevation:* 1,500 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown fine sandy loam

*Subsoil:*

12 to 28 inches—pale brown fine sandy loam

*Upper part of substratum:*

28 to 40 inches—brown and pale brown loamy sand

*Lower part of substratum:*

40 to 60 inches—multicolored sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Ewall soils
- Fivelakes and Owhi soils
- Nespelem soils
- Disautel and Conconully soils

### Major Uses

Livestock grazing, nonirrigated cropland, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction.

Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

## 199—Hallcreek loam, 0 to 10 percent slopes

### Composition

*Hallcreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash with a mantle of volcanic ash and loess

*Slope range:* 0 to 10 percent

*Elevation:* 1,700 to 2,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 3 inches—brown loam

*Upper part of subsoil:*

3 to 11 inches—pale brown loam

*Lower part of subsoil:*

11 to 17 inches—light yellowish brown gravelly sandy loam

*Substratum:*

17 to 60 inches—light gray extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Garrison soils
- Bisbee soils
- Phoebe soils

### Major Uses

Nonirrigated and irrigated cropland and hay and pasture, building site development, timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by droughtiness and steepness of slope.

## 200—Haploxerolls, 30 to 70 percent slopes

### Composition

*Haploxerolls and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terrace escarpments with dominantly north- and east-facing slopes

*Parent material:* Glacial outwash, glaciofluvial material, and glacial lake sediment

*Slope range:* 30 to 70 percent

*Elevation:* 1,200 to 2,600 feet

*Average annual precipitation:* 11 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Reference Profile

*Upper part of surface layer:*

0 to 3 inches—grayish brown gravelly sandy loam

*Lower part of surface layer:*

3 to 11 inches—brown very gravelly sandy loam

*Upper part of substratum:*

11 to 17 inches—pale brown very gravelly loamy sand

*Middle part of substratum:*

17 to 35 inches—light brownish gray very gravelly sand

*Lower part of substratum:*

35 to 60 inches—light gray gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained and somewhat excessively drained

*Permeability:* Moderate to rapid

*Available water capacity:* Low to moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium to very rapid

*Hazard of water erosion:* Rangeland—moderate to very severe

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a very stony or extremely stony surface
- Xeric Torriorthents that have a light-colored surface layer

### Major Uses

Limited livestock grazing, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

- The soil in this unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.

- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 201—Hartill silt loam, dry, 20 to 40 percent slopes

### Composition

*Hartill soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and shoulders of mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metamorphic rock  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,300 to 4,800 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 6 inches—brown silt loam  
*Upper part of subsoil:*  
 6 to 14 inches—light yellowish brown silt loam  
*Lower part of subsoil:*  
 14 to 30 inches—pale brown very channery sandy loam  
*Substratum:*  
 30 to 39 inches—pale brown extremely flaggy sandy loam  
*Bedrock:*  
 39 to 43 inches—graywacke

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Wilmont soils
- Elbowlake soils
- Raisio soils
- Inkler soils
- Soils that have bedrock at a depth of less than 20 inches
- Henneway soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, western larch, and grand fir—readily

*Limitations for planting:* None

### 202—Hartill silt loam, dry, 40 to 65 percent slopes

### Composition

*Hartill soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of mountains  
*Parent material:* Mantle of volcanic ash and loess over residuum and colluvium derived from metamorphic rock  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,300 to 4,800 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 6 inches—brown silt loam  
*Upper part of subsoil:*  
 6 to 14 inches—light yellowish brown silt loam  
*Lower part of subsoil:*  
 14 to 30 inches—pale brown very channery sandy loam  
*Substratum:*  
 30 to 39 inches—pale brown extremely flaggy sandy loam  
*Bedrock:*  
 39 to 43 inches—graywacke

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate

*Available water capacity:* Moderate  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Wilmont soils
- Elbowlake soils
- Raisio soils
- Inkler soils
- Soils that have bedrock at a depth of less than 20 inches
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, western larch, and grand fir—readily

*Limitation for planting:* Steepness of slope

## 203—Hellgate gravelly coarse sandy loam, 3 to 20 percent slopes

### Composition

*Hellgate soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toeslopes of mountains, and fan terraces

*Parent material:* Residuum, colluvium, and valley fill derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 3 to 20 percent

*Elevation:* 1,600 to 2,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*  
0 to 8 inches—grayish brown gravelly coarse sandy loam

*Upper part of subsoil:*  
8 to 12 inches—pale brown gravelly coarse sandy loam

*Lower part of subsoil:*  
12 to 25 inches—very pale brown gravelly coarse sandy loam

*Upper part of substratum:*  
25 to 36 inches—pale brown very gravelly loamy coarse sand

*Lower part of substratum:*  
36 to 60 inches—multicolored very gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Spokane soils
- Geogecreek soils
- Whitestone soils
- Phoebe soils
- Soils that have a very stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

## **204—Hellgate gravelly loam, cool, 3 to 15 percent slopes**

### **Composition**

*Hellgate soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### **Setting**

*Position on landscape:* Toeslopes of mountains, and fan terraces

*Parent material:* Colluvium, residuum, and valley fill derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 3 to 15 percent

*Elevation:* 1,600 to 2,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### **Typical Profile**

*Organic mat on surface:* 0.5 inch thick

*Surface layer:*

0 to 9 inches—grayish brown gravelly loam

*Subsoil:*

9 to 22 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

22 to 50 inches—pale brown gravelly coarse sandy loam

*Lower part of substratum:*

50 to 60 inches—very pale brown gravelly loamy coarse sand

### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### **Contrasting Inclusions**

- Spokane soils
- Georgecreek soils
- Whitestone soils
- Phoebe soils

### **Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### **Use and Management**

#### **Timber Production**

#### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### **Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

## **205—Henneway silt loam, 0 to 20 percent slopes**

### **Composition**

*Henneway soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### **Setting**

*Position on landscape:* Toeslopes and footslopes of hills and mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metasedimentary rock

*Slope range:* 0 to 20 percent

*Elevation:* 2,400 to 3,700 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### **Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 3 inches—dark yellowish brown silt loam

*Upper part of subsoil:*

3 to 10 inches—yellowish brown silt loam

*Subsurface layer:*

10 to 28 inches—brown and pale brown silt loam

*Middle part of subsoil:*

28 to 49 inches—yellowish brown silty clay loam and light olive brown channery silty clay loam

*Lower part of subsoil:*

49 to 59 inches—olive yellow channery clay loam and light olive brown channery silt loam

*Bedrock:*

59 to 63 inches—phyllite

**Soil Properties and Qualities**

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Friedlander soils
- Brusher soils
- Renha soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, grand fir, and western larch—readily

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**206—Henneway silt loam, 20 to 40 percent slopes****Composition**

*Henneway soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Foothills of hills and mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metasedimentary rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,400 to 3,700 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 3 inches—dark yellowish brown silt loam

*Upper part of subsoil:*

3 to 10 inches—yellowish brown silt loam

*Subsurface layer:*

10 to 28 inches—brown and pale brown silt loam

*Middle part of subsoil:*

28 to 49 inches—yellowish brown silty clay loam and light olive brown channery silty clay loam

*Lower part of subsoil:*

49 to 59 inches—olive yellow channery clay loam and light olive brown channery silt loam

*Bedrock:*

59 to 63 inches—phyllite

**Soil Properties and Qualities**

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Friedlander soils
- Brusher soils
- Hartill soils
- Wells creek soils
- Renha soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, grand fir, and western larch—readily

*Limitations for planting:* None

### 207—Henneway silt loam, warm, 20 to 40 percent slopes

#### Composition

*Henneway soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Foothills of hills and mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metasedimentary rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,400 to 3,700 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 3 inches—brown silt loam

*Upper part of subsoil:*

3 to 13 inches—light yellowish brown silt loam

*Subsurface layer:*

13 to 22 inches—light brownish gray loam

*Lower part of subsoil:*

22 to 45 inches—pale brown channery loam

*Substratum:*

45 to 58 inches—light brownish gray channery loam

*Bedrock:*

58 to 62 inches—phyllite

#### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe

*Hazard of wind erosion (bare surface):* Slight

#### Contrasting Inclusions

- Friedlander soils
- Brusher soils
- Oxerine soils
- Wells creek soils
- Renha soils

#### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

### 208—Heytou-Stubblefield stony loams complex, 25 to 65 percent slopes

#### Composition

*Heytou soil and similar soils:* 50 percent

*Stubblefield soil and similar soils:* 40 percent

*Contrasting inclusions:* 10 percent

#### Setting

*Position on landscape:* Backslopes of glaciated hills  
*Parent material:* Glacial till derived from basalt mixed with loess in the upper part

*Slope range:* 25 to 65 percent

*Elevation:* 1,200 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

## Typical Profile

### Heytou

*Upper part of surface layer:*  
0 to 4 inches—gray stony loam

*Lower part of surface layer:*  
4 to 16 inches—grayish brown gravelly loam

*Upper part of subsoil:*  
16 to 30 inches—grayish brown very cobbly loam

*Middle part of subsoil:*  
30 to 40 inches—light brownish gray, calcareous dense glacial till that crushes to very cobbly loam

*Lower part of subsoil:*  
40 to 60 inches—gray, calcareous dense glacial till that crushes to very gravelly loam

### Stubblefield

*Surface layer:*  
0 to 9 inches—grayish brown stony loam

*Upper part of subsoil:*  
9 to 24 inches—pale brown very gravelly loam

*Middle part of subsoil:*  
24 to 28 inches—light brownish gray hardpan

*Lower part of subsoil:*  
28 to 60 inches—light brownish gray dense glacial till that crushes to very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Heytou—moderately deep (20 to 40 inches to dense glacial till); Stubblefield—moderately deep (20 to 40 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Heytou—moderate over slow; Stubblefield—moderate above the hardpan and slow below the hardpan

*Available water capacity:* Heytou—moderately high; Stubblefield—low

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Strat soils
- Malott and Timentwa soils
- Soils that have a very stony or extremely stony surface
- Rock outcrop
- Rubble land

## Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This unit is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

## 209—Histosols, ponded

### Composition

*Histosols and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Backswamps of flood plains, and depressions surrounding lakes and ponds

*Parent material:* Decomposed organic matter overlying alluvium that commonly has a large component of volcanic ash

*Slope range:* 0 to 1 percent

*Elevation:* 1,500 to 4,000 feet

*Average annual precipitation:* 10 to 25 inches

*Average annual air temperature:* 44 to 47 degrees F

*Frost-free period:* 80 to 150 days

### Reference Profile

*Surface tier:*  
0 to 4 inches—black mucky peat

*Subsurface tier:*  
4 to 20 inches—black muck

*Upper part of substratum:*  
20 to 32 inches—very dark brown silt loam

*Lower part of substratum:*  
32 to 60 inches—gray silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Very poorly drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Ponded for very long periods in November through August

*Hazard of water erosion:* None

*Hazard of wind erosion (bare surface):* None

*Water table:* Present in January through December  
(see "Water Features" table)

### Contrasting Inclusions

- Borosaprists and Medisaprists
- Ralsen and Sanpoil soils
- Bossburg and Uncas soils
- Open water areas

### Major Use

Wetland wildlife habitat

## 210—Hobohill sandy loam, 40 to 70 percent slopes

### Composition

*Hobohill soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments with mainly northerly aspects

*Parent material:* Glacial outwash and alluvium

*Slope range:* 40 to 70 percent

*Elevation:* 1,400 to 2,500 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Upper part of surface layer:*

0 to 3 inches—dark grayish brown sandy loam

*Lower part of surface layer:*

3 to 18 inches—grayish brown sandy loam

*Upper part of substratum:*

18 to 30 inches—pale brown gravelly loamy sand

*Lower part of substratum:*

30 to 60 inches—light gray gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Hazard of water erosion:* Rangeland—severe or very severe

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Conconully soils
- Ewall soils
- Fivelakes and Owhi soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 211—Hobohill stony sandy loam, 3 to 25 percent slopes

### Composition

*Hobohill soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Fan terraces and old alluvial fans

*Parent material:* Glacial outwash and alluvium

*Slope range:* 3 to 25 percent

*Elevation:* 1,400 to 2,500 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*

0 to 3 inches—dark grayish brown stony sandy loam

*Lower part of surface layer:*

3 to 14 inches—dark grayish brown gravelly sandy loam

*Upper part of substratum:*

14 to 23 inches—pale brown gravelly loamy coarse sand

*Lower part of substratum:*

23 to 60 inches—very pale brown gravelly loamy coarse sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight to severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Moderate

**Contrasting Inclusions**

- Conconully soils
- Ewall soils
- Owhi soils
- Nespelem soils

**Major Uses**

Livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Livestock grazing**

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and large stones.

**212—Hodgson silt loam, 0 to 5 percent slopes****Composition**

*Hodgson soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Terraces

*Parent material:* Glacial lake sediment and mudflow deposits mixed with a component of loess and volcanic ash

*Slope range:* 0 to 5 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

**Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—light brownish gray silt loam

*Upper part of subsoil:*

3 to 28 inches—light brownish gray and light gray silty clay loam

*Middle part of subsoil:*

28 to 47 inches—light gray silty clay

*Lower part of subsoil:*

47 to 60 inches—light gray, calcareous silty clay

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow or slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in January through May (see “Water Features” table)

**Contrasting Inclusions**

- Jimcreek soils
- Cedonia and Hunters soils
- Donovan soils

**Major Uses**

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, building site development, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitation for planting:* High clay content

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by wetness and water erosion.

## 213—Hodgson silt loam, 5 to 15 percent slopes

### Composition

*Hodgson soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash

*Slope range:* 5 to 15 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—light brownish gray silt loam

*Upper part of subsoil:*

3 to 28 inches—light brownish gray and light gray silty clay loam

*Middle part of subsoil:*

28 to 47 inches—light gray silty clay

*Lower part of subsoil:*

47 to 60 inches—light gray, calcareous silty clay

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in January through May (see “Water Features” table)

### Contrasting Inclusions

- Cedonia and Hunters soils
- Donavan soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, building site development, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitation for planting:* High clay content

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, wetness, and water erosion.

## 214—Hodgson silt loam, 15 to 30 percent slopes

### Composition

*Hodgson soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash

*Slope range:* 15 to 30 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—light brownish gray silt loam

*Upper part of subsoil:*

3 to 28 inches—light brownish gray and light gray silty clay loam

*Middle part of subsoil:*

28 to 47 inches—light gray silty clay

*Lower part of subsoil:*

47 to 60 inches—light gray, calcareous silty clay

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Cropland—severe or very  
 severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Present in January through May (see  
 “Water Features” table)

### Contrasting Inclusions

- Cedonia and Hunters soils
- Donovan soils

### Major Uses

Timber production, livestock grazing, recreation,  
 watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
 tracked equipment—suitable; cable yarding—  
 suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—  
 readily; Douglas-fir—periodically  
*Limitation for planting:* High clay content

## 215—Hodgson silt loam, 30 to 50 percent slopes

### Composition

*Hodgson soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial lake sediment mixed with a  
 component of loess and volcanic ash  
*Slope range:* 30 to 50 percent  
*Elevation:* 1,300 to 2,000 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 3 inches—light brownish gray silt loam

*Upper part of subsoil:*  
 3 to 28 inches—light brownish gray and light gray silty  
 clay loam

*Middle part of subsoil:*  
 28 to 47 inches—light gray silty clay

*Lower part of subsoil:*  
 47 to 60 inches—light gray, calcareous silty clay

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very  
 severe

*Water table:* Present in January through May (see  
 “Water Features” table)

### Contrasting Inclusions

- Cedonia and Hunters soils
- Lakesol soils
- Donovan soils

### Major Uses

Timber production, livestock grazing, recreation,  
 watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
 tracked equipment—unsafe because of  
 steepness of slope and use results in excessive  
 soil damage and erosion; cable yarding—  
 suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—  
 readily; Douglas-fir—periodically  
*Limitations for planting:* High clay content and  
 steepness of slope

## 216—Hudnut gravelly sandy loam, 0 to 20 percent slopes

### Composition

*Hudnut soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Till plains and outwash terraces

*Parent material:* Granitic ablation till and glacial outwash mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 0 to 20 percent

*Elevation:* 1,800 to 2,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 2 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

2 to 17 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

17 to 50 inches—pale brown gravelly sandy loam

*Lower part of substratum:*

50 to 60 inches—pale brown very gravelly loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Garrison soils
- Vanbrunt soils
- Bisbee soils
- Republic soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

## 217—Hudnut gravelly sandy loam, 20 to 40 percent slopes

### Composition

*Hudnut soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Escarpments of till plains and outwash terraces

*Parent material:* Granitic ablation till and glacial outwash mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 2,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 2 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

2 to 17 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

17 to 50 inches—pale brown gravelly sandy loam

*Lower part of substratum:*

50 to 60 inches—pale brown very gravelly loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Cropland—moderate or  
 severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Garrison soils
- Vanbrunt soils
- Bisbee soils
- Republic soils

### Major Uses

Timber production, livestock grazing, recreation,  
 watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked  
 equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—  
 moderate  
*Limitation for planting:* Rock fragments in the soil

## 218—Hunters silt loam, 0 to 5 percent slopes

### Composition

*Hunters soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Glacial lake sediment mixed with a  
 component of loess and volcanic ash  
*Slope range:* 0 to 5 percent  
*Elevation:* 1,300 to 2,000 feet  
*Average annual precipitation:* 15 to 19 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick  
*Surface layer:*  
 0 to 10 inches—brown silt loam

*Upper part of subsoil:*  
 10 to 28 inches—light brownish gray silt loam  
*Lower part of subsoil:*  
 28 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Very high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight;  
 forestland—slight  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Scala soils
- Inchelium soils
- Phoebe soils
- Donovan soils

### Major Uses

Timber production, livestock grazing, nonirrigated  
 cropland, nonirrigated hay and pasture, building  
 site development, recreation, watershed, and  
 wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
 tracked equipment—suitable; cable yarding—  
 suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—  
 readily; Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by  
 water erosion.

## 219—Hunters silt loam, warm, 30 to 65 percent slopes

### Composition

*Hunters soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash  
*Slope range:* 30 to 65 percent  
*Elevation:* 1,300 to 1,800 feet  
*Average annual precipitation:* 15 to 19 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 110 to 130 days

### Typical Profile

*Surface layer:*  
 0 to 14 inches—grayish brown silt loam

*Upper part of subsoil:*  
 14 to 24 inches—brown silt loam

*Lower part of subsoil:*  
 24 to 42 inches—light brownish gray, calcareous silt loam

*Substratum:*  
 42 to 60 inches—light brownish gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Very high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Hazard of water erosion:* Rangeland—severe or very severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Scala soils
- Phoebe soils
- Spens soils
- Hodgson soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

• This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

### 220—Inchelium silt loam, 0 to 5 percent slopes

#### Composition

*Inchelium soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

#### Setting

*Position on landscape:* Terraces adjacent to uplands  
*Parent material:* Loess and glaciofluvial material over glacial lake sediment  
*Slope range:* 0 to 5 percent  
*Elevation:* 1,300 to 2,000 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

#### Typical Profile

*Upper part of surface layer:*  
 0 to 13 inches—very dark grayish brown silt loam

*Lower part of surface layer:*  
 13 to 42 inches—brown and dark grayish brown silt loam

*Upper part of subsoil:*  
 42 to 51 inches—pale brown silt loam

*Lower part of subsoil:*  
 51 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Moderately well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Very high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight; forestland—slight  
*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Present in January through June (see “Water Features” table)

### Contrasting Inclusions

- Hunters soils
- Cedonia soils
- Stevens soils
- Scala soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated and irrigated hay and

pasture, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by water erosion.

## 221—Inchelium silt loam, 5 to 10 percent slopes

### Composition

*Inchelium soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terraces adjacent to uplands  
*Parent material:* Loess and glaciofluvial material over glacial lake sediment

*Slope range:* 5 to 10 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Upper part of surface layer:*

0 to 13 inches—very dark grayish brown silt loam

*Lower part of surface layer:*

13 to 42 inches—brown and dark grayish brown silt loam

*Upper part of subsoil:*

42 to 51 inches—pale brown silt loam

*Lower part of subsoil:*

51 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in January through June (see “Water Features” table)

### Contrasting Inclusions

- Hunters soils
- Cedonia soils
- Stevens soils
- Scala soils

### Major Uses

Nonirrigated and irrigated cropland and hay and pasture, timber production, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 222—Inkler gravelly silt loam, dry, 5 to 20 percent slopes

### Composition

*Inkler soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of hills and mountains

*Parent material:* Mantle of volcanic ash and loess over glacial till and colluvium derived from volcanic and metamorphic rock

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 4,200 feet

*Average annual precipitation:* 16 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 3 inches—grayish brown gravelly silt loam

*Upper part of subsoil:*  
3 to 9 inches—light brownish gray gravelly silt loam

*Lower part of subsoil:*  
9 to 18 inches—pale brown gravelly loam

*Upper part of substratum:*  
18 to 31 inches—light brownish gray very gravelly loam

*Lower part of substratum:*  
31 to 60 inches—light brownish gray very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Scoap soils
- Nevine soils
- Apex and Republic soils
- Oxerine and Thout soils
- Soils that have a very stony surface layer

### Major Uses

Timber production, livestock grazing, wildlife habitat, nonirrigated hay and pasture, building site development, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 223—Inkler gravelly silt loam, dry, 20 to 40 percent slopes

### Composition

*Inkler soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains  
*Parent material:* Mantle of volcanic ash and loess over glacial till and colluvium derived from volcanic and metamorphic rock  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,000 to 4,200 feet  
*Average annual precipitation:* 16 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 3 inches—grayish brown gravelly silt loam

*Upper part of subsoil:*  
3 to 9 inches—light brownish gray gravelly silt loam

*Lower part of subsoil:*  
9 to 18 inches—pale brown gravelly loam

*Upper part of substratum:*  
18 to 31 inches—light brownish gray very gravelly loam

*Lower part of substratum:*  
31 to 60 inches—light brownish gray very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Scoap soils
- Nevine soils
- Apex and Republic soils
- Oxerine and Thout soils
- Baldknob soils
- Soils that have a very stony surface layer
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitations for planting:* None

## 224—Inkler gravelly silt loam, dry, 40 to 65 percent slopes

### Composition

*Inkler soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains  
*Parent material:* Mantle of volcanic ash and loess over glacial till and colluvium derived from volcanic and metamorphic rock  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,000 to 4,200 feet  
*Average annual precipitation:* 16 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
 0 to 3 inches—grayish brown gravelly silt loam

*Upper part of subsoil:*  
 3 to 9 inches—light brownish gray gravelly silt loam

*Lower part of subsoil:*  
 9 to 18 inches—pale brown gravelly loam

*Upper part of substratum:*  
 18 to 31 inches—light brownish gray very gravelly loam

*Lower part of substratum:*  
 31 to 60 inches—light brownish gray very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Scoap soils
- Nevine soils
- Apex and Republic soils
- Oxerine and Thout soils
- Baldknob soils
- Soils that have a very stony surface layer
- Rock outcrop

### Major Uses

Timber production, wildlife habitat, livestock grazing, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitation for planting:* Steepness of slope

**225—Inkler, dry-Baldknob-Rock  
outcrop complex, 5 to 30 percent  
slopes**

**Composition**

*Inkler soil and similar soils:* 40 percent

*Baldknob soil and similar soils:* 25 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Inkler—footslopes and

backslopes of mountains; Baldknob—summits and shoulders of mountains (fig. 10)

*Parent material:* Inkler—mantle of volcanic ash and loess over glacial till or colluvium derived from volcanic and metamorphic rock; Baldknob—dominantly colluvium and residuum derived from volcanic rock and some glacial till with volcanic ash and loess

*Slope range:* 5 to 30 percent

*Elevation:* 2,500 to 4,200 feet

*Average annual precipitation:* 16 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

Figure 10.—Area of Inkler, dry-Baldknob-Rock outcrop complex, 5 to 30 percent slopes. The Inkler soil is in the forested drainageways and other concave areas, and the Baldknob soil and Rock outcrop are in the nonforested, convex areas.

*Rock fragments on surface:* Inkler—none; Baldknob—stones cover 3 to 15 percent

### **Inkler Soil**

#### **Typical profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—grayish brown gravelly silt loam

*Upper part of subsoil:*

3 to 9 inches—light brownish gray gravelly silt loam

*Lower part of subsoil:*

9 to 18 inches—pale brown gravelly loam

*Upper part of substratum:*

18 to 31 inches—light brownish gray very gravelly loam

*Lower part of substratum:*

31 to 60 inches—light brownish gray very gravelly sandy loam

#### **Soil properties and qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate

### **Baldknob Soil**

#### **Typical profile**

*Surface layer:*

0 to 4 inches—brown very stony loam

*Upper part of subsoil:*

4 to 9 inches—brown very gravelly loam

*Lower part of subsoil:*

9 to 14 inches—yellowish brown extremely gravelly loam

*Bedrock:*

14 to 18 inches—rhyodacite

#### **Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate

### **Rock Outcrop**

*Kind of rock:* Rhyodacite, andesite, and quartz latite

#### **Contrasting Inclusions**

- Nevine soils
- Thout soils
- Lithic Xerochrepts
- Inkler soils
- Rubble land

#### **Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### **Silviculture**

*Potential for natural regeneration (Inkler):* Douglas-fir and ponderosa pine—readily

*Potential for natural regeneration (Baldknob):*

Ponderosa pine—periodically

*Limitations for planting:* Inkler—Rock outcrop; Baldknob—rock fragments in the soil, depth to bedrock, and Rock outcrop

### **226—Inkler, dry-Baldknob-Rock outcrop complex, 30 to 65 percent slopes**

#### **Composition**

*Inkler soil and similar soils:* 45 percent

*Baldknob soil and similar soils:* 20 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Inkler—backslopes of mountains; Baldknob—backslopes and shoulders of mountains

*Parent material:* Inkler—mantle of volcanic ash and loess over glacial till or colluvium derived from volcanic and metamorphic rock; Baldknob—dominantly colluvium and residuum derived from volcanic rock and some glacial till with volcanic ash and loess

*Slope range:* 30 to 65 percent  
*Elevation:* 2,500 to 4,200 feet  
*Average annual precipitation:* 16 to 22 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days  
*Rock fragments on surface:* Inkler—none;  
 Baldknob—stones cover 3 to 15 percent

### **Inkler Soil**

#### **Typical profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—grayish brown gravelly silt loam

*Upper part of subsoil:*

3 to 9 inches—light brownish gray gravelly silt loam

*Lower part of subsoil:*

9 to 18 inches—pale brown gravelly loam

*Upper part of substratum:*

18 to 31 inches—light brownish gray very gravelly loam

*Lower part of substratum:*

31 to 60 inches—light brownish gray very gravelly sandy loam

#### **Soil properties and qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

### **Baldknob Soil**

#### **Typical profile**

*Surface layer:*

0 to 4 inches—brown very stony loam

*Upper part of subsoil:*

4 to 9 inches—brown very gravelly loam

*Lower part of the subsoil:*

9 to 14 inches—yellowish brown extremely gravelly loam

*Bedrock:*

14 to 18 inches—rhyodacite

#### **Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

#### **Rock Outcrop**

*Kind of rock:* Rhyodacite, andesite, and quartz latite

#### **Contrasting Inclusions**

- Nevine soils that are silt loam and have a mantle of volcanic ash 14 to 25 inches thick
- Thout soils that have bedrock at a depth of 20 to 40 inches
- Lithic Xerorthents that have bedrock at a depth of 4 to 10 inches
- Inkler soils that have a very stony or extremely stony surface
- Rubble land

#### **Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion

##### **Silviculture**

*Potential for natural regeneration (Inkler):* Douglas-fir and ponderosa pine—readily

*Potential for natural regeneration (Baldknob):* Ponderosa pine—periodically

*Limitations for planting:* Inkler—Rock outcrop and steepness of slope; Baldknob—rock fragments in the soil, depth to bedrock, steepness of slope, and Rock outcrop

### **227—Inkler, dry-Rock outcrop complex, 20 to 40 percent slopes**

#### **Composition**

*Inkler soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains  
*Parent material:* Mantle of volcanic ash and loess over glacial till and colluvium derived from volcanic and metamorphic rock  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,000 to 4,200 feet  
*Average annual precipitation:* 16 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Inkler Soil

#### Typical profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 3 inches—grayish brown gravelly silt loam  
*Upper part of subsoil:*  
 3 to 9 inches—light brownish gray gravelly silt loam  
*Lower part of subsoil:*  
 9 to 18 inches—pale brown gravelly loam  
*Upper part of substratum:*  
 18 to 31 inches—light brownish gray very gravelly loam  
*Lower part of substratum:*  
 31 to 60 inches—light brownish gray very gravelly sandy loam

#### Soil properties and qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—moderate or severe

### Rock Outcrop

*Kind of rock:* Rhyodacite, phyllite, schist, slate, and graywacke

### Contrasting Inclusions

- Scoap soils

- Nevine soils
- Apex and Republic soils
- Oxerine and Thout soils
- Baldknob soils
- Soils that have a very stony surface layer
- Rubble land

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitation for planting:* Rock outcrop

## 228—Inkler, dry-Rock outcrop complex, 40 to 65 percent slopes

### Composition

*Inkler soil and similar soils:* 65 percent  
*Rock outcrop:* 20 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains  
*Parent material:* Mantle of volcanic ash and loess over glacial till and colluvium derived from volcanic and metamorphic rock  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,000 to 4,200 feet  
*Average annual precipitation:* 16 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Inkler Soil

#### Typical profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 3 inches—grayish brown gravelly silt loam  
*Upper part of subsoil:*  
 3 to 9 inches—light brownish gray gravelly silt loam

*Lower part of subsoil:*

9 to 18 inches—pale brown gravelly loam

*Upper part of substratum:*

18 to 31 inches—light brownish gray very gravelly loam

*Lower part of substratum:*

31 to 60 inches—light brownish gray very gravelly sandy loam

**Soil properties and qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

**Rock Outcrop**

*Kind of rock:* Rhyodacite, phyllite, schist, slate, and graywacke

**Contrasting Inclusions**

- Scoap soils
- Nevine soils
- Apex and Republic soils
- Oxerine and Thout soils
- Baldknob soils
- Soils that have a very stony surface layer
- Rubble land

**Major Uses**

Timber production, wildlife habitat, livestock grazing, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitations for planting:* Rock outcrop and steepness of slope

**229—Jimcreek silt loam, 0 to 5 percent slopes****Composition**

*Jimcreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Depressions on terraces and lake plains

*Parent material:* Glacial lake sediment and recent alluvium mixed with volcanic ash

*Slope range:* 0 to 5 percent

*Elevation:* 1,600 to 3,100 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 19 inches—dark gray and gray silt loam

*Upper part of subsoil:*

19 to 36 inches—mottled, light gray silty clay loam

*Middle part of subsoil:*

36 to 46 inches—mottled, light gray silty clay loam

*Lower part of subsoil:*

46 to 60 inches—mottled, light gray silty clay loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat poorly drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow or slow

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through July (see “Water Features” table)

**Contrasting Inclusions**

- Soils that are poorly drained or very poorly drained
- Omak soils
- Ret soils
- Hodgson and Kewach soils

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, wildlife habitat, recreation, and watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine, Douglas-fir, and western larch—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wetness and water erosion.

## 230—Johntom-Rock outcrop-Rubble land complex, 30 to 65 percent slopes

### Composition

*Johntom soil and similar soils:* 65 percent  
*Rock outcrop:* 15 percent  
*Rubble land:* 10 percent  
*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains  
*Parent material:* Colluvium and residuum derived from rhyodacite and quartz latite mixed with a component of loess and volcanic ash  
*Slope range:* 30 to 65 percent  
*Elevation:* 1,600 to 3,500 feet  
*Average annual precipitation:* 14 to 20 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Johntom Soil

#### Typical profile

*Upper part of surface layer:*  
0 to 4 inches—dark brown stony loam

*Lower part of surface layer:*  
4 to 11 inches—brown very gravelly sandy loam

#### *Substratum:*

11 to 16 inches—pale brown extremely gravelly coarse sandy loam

#### *Bedrock:*

16 to 20 inches—rhyodacite

### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Rhyodacite and quartz latite

### Rubble Land

Rubble land consists of areas of unconsolidated rock debris, commonly known as talus, on backslopes and footslopes of hills, mountains, and plateaus. Slopes range from 30 to 65 percent. Rock fragments are angular, and they range in size from gravel to boulders. Rubble land commonly is barren, but small areas where soil material has accumulated between rock fragments support a very sparse cover of shrubs, grasses, and forbs.

### Contrasting Inclusions

- Wynhoff and Northstar soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Louiecreek soils
- Soils that have a very stony or extremely stony surface
- Baldknob soils

### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be

buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### **231—Karamin fine sandy loam, 0 to 20 percent slopes**

#### **Composition**

*Karamin soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Terraces and mountain toeslopes

*Parent material:* Sandy glacial outwash mixed with a component of loess and volcanic ash in the surface

*Slope range:* 0 to 20 percent

*Elevation:* 2,700 to 4,500 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### **Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 6 inches—pale brown fine sandy loam

*Subsoil:*

6 to 18 inches—light yellowish brown fine sandy loam

*Upper part of substratum:*

18 to 28 inches—light gray loamy fine sand

*Lower part of substratum:*

28 to 60 inches—light gray loamy sand

#### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

#### **Contrasting Inclusions**

- Sacheen soils
- Goddard and Parmenter soils
- Louploup soils

- Wapal soils
- Stapaloop soils
- Merkel soils

#### **Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### **Silviculture**

*Potential for natural regeneration:* Ponderosa pine, western larch, Douglas-fir, and lodgepole pine—readily

*Limitations for planting:* None

##### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by wind erosion and steepness of slope.

### **232—Karamin fine sandy loam, 20 to 40 percent slopes**

#### **Composition**

*Karamin soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Terrace escarpments and mountain footslopes

*Parent material:* Sandy glacial outwash mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 20 to 40 percent

*Elevation:* 2,600 to 4,500 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### **Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 6 inches—pale brown fine sandy loam

*Subsoil:*

6 to 18 inches—light yellowish brown fine sandy loam

*Upper part of substratum:*  
18 to 28 inches—light gray loamy fine sand

*Lower part of substratum:*  
28 to 60 inches—light gray loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Sacheen soils
- Goddard and Parmenter soils
- Louploup soils
- Wapal soils
- Stapaloo soils
- Merkel soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine, western larch, Douglas-fir, and lodgepole pine—readily

*Limitations for planting:* None

## 233—Karamin fine sandy loam, 40 to 65 percent slopes

### Composition

*Karamin soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments and mountain backslopes

*Parent material:* Sandy glacial outwash mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 40 to 65 percent

*Elevation:* 2,600 to 4,500 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 6 inches—pale brown fine sandy loam

*Subsoil:*  
6 to 18 inches—light yellowish brown fine sandy loam

*Upper part of substratum:*  
18 to 28 inches—light gray loamy fine sand

*Lower part of substratum:*  
28 to 60 inches—light gray loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Sacheen soils
- Wapal soils
- Stapaloo soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine,

western larch, Douglas-fir, and lodgepole pine—readily

*Limitation for planting:* Steepness of slope

### **234—Kartar sandy loam, warm, 0 to 10 percent slopes**

#### **Composition**

*Kartar soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Terraces and till plains

*Parent material:* Glacial outwash and reworked glacial till mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 0 to 10 percent

*Elevation:* 2,000 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### **Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—pale brown sandy loam

*Upper part of subsoil:*

6 to 18 inches—pale brown sandy loam

*Lower part of subsoil:*

18 to 22 inches—very pale brown gravelly sandy loam

*Upper part of substratum:*

22 to 42 inches—very pale brown gravelly sand

*Lower part of substratum:*

42 to 60 inches—light gray fine sand

#### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Severe

#### **Contrasting Inclusions**

- Donavan soils
- Hudnut soils

- Hallcreek, Springdale, and Spens soils

#### **Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### **Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

##### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, wind erosion, and droughtiness.

### **235—Kellerbutte silt loam, 20 to 40 percent slopes**

#### **Composition**

*Kellerbutte soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Dominantly north-facing backslopes and footslopes of mountains

*Parent material:* Volcanic ash over colluvium derived from granitic rock and rhyodacite

*Slope range:* 20 to 40 percent

*Elevation:* 2,500 to 5,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### **Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Subsoil:*

5 to 17 inches—pale brown and light yellowish brown gravelly silt loam

*Substratum:*

17 to 60 inches—light gray very gravelly coarse sandy loam

#### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have a very stony or extremely stony surface
- Canteen soils
- Capoose and Mineral soils
- Bearspring soils
- Togo soils
- Rock outcrop

### Major Uses

Timber production, watershed, wildlife habitat, livestock grazing, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and western larch—readily; ponderosa pine and lodgepole pine—periodically

*Limitations for planting:* None

## 236—Kellerbutte silt loam, 40 to 65 percent slopes

### Composition

*Kellerbutte soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Dominantly north-facing backslopes of mountains  
*Parent material:* Volcanic ash over colluvium derived from granitic rock and rhyodacite  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,500 to 5,000 feet  
*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
 0 to 7 inches—brown silt loam

*Subsoil:*  
 7 to 17 inches—pale brown and light yellowish brown gravelly silt loam

*Substratum:*  
 17 to 60 inches—light gray very gravelly coarse sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Soils that have a very stony or extremely stony surface
- Canteen soils
- Capoose and Mineral soils
- Bearspring soils
- Togo soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and western larch—readily; ponderosa pine and lodgepole pine—periodically

*Limitation for planting:* Steepness of slope

## 237—Kenotrail silt loam, 20 to 40 percent slopes

### Composition

*Kenotrail soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges and shoulders of hills and mountains

*Parent material:* Residuum derived from serpentine, greenstone, and talc mixed with volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 3,200 to 3,800 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 9 inches—brown and light brown silt loam

*Subsoil:*

9 to 32 inches—reddish yellow gravelly silty clay loam

*Bedrock:*

32 to 42 inches—weathered talc

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Hartill and Oxerine soils
- Soils that are 10 to 20 inches deep to bedrock and are very gravelly throughout
- Friedlander soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* High clay content

## 238—Kewach silt loam, 0 to 5 percent slopes

### Composition

*Kewach soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial lake sediment mixed with volcanic ash and loess

*Slope range:* 0 to 5 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—pale brown silt loam

*Subsurface layer:*

4 to 10 inches—pale brown silt loam

*Upper part of subsoil:*

10 to 29 inches—very pale brown, pale yellow, and light gray silt loam

*Lower part of subsoil:*

29 to 42 inches—brownish yellow and light yellowish brown silty clay loam

*Substratum:*

42 to 60 inches—light gray, calcareous silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through June (see “Water Features” table)

### Contrasting Inclusions

- Jimcreek soils
- Cedonia soils
- Hunters soils
- Donavan soils

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by water erosion and wetness.

## 239—Kewach silt loam, 5 to 15 percent slopes

### Composition

*Kewach soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial lake sediment mixed with volcanic ash and loess

*Slope range:* 5 to 15 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 4 inches—pale brown silt loam

*Subsurface layer:*  
4 to 10 inches—pale brown silt loam

*Upper part of subsoil:*  
10 to 29 inches—very pale brown, pale yellow, and light gray silt loam

*Lower part of subsoil:*  
29 to 42 inches—brownish yellow and light yellowish brown silty clay loam

*Substratum:*  
42 to 60 inches—light gray, calcareous silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through June (see “Water Features” table)

### Contrasting Inclusions

- Cedonia soils
- Hunters soils
- Donavan soils

### Major Uses

Timber production, livestock grazing, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and

Douglas-fir—readily; western larch and lodgepole pine—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, wetness, and water erosion.

### 240—Kewach silt loam, 15 to 30 percent slopes

#### Composition

*Kewach soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terrace escarpments

*Parent material:* Glacial lake sediment mixed with volcanic ash and loess

*Slope range:* 15 to 30 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—pale brown silt loam

*Subsurface layer:*

4 to 10 inches—pale brown silt loam

*Upper part of subsoil:*

10 to 29 inches—very pale brown, pale yellow, and light gray silt loam

*Lower part of subsoil:*

29 to 42 inches—brownish yellow and light yellowish brown silty clay loam

*Substratum:*

42 to 60 inches—light gray, calcareous silty clay loam

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Present in December through June (see “Water Features” table)

#### Contrasting Inclusions

- Cedonia soils
- Hunters soils
- Donavan soils

#### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

#### Use and Management

##### Timber production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

##### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, wetness, and water erosion.

### 241—Kewach silt loam, 30 to 50 percent slopes

#### Composition

*Kewach soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terrace escarpments

*Parent material:* Glacial lake sediment mixed with volcanic ash and loess

*Slope range:* 30 to 50 percent

*Elevation:* 1,300 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—pale brown silt loam

*Subsurface layer:*

4 to 10 inches—pale brown silt loam

*Upper part of subsoil:*

10 to 29 inches—very pale brown, pale yellow, and light gray silt loam

*Lower part of subsoil:*

29 to 42 inches—brownish yellow and light yellowish brown silty clay loam

*Substratum:*

42 to 60 inches—light gray, calcareous silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

*Water table:* Present in December through June (see “Water Features” table)

### Contrasting Inclusions

- Cedonia soils
- Hunters soils
- Donovan soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—readily; western larch and lodgepole pine—periodically

*Limitation for planting:* Steepness of slope

## 242—Kiehl silt loam, 0 to 8 percent slopes

### Composition

*Kiehl soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Volcanic ash and loess over glacial outwash

*Slope range:* 0 to 8 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 2 inches—brown silt loam

*Upper part of subsoil:*

2 to 10 inches—light yellowish brown silt loam

*Lower part of subsoil:*

10 to 21 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

21 to 29 inches—brown extremely gravelly loamy coarse sand

*Lower part of substratum:*

29 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Karamin soils
- Scrabblers soils
- Wapal soils

- Aits and Apex soils
- Newbell soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by water erosion, steepness of slope, and droughtiness.

## 243—Kiehl silt loam, 20 to 40 percent slopes

### Composition

*Kiehl soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments  
*Parent material:* Volcanic ash and loess over glacial outwash  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,000 to 4,000 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 43 to 45 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 2 inches—brown silt loam

*Upper part of subsoil:*  
2 to 10 inches—light yellowish brown silt loam

*Lower part of subsoil:*  
10 to 21 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*  
21 to 29 inches—brown extremely gravelly loamy coarse sand

*Lower part of substratum:*  
29 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Karamin soils
- Scrabblers soils
- Wapal soils
- Aits and Apex soils
- Newbell soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitations for planting:* None

## 244—Kiehl silt loam, 40 to 65 percent slopes

### Composition

*Kiehl soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Volcanic ash and loess over glacial outwash  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,000 to 4,000 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 43 to 45 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 2 inches—brown silt loam

*Upper part of subsoil:*  
2 to 10 inches—light yellowish brown silt loam

*Lower part of subsoil:*  
10 to 21 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*  
21 to 29 inches—brown extremely gravelly loamy coarse sand

*Lower part of substratum:*  
29 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Karamin soils
- Scrabblers soils
- Wapal soils
- Aits and Apex soils
- Newbell soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitation for planting:* Steepness of slope

### 245—Kiehl silt loam, cool, 0 to 8 percent slopes

#### Composition

*Kiehl soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Terraces  
*Parent material:* Volcanic ash and loess over glacial outwash  
*Slope range:* 0 to 8 percent  
*Elevation:* 2,000 to 4,000 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 3 inches—brown silt loam

*Subsoil:*  
3 to 14 inches—yellowish brown and brownish yellow silt loam

*Upper part of substratum:*  
14 to 23 inches—light yellowish brown gravelly loamy coarse sand

*Lower part of substratum:*  
23 to 60 inches—very pale brown very gravelly loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Karamin soils
- Scrabblers soils
- Wapal soils
- Aits and Apex soils
- Newbell soils
- Parmenter soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine, western larch, and lodgepole pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and droughtiness.

## 246—Kiehl silt loam, cool, 20 to 40 percent slopes

### Composition

*Kiehl soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Volcanic ash and loess over glacial outwash

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 3 inches—brown silt loam

*Subsoil:*  
3 to 14 inches—yellowish brown and brownish yellow silt loam

*Upper part of substratum:*  
14 to 23 inches—light yellowish brown gravelly loamy coarse sand

*Lower part of substratum:*  
23 to 60 inches—very pale brown very gravelly loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Karamin soils
- Scrabblers soils
- Wapal soils
- Aits and Apex soils
- Newbell soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and

grand fir—readily; ponderosa pine, western larch, and lodgepole pine—periodically  
*Limitations for planting:* None

### **247—Kiehl silt loam, cool, 40 to 65 percent slopes**

#### **Composition**

*Kiehl soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

#### **Setting**

*Position on landscape:* Terrace escarpments  
*Parent material:* Volcanic ash and loess over glacial outwash  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,000 to 4,000 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

#### **Typical Profile**

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 3 inches—brown silt loam  
*Subsoil:*  
 3 to 14 inches—yellowish brown and brownish yellow silt loam  
*Upper part of substratum:*  
 14 to 23 inches—light yellowish brown gravelly loamy coarse sand  
*Lower part of substratum:*  
 23 to 60 inches—very pale brown very gravelly loamy sand

#### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

#### **Contrasting Inclusions**

- Karamin soils
- Scrabblers soils
- Wapal soils

- Aits and Apex soils
- Newbell soils

#### **Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

##### **Silviculture**

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine, western larch, and lodgepole pine—periodically  
*Limitation for planting:* Steepness of slope

### **248—Koepke loam, 15 to 30 percent slopes**

#### **Composition**

*Koepke soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Footslopes and backslopes of hills and mountains  
*Parent material:* Volcanic ash and loess over glacial till  
*Slope range:* 15 to 30 percent  
*Elevation:* 2,200 to 4,800 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

#### **Typical Profile**

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 22 inches—dark grayish brown and dark brown loam  
*Subsoil:*  
 22 to 40 inches—brown gravelly sandy loam  
*Substratum:*  
 40 to 60 inches—yellowish brown dense glacial till that crushes to very cobbly sandy loam

#### **Soil Properties and Qualities**

*Depth class:* Deep (40 to 60 inches to dense glacial till)

*Drainage class:* Well drained  
*Permeability:* Moderate over slow  
*Available water capacity:* Moderately high  
*Effective rooting depth:* 40 to 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Louploup soils
- Nevine soils
- Mineral soils
- Scoap soils
- Barnellcreek soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for crops, it is limited by steepness of slope, water erosion, and rooting depth.

## 249—Lakesol silt loam, 30 to 65 percent north slopes

### Composition

*Lakesol soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* North-facing terrace escarpments

*Parent material:* Glacial lake sediment mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 30 to 65 percent  
*Elevation:* 1,400 to 2,200 feet  
*Average annual precipitation:* 18 to 20 inches  
*Average annual air temperature:* 43 to 45 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 10 inches—dark grayish brown and brown silt loam

*Subsoil:*

10 to 37 inches—pale brown and light yellowish brown silt loam

*Substratum:*

37 to 60 inches—light gray silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Cedonia soils
- Scala soils
- Hodgson and Kewach soils
- Spens soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and use results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine—periodically

*Limitation for planting:* Steepness of slope

## 250—Lithic Xerorthents-Baldknob-Rock outcrop complex, 8 to 40 percent slopes

### Composition

*Lithic Xerorthents and similar soils:* 40 percent

*Baldknob soil and similar soils:* 30 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Summits and shoulders of glacially scoured hills and mountains

*Parent material:* Colluvium and residuum derived from rhyodacite and quartz latite mixed with glacial till, volcanic ash, and loess

*Slope range:* 8 to 40 percent

*Elevation:* 2,500 to 4,200 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Lithic Xerorthents—stones cover 0 to 10 percent; Baldknob—stones cover 3 to 15 percent

### Lithic Xerorthents

#### Reference profile

*Surface layer:*

0 to 2 inches—yellowish brown gravelly loam

*Subsoil:*

2 to 7 inches—yellowish brown gravelly loam

*Bedrock:*

7 to 11 inches—rhyodacite

#### Soil properties and qualities

*Depth class:* Very shallow (4 to 10 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 4 to 10 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Baldknob Soil

#### Typical profile

*Surface layer:*

0 to 4 inches—brown very stony loam

*Upper part of subsoil:*

4 to 9 inches—brown very gravelly loam

*Lower part of subsoil:*

9 to 14 inches—yellowish brown extremely gravelly loam

*Bedrock:*

14 to 18 inches—rhyodacite

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Rhyodacite and quartz latite

### Contrasting Inclusions

- Thout soils
- Inkler and Nevine soils
- Rubble land

### Major Uses

Livestock grazing, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soils in this unit are too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

## 251—Lithic Xerorthents-Baldknob-Rock outcrop complex, 40 to 70 percent slopes

### Composition

*Lithic Xerorthents and similar soils:* 40 percent

*Baldknob soil and similar soils:* 25 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of glacially scoured hills and mountains

*Parent material:* Colluvium derived from rhyodacite

and quartz latite mixed with volcanic ash and loess

*Slope range:* 40 to 70 percent

*Elevation:* 2,500 to 4,200 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Lithic Xerorthents—stones cover 0 to 10 percent; Baldknob—stones cover 3 to 15 percent

### Lithic Xerorthents

#### Reference profile

*Surface layer:*

0 to 2 inches—yellowish brown gravelly loam

*Subsoil:*

2 to 7 inches—yellowish brown gravelly loam

*Bedrock:*

7 to 11 inches—rhyodacite

#### Soil properties and qualities

*Depth class:* Very shallow (4 to 10 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 4 to 10 inches

*Runoff:* Rapid or very rapid

*Hazard of water erosion:* Rangeland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

### Baldknob Soil

#### Typical profile

*Surface layer:*

0 to 4 inches—brown very stony loam

*Upper part of subsoil:*

4 to 9 inches—brown very gravelly loam

*Lower part of subsoil:*

9 to 14 inches—yellowish brown extremely gravelly loam

*Bedrock:*

14 to 18 inches—rhyodacite

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Rapid or very rapid

*Hazard of water erosion:* Rangeland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Rhyodacite and quartz latite

### Contrasting Inclusions

- Thout soils
- Nevine and Inkler soils and Xerochrepts
- Rubble land

### Major Uses

Livestock grazing, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soils in this unit are too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 252—Logy very stony sandy loam, 3 to 25 percent slopes

#### Composition

*Logy soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Alluvial fans

*Parent material:* Alluvium

*Slope range:* 3 to 25 percent

*Elevation:* 800 to 1,600 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Stones cover 3 to 15 percent

#### Typical Profile

*Surface layer:*

0 to 10 inches—grayish brown very stony sandy loam

*Subsoil:*

10 to 24 inches—brown very gravelly sandy loam

*Substratum:*

24 to 60 inches—brown very gravelly loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Skaha soils
- Heytou and Peshastin soils
- Cashmere, Cashmont, Malott, and Farrell soils

### Major Uses

Livestock grazing, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and droughtiness.

## 253—Loony loam, 0 to 15 percent slopes

### Composition

*Loony soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Till plains and toeslopes of mountains  
*Parent material:* Volcanic ash over dense glacial till  
*Slope range:* 0 to 15 percent  
*Elevation:* 2,500 to 4,000 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 3 inches—light brownish gray loam

#### Subsoil:

3 to 17 inches—pale brown and light yellowish brown loam

#### Substratum:

17 to 28 inches—light gray cobbly sandy loam  
 28 to 60 inches—white and light gray dense glacial till that crushes to sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)  
*Drainage class:* Moderately well drained  
*Permeability:* Moderate over slow  
*Available water capacity:* Moderate  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Present in February through May (see “Water Features” table)

### Contrasting Inclusions

- Scrabblers and Torboy soils
- Soils that have a stony surface
- Nevine and Stepstone soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Lodgepole pine—readily; western larch and Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, water erosion, and rooting depth.

## 254—Lostcreek loam, 3 to 15 percent slopes

### Composition

*Lostcreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Alluvial fans, terraces, and toeslopes of hills and mountains

*Parent material:* Alluvium and glacial till mixed with a component of loess and volcanic ash

*Slope range:* 3 to 15 percent

*Elevation:* 2,000 to 3,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 0.5 inch thick

*Surface layer:*

0 to 11 inches—grayish brown loam

*Subsoil:*

11 to 27 inches—light brownish gray loam

*Upper part of substratum:*

27 to 42 inches—pale brown fine sandy loam

*Lower part of substratum:*

42 to 60 inches—mottled, light gray fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in February through June (see “Water Features” table)

### Contrasting Inclusions

- Republic soils
- Apex soils
- Scoap soils
- Donovan and Stevens soils
- Stapaloo soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 255—Louiecreek gravelly loam, 3 to 20 percent slopes

### Composition

*Louiecreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of hills and mountains

*Parent material:* Colluvium derived from rhyodacite and quartz latite mixed with a component of loess and volcanic ash

*Slope range:* 3 to 20 percent

*Elevation:* 1,600 to 3,800 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 13 inches—dark brown gravelly loam

*Upper part of subsoil:*

13 to 20 inches—pale brown gravelly loam

*Lower part of subsoil:*

20 to 32 inches—pale brown very gravelly sandy loam

*Substratum:*  
32 to 60 inches—very pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Donavan soils
- Inkler and similar soils
- Soils that have a very stony surface
- Northstar soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 256—Louplop silt loam, 0 to 20 percent slopes

### Composition

*Louplop soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Till plains, and footslopes and toeslopes of mountains

*Parent material:* Volcanic ash over glacial till  
*Slope range:* 0 to 20 percent  
*Elevation:* 2,000 to 4,500 feet  
*Average annual precipitation:* 17 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*  
0 to 6 inches—brown silt loam

*Subsoil:*  
6 to 22 inches—pale brown silt loam

*Upper part of substratum:*  
22 to 46 inches—light gray sandy loam

*Lower part of substratum:*  
46 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 40 to 60 inches

*Runoff:* Slow to rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Nevine soils
- Stepstone soils
- Scrabblers soils
- Stapaloo and Torboy soils
- Republic soils
- Soils that have a stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**257—Louplop silt loam, 20 to 40 percent slopes****Composition**

*Louplop soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Backslopes and footslopes of mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,500 feet

*Average annual precipitation:* 17 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 6 inches—brown silt loam

*Subsoil:*

6 to 22 inches—pale brown silt loam

*Upper part of substratum:*

22 to 46 inches—light gray sandy loam

*Lower part of substratum:*

46 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

**Soil Properties and Qualities**

*Depth class:* Deep (40 to 60 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 40 to 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Nevine soils
- Stepstone soils
- Scrabblers soils
- Stapaloo and Torboy soils
- Republic soils
- Soils that have a stony surface

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily  
*Limitations for planting:* None

**258—Lynxcreek silt loam, 20 to 40 percent slopes****Composition**

*Lynxcreek soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Terraces in narrow mountain valleys

*Parent material:* Glacial lake sediment with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 20 to 40 percent

*Elevation:* 3,300 to 4,200 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 9 inches—light yellowish brown silt loam

*Subsurface layer:*

9 to 10 inches—very pale brown silt loam

*Subsoil:*

10 to 36 inches—light gray and very pale brown silty clay loam

*Substratum:*

36 to 60 inches—light gray silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—severe

*Water table:* Present in February through May (see “Water Features” table)

### Contrasting Inclusions

- Manley soils
- Cryofluvents
- Soils that have more clay in the subsoil
- Soils that are somewhat poorly drained

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Subalpine fir and Engelmann spruce—readily; Douglas-fir and western larch—periodically

*Limitations for planting:* None

## 259—Malott very fine sandy loam, 0 to 5 percent slopes

### Composition

*Malott soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Till plains and summits of hills

*Parent material:* Loess over glacial till

*Slope range:* 0 to 5 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

#### Surface layer:

0 to 12 inches—grayish brown and brown very fine sandy loam

#### Upper part of subsoil:

12 to 36 inches—yellowish brown very fine sandy loam

#### Lower part of subsoil:

36 to 49 inches—pale brown, calcareous gravelly sandy loam

#### Substratum:

49 to 60 inches—white hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a stony or bouldery surface
- Aeneas soils
- Pogue soils
- Peshastin soils
- Emdent soils

### Major Uses

Nonirrigated cropland, livestock grazing, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion.

## 260—Malott very fine sandy loam, 5 to 10 percent slopes

### Composition

*Malott soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Till plains and toeslopes of hills

*Parent material:* Loess over glacial till

*Slope range:* 5 to 10 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown and brown very fine sandy loam

*Upper part of subsoil:*

12 to 36 inches—yellowish brown very fine sandy loam

*Middle part of subsoil:*

36 to 49 inches—pale brown, calcareous gravelly sandy loam

*Substratum:*

49 to 60 inches—white hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a stony or bouldery surface
- Aeneas soils
- Pogue soils
- Peshastin soils
- Emdent soils

### Major Uses

Nonirrigated cropland, livestock grazing, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by water and wind erosion and steepness of slope.

### 261—Malott very fine sandy loam, 10 to 25 percent slopes

#### Composition

*Malott soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Toeslopes and footslopes of hills

*Parent material:* Loess over glacial till

*Slope range:* 10 to 25 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

#### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown and brown very fine sandy loam

*Upper part of subsoil:*

12 to 36 inches—yellowish brown very fine sandy loam

*Lower part of subsoil:*

36 to 49 inches—pale brown, calcareous gravelly sandy loam

*Substratum:*

49 to 60 inches—white hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a stony or bouldery surface
- Peshastin soils
- Couleedam and Soaplake soils
- Aeneas soils
- Pogue soils

### Major Uses

Livestock grazing, nonirrigated cropland, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind and water erosion and steepness of slope.

## 262—Malott stony very fine sandy loam, 3 to 25 percent slopes

### Composition

*Malott soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Summits, footslopes, and toeslopes of hills

*Parent material:* Loess over glacial till

*Slope range:* 3 to 25 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*

0 to 6 inches—gray stony very fine sandy loam

*Lower part of surface layer:*

6 to 11 inches—grayish brown very fine sandy loam

*Upper part of subsoil:*

11 to 30 inches—pale brown cobbly fine sandy loam

*Lower part of subsoil:*

30 to 53 inches—light gray, calcareous gravelly fine sandy loam

*Substratum:*

53 to 60 inches—light gray hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Peshastin soils
- Couleedam and Soaplake soils
- Soils that have a very stony or very bouldery surface
- Aeneas soils
- Pogue soils
- Emdent soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and water erosion.

## 263—Malott stony very fine sandy loam, 25 to 65 percent slopes

### Composition

*Malott soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills

*Parent material:* Loess over glacial till

*Slope range:* 25 to 65 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*

0 to 6 inches—gray stony very fine sandy loam

*Lower part of surface layer:*

6 to 11 inches—grayish brown very fine sandy loam

*Upper part of subsoil:*

11 to 30 inches—pale brown cobbly fine sandy loam

*Lower part of subsoil:*

30 to 53 inches—light gray, calcareous gravelly fine sandy loam

*Substratum:*

53 to 60 inches—light gray hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Peshastin soils
- Couleedam and Soaplake soils
- Soils that have a very stony or very bouldery surface
- Aeneas soils
- Pogue soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

## 264—Malott-Rock outcrop complex, 3 to 25 percent slopes

### Composition

*Malott soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Summits and footslopes of hills

*Parent material:* Loess over glacial till

*Slope range:* 3 to 25 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Malott—stones cover 0.1 to 3.0 percent

### Malott Soil

#### Typical profile

*Upper part of surface layer:*

0 to 6 inches—gray stony very fine sandy loam

*Lower part of surface layer:*

6 to 11 inches—grayish brown very fine sandy loam

*Upper part of subsoil:*

11 to 30 inches—pale brown cobbly fine sandy loam

*Lower part of subsoil:*

30 to 53 inches—light gray, calcareous gravelly fine sandy loam

*Substratum:*

53 to 60 inches—light gray hardpan

### Soil properties and qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Peshastin soils
- Couleedam and Soaplake soils
- Soils that have a very stony or very bouldery surface
- Aeneas soils
- Pogue soils
- Emdent soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this unit for this use.

## 265—Malott-Rock outcrop complex, 25 to 65 percent slopes

### Composition

*Malott soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and shoulders of hills

*Parent material:* Loess over glacial till

*Slope range:* 25 to 65 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Malott—stones cover 0.1 to 3.0 percent

### Malott Soil

#### Typical profile

*Upper part of surface layer:*

0 to 6 inches—gray stony very fine sandy loam

*Lower part of surface layer:*

6 to 11 inches—grayish brown very fine sandy loam

*Upper part of subsoil:*

11 to 30 inches—pale brown cobbly fine sandy loam

*Lower part of subsoil:*

30 to 53 inches—light gray, calcareous gravelly fine sandy loam

*Substratum:*

53 to 60 inches—light gray hardpan

#### Soil properties and qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Peshastin soils
- Couleedam and Soaplake soils
- Soils that have a very stony or very bouldery surface

- Aeneas soils

- Pogue soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

## 266—Malott-Torriorthents complex, 25 to 70 percent slopes

### Composition

*Malott soil and similar soils:* 45 percent

*Torriorthents and similar soils:* 40 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Malott—backslopes and shoulders of highly dissected hills; Torriorthents—backslopes of highly dissected, eroded hills

*Parent material:* Malott—loess over glacial till; Torriorthents—glacial till mixed with a small amount of loess in the upper part

*Slope range:* 25 to 70 percent

*Elevation:* 1,000 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

#### Malott

*Upper part of surface layer:*

0 to 6 inches—gray stony very fine sandy loam

*Lower part of surface layer:*

6 to 11 inches—grayish brown very fine sandy loam

*Upper part of subsoil:*

11 to 30 inches—pale brown cobbly fine sandy loam

*Lower part of subsoil:*

30 to 53 inches—light gray, calcareous gravelly fine sandy loam

*Substratum:*

53 to 60 inches—light gray hardpan

## Reference Profile

### Torriorthents

#### Surface layer:

0 to 6 inches—light gray, calcareous stony loam

#### Substratum:

6 to 60 inches—light gray, calcareous very cobbly fine sandy loam

## Soil Properties and Qualities

*Depth class:* Malott—deep (40 to 60 inches to a hardpan); Torriorthents—deep and very deep (40 to 60 inches or more to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Malott—moderately high; Torriorthents—moderate

*Potential rooting depth:* Malott—40 to 60 inches; Torriorthents—40 to 60 inches or more

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Malott—moderate; Torriorthents—slight

## Contrasting Inclusions

- Rock outcrop
- Couleedam soils
- Heytou and Peshastin soils
- Soils that have an extremely gravelly sand substratum

## Major Uses

Livestock grazing, watershed, and wildlife habitat

## Use and Management

### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, and normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

## 267—Manley silt loam, dry, 5 to 20 percent slopes

### Composition

*Manley soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 5 to 20 percent

*Elevation:* 3,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 38 to 41 degrees F

*Frost-free period:* 80 to 100 days

## Typical Profile

*Organic mat on surface:* 3 inches thick

#### Surface layer:

0 to 1 inch—pale brown silt loam

#### Upper part of subsoil:

1 inch to 12 inches—light yellowish brown silt loam

#### Middle part of subsoil:

12 to 17 inches—light yellowish brown silt loam

#### Lower part of subsoil:

17 to 38 inches—light gray very gravelly sandy loam and very pale brown extremely gravelly coarse sandy loam

#### Substratum:

38 to 60 inches—light gray dense glacial till that crushes to very gravelly loamy coarse sand

## Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—slight or moderate

## Contrasting Inclusions

- Resner and Sitdown soils
- Buhrig and Moses soils
- Andic Cryaquepts
- Soils that have a very stony or bouldery surface

## Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, western larch, and subalpine fir—readily; Engelmann spruce—periodically

*Limitations for planting:* None

**268—Manley silt loam, dry, 20 to 40 percent slopes****Composition**

*Manley soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Backslopes and footslopes of mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 20 to 40 percent

*Elevation:* 3,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 38 to 41 degrees F

*Frost-free period:* 80 to 100 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 1 inch—pale brown silt loam

*Upper part of subsoil:*

1 inch to 12 inches—light yellowish brown silt loam

*Middle part of subsoil:*

12 to 17 inches—light yellowish brown silt loam

*Lower part of subsoil:*

17 to 38 inches—light gray very gravelly sandy loam and very pale brown extremely gravelly coarse sandy loam

*Substratum:*

38 to 60 inches—light gray dense glacial till that crushes to very gravelly loamy coarse sand

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

**Contrasting Inclusions**

- Resner and Sitdown soils
- Buhrig and Moses soils
- Soils that have a very stony or bouldery surface
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, western larch, and subalpine fir—readily; Engelmann spruce—periodically

*Limitations for planting:* None

**269—Manley silt loam, dry, 40 to 65 percent slopes****Composition**

*Manley soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Backslopes of mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 40 to 65 percent

*Elevation:* 3,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 38 to 41 degrees F

*Frost-free period:* 80 to 100 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 1 inch—pale brown silt loam

*Upper part of subsoil:*

1 inch to 12 inches—light yellowish brown silt loam

*Middle part of subsoil:*

12 to 17 inches—light yellowish brown silt loam

*Lower part of subsoil:*

17 to 38 inches—light gray very gravelly sandy loam and very pale brown extremely gravelly coarse sandy loam

*Substratum:*

38 to 60 inches—light gray dense glacial till that crushes to very gravelly loamy coarse sand

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—severe or very severe

**Contrasting Inclusions**

- Resner and Sitdown soils
- Buhrig and Moses soils
- Soils that have a very stony or bouldery surface
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, western larch, and subalpine fir—readily; Engelmann spruce—periodically

*Limitation for planting:* Steepness of slope

**270—Manley, dry-Codylake complex,  
20 to 40 percent slopes****Composition**

*Manley soil and similar soils:* 55 percent

*Codylake soil and similar soils:* 30 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Backslopes and footslopes of mountains

*Parent material:* Manley—volcanic ash over glacial till;

Codylake—volcanic ash over residuum and colluvium derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 3,800 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 38 to 41 degrees F

*Frost-free period:* 80 to 100 days

**Typical Profile****Manley**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 1 inch—pale brown silt loam

*Upper part of subsoil:*

1 inch to 12 inches—light yellowish brown silt loam

*Middle part of subsoil:*

12 to 17 inches—light yellowish brown silt loam

*Lower part of subsoil:*

17 to 38 inches—light gray very gravelly sandy loam and very pale brown extremely gravelly coarse sandy loam

*Substratum:*

38 to 60 inches—light gray dense glacial till that crushes to very gravelly loamy coarse sand

**Codylake**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—yellowish brown loam

*Upper part of subsoil:*

5 to 13 inches—yellowish brown loam

*Lower part of subsoil:*

13 to 24 inches—light yellowish brown gravelly fine sandy loam

*Substratum:*

24 to 43 inches—light yellowish brown gravelly sandy loam

*Bedrock:*

43 to 53 inches—weathered granitic rock

**Soil Properties and Qualities**

*Depth class:* Manley—moderately deep (20 to 40 inches to dense glacial till); Codylake—deep (40 to 60 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Manley—moderate over slow;

Codylake—moderate

*Available water capacity:* Moderately high

*Effective rooting depth:* Manley—20 to 40 inches;

Codylake—40 to 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Resner and Sitdown soils
- Buhrig and Moses soils
- Soils that have a very stony or bouldery surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, western larch, and subalpine fir—readily; Engelmann spruce—periodically

*Limitations for planting:* None

### 271—Manley, dry-Rock outcrop complex, 20 to 40 percent slopes

#### Composition

*Manley soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes and footslopes of mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 20 to 40 percent

*Elevation:* 3,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 38 to 41 degrees F

*Frost-free period:* 80 to 100 days

#### Manley Soil

#### Typical profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 1 inch—pale brown silt loam

*Upper part of subsoil:*

1 inch to 12 inches—light yellowish brown silt loam

*Middle part of subsoil:*

12 to 17 inches—light yellowish brown silt loam

*Lower part of subsoil:*

17 to 38 inches—light gray very gravelly sandy loam and very pale brown extremely gravelly coarse sandy loam

*Substratum:*

38 to 60 inches—light gray dense glacial till that crushes to very gravelly loamy coarse sand

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

### Rock Outcrop

*Kind of rock:* Granitic rock, diorite, and gneiss

### Contrasting Inclusions

- Resner and Sitdown soils
- Buhrig and Moses soils
- Soils that have a very stony or bouldery surface layer

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, western larch, and subalpine fir—readily; Engelmann spruce—periodically

*Limitation for planting:* Rock outcrop

## 272—Manley, dry-Rock outcrop complex, 40 to 65 percent slopes

### Composition

*Manley soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 40 to 65 percent

*Elevation:* 3,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 38 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Manley Soil

#### Typical profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 1 inch—pale brown silt loam

*Upper part of subsoil:*

1 inch to 12 inches—light yellowish brown silt loam

*Middle part of subsoil:*

12 to 17 inches—light yellowish brown silt loam

*Lower part of subsoil:*

17 to 38 inches—light gray very gravelly sandy loam  
and very pale brown extremely gravelly coarse  
sandy loam

*Substratum:*

38 to 60 inches—light gray dense glacial till that  
crushes to very gravelly loamy coarse sand

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to  
dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—November through  
April; more than 3 feet—December through  
March

*Hazard of water erosion:* Forestland—severe or very  
severe

### Rock Outcrop

*Kind of rock:* Granitic rock, diorite, and gneiss

### Contrasting Inclusions

- Resner and Sitdown soils
- Buhrig and Moses soils
- Soils that have a very stony or bouldery surface

### Major Uses

Timber production, livestock grazing, wildlife habitat,  
watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked  
equipment—unsafe because of steepness of  
slope and results in excessive soil damage and  
erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, western  
larch, and subalpine fir—readily; Engelmann  
spruce—periodically

*Limitations for planting:* Rock outcrop and steepness  
of slope

## 273—Martella silt loam, 0 to 8 percent slopes

### Composition

*Martella soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Volcanic ash over glacial lake  
sediment

*Slope range:* 0 to 8 percent

*Elevation:* 2,000 to 3,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 3 inches—light yellowish brown silt loam

*Upper part of subsoil:*

3 to 12 inches—light yellowish brown silt loam

*Subsurface layer:*

12 to 23 inches—light yellowish brown and yellowish  
brown silt loam

*Lower part of subsoil:*

23 to 46 inches—brown and pale brown silt loam

*Substratum:*

46 to 60 inches—pale olive silty clay loam and silt loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through June (see “Water Features” table)

**Contrasting Inclusions**

- Aits soils
- Scrabblers soils
- Kiehl soils
- Kewach soils

**Major Uses**

Timber production, nonirrigated hay and pasture, building site development, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, grand fir, and ponderosa pine—readily; western larch and western redcedar—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, wetness, and water erosion.

**274—Martella silt loam, dry, 0 to 8 percent slopes****Composition**

*Martella soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Terraces

*Parent material:* Volcanic ash and loess over glacial lake sediment

*Slope range:* 0 to 8 percent

*Elevation:* 2,000 to 3,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 2 inches—brown silt loam

*Upper part of subsoil:*

2 to 10 inches—pale brown silt loam

*Lower part of subsoil:*

10 to 46 inches—light gray silt loam

*Substratum:*

46 to 60 inches—light gray silty clay loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through June (see “Water Features” table)

**Contrasting Inclusions**

- Loony and Louploup soils
- Tunkcreek soils
- Nevine soils
- Karamin soils
- Stapaloo soils
- Kewach soils
- Jimcreek soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, western larch, ponderosa pine, and lodgepole pine—readily

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, wetness, and water erosion.

## 275—Martella silt loam, dry, 8 to 30 percent slopes

### Composition

*Martella soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Volcanic ash and loess over glacial lake sediment

*Slope range:* 8 to 30 percent

*Elevation:* 2,000 to 3,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 2 inches—brown silt loam

*Upper part of subsoil:*

2 to 10 inches—pale brown silt loam

*Lower part of subsoil:*

10 to 46 inches—light gray silt loam

*Substratum:*

46 to 60 inches—light gray silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate to very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through June (see “Water Features” table)

### Contrasting Inclusions

- Loony and Louploup soils
- Nevine soils
- Karamin soils
- Stapaloo soils
- Kewach soils

### Major Use

Wildlife habitat and timber production

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, western larch, ponderosa pine, and lodgepole pine—readily

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, wetness, and water erosion.

## 276—Medisaprists, 0 to 2 percent slopes

### Composition

*Medisaprists and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backswamps of flood plains, and depressions on till plains, ground moraines, and terraces

*Parent material:* Decomposed organic material that overlies alluvium, glacial outwash, or glacial lake sediment in some places

*Slope range:* 0 to 2 percent

*Elevation:* 1,700 to 2,800 feet

*Average annual precipitation:* 12 to 18 inches

*Average annual air temperature:* 45 to 49 degrees F  
*Frost-free period:* 100 to 150 days

### Reference Profile

*Organic mat on surface:* 2 inches thick

*Surface tier:*

0 to 10 inches—dark gray muck

*Subsurface tier:*

10 to 36 inches—dark gray muck

*Bottom tier:*

36 to 60 inches—gray muck

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Very poorly drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none

*Hazard of water erosion:* Forestland—none

*Water table:* Present in January through December  
 (see “Water Features” table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in February through  
 April

### Contrasting Inclusions

- Aquic Xerofluvents
- Ralsen soils
- Emdent soils
- Poween soils
- Histosols

### Major Uses

Wetland wildlife habitat, timber production, and  
 watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked  
 equipment—suitable only during the very short  
 periods when the soil is dry or frozen; cable  
 yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Quaking aspen,  
 thinleaf alder, and paper birch—periodically

*Limitation for planting:* Prolonged seasonal high water  
 table

## 277—Merkel sandy loam, 5 to 20 percent slopes

### Composition

*Merkel soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Toeslopes and footslopes of  
 hills and mountains

*Parent material:* Loess and volcanic ash over granitic  
 glacial till

*Slope range:* 5 to 20 percent

*Elevation:* 2,600 to 5,200 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—brown sandy loam

*Subsoil:*

6 to 29 inches—yellowish brown gravelly sandy loam

*Upper part of substratum:*

29 to 35 inches—light yellowish brown very gravelly  
 sandy loam

*Lower part of substratum:*

35 to 60 inches—pale brown dense glacial till that  
 crushes to very gravelly coarse sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to  
 dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderate

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate;  
 forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Nevine and Stepstone soils
- Stapaloup and Louploup soils
- Wapal soils
- Barnellcreek soils
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, nonirrigated hay and pasture, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, wind and water erosion, and rooting depth.

### 278—Merkel sandy loam, 20 to 40 percent slopes

#### Composition

*Merkel soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Foothills and backslopes of hills and mountains

*Parent material:* Loess and volcanic ash over granitic glacial till

*Slope range:* 20 to 40 percent

*Elevation:* 2,600 to 5,200 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—brown sandy loam

*Subsoil:*

6 to 29 inches—yellowish brown gravelly sandy loam

*Upper part of substratum:*

29 to 35 inches—light yellowish brown very gravelly sandy loam

*Lower part of substratum:*

35 to 60 inches—pale brown dense glacial till that crushes to very gravelly coarse sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderate

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Nevine and Stepstone soils
- Wapal soils
- Torboy soils
- Stapaloo and Louploup soils
- Mineral soils
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* None

### 279—Merkel sandy loam, 40 to 65 percent slopes

#### Composition

*Merkel soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Loess and volcanic ash over granitic glacial till

*Slope range:* 40 to 65 percent

*Elevation:* 2,600 to 5,200 feet

*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 6 inches—brown sandy loam

*Subsoil:*  
6 to 29 inches—yellowish brown gravelly sandy loam

*Upper part of substratum:*  
29 to 35 inches—light yellowish brown very gravelly sandy loam

*Lower part of substratum:*  
35 to 60 inches—pale brown dense glacial till that crushes to very gravelly coarse sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderate

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* None

### Contrasting Inclusions

- Nevine and Stepstone soils
- Wapal soils
- Torboy soils
- Stapalooop and Louploup soils
- Mineral soils
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Timber production, wildlife habitat, livestock grazing, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitation for planting:* Steepness of slope

## 280—Merkel bouldery fine sandy loam, 5 to 20 percent slopes

### Composition

*Merkel soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toeslopes and summits of hills and mountains

*Parent material:* Loess and volcanic ash over granitic glacial till

*Slope range:* 5 to 20 percent

*Elevation:* 2,600 to 4,800 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Stones and boulders cover 0.1 to 3.0 percent

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 3 inches—light brownish gray bouldery fine sandy loam

*Subsoil:*  
3 to 21 inches—pale brown gravelly fine sandy loam

*Upper part of substratum:*  
21 to 29 inches—light yellowish brown very gravelly sandy loam

*Lower part of substratum:*  
29 to 60 inches—pale brown dense glacial till that crushes to very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderate

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—slight or moderate

### Contrasting Inclusions

- Torboy soils
- Louploup and Stapaloo soils
- Nevine soils
- Mineral soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by large stones, steepness of slope, water erosion, droughtiness, and rooting depth.

## 281—Merkel bouldery fine sandy loam, 20 to 40 percent slopes

### Composition

*Merkel soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and backslopes of hills and mountains

*Parent material:* Loess and volcanic ash over granitic glacial till

*Slope range:* 20 to 40 percent

*Elevation:* 2,600 to 5,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Stones and boulders cover 0.1 to 3.0 percent

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—light brownish gray bouldery fine sandy loam

*Subsoil:*

3 to 21 inches—pale brown gravelly fine sandy loam

*Upper part of substratum:*

21 to 29 inches—light yellowish brown very gravelly sandy loam

*Lower part of substratum:*

29 to 60 inches—pale brown dense glacial till that crushes to very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Moderate

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Torboy soils
- Nevine and Stepstone soils
- Mineral soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* None

## 282—Mineral stony loam, 20 to 40 percent slopes

### Composition

*Mineral soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and shoulders of mountains

*Parent material:* Colluvium and glacial till derived from granitic rock mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 20 to 40 percent

*Elevation:* 2,300 to 5,300 feet

*Average annual precipitation:* 17 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 110 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—grayish brown stony loam

*Subsoil:*

6 to 12 inches—pale brown very gravelly loam

*Substratum:*

12 to 23 inches—very pale brown very stony sandy loam

*Bedrock:*

23 to 27 inches—granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Pole soils
- Dinkelman and Bearspring soils
- Centralpeak soils
- Capoose soils
- Soils that have a very stony surface
- Spokane, Vanbrunt, and Skanid soils
- Buhrig and Moses soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

## 283—Mineral stony loam, 40 to 65 percent slopes

### Composition

*Mineral soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Colluvium and glacial till derived from granitic rock mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 40 to 65 percent

*Elevation:* 2,300 to 5,300 feet

*Average annual precipitation:* 17 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 110 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—grayish brown stony loam

*Subsoil:*

6 to 12 inches—pale brown very gravelly loam

*Substratum:*

12 to 23 inches—very pale brown very stony sandy loam

*Bedrock:*

23 to 27 inches—granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—none  
*Hazard of water erosion:* Forestland—severe

### Contrasting Inclusions

- Pole soils
- Dinkelman and Bearspring soils
- Centralpeak soils
- Capoose soils
- Soils that have a very stony surface
- Spokane, Vanbrunt, and Skanid soils
- Buhrig and Moses soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically  
*Limitations for planting:* Rock fragments in the soil and steepness of slope

## 284—Mineral-Rock outcrop complex, 5 to 20 percent slopes

### Composition

*Mineral soil and similar soils:* 65 percent  
*Rock outcrop:* 20 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders and ridges of mountains  
*Parent material:* Colluvium and glacial till derived from granitic rock mixed with a component of loess and volcanic ash in the upper part  
*Slope range:* 5 to 20 percent  
*Elevation:* 2,300 to 5,300 feet  
*Average annual precipitation:* 17 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 110 days  
*Rock fragments on surface:* Mineral—stones cover 0.1 to 3.0 percent

### Mineral Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 6 inches—grayish brown stony loam  
*Subsoil:*  
 6 to 12 inches—pale brown very gravelly loam  
*Substratum:*  
 12 to 23 inches—very pale brown very stony sandy loam

*Bedrock:*  
 23 to 27 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Low  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—none  
*Hazard of water erosion:* Forestland—slight or moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Chumstick soils
- Dinkelman and Bearspring soils
- Centralpeak soils
- Capoose soils
- Soils that have a very stony surface
- Spokane, Vanbrunt, and Skanid soils
- Buhrig and Moses soils

### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and

tracked equipment—suitable; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

## 285—Mineral-Rock outcrop complex, 20 to 40 percent slopes

### Composition

*Mineral soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and shoulders of mountains

*Parent material:* Colluvium and glacial till derived from granitic rock mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 20 to 40 percent

*Elevation:* 2,300 to 5,300 feet

*Average annual precipitation:* 17 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 110 days

*Rock fragments on surface:* Mineral—stones cover 0.1 to 3.0 percent

### Mineral Soil

### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—grayish brown stony loam

*Subsoil:*

6 to 12 inches—pale brown very gravelly loam

*Substratum:*

12 to 23 inches—very pale brown very stony sandy loam

*Bedrock:*

23 to 27 inches—granitic rock

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Chumstick soils
- Dinkelman and Bearspring soils
- Centralpeak soils
- Capoose soils
- Soils that have a very stony surface
- Spokane, Vanbrunt, and Skanid soils
- Buhrig and Moses soils

### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

## 286—Mineral-Rock outcrop complex, 40 to 65 percent slopes

### Composition

*Mineral soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Colluvium and glacial till derived from granitic rock with a component of loess and volcanic ash in the upper part

*Slope range:* 40 to 65 percent

*Elevation:* 2,300 to 5,300 feet

*Average annual precipitation:* 17 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 110 days

*Rock fragments on surface:* Mineral—stones cover 0.1 to 3.0 percent

## Mineral Soil

### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—grayish brown stony loam

*Subsoil:*

6 to 12 inches—pale brown very gravelly loam

*Substratum:*

12 to 23 inches—very pale brown very stony sandy loam

*Bedrock:*

23 to 27 inches—granitic rock

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe

## Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Chumstick soils
- Dinkelman and Bearspring soils
- Centralpeak soils
- Capoose soils
- Soils that have a very stony surface
- Spokane, Vanbrunt, and Skanid soils
- Buhrig and Moses soils
- Rubble land

### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

## Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

## 287—Mineral-Rock outcrop complex, 40 to 65 percent north slopes

### Composition

*Mineral soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* North-facing backslopes of mountains

*Parent material:* Colluvium and glacial till derived from granitic rock mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 40 to 65 percent

*Elevation:* 2,000 to 4,700 feet

*Average annual precipitation:* 17 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 110 days

*Rock fragments on surface:* Mineral—stones cover 0.1 to 3.0 percent

## Mineral Soil

### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 8 inches—grayish brown stony loam

*Subsoil:*

8 to 12 inches—pale brown very gravelly loam

*Substratum:*

12 to 23 inches—yellowish brown and light yellowish brown very cobbly sandy loam

*Bedrock:*

23 to 27 inches—granitic rock

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—none  
*Hazard of water erosion:* Forestland—severe

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Chumstick soils
- Dinkelman and Bearspring soils
- Centralpeak soils
- Capoose soils
- Soils that have a very stony surface
- Buhrig and Moses soils
- Rubble land

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically  
*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

## 288—Mitchellpoint silt loam, 0 to 5 percent slopes

### Composition

*Mitchellpoint soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces  
*Parent material:* Volcanic ash and loess over glaciofluvial deposits underlain by glacial outwash  
*Slope range:* 0 to 5 percent  
*Elevation:* 1,800 to 2,100 feet  
*Average annual precipitation:* 17 to 19 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*  
 0 to 7 inches—brown silt loam

*Upper part of subsoil:*  
 7 to 14 inches—light yellowish brown silt loam

*Middle part of subsoil:*  
 14 to 20 inches—light yellowish brown silt loam

*Lower part of subsoil:*  
 20 to 26 inches—very pale brown cobbly silt loam

*Upper part of substratum:*  
 26 to 36 inches—multicolored very cobbly loamy coarse sand

*Lower part of substratum:*  
 36 to 60 inches—multicolored very gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Hallcreek and Garrison soils
- Hunters soils
- Bernhill soils

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, wildlife habitat, and watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by water erosion.

## 289—Monse silt loam, 0 to 8 percent slopes

### Composition

*Monse soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Stream terraces

*Parent material:* Alluvium over glacial lake sediment

*Slope range:* 0 to 8 percent

*Elevation:* 750 to 1,400 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 14 inches—grayish brown silt loam

*Upper part of subsoil:*

14 to 19 inches—light brownish gray silt loam

*Middle part of subsoil:*

19 to 40 inches—mottled, light gray and light brownish gray silty clay loam and silt loam

*Lower part of subsoil:*

40 to 45 inches—mottled, light gray, calcareous silt loam

*Substratum:*

45 to 60 inches—mottled, very pale brown, calcareous silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through July (see “Water Features” table)

### Contrasting Inclusions

- Aeneas soils
- Pogue soils
- Cashmere and Cashmont soils
- Okanogan soils

### Major Uses

Nonirrigated cropland, nonirrigated hay and pasture,

irrigated hay and pasture, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil has a high water table at certain times of the year that limits use of the soil.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, wetness, and water erosion.

## 290—Morical silt loam, 8 to 30 percent slopes

### Composition

*Morical soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Summits and shoulders of foothills

*Parent material:* Residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 8 to 30 percent

*Elevation:* 2,400 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 13 inches—brown silt loam

*Subsoil:*

13 to 22 inches—yellowish brown loam

*Bedrock:*

22 to 32 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Tye soils
- Broadax soils
- Ginnis soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction.
- The soil in this unit is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If the soil in this unit is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 291—Morical silt loam, 30 to 45 percent slopes

### Composition

*Morical soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders and backslopes of foothills

*Parent material:* Residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 30 to 45 percent

*Elevation:* 2,400 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 13 inches—brown silt loam

*Subsoil:*

13 to 22 inches—yellowish brown loam

*Bedrock:*

22 to 32 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Hazard of water erosion:* Rangeland—severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Tye soils
- Ginnis soils
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, or brush management using ground equipment.
- This unit is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 292—Morical silt loam, 8 to 30 percent north slopes

### Composition

*Morical soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* North- and east-facing summits and shoulders of foothills

*Parent material:* Residuum and colluvium derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 8 to 30 percent

*Elevation:* 2,400 to 3,200 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*  
 0 to 17 inches—grayish brown silt loam

*Upper part of subsoil:*  
 17 to 28 inches—light yellowish brown silt loam

*Lower part of subsoil:*  
 28 to 33 inches—light yellowish brown gravelly loam

*Bedrock:*  
 33 to 43 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderately high  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Tye soils
- Broadax soils
- Ginnis soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction.
- This unit is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope, water erosion, and rooting depth.

## 293—Moscow silt loam, dry, 20 to 40 percent slopes

### Composition

*Moscow soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Shoulders, backslopes, and footslopes of mountains  
*Parent material:* Mantle of volcanic ash and loess over residuum and colluvium derived from granitic rock  
*Slope range:* 20 to 40 percent  
*Elevation:* 3,000 to 4,500 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
 0 to 3 inches—brown silt loam

*Upper part of subsoil:*  
 3 to 11 inches—light yellowish brown silt loam

*Lower part of subsoil:*  
 11 to 23 inches—pale brown gravelly sandy loam

*Substratum:*  
 23 to 34 inches—very pale brown gravelly sandy loam

*Bedrock:*  
 34 to 44 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

### Contrasting Inclusions

- Ohscow soils
- Mineral soils
- Codylake soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch and ponderosa pine—periodically

*Limitations for planting:* None

## 294—Moscow silt loam, dry, 40 to 65 percent slopes

### Composition

*Moscow soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Footslopes, backslopes, and shoulders of mountains

*Parent material:* Mantle of volcanic ash and loess over residuum and colluvium derived from granitic rock

*Slope range:* 40 to 65 percent

*Elevation:* 3,000 to 4,500 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—brown silt loam

*Upper part of subsoil:*

3 to 11 inches—light yellowish brown silt loam

*Lower part of subsoil:*

11 to 23 inches—pale brown gravelly sandy loam

*Substratum:*

23 to 34 inches—very pale brown gravelly sandy loam

*Bedrock:*

34 to 44 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Ohscow soils
- Mineral soils
- Codylake soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch and ponderosa pine—periodically

*Limitation for planting:* Steepness of slope

## 295—Moses silt loam, 0 to 30 percent slopes

### Composition

*Moses soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Summits and footslopes of mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from granitic rock

*Slope range:* 0 to 30 percent

*Elevation:* 3,500 to 6,000 feet

*Average annual precipitation:* 25 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 4 inches thick

*Surface layer:*

0 to 1 inch—light gray silt loam

*Upper part of subsoil:*

1 inch to 13 inches—yellowish brown and brownish yellow silt loam

*Lower part of subsoil:*

13 to 20 inches—light yellowish brown very gravelly coarse sandy loam

*Substratum:*

20 to 34 inches—very pale brown very gravelly coarse sandy loam

*Bedrock:*

34 to 44 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—slight or moderate

### Contrasting Inclusions

- Manley and Togo soils
- Codylake soils
- Centralpeak soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Lodgepole pine, western larch, and subalpine fir—readily; Douglas-fir and Engelmann spruce—periodically

*Limitations for planting:* None

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by rooting depth, steepness of slope, water erosion, and droughtiness.

## 296—Moses silt loam, 30 to 65 percent slopes

### Composition

*Moses soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Foothills and backslopes of mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from granitic rock

*Slope range:* 30 to 65 percent

*Elevation:* 3,500 to 6,000 feet

*Average annual precipitation:* 25 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—light gray silt loam

*Upper part of subsoil:*

1 inch to 13 inches—yellowish brown and brownish yellow silt loam

*Lower part of subsoil:*

13 to 20 inches—light yellowish brown very gravelly coarse sandy loam

*Substratum:*

20 to 34 inches—very pale brown very gravelly coarse sandy loam

*Bedrock:*

34 to 44 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Manley and Togo soils
- Codylake soils
- Centralpeak soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Lodgepole pine, western larch, and subalpine fir—readily; Douglas-fir and Engelmann spruce—periodically  
*Limitation for planting:* Steepness of slope

### 297—Moses extremely bouldery silt loam, 30 to 65 percent slopes

#### Composition

*Moses soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Foothills, backslopes, and shoulders of mountains  
*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from granitic rock  
*Slope range:* 30 to 65 percent  
*Elevation:* 4,600 to 6,500 feet  
*Average annual precipitation:* 25 to 35 inches  
*Average annual air temperature:* 39 to 41 degrees F  
*Frost-free period:* 80 to 100 days  
*Rock fragments on surface:* Boulders and stones cover 15 to 50 percent

#### Typical Profile

*Organic mat on surface:* 1.5 inches thick  
*Surface layer:*  
0 to 8 inches—light yellowish brown extremely bouldery silt loam  
*Subsoil:*  
8 to 22 inches—pale brown very stony sandy loam  
*Substratum:*  
22 to 30 inches—very pale brown very gravelly coarse sandy loam  
*Bedrock:*  
30 to 40 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Manley and Togo soils
- Codylake soils
- Centralpeak soils

### Major Uses

Wildlife habitat, watershed, timber production, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Lodgepole pine, western larch, and subalpine fir—readily; Douglas-fir and Engelmann spruce—periodically  
*Limitations for planting:* Boulders on and in the soil and steepness of slope

### 298—Moses extremely bouldery silt loam, cold, 5 to 70 percent slopes

#### Composition

*Moses soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Summits, shoulders, and backslopes of mountains  
*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from granitic rock  
*Slope range:* 5 to 70 percent  
*Elevation:* 5,400 to 6,800 feet  
*Average annual precipitation:* 25 to 35 inches

*Average annual air temperature:* 37 to 39 degrees F

*Frost-free period:* 70 to 90 days

*Rock fragments on surface:* Boulders and stones cover 15 to 50 percent

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 8 inches—light yellowish brown extremely bouldery silt loam

*Subsoil:*

8 to 22 inches—pale brown very stony sandy loam

*Substratum:*

22 to 30 inches—very pale brown very gravelly coarse sandy loam

*Bedrock:*

30 to 40 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to weathered bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through May; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Soils that have weathered bedrock at a depth of 40 to 60 inches and have fewer rock fragments in the substratum
- Togo and Manley soils
- Rock outcrop

### Major Uses

Limited timber production, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Lodgepole pine,

subalpine fir, and whitebark pine—periodically

*Limitations for planting:* Boulders on and in the soil and steepness of slope in some areas

### 299—Narcisse silt loam, 0 to 3 percent slopes

#### Composition

*Narcisse soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Low stream terraces and flood plains

*Parent material:* Alluvium

*Slope range:* 0 to 3 percent

*Elevation:* 1,700 to 2,400 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Surface layer:*

0 to 16 inches—dark grayish brown silt loam

*Subsoil:*

16 to 25 inches—grayish brown silt loam

*Upper part of substratum:*

25 to 42 inches—light brownish gray fine sandy loam

*Lower part of substratum:*

42 to 60 inches—light gray silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderate

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in February through April (see "Water Features" table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in February through April

### Contrasting Inclusions

- Cowlake soils
- Aquic Xerofluvents

- Bossburg soils
- Ralsen soils

### Major Uses

Timber production, nonirrigated hay and pasture, livestock grazing, wildlife habitat, and watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Quaking aspen, paper birch, and thinleaf alder—readily; ponderosa pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by water erosion and flooding.

## 300—Narcisse silt loam, dry, 0 to 3 percent slopes

### Composition

*Narcisse soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Low stream terraces and flood plains

*Parent material:* Alluvium

*Slope range:* 0 to 3 percent

*Elevation:* 1,700 to 2,400 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Upper part of surface layer:*

0 to 10 inches—very dark gray and dark gray silt loam

*Lower part of surface layer:*

10 to 21 inches—grayish brown silt loam

*Subsoil:*

21 to 31 inches—light brownish gray silt loam

*Upper part of substratum:*

31 to 46 inches—grayish brown and light brownish gray sandy loam

*Lower part of substratum:*

46 to 60 inches—pale brown gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Moderately well drained

*Permeability:* Moderate in the upper 46 inches and very rapid below

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in February through April (see “Water Features” table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in February through April

### Contrasting Inclusions

- Coxlake soils
- Ralsen soils
- Bossburg soils
- Aquic Xerofluvents

### Major Uses

Nonirrigated hay and pasture, livestock grazing, wildlife habitat, and watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Quaking aspen, paper birch, and thinleaf alder—readily; ponderosa pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by water erosion and flooding.

## 301—Nespelem silt loam, 0 to 5 percent slopes

### Composition

*Nespelem soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Loess over glacial lake sediment

*Slope range:* 0 to 5 percent

*Elevation:* 1,200 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 12 inches—grayish brown silt loam

*Upper part of subsoil:*

12 to 22 inches—brown silt loam

22 to 24 inches—light brownish gray hardpan

*Lower part of subsoil:*

24 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

*Salinity:* Slight between depths of 24 and 60 inches

### Contrasting Inclusions

- Disautel soils
- Emdent soils
- Soils that do not have a hardpan
- Poween soils
- Haley soils

### Major Uses

Livestock grazing, nonirrigated and irrigated hay and pasture, building site development, wildlife habitat, recreation, and watershed

### Use and Management

#### Livestock grazing

• The depth to the hardpan limits pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### Irrigated cropland

• If this soil is used for irrigated crops, it is limited by rooting depth and water erosion.

## 302—Nespelem silt loams complex, 5 to 30 percent slopes

### Composition

*Nespelem soil, north slopes, and similar soils:* 50 percent

*Nespelem soil, south slopes, and similar soils:* 40 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Dissected terraces and terrace escarpments in an area of complex topography with both north- and south-facing slopes

*Parent material:* Loess over glacial lake sediment

*Slope range:* 5 to 30 percent

*Elevation:* 1,200 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

#### Nespelem, north slopes

*Surface layer:*

0 to 19 inches—grayish brown silt loam

*Upper part of subsoil:*

19 to 30 inches—brown silt loam

30 to 32 inches—light yellowish brown hardpan

*Lower part of subsoil:*

32 to 60 inches—pale yellow and light yellowish brown, calcareous silt loam

#### Nespelem, south slopes

*Upper part of surface layer:*

0 to 8 inches—dark brown silt loam

*Lower part of surface layer:*

8 to 16 inches—dark brown very fine sandy loam

*Upper part of subsoil:*

16 to 36 inches—dark grayish brown very fine sandy loam

36 to 38 inches—grayish brown hardpan

*Lower part of subsoil:*

38 to 60 inches—grayish brown, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Hazard of water erosion:* Cropland—moderate to very severe; rangeland—slight to severe

*Hazard of wind erosion (bare surface):* Slight

*Salinity:* Slight in the lower part of the subsoil

### Contrasting Inclusions

- Disautel soils
- Soils that do not have a hardpan
- Haley soils
- Ewall soils
- Picard and Rebecca soils

### Major Uses

Livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction.
  - This unit is too shallow for pond construction.
- Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 303—Nespelem-Emdent silt loams complex, 0 to 15 percent slopes

### Composition

*Nespelem soil and similar soils:* 55 percent

*Emdent soil and similar soils:* 30 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Nespelem—dissected terraces with swells and swales; Emdent—swales in dissected terraces

*Parent material:* Nespelem—loess over glacial lake sediment; Emdent—alluvium derived from volcanic ash and loess

*Slope range:* Nespelem—0 to 15 percent; Emdent—0 to 3 percent

*Elevation:* 1,200 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

#### Nespelem

*Surface layer:*

0 to 12 inches—grayish brown silt loam

*Upper part of subsoil:*

12 to 22 inches—brown silt loam

22 to 24 inches—light brownish gray hardpan

*Lower part of subsoil:*

24 to 60 inches—light gray, calcareous silt loam

#### Emdent

*Surface layer:*

0 to 16 inches—grayish brown, calcareous silt loam

*Upper part of subsoil:*

16 to 26 inches—light brownish gray, calcareous silt loam

*Lower part of subsoil:*

26 to 60 inches—light gray, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Nespelem—moderately deep (20 to 40 inches to a hardpan); Emdent—very deep (more than 60 inches)

*Drainage class:* Nespelem—well drained; Emdent—somewhat poorly drained

*Permeability:* Moderate

*Available water capacity:* Nespelem—moderately high; Emdent—very high

*Potential rooting depth:* Nespelem—20 to 40 inches; Emdent—more than 60 inches

*Runoff:* Nespelem—slow; Emdent—ponded for long periods in February through May

*Hazard of water erosion (Nespelem):* Cropland—slight or moderate; rangeland—slight

*Hazard of water erosion (Emdent):* Cropland—slight; rangeland—none

*Hazard of wind erosion (bare surface):* Nespelem—slight; Emdent—moderate

*Water table:* Present in January through December (see “Water Features” table)

*Salinity:* Nespelem—slight in the lower part of the subsoil; Emdent—slight in the upper 18 inches and very slight between depths of 18 and 60 inches

### Contrasting Inclusions

- Soils that are poorly drained
- Ewall soils
- Poween soils
- Disautel soils
- Narcisse soils

### Major Uses

Livestock grazing, nonirrigated hay and pasture, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- The depth to the hardpan in the Nespelem soil limits pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The Emdent soil has a high water table at certain times of the year that limits use of the soil.
- The Emdent soil is affected by salt. If the range is in poor condition, salts concentrate on the bare surface as a result of evaporation. Reseeding is very difficult, and only salt-tolerant species should be used.

#### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope, water erosion, and rooting depth of the Nespelem soil and by wind erosion and wetness in the Emdent soil.

### 304—Nespelem-Typic Xerorthents, eroded complex, 5 to 20 percent slopes

#### Composition

*Nespelem soil and similar soils:* 75 percent  
*Typic Xerorthents and similar soils:* 20 percent  
*Contrasting inclusions:* 5 percent

#### Setting

*Position on landscape:* Dissected glacial lake terraces  
*Parent material:* Nespelem—loess over glacial lake sediment; Typic Xerorthents—glacial lake sediment  
*Slope range:* 5 to 20 percent  
*Elevation:* 2,100 to 2,600 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

#### Typical Profile

##### Nespelem

*Surface layer:*  
 0 to 12 inches—grayish brown silt loam

*Upper part of subsoil:*  
 12 to 22 inches—brown silt loam

22 to 24 inches—light brownish gray hardpan

*Lower part of subsoil:*  
 24 to 60 inches—light gray, calcareous silt loam

### Reference Profile

#### Typic Xerorthents

*Surface layer:*  
 0 to 9 inches—light gray, calcareous silt loam

*Substratum:*  
 9 to 60 inches—light gray and white, calcareous silt loam

### Soil Properties and Qualities

*Depth class:* Nespelem—moderately deep (20 to 40 inches to a hardpan); Typic Xerorthents—very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Nespelem—moderate; Typic Xerorthents—moderately slow

*Available water capacity:* Nespelem—moderately high; Typic Xerorthents—very high

*Potential rooting depth:* Nespelem—20 to 40 inches; Typic Xerorthents—more than 60 inches

*Runoff:* Nespelem—slow or medium; Typic Xerorthents—medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Nespelem—slight; Typic Xerorthents—moderate

*Salinity:* Nespelem—slight in the lower part of the subsoil; Typic Xerorthents—slight throughout

### Contrasting Inclusions

- Disautel soils
- Emdent soils

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- The depth to the hardpan in the Nespelem soil limits pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope, water erosion, and rooting depth.

### 305—Neuske silt loam, 0 to 20 percent slopes

#### Composition

*Neuske soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Ground moraines and footslopes of mountains

*Parent material:* Glacial till mixed with volcanic ash and loess

*Slope range:* 0 to 20 percent

*Elevation:* 1,800 to 3,300 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—grayish brown silt loam

*Upper part of subsurface layer:*

5 to 24 inches—pale brown silt loam

*Lower part of subsurface layer:*

24 to 30 inches—light gray loam

*Upper part of subsoil:*

30 to 39 inches—light brownish gray and light gray loam

*Middle part of subsoil:*

39 to 50 inches—pale brown and light gray clay loam

*Lower part of subsoil:*

50 to 60 inches—light gray dense glacial till that crushes to cobbly loam

#### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Very high

*Effective rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

#### Contrasting Inclusions

- Republic soils

- Soils that are very gravelly
- Louploup soils
- Kewach soils

#### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### Use and Management

##### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir and western larch—periodically

*Limitations for planting:* None

##### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

### 306—Neuske silt loam, 20 to 40 percent slopes

#### Composition

*Neuske soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes and footslopes of mountains

*Parent material:* Glacial till mixed with volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 3,300 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—grayish brown silt loam

*Upper part of subsurface layer:*

5 to 24 inches—pale brown silt loam

*Lower part of subsurface layer:*

24 to 30 inches—light gray loam

*Upper part of subsoil:*

30 to 39 inches—light brownish gray and light gray loam

*Middle part of subsoil:*

39 to 50 inches—pale brown and light gray clay loam

*Lower part of subsoil:*

50 to 60 inches—light gray dense glacial till that crushes to cobbly loam

**Soil Properties and Qualities**

*Depth class:* Deep (40 to 60 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Very high

*Effective rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Republic soils
- Soils that are very gravelly
- Louploup soils
- Kewach soils

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir and western larch—periodically

*Limitations for planting:* None

**307—Nevine silt loams association,  
5 to 20 percent slopes****Composition**

*Nevine soil and similar soils:* 45 percent

*Nevine soil, warm, and similar soils:* 40 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Footslopes and toeslopes of hills and mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 4,500 feet

*Average annual precipitation:* 16 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile****Nevine**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 9 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

9 to 18 inches—light yellowish brown loam

*Lower part of subsoil:*

18 to 28 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

28 to 41 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

41 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

**Nevine, warm**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 7 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

7 to 15 inches—light yellowish brown loam

*Lower part of subsoil:*

15 to 25 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

25 to 38 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

38 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Louploup and Apex soils
- Stepstone and Scrabblers soils
- Merkel soils
- Republic soils
- Soils that have a very stony surface
- Manley soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitations for planting:* None

#### Irrigated Cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

### 308—Nevine silt loams association, 20 to 40 percent slopes

#### Composition

*Nevine soil and similar soils:* 45 percent

*Nevine soil, warm, and similar soils:* 40 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,500 feet

*Average annual precipitation:* 16 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

#### Nevine

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 9 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

9 to 18 inches—light yellowish brown loam

*Lower part of subsoil:*

18 to 28 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

28 to 41 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

41 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

#### Nevine, warm

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 7 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

7 to 15 inches—light yellowish brown loam

*Lower part of subsoil:*

15 to 25 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

25 to 38 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

38 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

**Contrasting Inclusions**

- Mineral soils
- Louploup and Apex soils
- Stepstone and Scrabblers soils
- Merkel soils
- Republic soils
- Soils that have a very stony surface
- Manley soils
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitations for planting:* None

**309—Nevine silt loams association, 40 to 65 percent slopes****Composition**

*Nevine soil and similar soils:* 45 percent

*Nevine soil, warm, and similar soils:* 40 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 40 to 65 percent

*Elevation:* 2,000 to 4,500 feet

*Average annual precipitation:* 16 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile****Nevine**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 9 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

9 to 18 inches—light yellowish brown loam

*Lower part of subsoil:*

18 to 28 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

28 to 41 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

41 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

**Nevine, warm**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 7 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

7 to 15 inches—light yellowish brown loam

*Lower part of subsoil:*

15 to 25 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

25 to 38 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

38 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

**Contrasting Inclusions**

- Mineral soils
- Louploup and Apex soils
- Stepstone soils
- Merkel soils
- Manley soils
- Soils that have a very stony surface
- Rock outcrop
- Rubble land

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitation for planting:* Steepness of slope

**310—Nevine-Rock outcrop association, 20 to 40 percent slopes****Composition**

*Nevine soil and similar soils:* 30 percent

*Nevine soil, warm, and similar soils:* 30 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Backslopes and footslopes of mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,500 feet

*Average annual precipitation:* 16 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Nevine Soil****Typical profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 9 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

9 to 18 inches—light yellowish brown loam

*Lower part of subsoil:*

18 to 28 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

28 to 41 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

41 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate or severe

**Nevine Soil, Warm****Typical profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 7 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

7 to 15 inches—light yellowish brown loam

*Lower part of subsoil:*

15 to 25 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

25 to 38 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

38 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate or severe

**Rock Outcrop**

*Kind of rock:* Rhyodacite, quartz latite, granitic rock, and diorite

**Contrasting Inclusions**

- Mineral and Thout soils
- Baldknob and Chumstick soils
- Louploup and Apex soils
- Stepstone soils
- Merkel soils
- Manley soils
- Soils that have a very stony surface
- Rubble land

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitation for planting:* Rock outcrop

**311—Nevine-Rock outcrop association, 40 to 65 percent slopes****Composition**

*Nevine soil and similar soils:* 30 percent

*Nevine soil, warm, and similar soils:* 30 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Volcanic ash over glacial till

*Slope range:* 40 to 65 percent

*Elevation:* 2,000 to 4,500 feet

*Average annual precipitation:* 16 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Nevine Soil****Typical profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*

1 inch to 9 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*

9 to 18 inches—light yellowish brown loam

*Lower part of subsoil:*

18 to 28 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*

28 to 41 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*

41 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### **Nevine Soil, Warm**

#### **Typical profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 1 inch—pale brown and light gray silt loam

*Upper part of subsoil:*  
1 inch to 7 inches—brown and light yellowish brown silt loam

*Middle part of subsoil:*  
7 to 15 inches—light yellowish brown loam

*Lower part of subsoil:*  
15 to 25 inches—light yellowish brown very gravelly sandy loam

*Upper part of substratum:*  
25 to 38 inches—white dense glacial till that crushes to very gravelly sandy loam

*Lower part of substratum:*  
38 to 60 inches—white dense glacial till that crushes to very gravelly loamy sand

#### **Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

#### **Rock Outcrop**

*Kind of rock:* Rhyodacite, quartz latite, granitic rock, and diorite

#### **Contrasting Inclusions**

- Mineral and Thout soils
- Baldknob and Pole soils
- Louploup and Apex soils
- Stepstone soils
- Merkel soils
- Manley soils

- Soils that have a very stony surface
- Rubble land

#### **Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

##### **Silviculture**

*Potential for natural regeneration:* Douglas-fir, ponderosa pine, and western larch—readily

*Limitations for planting:* Rock outcrop and steepness of slope

### **312—Newbell silt loam, dry, 5 to 20 percent slopes**

#### **Composition**

*Newbell soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### **Setting**

*Position on landscape:* Toeslopes and footslopes of mountains

*Parent material:* Mantle of volcanic ash and loess over glacial till

*Slope range:* 5 to 20 percent

*Elevation:* 2,400 to 4,500 feet

*Average annual precipitation:* 19 to 24 inches

*Average annual air temperature:* 42 to 45 degrees F

*Frost-free period:* 90 to 120 days

#### **Typical Profile**

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*  
0 to 1 inch—dark brown silt loam

*Upper part of subsoil:*  
1 inch to 11 inches—light yellowish brown silt loam

*Lower part of subsoil:*  
11 to 21 inches—very pale brown very gravelly loam

*Substratum:*  
21 to 60 inches—very pale brown dense glacial till that crushes to very gravelly loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)  
*Drainage class:* Well drained  
*Permeability:* Moderate over slow  
*Available water capacity:* Moderately high  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Inkler and Merkel soils
- Kiehl soils
- Hartill and Mineral soils
- Aits soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, western larch, and grand fir—readily; ponderosa pine and lodgepole pine—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 313—Newbell silt loam, dry, 20 to 40 percent slopes

### Composition

*Newbell soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and backslopes of mountains

*Parent material:* Mantle of volcanic ash and loess over glacial till  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,400 to 4,500 feet  
*Average annual precipitation:* 19 to 24 inches  
*Average annual air temperature:* 42 to 45 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick  
*Surface layer:*  
 0 to 1 inch—dark brown silt loam  
*Upper part of subsoil:*  
 1 inch to 11 inches—light yellowish brown silt loam  
*Lower part of subsoil:*  
 11 to 21 inches—very pale brown very gravelly loam  
*Substratum:*  
 21 to 60 inches—very pale brown dense glacial till that crushes to very gravelly loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)  
*Drainage class:* Well drained  
*Permeability:* Moderate over slow  
*Available water capacity:* Moderately high  
*Effective rooting depth:* 20 to 40 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

### Contrasting Inclusions

- Inkler and Merkel soils
- Kiehl soils
- Hartill and Mineral soils
- Aits soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, western larch, and grand fir—readily; ponderosa pine and lodgepole pine—periodically

*Limitations for planting:* None

**314—Newbell silt loam, dry, 40 to 65 percent slopes****Composition**

*Newbell soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Backslopes of mountains

*Parent material:* Mantle of volcanic ash and loess over glacial till

*Slope range:* 40 to 65 percent

*Elevation:* 2,400 to 4,500 feet

*Average annual precipitation:* 19 to 24 inches

*Average annual air temperature:* 42 to 45 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 1 inch—dark brown silt loam

*Upper part of subsoil:*

1 inch to 11 inches—light yellowish brown silt loam

*Lower part of subsoil:*

11 to 21 inches—very pale brown very gravelly loam

*Substratum:*

21 to 60 inches—very pale brown dense glacial till that crushes to very gravelly loam

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* Moderately high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

**Contrasting Inclusions**

- Inkler and Merkel soils
- Kiehl soils

- Hartill and Mineral soils
- Aits soils
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir, western larch, and grand fir—readily; ponderosa pine and lodgepole pine—periodically

*Limitation for planting:* Steepness of slope

**315—Northstar gravelly loam, dry, 5 to 30 percent slopes****Composition**

*Northstar soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Backslopes, shoulders, and ridges of hills and mountains

*Parent material:* Colluvium and residuum derived from rhyodacite and quartz latite mixed with a component of loess and volcanic ash

*Slope range:* 5 to 30 percent

*Elevation:* 1,600 to 3,500 feet

*Average annual precipitation:* 15 to 17 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 10 inches—grayish brown gravelly loam

*Subsoil:*

10 to 26 inches—brown and light yellowish brown very gravelly loam

*Bedrock:*

26 to 30 inches—rhyodacite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow to rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Johntom soils
- Skanid soils
- Spokane soils
- Soils that have a very stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and rooting depth.

### 316—Northstar gravelly loam, dry, 30 to 65 percent slopes

#### Composition

*Northstar soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains

*Parent material:* Colluvium derived from rhyodacite and quartz latite mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 1,600 to 3,500 feet

*Average annual precipitation:* 15 to 17 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*

0 to 10 inches—grayish brown gravelly loam

*Subsoil:*

10 to 26 inches—brown and light yellowish brown very gravelly loam

*Bedrock:*

26 to 30 inches—rhyodacite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Johntom soils
- Skanid soils
- Spokane soils
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Steepness of slope

### 317—Northstar-Johntom-Rock outcrop complex, 8 to 30 percent slopes

#### Composition

*Northstar soil and similar soils:* 50 percent

*Johntom soil and similar soils:* 20 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Northstar—backslopes, shoulders, and ridges of hills and mountains (fig. 11); Johntom—shoulders and ridges of hills and mountains

*Parent material:* Colluvium and residuum derived from rhyodacite and quartz latite mixed with a component of loess and volcanic ash

*Slope range:* 8 to 30 percent

*Elevation:* 1,600 to 3,500 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Northstar—none; Johntom—stones cover 0.1 to 3.0 percent

#### Northstar Soil

##### Typical profile

*Organic mat on surface:* 1.5 inches thick

*Upper part of surface layer:*

0 to 2 inches—grayish brown gravelly loam

*Lower part of surface layer:*

2 to 11 inches—grayish brown very gravelly loam

*Subsoil:*

11 to 18 inches—pale brown very gravelly loam

*Substratum:*

18 to 27 inches—pale brown extremely cobbly loam

*Bedrock:*

27 to 31 inches—rhyodacite

##### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Slight or moderate

#### Johntom Soil

##### Typical profile

*Upper part of surface layer:*

0 to 4 inches—dark brown stony loam

*Lower part of surface layer:*

4 to 11 inches—brown very gravelly sandy loam

*Substratum:*

11 to 16 inches—pale brown extremely gravelly coarse sandy loam

*Bedrock:*

16 to 20 inches—rhyodacite

##### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Slight or moderate

#### Rock Outcrop

*Kind of rock:* Rhyodacite and quartz latite

#### Contrasting Inclusions

- Soils that have hard bedrock at a depth of 4 to 10 inches
- Louiecreek and Scoap soils
- Donovan soils
- Soils that have a very stony surface
- Rubble land

#### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### Use and Management

##### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Northstar—Rock outcrop and rock fragments in the soil; Johntom—depth to bedrock, rock fragments in the soil, and Rock outcrop

Figure 11.—Northstar soil in an area of Northstar-Johntom-Rock outcrop complex, 8 to 30 percent slopes. The ecological site is ponderosa pine/Idaho fescue. The large-leaved herbaceous plant is arrowleaf balsamroot. (Pole height is 1 meter.)

### 318—Northstar-Johntom-Rock outcrop complex, 30 to 65 percent slopes

#### Composition

*Northstar soil and similar soils:* 50 percent

*Johntom soil and similar soils:* 20 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains

*Parent material:* Colluvium and residuum derived from

rhyodacite and quartz latite mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 1,600 to 3,500 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Northstar—none; Johntom—stones cover 0.1 to 3.0 percent

#### Northstar Soil

#### Typical profile

*Organic mat on surface:* 1.5 inches thick

*Upper part of surface layer:*

0 to 2 inches—grayish brown gravelly loam

*Lower part of surface layer:*

2 to 11 inches—grayish brown very gravelly loam

*Subsoil:*

11 to 18 inches—pale brown very gravelly loam

*Substratum:*

18 to 27 inches—pale brown extremely cobbly loam

*Bedrock:*

27 to 31 inches—rhyodacite

**Soil properties and qualities***Depth class:* Moderately deep (20 to 40 inches to bedrock)*Drainage class:* Well drained*Permeability:* Moderate*Available water capacity:* Very low*Potential rooting depth:* 20 to 40 inches*Runoff:* Medium or rapid*Snowpack:* More than 1 foot—January and February; more than 3 feet—none*Hazard of water erosion:* Moderate or severe**Johntom Soil****Typical profile***Upper part of surface layer:*

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

### 323—Ohscow silt loam, 40 to 65 percent slopes

#### Composition

*Ohscow soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Mantle of volcanic ash and loess over colluvium and residuum derived from granitic rock

*Slope range:* 40 to 65 percent

*Elevation:* 2,200 to 5,000 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—brown silt loam

*Upper part of subsoil:*

4 to 11 inches—light yellowish brown silt loam

*Lower part of subsoil:*

11 to 27 inches—light gray very gravelly sandy loam

*Upper part of substratum:*

27 to 46 inches—light gray very cobbly sandy loam

*Lower part of substratum:*

46 to 60 inches—light gray very cobbly loamy sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe

#### Contrasting Inclusions

- Centralpeak, Mineral, and Oxerine soils
- Canteen soils
- Bearspring soils
- Soils that have a very stony surface
- Rock outcrop

#### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

#### Use and Management

##### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitation for planting:* Steepness of slope

### 324—Ohscow silt loam, cool, 20 to 40 percent slopes

#### Composition

*Ohscow soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Footslopes and backslopes of mountains

*Parent material:* Mantle of volcanic ash and loess over residuum and colluvium derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,200 to 5,000 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 41 to 43 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 14 inches—light yellowish brown silt loam

*Lower part of subsoil:*

14 to 25 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

25 to 39 inches—very pale brown very gravelly sandy loam

*Lower part of substratum:*

39 to 60 inches—light gray very cobbly loamy sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Moscow and Oxerine soils
- Canteen soils
- Soils that have weathered granitic rock at a depth of 10 to 20 inches
- Bearspring soils
- Codylake soils
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

**325—Ohscow silt loam, cool, 40 to 65 percent slopes****Composition**

*Ohscow soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Backslopes of mountains

*Parent material:* Mantle of volcanic ash and loess over colluvium and residuum derived from granitic rock

*Slope range:* 40 to 65 percent

*Elevation:* 2,200 to 5,000 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 41 to 43 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 14 inches—light yellowish brown silt loam

*Lower part of subsoil:*

14 to 25 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

25 to 39 inches—very pale brown very gravelly sandy loam

*Lower part of substratum:*

39 to 60 inches—light gray very cobbly loamy sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

**Contrasting Inclusions**

- Moscow and Oxerine soils
- Canteen soils
- Soils that have weathered granitic rock at a depth of 10 to 20 inches
- Bearspring soils
- Codylake soils
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; ponderosa pine and western larch—periodically

*Limitation for planting:* Steepness of slope

## 326—Okanogan loam, 0 to 5 percent slopes

### Composition

*Okanogan soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Flood plains and low stream terraces

*Parent material:* Alluvium

*Slope range:* 0 to 5 percent

*Elevation:* 780 to 900 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Upper part of surface layer:*

0 to 14 inches—dark grayish brown loam

*Lower part of surface layer:*

14 to 24 inches—grayish brown very fine sandy loam

*Subsoil:*

24 to 42 inches—brown, calcareous very fine sandy loam

*Upper part of substratum:*

42 to 48 inches—pale brown, calcareous fine sandy loam

*Middle part of substratum:*

48 to 51 inches—pale brown, calcareous fine sand

*Lower part of substratum:*

51 to 60 inches—pale brown, calcareous fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

*Frequency, duration, and period of flooding:*

Occasional, long periods in January through April

### Contrasting Inclusions

- Aeneas soils
- Pogue soils
- Monse soils
- Ellisforde soils
- Typic Haplaquolls

### Major Uses

Irrigated and nonirrigated cropland, irrigated and nonirrigated hay and pasture, irrigated orchards, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is subject to flooding.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by flooding and water erosion.

## 327—Omak silt loam, 0 to 8 percent slopes

### Composition

*Omak soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Intermixed glacial lake sediment and glacial till mixed with a component of loess and volcanic ash

*Slope range:* 0 to 8 percent

*Elevation:* 2,100 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 10 inches—brown silt loam

*Subsurface layer:*

10 to 15 inches—pale brown silt loam

*Upper part of subsoil:*

15 to 26 inches—light brownish gray and light gray silt loam

26 to 38 inches—light yellowish brown silty clay loam

*Lower part of subsoil:*

38 to 45 inches—light yellowish brown hardpan

45 to 60 inches—light gray hardpan

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to a hardpan)

*Drainage class:* Moderately well drained

*Permeability:* Moderately slow

*Available water capacity:* Moderately high

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in February through April (see “Water Features” table)

### Contrasting Inclusions

- Cedonia soils
- Swipkin soils
- Martella soils
- Bernhill soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, recreation, and nonirrigated cropland

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, wetness, and rooting depth.

## 328—Owhi loam, 0 to 8 percent slopes

### Composition

*Owhi soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 0 to 8 percent

*Elevation:* 1,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Upper part of surface layer:*

0 to 7 inches—grayish brown loam

*Lower part of surface layer:*

7 to 12 inches—brown loam

*Upper part of subsoil:*

12 to 20 inches—light yellowish brown gravelly loam

*Lower part of subsoil:*

20 to 26 inches—pale brown very gravelly sandy loam

*Substratum:*

26 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Fivelakes soils

- Soils that are very gravelly or very cobbly sand below a depth of about 10 inches
- Haley soils
- Picard soils

### Major Uses

Irrigated hay and pasture, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and droughtiness.

## 329—Owhi stony loam, 3 to 30 percent slopes

### Composition

*Owhi soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces and terrace escarpments

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 3 to 30 percent

*Elevation:* 1,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*

0 to 6 inches—grayish brown stony loam

*Lower part of surface layer:*

6 to 12 inches—brown loam

*Upper part of subsoil:*

12 to 18 inches—pale brown sandy loam

*Lower part of subsoil:*

18 to 23 inches—yellowish brown gravelly sandy loam

*Upper part of substratum:*

23 to 29 inches—pale brown very gravelly loamy coarse sand

*Lower part of substratum:*

29 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight to severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have a very cobbly loam or very cobbly sandy loam surface layer
- Soils that have sand or very gravelly sand at a depth of about 10 inches
- Soils that are very gravelly sand throughout
- Fivelakes soils

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, large stones, and droughtiness.

## 330—Owhi-Haley fine sandy loams complex, 0 to 25 percent slopes

### Composition

*Owhi soil and similar soils:* 45 percent

*Haley soil and similar soils:* 35 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Hummocky outwash terraces

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 0 to 25 percent

*Elevation:* 2,000 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

#### Owhi

*Surface layer:*

0 to 9 inches—grayish brown fine sandy loam

*Subsoil:*

9 to 18 inches—brown gravelly fine sandy loam

*Substratum:*

18 to 60 inches—multicolored extremely gravelly coarse sand

#### Haley

*Surface layer:*

0 to 10 inches—gray and grayish brown fine sandy loam

*Subsoil:*

10 to 24 inches—brown fine sandy loam

*Upper part of substratum:*

24 to 30 inches—light brownish gray loamy fine sand

*Lower part of substratum:*

30 to 60 inches—multicolored sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Owhi—moderately rapid over very rapid;  
Haley—moderate over very rapid

*Available water capacity:* Owhi—low; Haley—moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight to severe;  
rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Conconully and Disautel soils
- Emdent soils
- Fivelakes soils
- Picard soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- The soils in this unit are too sandy to support the sidewalls of trenches for conventional pipeline installation.
- The soils in this unit are too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If the soils in this unit are used for irrigated crops, they are limited by steepness of slope, water and wind erosion, and droughtiness.

### 331—Oxerine silt loam, 5 to 20 percent slopes

#### Composition

*Oxerine soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Shoulders and ridges of hills and mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metamorphic rock

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 4,800 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 11 inches—brown channery silt loam

*Lower part of subsoil:*

11 to 20 inches—light yellowish brown very channery loam

*Substratum:*

20 to 28 inches—light yellowish brown very channery loam

*Bedrock:*

28 to 32 inches—phyllite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Elbowlake and Nevine soils
- Wilmont and Inkler soils
- Raisio soils
- Soils that have bedrock at a depth of 10 to 20 inches
- Rock outcrop

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, rooting depth, and droughtiness.

### 332—Oxerine silt loam, 20 to 40 percent slopes

#### Composition

*Oxerine soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metamorphic rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 4,800 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 5 inches—brown silt loam

*Upper part of subsoil:*  
5 to 11 inches—brown channery silt loam

*Lower part of subsoil:*  
11 to 20 inches—light yellowish brown very channery loam

*Substratum:*  
20 to 28 inches—light yellowish brown very channery loam

*Bedrock:*  
28 to 32 inches—phyllite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Elbowlake and Nevine soils
- Wilmont and Inkler soils
- Henneway soils
- Raisio soils
- Soils that have bedrock at a depth of 10 to 20 inches
- Rock outcrop

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

### 333—Oxerine silt loam, 40 to 65 percent slopes

#### Composition

*Oxerine soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metamorphic rock

*Slope range:* 40 to 65 percent

*Elevation:* 2,000 to 4,800 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 11 inches—brown channery silt loam

*Lower part of subsoil:*

11 to 20 inches—light yellowish brown very channery loam

*Substratum:*

20 to 28 inches—light yellowish brown very channery loam

*Bedrock:*

28 to 32 inches—phyllite

#### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—very severe

#### Contrasting Inclusions

- Elbowlake and Nevine soils
- Wilmont and Inkler soils
- Henneway soils
- Raisio soils
- Soils that have bedrock at a depth of 10 to 20 inches
- Rock outcrop

#### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

#### Use and Management

##### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitation for planting:* Steepness of slope

### 334—Oxerine-Rock outcrop complex, 5 to 30 percent slopes

#### Composition

*Oxerine soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Shoulders and backslopes of mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metamorphic rock

*Slope range:* 5 to 30 percent

*Elevation:* 2,000 to 5,700 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Oxerine Soil

##### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 11 inches—brown channery silt loam

*Lower part of subsoil:*

11 to 20 inches—light yellowish brown very channery loam

*Substratum:*

20 to 28 inches—light yellowish brown very channery loam

*Bedrock:*

28 to 32 inches—phyllite

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate or severe

**Rock Outcrop**

*Kind of rock:* Phyllite, schist, slate, graywacke, and quartzite

**Contrasting Inclusions**

- Elbowlake and Nevine soils
- Wilmont and Inkler soils
- Raisio soils
- Soils that have bedrock at a depth of 10 to 20 inches
- Soils that have a very stony surface

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitation for planting:* Rock outcrop

**335—Oxerine-Rock outcrop complex,  
30 to 65 percent slopes****Composition**

*Oxerine soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Backslopes of mountains

*Parent material:* Mantle of volcanic ash over residuum and colluvium derived from metamorphic rock

*Slope range:* 30 to 65 percent

*Elevation:* 2,000 to 5,700 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Oxerine Soil****Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 11 inches—brown channery silt loam

*Lower part of subsoil:*

11 to 28 inches—light yellowish brown very channery loam

*Bedrock:*

28 to 32 inches—phyllite

**Soil properties and qualities**

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

**Rock Outcrop**

*Kind of rock:* Phyllite, schist, slate, graywacke, and quartzite

**Contrasting Inclusions**

- Elbowlake and Nevine soils
- Wilmont and Inkler soils

- Raisio soils
- Soils that have bedrock at a depth of 10 to 20 inches
- Soils that have a very stony surface

### Major Uses

Timber production, wildlife habitat, watershed, livestock grazing, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically  
*Limitations for planting:* Rock outcrop and steepness of slope

## 336—Parmenter silt loam, 0 to 8 percent slopes

### Composition

*Parmenter soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces and kame terraces  
*Parent material:* Volcanic ash over glacial outwash  
*Slope range:* 0 to 8 percent  
*Elevation:* 1,900 to 3,500 feet  
*Average annual precipitation:* 15 to 22 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 0.5 inch thick  
*Surface layer:*  
0 to 4 inches—grayish brown silt loam  
*Subsoil:*  
4 to 16 inches—pale brown stony silt loam  
*Upper part of substratum:*  
16 to 31 inches—pale brown very stony loamy sand  
*Lower part of substratum:*  
31 to 60 inches—multicolored extremely cobbly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Nevine and Merkel soils
- Wapal soils
- Aquic Xerofluvents
- Soils that have a stony or bouldery surface

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically  
*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, water erosion, and large stones.

## 337—Parmenter silt loam, 8 to 20 percent slopes

### Composition

*Parmenter soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces and kame terraces

*Parent material:* Volcanic ash over glacial outwash  
*Slope range:* 8 to 20 percent  
*Elevation:* 1,900 to 3,500 feet  
*Average annual precipitation:* 15 to 22 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 0.5 inch thick

*Surface layer:*  
 0 to 4 inches—grayish brown silt loam

*Subsoil:*  
 4 to 16 inches—pale brown stony silt loam

*Upper part of substratum:*  
 16 to 31 inches—pale brown very stony loamy sand

*Lower part of substratum:*  
 31 to 60 inches—multicolored extremely cobbly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—moderate or severe; forestland—moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Inkler, Merkel, and Nevine soils
- Wapal soils
- Soils that have a stony or bouldery surface

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and

ponderosa pine—readily; western larch—periodically  
*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, droughtiness, and large stones.

## 338—Parmenter silt loam, 20 to 40 percent slopes

### Composition

*Parmenter soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Kames and terrace escarpments

*Parent material:* Volcanic ash over glacial outwash  
*Slope range:* 20 to 40 percent  
*Elevation:* 1,900 to 3,500 feet  
*Average annual precipitation:* 15 to 22 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 0.5 inch thick

*Surface layer:*  
 0 to 4 inches—grayish brown silt loam

*Subsoil:*  
 4 to 16 inches—pale brown stony silt loam

*Upper part of substratum:*  
 16 to 31 inches—pale brown very stony loamy sand

*Lower part of substratum:*  
 31 to 60 inches—multicolored extremely cobbly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Inkler, Merkel, and Nevine soils
- Wapal soils
- Soils that have a stony or bouldery surface

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

### 339—Parmenter bouldery silt loam, 8 to 20 percent slopes

#### Composition

*Parmenter soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Kames and kame terraces

*Parent material:* Volcanic ash over glacial outwash

*Slope range:* 8 to 20 percent

*Elevation:* 1,900 to 3,500 feet

*Average annual precipitation:* 15 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Boulders and stones cover 0.1 to 3.0 percent

#### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 5 inches—brown bouldery silt loam

*Subsoil:*

5 to 15 inches—pale brown bouldery silt loam

*Upper part of substratum:*

15 to 27 inches—pale brown extremely bouldery loamy coarse sand

*Lower part of substratum:*

27 to 60 inches—pale brown extremely bouldery loamy fine sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate

### Contrasting Inclusions

- Inkler, Merkel, and Nevine soils
- Wapal soils
- Soils that have a very bouldery surface

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by large stones, steepness of slope, water erosion, and droughtiness.

### 340—Peshastin stony fine sandy loam, 0 to 10 percent slopes

#### Composition

*Peshastin soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces and moraines

*Parent material:* Glacial outwash and ablation glacial till mixed with loess

*Slope range:* 0 to 10 percent

*Elevation:* 950 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*  
 0 to 10 inches—grayish brown stony fine sandy loam

*Upper part of subsoil:*  
 10 to 21 inches—pale brown fine sandy loam

*Lower part of subsoil:*  
 21 to 60 inches—light yellowish brown, calcareous very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Aeneas soils
- Pogue and Strat soils
- Couleedam and Soaplake soils
- Stubblefield soils
- Quincy and Skaha soils
- Malott, Farrell, Cashmere, and Cashmont soils

### Major Uses

Livestock grazing, irrigated orchards, irrigated hay and pasture, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by large stones, steepness of slope, and droughtiness.

## 341—Peshastin stony fine sandy loam, 10 to 30 percent slopes

### Composition

*Peshastin soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces and moraines  
*Parent material:* Glacial outwash and ablation glacial till mixed with loess  
*Slope range:* 10 to 30 percent  
*Elevation:* 950 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*  
 0 to 10 inches—grayish brown stony fine sandy loam

*Upper part of subsoil:*  
 10 to 21 inches—pale brown fine sandy loam

*Lower part of subsoil:*  
 21 to 60 inches—light yellowish brown, calcareous very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Aeneas soils that have a sandy substratum
- Pogue and Strat soils
- Couleedam and Soaplake soils
- Stubblefield soils
- Quincy and Skaha soils
- Malott, Farrell, Cashmere, and Cashmont soils

### Major Uses

Livestock grazing, irrigated orchards, irrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### 342—Peshastin extremely bouldery loam, 20 to 60 percent slopes

#### Composition

*Peshastin soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Terrace escarpments and moraines

*Parent material:* Glacial outwash and ablation glacial till mixed with loess

*Slope range:* 20 to 60 percent

*Elevation:* 900 to 2,400 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Boulders and stones cover 15 to 50 percent

#### Typical Profile

*Surface layer:*

0 to 8 inches—grayish brown extremely bouldery loam

*Upper part of subsoil:*

8 to 22 inches—pale brown cobbly sandy loam

*Lower part of subsoil:*

22 to 60 inches—light brownish gray, calcareous extremely cobbly sandy loam

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

#### Contrasting Inclusions

- Pogue and Strat soils
- Couleedam and Soaplake soils
- Stubblefield soils
- Quincy and Skaha soils
- Malott, Farrell, Cashmere, and Cashmont soils
- Rock outcrop

#### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, or brush management using ground equipment.
- This unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### 343—Phoebe fine sandy loam, 0 to 5 percent slopes

#### Composition

*Phoebe soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with volcanic ash and loess

*Slope range:* 0 to 5 percent

*Elevation:* 1,400 to 2,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Surface layer:*

0 to 11 inches—dark grayish brown and grayish brown fine sandy loam

*Upper part of subsoil:*

11 to 30 inches—brown fine sandy loam

*Lower part of subsoil:*

30 to 47 inches—pale brown sandy loam

*Substratum:*

47 to 60 inches—pale brown loamy sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Hunters soils
- Bong soils
- Garrison and Hallcreek soils
- Dart and Bisbee soils
- Soils that are moderately well drained and have redoximorphic features below a depth of about 24 inches

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated and irrigated hay and pasture, building site development, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wind erosion.

## 344—Phoebe fine sandy loam, 5 to 10 percent slopes

### Composition

*Phoebe soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Glacial outwash mixed with volcanic ash and loess  
*Slope range:* 5 to 10 percent  
*Elevation:* 1,400 to 2,500 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

#### *Surface layer:*

0 to 11 inches—dark grayish brown and grayish brown fine sandy loam

#### *Upper part of subsoil:*

11 to 30 inches—brown fine sandy loam

#### *Lower part of subsoil:*

30 to 47 inches—pale brown sandy loam

#### *Substratum:*

47 to 60 inches—pale brown loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Hunters soils
- Bong soils
- Garrison and Hallcreek soils
- Dart and Bisbee soils

### Major Uses

Nonirrigated and irrigated cropland, nonirrigated and irrigated hay and pasture, timber production, livestock grazing, building site development, wildlife habitat, recreation, and watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

### 345—Phoebe fine sandy loam, 10 to 25 percent slopes

#### Composition

*Phoebe soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash mixed with volcanic ash and loess

*Slope range:* 10 to 25 percent

*Elevation:* 1,400 to 2,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Surface layer:*

0 to 11 inches—dark grayish brown and grayish brown fine sandy loam

*Upper part of subsoil:*

11 to 30 inches—brown fine sandy loam

*Lower part of subsoil:*

30 to 47 inches—pale brown sandy loam

*Substratum:*

47 to 60 inches—pale brown loamy sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; forestland—moderate

*Hazard of wind erosion (bare surface):* Severe

#### Contrasting Inclusions

- Hunters soils that are silt loam throughout
- Bong soils that are sandy below a depth of about 14 inches
- Garrison and Hallcreek soils that have an extremely gravelly sand substratum
- Dart and Bisbee soils that are sandy throughout

#### Major Uses

Timber production, livestock grazing, nonirrigated cropland and hay and pasture, and wildlife habitat

#### Use and Management

##### Timber production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

##### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind and water erosion.

### 346—Phoebe fine sandy loam, 40 to 65 percent slopes

#### Composition

*Phoebe soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terrace escarpments and backslopes of hills

*Parent material:* Glacial outwash mixed with volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 1,300 to 2,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Surface layer:*

0 to 11 inches—dark grayish brown and grayish brown fine sandy loam

*Upper part of subsoil:*

11 to 30 inches—brown fine sandy loam

*Lower part of subsoil:*

30 to 47 inches—pale brown sandy loam

*Substratum:*

47 to 60 inches—pale brown loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* High  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Soils that have a stony surface
- Cedonia soils
- Dehart soils
- Dart soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically  
*Limitation for planting:* Steepness of slope

### 347—Phoebe fine sandy loam, dry, 0 to 5 percent slopes

#### Composition

*Phoebe soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces  
*Parent material:* Glacial outwash mixed with volcanic ash and loess  
*Slope range:* 0 to 5 percent  
*Elevation:* 1,300 to 2,500 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 10 inches—brown fine sandy loam  
*Subsoil:*  
 10 to 27 inches—light yellowish brown fine sandy loam  
*Upper part of substratum:*  
 27 to 36 inches—light yellowish brown fine sandy loam  
*Lower part of substratum:*  
 36 to 60 inches—light brownish gray loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight;  
 forestland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Bong soils
- Garrison soils
- Donovan soils
- Dart and Bisbee soils
- Hunters soils
- Soils that are underlain by silt loam or silty clay loam lake sediment

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, watershed, building site development, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically  
*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by wind erosion.

**348—Phoebe fine sandy loam, dry, 5 to 10 percent slopes****Composition**

*Phoebe soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with volcanic ash and loess

*Slope range:* 5 to 10 percent

*Elevation:* 1,300 to 2,500 feet

- Dart and Bisbee soils
- Hunters soils
- Soils that are underlain by silt loam or silty clay loam lake sediment

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind and water erosion.

### 350—Phoebe, dry-Dehart complex, 8 to 30 percent slopes

#### Composition

*Phoebe soil, dry, and similar soils:* 55 percent

*Dehart soil and similar soils:* 25 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments  
*Parent material:* Phoebe—glacial outwash mixed with a component of loess and volcanic ash; Dehart—colluvium derived from glacial till and metamorphic rock mixed with a component of loess and volcanic ash  
*Slope range:* 8 to 30 percent  
*Elevation:* 1,300 to 1,600 feet  
*Average annual precipitation:* 15 to 17 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

#### Phoebe

*Organic mat on surface:* 0.25 inch thick  
*Surface layer:*  
0 to 16 inches—grayish brown fine sandy loam  
*Upper part of subsoil:*  
16 to 30 inches—yellowish brown gravelly fine sandy loam  
*Lower part of subsoil:*  
30 to 39 inches—light olive brown gravelly sandy loam

*Substratum:*  
39 to 60 inches—light olive brown loamy sand

#### Dehart

*Organic mat on surface:* 3 inches thick  
*Upper part of surface layer:*  
0 to 7 inches—dark grayish brown gravelly loam  
*Lower part of surface layer:*  
7 to 11 inches—pale brown very gravelly loam  
*Upper part of subsoil:*  
11 to 32 inches—light yellowish brown very gravelly sandy loam  
*Lower part of subsoil:*  
32 to 60 inches—light yellowish brown very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Phoebe—moderately rapid over very rapid; Dehart—moderate  
*Available water capacity:* Phoebe—moderately high; Dehart—moderate

*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Cropland—moderate or  
 severe; forestland—moderate  
*Hazard of wind erosion (bare surface):* Phoebe—  
 severe; Dehart—slight

### Contrasting Inclusions

- Garrison soils
- Soils that have a very stony or very cobbly surface
- Soils that have more clay in the subsoil
- Dart soils

### Major Uses

Livestock grazing, timber production, wildlife habitat,  
 building site development, and watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
 tracked equipment—suitable; cable yarding—  
 suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—  
 periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this unit is used for irrigated crops, it is limited by  
 steepness of slope, wind erosion on the Phoebe soil,  
 and droughtiness of the Dehart soil.

## 351—Picard very fine sandy loam, 0 to 8 percent slopes

### Composition

*Picard soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Glaciofluvial material mixed with  
 loess  
*Slope range:* 0 to 8 percent  
*Elevation:* 1,200 to 2,700 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

### Typical Profile

*Upper part of surface layer:*  
 0 to 5 inches—grayish brown very fine sandy  
 loam

*Lower part of surface layer:*  
 5 to 16 inches—brown fine sandy loam

*Subsoil:*  
 16 to 40 inches—light yellowish brown fine sandy  
 loam

*Upper part of substratum:*  
 40 to 51 inches—light yellowish brown fine sandy  
 loam

*Lower part of substratum:*  
 51 to 60 inches—light yellowish brown loamy fine  
 sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight or  
 moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Ewall soils
- Conconully soils
- Timentwa soils
- Nespelem soils

### Major Uses

Livestock grazing, nonirrigated and irrigated  
 cropland, nonirrigated and irrigated hay and  
 pasture, watershed, wildlife habitat, recreation,  
 and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of  
 trenches for conventional pipeline installation.
- This soil is too permeable for successful pond  
 installation unless special liners or sealants are used  
 to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by  
 steepness of slope and wind erosion.

### 352—Picard very fine sandy loam, 8 to 30 percent slopes

#### Composition

*Picard soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glaciofluvial material mixed with loess

*Slope range:* 8 to 30 percent

*Elevation:* 1,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

#### Typical Profile

*Upper part of surface layer:*

0 to 5 inches—grayish brown very fine sandy loam

*Lower part of surface layer:*

5 to 16 inches—brown fine sandy loam

*Subsoil:*

16 to 40 inches—light yellowish brown fine sandy loam

*Upper part of substratum:*

40 to 51 inches—light yellowish brown fine sandy loam

*Lower part of substratum:*

51 to 60 inches—light yellowish brown loamy fine sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Severe

#### Contrasting Inclusions

- Ewall soils
- Conconully soils
- Timentwa soils
- Nespelem soils

#### Major Uses

Livestock grazing, nonirrigated cropland, watershed, wildlife habitat and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind and water erosion.

### 353—Pits, sand and gravel

This map unit consists of open excavations from which soil material and underlying sand and gravel have been removed. The unit is used mainly as a source of sand and gravel for roadfill and for construction material such as concrete. It typically is barren or has very sparse vegetation.

### 354—Pogue fine sandy loam, 0 to 5 percent slopes

#### Composition

*Pogue soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 0 to 5 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

#### Typical Profile

*Surface layer:*

0 to 8 inches—brown fine sandy loam

*Upper part of subsoil:*

8 to 14 inches—pale brown fine sandy loam

*Lower part of subsoil:*

14 to 22 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

22 to 29 inches—light brownish gray very gravelly loamy coarse sand

*Lower part of substratum:*  
29 to 60 inches—multicolored very gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Skaha soils
- Quincy soils
- Peshastin soils
- Malott soils
- Cashmere and Cashmont soils
- Soils that have a stony or very stony surface

### Major Uses

Livestock grazing, irrigated and nonirrigated cropland, irrigated hay and pasture, irrigated orchards, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by wind erosion and droughtiness.

## 355—Pogue fine sandy loam, 5 to 10 percent slopes

### Composition

*Pogue soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces  
*Parent material:* Glacial outwash mixed with loess in the upper part  
*Slope range:* 5 to 10 percent

*Elevation:* 800 to 2,000 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
0 to 8 inches—brown fine sandy loam  
*Upper part of subsoil:*  
8 to 14 inches—pale brown fine sandy loam  
*Lower part of subsoil:*  
14 to 22 inches—pale brown gravelly sandy loam  
*Upper part of substratum:*  
22 to 29 inches—light brownish gray very gravelly loamy coarse sand  
*Lower part of substratum:*  
29 to 60 inches—multicolored very gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Skaha soils
- Quincy soils
- Peshastin soils
- Malott soils
- Cashmere and Cashmont soils
- Soils that have a stony or very stony surface

### Major Uses

Livestock grazing, irrigated cropland, irrigated hay and pasture, irrigated orchards, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, wind erosion, and droughtiness.

**356—Pogue fine sandy loam, 10 to 25 percent slopes****Composition**

*Pogue soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 10 to 25 percent

*Elevation:* 800 to 2,000 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

**Typical Profile**

*Surface layer:*

0 to 8 inches—brown fine sandy loam

*Upper part of subsoil:*

8 to 14 inches—pale brown fine sandy loam

*Lower part of subsoil:*

14 to 22 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

22 to 29 inches—light brownish gray very gravelly loamy coarse sand

*Lower part of substratum:*

29 to 60 inches—multicolored very gravelly sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

**Contrasting Inclusions**

- Skaha soils
- Quincy and Winchester soils
- Peshastin soils
- Malott soils

- Cashmere and Cashmont soils
- Soils that have a stony or very stony surface

**Major Uses**

Livestock grazing, irrigated hay and pasture, irrigated orchards, recreation, watershed, and wildlife habitat

**Use and Management****Livestock grazing**

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

**Irrigated cropland**

- If the soil in this unit is used for irrigated crops, it is limited by steepness of slope, water and wind erosion, and droughtiness.

**357—Pogue gravelly fine sandy loam, 0 to 10 percent slopes****Composition**

*Pogue soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Terraces

*Parent material:* Glacial outwash mixed with loess in the upper part

*Slope range:* 0 to 10 percent

*Elevation:* 800 to 1,500 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

**Typical Profile**

*Surface layer:*

0 to 12 inches—grayish brown gravelly fine sandy loam

*Subsoil:*

12 to 29 inches—light brownish gray gravelly fine sandy loam

*Substratum:*

29 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium  
*Hazard of water erosion:* Cropland—slight;  
 rangeland—slight  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Skaha soils
- Quincy and Winchester soils
- Peshastin soils
- Malott soils
- Cashmere and Cashmont soils
- Soils that have a cobbly, stony, or very stony surface

### Major Uses

Livestock grazing, irrigated hay and pasture, irrigated orchards, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

### 358—Pogue stony fine sandy loam, 0 to 25 percent slopes

#### Composition

*Pogue soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces and terrace escarpments  
*Parent material:* Glacial outwash mixed with loess in the upper part  
*Slope range:* 0 to 25 percent  
*Elevation:* 800 to 2,000 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*  
 0 to 7 inches—brown stony fine sandy loam  
*Subsoil:*  
 7 to 21 inches—pale brown gravelly fine sandy loam  
*Substratum:*  
 21 to 60 inches—multicolored very gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Skaha soils
- Quincy and Winchester soils
- Peshastin soils
- Malott soils
- Cashmere and Cashmont soils

### Major Uses

Building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and droughtiness.

### 359—Pogue stony fine sandy loam, 25 to 65 percent slopes

#### Composition

*Pogue soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash mixed with loess in the upper part  
*Slope range:* 25 to 65 percent  
*Elevation:* 800 to 2,000 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*  
 0 to 7 inches—brown stony fine sandy loam

*Subsoil:*  
 7 to 21 inches—pale brown gravelly fine sandy loam

*Substratum:*  
 21 to 60 inches—multicolored very gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Rangeland—moderate or severe  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Skaha soils
- Quincy and Winchester soils
- Peshastin soils
- Malott soils
- Cashmere and Cashmont soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 360—Poween loam, 0 to 5 percent slopes

### Composition

*Poween soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Stream terraces and alluvial fans  
*Parent material:* Calcareous alluvium  
*Slope range:* 0 to 5 percent  
*Elevation:* 1,600 to 2,600 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

### Typical Profile

*Upper part of surface layer:*  
 0 to 12 inches—very dark gray loam

*Lower part of surface layer:*  
 12 to 30 inches—dark grayish brown, calcareous sandy loam

*Upper part of substratum:*  
 30 to 44 inches—grayish brown, calcareous sandy loam

*Lower part of substratum:*  
 44 to 60 inches—light brownish gray, calcareous loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Moderately well drained  
*Permeability:* Moderate  
*Available water capacity:* High  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight; rangeland—slight  
*Hazard of wind erosion (bare surface):* Moderate  
*Water table:* Present in February through May (see “Water Features” table)  
*Frequency of flooding:* Rare  
*Salinity:* Very slightly saline

### Contrasting Inclusions

- Bossburg soils
- Emdent soils
- Nespelem soils

### Major Uses

Livestock grazing, nonirrigated hay and pasture, watershed, wildlife habitat, and recreation

## Use and Management

### Livestock grazing

- This soil has a high water table at certain times of the year that limits use of the soil.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by water erosion.

## 361—Quincy sand, 8 to 50 percent slopes, eroded

### Composition

*Quincy soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Dunes  
*Parent material:* Eolian sand and glacial outwash sand  
*Slope range:* 8 to 50 percent  
*Elevation:* 800 to 1,300 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 1 inch—pale brown sand

*Upper part of substratum:*

1 inch to 12 inches—light yellowish brown sand

*Lower part of substratum:*

12 to 60 inches—pale yellow sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Very severe

### Contrasting Inclusions

- Skaha soils
- Pogue soils
- Cashmere and Cashmont soils
- Aeneas soils

## Major Uses

Livestock grazing, recreation, watershed, wildlife habitat, and building site development

### Use and Management

### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 362—Quincy fine sand, 25 to 60 percent slopes

### Composition

*Quincy soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash sand and eolian sand  
*Slope range:* 25 to 60 percent  
*Elevation:* 800 to 1,600 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 5 inches—brown fine sand

*Substratum:*

5 to 60 inches—pale brown fine sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Very severe

### Contrasting Inclusions

- Skaha soils
- Pogue soils

- Couleedam and Soaplake soils
- Aeneas soils
- Cashmere soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas.
- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### 363—Quincy loamy sand, fan, 2 to 10 percent slopes

#### Composition

*Quincy soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Alluvial fans

*Parent material:* Sandy alluvium and glacial outwash sand

*Slope range:* 2 to 10 percent

*Elevation:* 850 to 1,100 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

#### Typical Profile

*Surface layer:*

0 to 12 inches—brown loamy sand

*Upper part of substratum:*

12 to 40 inches—yellowish brown and light yellowish brown sand

*Middle part of substratum:*

40 to 49 inches—pale brown gravelly coarse sand

*Lower part of substratum:*

49 to 60 inches—very pale brown sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight;

rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Skaha soils
- Pogue soils
- Aeneas soils
- Cashmere, Cashmont, and Okanogan soils

### Major Uses

Livestock grazing, irrigated hay and pasture, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration.

### 364—Quincy loamy fine sand, 0 to 10 percent slopes

#### Composition

*Quincy soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash sand and eolian sand

*Slope range:* 0 to 10 percent

*Elevation:* 800 to 1,600 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

#### Typical Profile

*Surface layer:*

0 to 5 inches—grayish brown loamy fine sand

*Upper part of substratum:*

5 to 28 inches—brown loamy fine sand

*Middle part of substratum:*

28 to 52 inches—pale brown and light brownish gray, calcareous loamy sand

*Lower part of substratum:*

52 to 60 inches—multicolored, calcareous coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Skaha soils
- Pogue soils
- Monse soils
- Aeneas soils
- Cashmere and Cashmont soils

### Major Uses

Livestock grazing, irrigated hay and pasture (fig. 12), irrigated orchards, irrigated cropland, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration.

## 365—Quincy loamy fine sand, 0 to 10 percent slopes, eroded

### Composition

*Quincy soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces and dunes

*Parent material:* Glacial outwash sand and eolian sand

*Slope range:* 0 to 10 percent

*Elevation:* 800 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 1 inch—grayish brown loamy fine sand

*Upper part of substratum:*

1 inch to 28 inches—brown loamy fine sand

*Middle part of substratum:*

28 to 52 inches—pale brown and light brownish gray, calcareous loamy sand

*Lower part of substratum:*

52 to 60 inches—multicolored, calcareous coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—moderate

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Skaha soils
- Pogue soils
- Monse soils that are moderately well drained and are silt loam and silty clay loam throughout
- Aeneas soils
- Cashmere and Cashmont soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

Figure 12.—Irrigated alfalfa in an area of Quincy loamy fine sand, 0 to 10 percent slopes, in foreground. Pogue and Skaha soils are on higher terraces in background, and Malott and Couleedam soils are on hills and plateaus.

### 366—Quincy loamy fine sand, 10 to 25 percent slopes

#### Composition

*Quincy soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Outwash terraces, terrace escarpments, and dunes  
*Parent material:* Glacial outwash sand and eolian sand  
*Slope range:* 10 to 25 percent  
*Elevation:* 800 to 1,600 feet  
*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

#### Typical Profile

*Surface layer:*  
 0 to 5 inches—grayish brown loamy fine sand  
*Upper part of substratum:*  
 5 to 28 inches—brown loamy fine sand  
*Middle part of substratum:*  
 28 to 52 inches—pale brown and light brownish gray, calcareous loamy sand  
*Lower part of substratum:*  
 52 to 60 inches—multicolored, calcareous coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium  
*Hazard of water erosion:* Cropland—moderate; rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Skaha soils
- Pogue soils
- Ellisforde soils
- Aeneas soils
- Cashmere and Cashmont soils

### Major Uses

Livestock grazing, recreation, watershed, wildlife habitat, irrigated orchards, and irrigated hay and pasture

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If the soil in this unit is used for irrigated crops, it is limited by steepness of slope, droughtiness, fast infiltration, and water erosion.

### 367—Quincy-Aeneas complex, 3 to 15 percent slopes

#### Composition

*Quincy soil and similar soils:* 55 percent  
*Aeneas soil and similar soils:* 35 percent  
*Contrasting inclusions:* 10 percent

#### Setting

*Position on landscape:* Quincy—undulating dunes; Aeneas—depressions between dunes  
*Parent material:* Quincy—glacial outwash sand;

Aeneas—wind-reworked glacial outwash mixed with loess in the upper part  
*Slope range:* Quincy—3 to 15 percent; Aeneas—3 to 8 percent  
*Elevation:* 1,500 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

#### Quincy

*Surface layer:*  
 0 to 7 inches—brown loamy sand  
*Upper part of substratum:*  
 7 to 17 inches—yellowish brown loamy fine sand  
*Lower part of substratum:*  
 17 to 60 inches—light yellowish brown and light olive brown fine sand

#### Aeneas

*Surface layer:*  
 0 to 10 inches—grayish brown fine sandy loam  
*Subsoil:*  
 10 to 27 inches—pale brown fine sandy loam  
*Substratum:*  
 27 to 60 inches—light brownish gray and multicolored sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Quincy—excessively drained; Aeneas—well drained  
*Permeability:* Quincy—rapid; Aeneas—moderately rapid  
*Available water capacity:* Quincy—moderate; Aeneas—moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion (Quincy):* Cropland—slight; rangeland—slight  
*Hazard of water erosion (Aeneas):* Cropland—moderate; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Farrell soils
- Soils that are underlain by calcareous silt loam glacial lake sediment at a depth of about 35 inches
- Cashmere soils

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

## Use and Management

### Livestock grazing

- This unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration in the Quincy soil and by water erosion on the Aeneas soil.

## 368—Raisio channery loam, dry, 40 to 65 percent slopes

### Composition

*Raisio soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains

*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 1,900 to 4,700 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 5 inches—grayish brown channery loam

*Lower part of surface layer:*

5 to 12 inches—grayish brown very channery loam

*Subsoil:*

12 to 28 inches—grayish brown very channery loam

*Bedrock:*

28 to 32 inches—phyllite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe

### Contrasting Inclusions

- Rufus soils
- Oxerine soils
- Dehart soils
- Rock outcrop
- Rubble land

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

## 369—Raisio, dry-Rock outcrop complex, 20 to 40 percent slopes

### Composition

*Raisio soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes, shoulders, and ridges of hills and mountains

*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 2,100 to 4,000 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

## Raisio Soil

### Typical profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*  
0 to 5 inches—grayish brown channery loam

*Lower part of surface layer:*  
5 to 12 inches—grayish brown very channery loam

*Subsoil:*  
12 to 28 inches—grayish brown very channery loam

*Bedrock:*  
28 to 32 inches—phyllite

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate

### Rock Outcrop

*Kind of rock:* Phyllite, schist, slate, graywacke, and quartzite

### Contrasting Inclusions

- Rufus soils
- Oxerine soils
- Donovan soils
- Elbowlake soils
- Apex soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

## 370—Raisio-Rufus channery loams complex, 8 to 30 percent slopes

### Composition

*Raisio soil and similar soils:* 45 percent

*Rufus soil and similar soils:* 35 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Shoulders, ridges, and backslopes of mountains

*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess

*Slope range:* 8 to 30 percent

*Elevation:* 2,100 to 4,400 feet

*Average annual precipitation:* 19 to 22 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

#### Raisio

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 8 inches—grayish brown channery loam

*Subsoil:*  
8 to 14 inches—brown very channery loam

*Substratum:*  
14 to 24 inches—light brownish gray very channery loam

*Bedrock:*  
24 to 28 inches—phyllite

#### Rufus

*Upper part of surface layer:*  
0 to 7 inches—dark brown channery loam

*Lower part of surface layer:*  
7 to 12 inches—brown very channery loam

*Subsoil:*  
12 to 14 inches—pale brown extremely channery sandy loam

*Bedrock:*  
14 to 18 inches—schist

### Soil Properties and Qualities

*Depth class:* Raisio soil—moderately deep (20 to 40 inches to bedrock); Rufus—shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Very low  
*Potential rooting depth:* Raisio—20 to 40 inches;  
 Rufus—10 to 20 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Forestland—slight or moderate

### Contrasting Inclusions

- Oxerine soils
- Wells creek and Wilmont soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically  
*Limitations for planting:* Raisio—rock fragments in the soil; Rufus—depth to bedrock and rock fragments in the soil

### 371—Raisio-Rufus channery loams complex, 30 to 65 percent slopes

#### Composition

*Raisio soil and similar soils:* 45 percent  
*Rufus soil and similar soils:* 35 percent  
*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Backslopes of mountains  
*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess  
*Slope range:* 30 to 65 percent  
*Elevation:* 2,100 to 4,400 feet  
*Average annual precipitation:* 19 to 22 inches

*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

#### Raisio

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 8 inches—grayish brown channery loam

*Subsoil:*  
 8 to 14 inches—brown very channery loam

*Substratum:*  
 14 to 24 inches—light brownish gray very channery loam

*Bedrock:*  
 24 to 28 inches—phyllite

#### Rufus

*Upper part of surface layer:*  
 0 to 7 inches—dark brown channery loam

*Lower part of surface layer:*  
 7 to 12 inches—brown very channery loam

*Subsoil:*  
 12 to 14 inches—pale brown extremely channery sandy loam

*Bedrock:*  
 14 to 18 inches—schist

### Soil Properties and Qualities

*Depth class:* Raisio—moderately deep (20 to 40 inches to bedrock); Rufus—shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Very low  
*Potential rooting depth:* Raisio—20 to 40 inches;  
 Rufus—10 to 20 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Severe or very severe

### Contrasting Inclusions

- Oxerine soils
- Wells creek and Wilmont soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* Raisio—rock fragments in the soil and steepness of slope; Rufus—depth to bedrock, rock fragments in the soil, and steepness of slope

### 372—Raisio, dry-Rufus channery loams complex, 30 to 65 percent slopes

#### Composition

*Raisio soil and similar soils:* 60 percent

*Rufus soil and similar soils:* 30 percent

*Contrasting inclusions:* 10 percent

#### Setting

*Position on landscape:* Raisio—backslopes and shoulders of mountains; Rufus—ridges and shoulders of mountains

*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess

*Slope range:* 30 to 65 percent

*Elevation:* 1,900 to 4,700 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

##### Raisio

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 5 inches—grayish brown channery loam

*Lower part of surface layer:*

5 to 12 inches—grayish brown very channery loam

*Subsoil:*

12 to 28 inches—grayish brown very channery loam

*Bedrock:*

28 to 32 inches—phyllite

##### Rufus

*Upper part of surface layer:*

0 to 5 inches—dark brown channery loam

*Lower part of surface layer:*

5 to 15 inches—dark brown very channery sandy loam

*Bedrock:*

15 to 19 inches—schist

#### Soil Properties and Qualities

*Depth class:* Raisio—moderately deep (20 to 40 inches to bedrock); Rufus—shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* Raisio—20 to 40 inches; Rufus—10 to 20 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Moderate or severe

#### Contrasting Inclusions

- Donovan and Stevens soils
- Oxerine soils
- Dehart soils
- Rock outcrop
- Rubble land

#### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### Use and Management

##### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 373—Raisio, dry-Rufus-Rock outcrop complex, 30 to 65 percent slopes

#### Composition

*Raisio soil and similar soils:* 40 percent

*Rufus soil and similar soils:* 25 percent

*Rock outcrop:* 15 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains  
*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess  
*Slope range:* 30 to 65 percent  
*Elevation:* 2,500 to 4,000 feet  
*Average annual precipitation:* 15 to 20 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Raisio Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick  
*Upper part of surface layer:*  
 0 to 5 inches—grayish brown channery loam  
*Lower part of surface layer:*  
 5 to 12 inches—grayish brown very channery loam  
*Subsoil:*  
 12 to 28 inches—grayish brown very channery loam  
*Bedrock:*  
 28 to 32 inches—phyllite

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Very low  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Moderate or severe

### Rufus Soil

#### Typical profile

*Upper part of surface layer:*  
 0 to 5 inches—dark brown channery loam  
*Lower part of surface layer:*  
 5 to 15 inches—dark brown very channery loam  
*Bedrock:*  
 15 to 19 inches—schist

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Very low  
*Potential rooting depth:* 10 to 20 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Moderate or severe

### Rock Outcrop

*Kind of rock:* Schist and phyllite

### Contrasting Inclusions

- Oxerine soils
- Donavan soils
- Elbowlake soils
- Apex soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 374—Raisio, warm-Rufus channery loams complex, 8 to 30 percent slopes

#### Composition

*Raisio soil and similar soils:* 45 percent  
*Rufus soil and similar soils:* 35 percent  
*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains  
*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess  
*Slope range:* 8 to 30 percent  
*Elevation:* 2,100 to 4,000 feet  
*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

#### Raisio

*Surface layer:*  
 0 to 11 inches—yellowish brown channery loam

*Subsoil:*  
 11 to 24 inches—light yellowish brown very channery loam

*Bedrock:*  
 24 to 28 inches—schist

#### Rufus

*Surface layer:*  
 0 to 12 inches—brown channery loam

*Subsoil:*  
 12 to 16 inches—pale brown very channery loam

*Bedrock:*  
 16 to 20 inches—quartzitic rock

### Soil Properties and Qualities

*Depth class:* Raisio—moderately deep (20 to 40 inches to bedrock); Rufus—shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* Raisio—20 to 40 inches;  
 Rufus—10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Slight or moderate

### Contrasting Inclusions

- Borgeau soils
- Donovan soils
- Apex soils
- Dehart soils
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction.
- The soils in this unit are too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

## 375—Raisio, warm-Rufus channery loams complex, 30 to 65 percent slopes

### Composition

*Raisio soil and similar soils:* 45 percent

*Rufus soil and similar soils:* 35 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess

*Slope range:* 30 to 65 percent

*Elevation:* 2,100 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

#### Raisio

*Surface layer:*  
 0 to 11 inches—yellowish brown channery loam

*Subsoil:*  
 11 to 24 inches—light yellowish brown very channery loam

*Bedrock:*  
 24 to 28 inches—schist

#### Rufus

*Surface layer:*  
 0 to 12 inches—brown channery loam

*Subsoil:*  
 12 to 16 inches—pale brown very channery loam

*Bedrock:*  
 16 to 20 inches—quartzitic rock

### Soil Properties and Qualities

*Depth class:* Raisio—moderately deep (20 to 40 inches to bedrock); Rufus—shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* Raisio—20 to 40 inches;  
 Rufus—10 to 20 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Moderate or severe

### Contrasting Inclusions

- Borgeau soils

- Donavan soils
- Apex soils
- Dehart soils
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This unit is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

## 376—Ralsen silt loam, 0 to 3 percent slopes

### Composition

*Ralsen soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Flood plains and low stream terraces

*Parent material:* Alluvium

*Slope range:* 0 to 3 percent

*Elevation:* 1,700 to 2,600 feet

*Average annual precipitation:* 14 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*

0 to 11 inches—dark grayish brown silt loam

*Upper part of substratum:*

11 to 26 inches—mottled, light gray sandy loam and fine sandy loam

*Middle part of substratum:*

26 to 42 inches—mottled, white fine sandy loam

*Lower part of substratum:*

42 to 60 inches—brown gravelly coarse sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Poorly drained

*Permeability:* Moderate

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—none or slight; forestland—none

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through August (see “Water Features” table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in March through May

### Contrasting Inclusions

- Narcisse soils
- Bossburg soils
- Aquic Xerofluvents

### Major Uses

Timber production and livestock grazing

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable during periods when the soil is dry; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Quaking aspen and thinleaf alder—readily; paper birch, willow, black cottonwood, Douglas-fir, and ponderosa pine—periodically

*Limitation for planting:* Seasonal high water table

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by flooding and wetness.

## 377—Ratlake silty clay loam, 0 to 2 percent slopes

### Composition

*Ratlake soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Closed depressions on valley flats

*Parent material:* Glacial lake sediment with some recent alluvium

*Slope range:* 0 to 2 percent

*Elevation:* 1,100 to 1,350 feet  
*Average annual precipitation:* 9 to 11 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
 0 to 2 inches—light gray, calcareous silty clay loam

*Subsoil:*  
 2 to 18 inches—gray, calcareous silty clay loam

*Substratum:*  
 18 to 22 inches—light gray hardpan

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to a hardpan)  
*Drainage class:* Poorly drained  
*Permeability:* Moderately slow  
*Available water capacity:* Very low  
*Potential rooting depth:* 10 to 20 inches  
*Runoff:* Ponded for brief periods during March through May  
*Hazard of water erosion:* Rangeland—none  
*Hazard of wind erosion (bare surface):* Moderate  
*Water table:* Present in January through July (see “Water Features” table)  
*Salinity:* Strongly saline

### Contrasting Inclusions

- Gooseflats soils
- Soils that have a cemented hardpan at a depth of 20 to 40 inches

### Major Uses

Wetland wildlife habitat and livestock grazing

### Use and Management

#### Livestock grazing

- This soil is affected by salt. If the range is in poor condition, salts concentrate on the bare surface as a result of evaporation. Reseeding is very difficult, and only salt-tolerant species should be used.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by rooting depth, wetness, and excess salts.

## 378—Reardan silt loam, 0 to 8 percent slopes

### Composition

*Reardan soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Plateaus and broad summits of hills

*Parent material:* Loess

*Slope range:* 0 to 8 percent

*Elevation:* 2,500 to 2,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
 0 to 11 inches—grayish brown silt loam

*Subsurface layer:*  
 11 to 22 inches—pale brown silt loam

*Upper part of subsoil:*  
 22 to 38 inches—brown and pale brown silty clay loam

*Middle part of subsoil:*  
 38 to 51 inches—brown silty clay

*Lower part of subsoil:*  
 51 to 60 inches—light brown, calcareous silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Slow  
*Available water capacity:* Very high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Anders soils
- Geogecreek soils
- Broadax soils

### Major Uses

Timber production and grazeable woodland

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* High clay content

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by slow permeability, steepness of slope, and water erosion.

**379—Reardan silt loam, 8 to 15 percent slopes****Composition**

*Reardan soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Plateaus and broad summits of hills

*Parent material:* Loess

*Slope range:* 8 to 15 percent

*Elevation:* 2,500 to 2,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 11 inches—grayish brown silt loam

*Subsurface layer:*

11 to 22 inches—pale brown silt loam

*Upper part of subsoil:*

22 to 38 inches—brown and pale brown silty clay loam

*Middle part of subsoil:*

38 to 51 inches—brown silty clay

*Lower part of subsoil:*

51 to 60 inches—light brown, calcareous silty clay loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate; forestland—moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Anders soils
- Georgecreek soils
- Broadax soils

**Major Uses**

Timber production and grazeable woodland

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* High clay content

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, slow permeability, and water erosion.

**380—Rebecca fine sandy loam, 0 to 5 percent slopes****Composition**

*Rebecca soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

**Setting**

*Position on landscape:* Alluvial fans

*Parent material:* Alluvium

*Slope range:* 0 to 5 percent

*Elevation:* 1,200 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Typical Profile**

*Upper part of surface layer:*

0 to 6 inches—gray fine sandy loam

*Lower part of surface layer:*

6 to 16 inches—grayish brown fine sandy loam

*Subsoil:*

16 to 36 inches—light brownish gray gravelly fine sandy loam

*Substratum:*

36 to 60 inches—light brownish gray and gray gravelly fine sandy loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

**Contrasting Inclusions**

- Haley soils
- Ewall soils
- Narcisse soils
- Conconully soils

**Major Uses**

Livestock grazing, nonirrigated cropland, nonirrigated and irrigated hay and pasture, building site development, watershed, wildlife habitat, and recreation

**Use and Management****Livestock grazing**

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

**381—Rebecca gravelly sandy loam, 3 to 15 percent slopes****Composition**

*Rebecca soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Alluvial fans

*Parent material:* Alluvium

*Slope range:* 3 to 15 percent

*Elevation:* 1,200 to 2,600 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Typical Profile***Surface layer:*

0 to 15 inches—dark grayish brown and brown gravelly sandy loam

*Subsoil:*

15 to 45 inches—pale brown and light yellowish brown gravelly sandy loam

*Substratum:*

45 to 60 inches—light yellowish brown gravelly coarse sandy loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Moderate

**Contrasting Inclusions**

- Soils that are very gravelly below a depth of about 15 inches
- Cumulic Haploxerolls
- Hobohill soils
- Conconully soils

**Major Uses**

Livestock grazing, wildlife habitat, watershed, nonirrigated hay and pasture, and recreation

**Use and Management****Livestock grazing**

- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope.

**382—Renha silt loam, 5 to 20 percent slopes****Composition**

*Renha soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Benches, shoulders, and footslopes of hills and mountains

*Parent material:* Mantle of volcanic ash and loess over residuum and colluvium derived from limestone, marble, and dolomite

*Slope range:* 5 to 20 percent

*Elevation:* 2,300 to 3,800 feet

*Average annual precipitation:* 20 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 2 inches—grayish brown silt loam

*Upper part of subsoil:*

2 to 7 inches—pale brown silt loam

*Subsurface layer:*

7 to 11 inches—very pale brown and light yellowish brown silt loam

*Middle part of subsoil:*

11 to 22 inches—reddish brown clay

*Lower part of subsoil:*

22 to 28 inches—reddish brown and reddish yellow gravelly clay loam

*Substratum:*

28 to 32 inches—limestone

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Moderately high

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate

### Contrasting Inclusions

- Friedlander soils
- Soils that are 10 to 20 inches deep to limestone
- Soils that have less clay in the subsoil
- Oxerine soils, limestone substratum

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 383—Renha silt loam, 20 to 40 percent slopes

### Composition

*Renha soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders and footslopes of hills and mountains

*Parent material:* Mantle of volcanic ash and loess over residuum and colluvium derived from limestone, marble, and dolomite

*Slope range:* 20 to 40 percent

*Elevation:* 2,800 to 3,800 feet

*Average annual precipitation:* 20 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 2 inches—grayish brown silt loam

*Upper part of subsoil:*

2 to 7 inches—pale brown silt loam

*Subsurface layer:*

7 to 11 inches—very pale brown and light yellowish brown silt loam

*Middle part of subsoil:*

11 to 22 inches—reddish brown clay

*Lower part of subsoil:*

22 to 28 inches—reddish brown and reddish yellow gravelly clay loam

*Substratum:*  
28 to 32 inches—limestone

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Moderately high  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Friedlander soils
- Soils that are 10 to 20 inches deep to limestone
- Soils that have less clay in the subsoil
- Oxerine soils, limestone substratum

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch and lodgepole pine—periodically

*Limitations for planting:* None

## 384—Renha, warm-Oxerine silt loams complex, 20 to 40 percent slopes

### Composition

*Renha soil and similar soils:* 45 percent  
*Oxerine soil and similar soils:* 40 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders, backslopes, and footslopes of mountains  
*Parent material:* Mantle of volcanic ash and loess over

residuum and colluvium derived from limestone, marble, and dolomite

*Slope range:* 20 to 40 percent

*Elevation:* 2,300 to 3,800 feet

*Average annual precipitation:* 20 to 22 inches

*Average annual air temperature:* 43 to 45 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

#### Renha

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 2 inches—grayish brown silt loam

*Upper part of subsoil:*

2 to 7 inches—pale brown silt loam

*Subsurface layer:*

7 to 11 inches—very pale brown and light yellowish brown silt loam

*Middle part of subsoil:*

11 to 22 inches—reddish brown clay

*Lower part of subsoil:*

22 to 28 inches—reddish brown and reddish yellow gravelly clay loam

*Bedrock:*

28 to 32 inches—limestone

#### Oxerine

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 2 inches—grayish brown silt loam

*Upper part of subsoil:*

2 to 9 inches—pale brown silt loam

*Middle part of subsoil:*

9 to 14 inches—yellowish brown channery silt loam

*Lower part of subsoil:*

14 to 24 inches—pale brown very channery fine sandy loam

*Substratum:*

24 to 27 inches—light gray very channery fine sandy loam

*Bedrock:*

27 to 31 inches—limestone

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Renha—moderately slow; Oxerine—moderate  
*Available water capacity:* Renha—moderately high; Oxerine—low  
*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—severe; cropland—severe or very severe

### Contrasting Inclusions

- Soils that are 10 to 20 inches deep to limestone
- Henneway and Friedlander soils
- Soils that have less clay in the subsoil
- Soils that have a stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* Renha—high clay content; Oxerine—none

## 385—Republic loam, 3 to 15 percent slopes

### Composition

*Republic soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Alluvial fans and toeslopes of hills and mountains

*Parent material:* Alluvium and glacial till mixed with a component of loess and volcanic ash

*Slope range:* 3 to 15 percent

*Elevation:* 1,700 to 3,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*  
0 to 5 inches—grayish brown loam

*Lower part of surface layer:*  
5 to 11 inches—grayish brown gravelly loam

*Subsoil:*  
11 to 16 inches—brown gravelly loam

*Upper part of substratum:*  
16 to 38 inches—brown gravelly sandy loam

*Lower part of substratum:*  
38 to 60 inches—very pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Apex soils
- Scoap soils
- Donovan and Stevens soils
- Goldlake and Lostcreek soils
- Stapaloo soils

### Major Uses

Timber production, livestock grazing (fig. 13), wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily

*Limitations for planting:* None

Figure 13.—Cattle grazing on winter wheat in an area of Republic loam, 3 to 15 percent slopes. Mineral soils are on hills in background.

#### **Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

#### **386—Republic loam, 15 to 30 percent slopes**

##### **Composition**

*Republic soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

##### **Setting**

*Position on landscape:* Footslopes and backslopes of hills and mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash  
*Slope range:* 15 to 30 percent  
*Elevation:* 1,700 to 3,500 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

##### **Typical Profile**

*Organic mat on surface:* 1 inch thick  
*Upper part of surface layer:*  
0 to 5 inches—grayish brown loam  
*Lower part of surface layer:*  
5 to 11 inches—grayish brown gravelly loam

*Subsoil:*

11 to 16 inches—brown gravelly loam

*Upper part of substratum:*

16 to 38 inches—brown gravelly sandy loam

*Lower part of substratum:*

38 to 60 inches—very pale brown very gravelly sandy loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Apex soils
- Scoap soils
- Donovan and Stevens soils
- Goldlake and Lostcreek soils
- Stapaloo soils

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**387—Republic loam, 30 to 65 percent slopes****Composition**

*Republic soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Shoulders and backslopes of mountains

*Parent material:* Glacial till mixed with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 1,700 to 3,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 5 inches—grayish brown loam

*Lower part of surface layer:*

5 to 11 inches—grayish brown gravelly loam

*Subsoil:*

11 to 16 inches—brown gravelly loam

*Upper part of substratum:*

16 to 38 inches—brown gravelly sandy loam

*Lower part of substratum:*

38 to 60 inches—very pale brown very gravelly sandy loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

**Contrasting Inclusions**

- Apex soils
- Scoap soils
- Inkler soils
- Donovan soils
- Stapaloo soils
- Soils that have a very stony surface

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily

*Limitation for planting:* Steepness of slope

## 388—Resner loam, 0 to 20 percent slopes

### Composition

*Resner soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Outwash terraces and toeslopes of mountains

*Parent material:* Volcanic ash over glacial outwash and ablation till derived from granitic rock

*Slope range:* 0 to 20 percent

*Elevation:* 3,500 to 5,200 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 5 inches—yellowish brown loam

*Subsoil:*

5 to 17 inches—light yellowish brown loam

*Upper part of substratum:*

17 to 34 inches—white very gravelly loamy sand

*Lower part of substratum:*

34 to 60 inches—white extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—slight or moderate

### Contrasting Inclusions

- Nevine and Stepstone soils
- Andic Cryaquepts and Cryofluvents
- Tunkcreek soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Western larch, Douglas-fir, lodgepole pine, and subalpine fir—readily

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and water erosion.

## 389—Resner loam, 20 to 40 percent slopes

### Composition

*Resner soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Foothills of mountains and outwash terrace escarpments

*Parent material:* Volcanic ash over glacial outwash and ablation till derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 3,500 to 5,200 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 5 inches—yellowish brown loam

*Subsoil:*

5 to 17 inches—light yellowish brown loam

*Upper part of substratum:*

17 to 34 inches—white very gravelly loamy sand

*Lower part of substratum:*

34 to 60 inches—white extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Nevine and Stepstone soils
- Buhrig soils
- Tunkcreek soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Western larch, Douglas-fir, lodgepole pine, and subalpine fir—readily

*Limitations for planting:* None

## 390—Ret silt loam, 0 to 3 percent slopes

### Composition

*Ret soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Flood plains and low stream terraces

*Parent material:* Recent alluvium

*Slope range:* 0 to 3 percent

*Elevation:* 1,600 to 3,800 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Upper part of surface layer:*

0 to 8 inches—very dark gray silt loam

*Lower part of surface layer:*

8 to 22 inches—very dark grayish brown and dark grayish brown loam

*Subsoil:*

22 to 30 inches—pale brown sandy loam

*Substratum:*

30 to 60 inches—mottled, pale brown and very pale brown loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat poorly drained

*Permeability:* Moderate over rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in December through July (see “Water Features” table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in February through May

### Contrasting Inclusions

- Sanpoil soils
- Boesel and Cubcreek soils
- Aquic Xerofluvents
- Narcisse soils

### Major Uses

Livestock grazing, nonirrigated hay and pasture, timber production, wildlife habitat, and watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir and western larch—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by wetness.

**391—Riverwash**

This map unit consists of nearly level bars of recently deposited sand and gravel on flood plains of perennial and intermittent streams. This unit is subject to frequent periods of flooding in October through July that remove and redeposit the material. A water table is at the surface to a depth of 24 inches throughout the year. This unit is dominantly barren, but some areas support a sparse cover of deciduous trees, shrubs, and forbs.

**392—Rock outcrop**

This map unit consists of areas where exposed bedrock covers 90 percent of the surface or more. It is mainly on ridges, shoulders, and backslopes of hills and mountains. Slopes range from 5 to 100 percent or more. Most of the outcroppings are hard, but some are soft and highly weathered.

Included in this unit are small areas of shallow and very shallow soils that support a sparse cover of grasses, shrubs, and forbs. Scattered coniferous trees are in crevices in the rock, where moisture and small amounts of soil have accumulated.

**393—Rock outcrop-Chumstick complex, 20 to 65 percent slopes****Composition**

*Rock outcrop:* 55 percent

*Chumstick soil and similar soils:* 30 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Shoulders and backslopes of mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with volcanic ash and loess

*Slope range:* 20 to 65 percent

*Elevation:* 3,500 to 5,000 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Chumstick—boulders and stones cover 15 to 50 percent

**Rock Outcrop**

*Kind of rock:* Granitic rock

**Chumstick Soil****Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—grayish brown extremely bouldery loam

*Subsoil:*

5 to 12 inches—brown very cobbly sandy loam

*Bedrock:*

12 to 16 inches—granitic rock

**Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 4 to 10 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

**Contrasting Inclusions**

- Mineral and Capoose soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Merkel soils
- Rubble land

**Major Uses**

Wildlife habitat, watershed, recreation, limited timber production, and limited livestock grazing

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

### **394—Rock outcrop-Chumstick, cold complex, 20 to 65 percent slopes**

#### **Composition**

*Rock outcrop:* 55 percent

*Chumstick soil and similar soils:* 30 percent

*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Ridges, shoulders, and backslopes of mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with volcanic ash and loess

*Slope range:* 20 to 65 percent

*Elevation:* 5,000 to 5,800 feet

*Average annual precipitation:* 22 to 28 inches

*Average annual air temperature:* 41 to 43 degrees F

*Frost-free period:* 85 to 110 days

*Rock fragments on surface:* Chumstick—boulders and stones cover 15 to 50 percent

#### **Rock Outcrop**

*Kind of rock:* Granitic rock

#### **Chumstick Soil**

##### **Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—grayish brown extremely bouldery loam

*Subsoil:*

5 to 12 inches—brown very cobbly sandy loam

*Bedrock:*

12 to 16 inches—granitic rock

##### **Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

#### **Contrasting Inclusions**

- Mineral and Capoose soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Merkel soils
- Buhrig soils
- Rubble land

#### **Major Uses**

Wildlife habitat, watershed, recreation, limited timber production, and limited livestock grazing

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

- Logging is not recommended on this unit because of the very low productivity and severe limitations for regeneration.

##### **Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

### **395—Rock outcrop-Mineral complex, 30 to 65 percent slopes**

#### **Composition**

*Rock outcrop:* 50 percent

*Mineral soil and similar soils:* 30 percent

*Contrasting inclusions:* 20 percent

#### **Setting**

*Position on landscape:* Backslopes and shoulders of mountains

*Parent material:* Colluvium and glacial till derived from granitic rock mixed with a component of loess and volcanic ash in the upper part

*Slope range:* 30 to 65 percent

*Elevation:* 2,000 to 4,700 feet

*Average annual precipitation:* 17 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 110 days

*Rock fragments on surface:* Mineral—stones cover 0.1 to 3.0 percent

#### **Rock Outcrop**

*Kind of rock:* Granitic rock

## Mineral Soil

### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—grayish brown stony loam

*Subsoil:*

6 to 12 inches—pale brown very gravelly loam

*Substratum:*

12 to 23 inches—very pale brown very stony sandy loam

*Bedrock:*

23 to 27 inches—granitic rock

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Dinkelman and Bearspring soils
- Centralpeak soils
- Spokane, Vanbrunt, and Skanid soils
- Buhrig and Moses soils
- Rubble land

### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

## 396—Rock outcrop-Rufus complex, 20 to 65 percent slopes

### Composition

*Rock outcrop:* 55 percent

*Rufus soil and similar soils:* 25 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes, shoulders, and ridges of hills and mountains

*Parent material:* Colluvium and residuum derived from metamorphic rock mixed with volcanic ash and loess

*Slope range:* 20 to 65 percent

*Elevation:* 2,100 to 4,000 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Rock Outcrop

*Kind of rock:* Phyllite, schist, slate, graywacke, and quartzite

### Rufus Soil

#### Typical profile

*Upper part of surface layer:*

0 to 5 inches—brown channery loam

*Lower part of surface layer:*

5 to 15 inches—brown very channery loam

*Bedrock:*

15 to 19 inches—schist

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Rangeland—severe or very severe

### Contrasting Inclusions

- Raisio soils

- Donavan soils
- Elbowlake soils
- Soils that are somewhat poorly drained

### Major Uses

Wildlife habitat, recreation, watershed, and limited livestock grazing

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* Depth to bedrock, Rock outcrop, rock fragments in the soil, and steepness of slope

## 397—Rock outcrop-Soaplake complex, 5 to 30 percent slopes

### Composition

*Rock outcrop:* 45 percent

*Soaplake soil and similar soils:* 35 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Ridges, shoulders, and backslopes of hills

*Parent material:* Colluvium and residuum derived from granitic rock mixed with loess

*Slope range:* 5 to 30 percent

*Elevation:* 1,300 to 2,400 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Rock Outcrop

*Kind of rock:* Granitic rock

### Soaplake Soil

#### Typical profile

*Surface layer:*

0 to 10 inches—dark grayish brown loam

*Upper part of subsoil:*

10 to 14 inches—yellowish brown loam

*Lower part of subsoil:*

14 to 17 inches—light yellowish brown loam

*Bedrock:*

17 to 21 inches—granitic rock

### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Couleedam soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Roosevelt soils
- Malott soils
- Soils that have a very stony surface
- Rubble land

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

## 398—Rock outcrop-Swakane complex, 5 to 30 percent slopes

### Composition

*Rock outcrop:* 50 percent

*Swakane soil and similar soils:* 35 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges and shoulders of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 5 to 30 percent  
*Elevation:* 1,500 to 3,000 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days  
*Rock fragments on surface:* Swakane—stones cover 3 to 15 percent

### Rock Outcrop

*Kind of rock:* Granitic rock

### Swakane Soil

#### Typical profile

*Upper part of surface layer:*  
 0 to 7 inches—dark brown very stony loam

*Lower part of surface layer:*  
 7 to 11 inches—brown very gravelly loam

*Subsoil:*  
 11 to 14 inches—yellowish brown very cobbly loam

*Bedrock:*  
 14 to 18 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

#### Contrasting Inclusions

- Conconully and Donovan soils
- Wynhoff and Vanbrunt soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Ginnis and Spokane soils
- Rubble land

#### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

#### Use and Management

##### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be

buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 399—Rock outcrop-Vanbrunt complex, 20 to 65 percent slopes

#### Composition

*Rock outcrop:* 45 percent

*Vanbrunt soil and similar soils:* 35 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Shoulders and backslopes of hills and mountains

*Parent material:* Colluvium derived from granitic glacial till and granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 20 to 65 percent

*Elevation:* 1,800 to 3,500 feet

*Average annual precipitation:* 14 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Vanbrunt—stones cover 3 to 15 percent

#### Rock Outcrop

*Kind of rock:* Granitic rock

#### Vanbrunt Soil

#### Typical profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*  
 0 to 3 inches—brown very stony sandy loam

*Lower part of surface layer:*  
 3 to 10 inches—brown very gravelly sandy loam

*Subsoil:*  
 10 to 19 inches—light yellowish brown extremely cobbly sandy loam

*Substratum:*  
 19 to 25 inches—very pale brown very cobbly sandy loam

*Bedrock:*  
 25 to 29 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or  
severe

### Contrasting Inclusions

- Swakane soils
- Whitestone soils
- Rubble land

### Major Uses

Wildlife habitat, watershed, and limited livestock  
grazing

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
tracked equipment—unsafe because of  
steepness of slope and results in excessive  
soil damage and erosion; cable yarding—  
suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—  
periodically

*Limitations for planting:* Rock outcrop, rock fragments  
in the soil, and steepness of slope

## 400—Roosevelt-Soaplake-Rock outcrop complex, 5 to 30 percent slopes

### Composition

*Roosevelt soil and similar soils:* 45 percent

*Soaplake soil and similar soils:* 25 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges, shoulders, and  
backslopes of hills

*Parent material:* Residuum and colluvium derived  
from granitic rock mixed with loess

*Slope range:* 5 to 30 percent

*Elevation:* 1,300 to 2,400 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51  
degrees F

*Frost-free period:* 140 to 180 days

## Roosevelt Soil

### Typical profile

*Surface layer:*  
0 to 14 inches—grayish brown and brown gravelly  
loam

*Subsoil:*  
14 to 28 inches—pale brown gravelly sandy loam

*Bedrock:*  
28 to 32 inches—granitic rock

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to  
bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or  
moderate

## Soaplake Soil

### Typical profile

*Surface layer:*  
0 to 10 inches—dark grayish brown loam

*Upper part of subsoil:*  
10 to 14 inches—yellowish brown loam

*Lower part of subsoil:*  
14 to 17 inches—light yellowish brown loam

*Bedrock:*  
17 to 21 inches—granitic rock

### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or  
moderate

## Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Couleedam soils
- Soils that have bedrock at a depth of 20 to 60 inches  
and have more rock fragments throughout

- Soils that have bedrock at a depth of 4 to 10 inches
- Malott soils
- Farrell soils
- Soils that have a very stony surface
- Rubble land

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction.
- Depth to bedrock in the soils in this unit limits pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

## 401—Roosevelt-Soaplake-Rock outcrop complex, 30 to 65 percent slopes

### Composition

*Roosevelt soil and similar soils:* 40 percent

*Soaplake soil and similar soils:* 30 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Roosevelt—shoulders and backslopes of hills; Soaplake—ridges, shoulders, and backslopes of hills

*Parent material:* Residuum and colluvium derived from granitic rock mixed with loess

*Slope range:* 30 to 65 percent

*Elevation:* 1,300 to 2,400 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Roosevelt Soil

#### Typical profile

*Surface layer:*

0 to 14 inches—grayish brown and brown gravelly loam

*Subsoil:*

14 to 28 inches—pale brown gravelly sandy loam

*Bedrock:*

28 to 32 inches—granitic rock

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Hazard of water erosion:* Rangeland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

### Soaplake Soil

#### Typical profile

*Surface layer:*

0 to 10 inches—dark grayish brown loam

*Upper part of subsoil:*

10 to 14 inches—yellowish brown loam

*Lower part of subsoil:*

14 to 17 inches—light yellowish brown loam

*Bedrock:*

17 to 21 inches—granitic rock

### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Rapid or very rapid

*Hazard of water erosion:* Rangeland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Couleedam soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Malott soils
- Soils that have a very stony surface
- Rubble land

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range

seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

- Depth to bedrock in the soils in this unit limits pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### **402—Rubble land**

This map unit consists of areas of unconsolidated rock debris, commonly known as talus, on backslopes and footslopes of hills, mountains, and plateaus. Slopes range from 20 to 90 percent. Rock fragments are angular, and they range in size from gravel to boulders.

This unit commonly is barren, but small areas where soil material has accumulated between rock fragments support a very sparse cover of shrubs, grasses, and forbs.

#### **403—Rubble land-Rock outcrop complex**

##### **Composition**

*Rubble land:* 60 percent  
*Rock outcrop:* 25 percent  
*Contrasting inclusions:* 15 percent

##### **Rubble Land**

Rubble land consists of areas of unconsolidated rock debris, commonly known as talus, on backslopes and footslopes of hills, mountains, and plateaus. Slopes range from 20 to 90 percent. Rock fragments are angular, and they range in size from gravel to boulders. Rubble land commonly is barren, but small areas where soil material has accumulated between rock fragments support a very sparse cover of shrubs, grasses, and forbs.

##### **Rock Outcrop**

Rock outcrop consists of areas where exposed bedrock covers 90 percent of the surface or more. It is mainly on ridges, shoulders, and backslopes of hills and mountains, but it also occurs as nearly vertical rock walls associated with basalt plateaus. Slopes range from 5 to 100 percent or more.

##### **Contrasting Inclusions**

- Soils that are very cobbly or very stony and support a variety of vegetation, depending on location.

- Soils that have bedrock at a depth of 4 to 20 inches and support a sparse cover of grasses, shrubs, and forbs. Scattered coniferous trees also occur in crevices in the rock where moisture and small amounts of soil have accumulated.

#### **404—Rubble land-Rock outcrop-Haploxerolls, cobbly complex, 30 to 70 percent slopes**

##### **Composition**

*Rubble land:* 40 percent  
*Rock outcrop:* 25 percent  
*Haploxerolls, cobbly, and similar soils:* 20 percent  
*Contrasting inclusions:* 15 percent

##### **Setting**

*Position on landscape:* Backslopes of hills and escarpments of basalt plateaus (fig. 14)  
*Parent material:* Colluvium derived from basalt and granitic rock mixed with loess  
*Slope range:* 30 to 70 percent  
*Elevation:* 1,600 to 2,500 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

##### **Rubble Land**

Rubble land consists of areas of unconsolidated basalt and granitic rock debris, commonly known as talus, on backslopes of hills and escarpments of plateaus. Rock fragments are angular, and they range in size from gravel to boulders. Rubble land commonly is barren, but small areas where soil material has accumulated between rock fragments support a very sparse cover of shrubs, grasses, and forbs.

##### **Rock Outcrop**

Rock outcrop consists of areas where exposed basalt and granitic rock cover 90 percent of the surface or more. It is mainly on backslopes of hills, but it also occurs as nearly vertical rock walls associated with basalt plateau escarpments. Rock outcrop commonly is barren, but a sparse cover of stunted coniferous trees, shrubs, grasses, and forbs is in some crevices.

##### **Haploxerolls, Cobbly**

##### **Reference profile**

*Surface layer:*  
0 to 16 inches—brown very cobbly silt loam

Figure 14.—Area of Rubble land-Rock outcrop-Haploxerolls, cobbly complex, 30 to 70 percent slopes. Rubble land and Haploxerolls are in foreground, and columnar basalt Rock outcrop is in background.

*Substratum:*  
16 to 60 inches—fragmental basalt rock fragments

**Soil properties and qualities**

*Depth class:* Moderately deep to very deep (20 to 80 inches to bedrock)

*Drainage class:* Well drained to excessively drained

*Permeability:* Moderate to rapid

*Available water capacity:* Moderate

*Potential rooting depth:* 20 to 60 inches or more

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Swakane soils
- Conconully soils

### Major Uses

Limited livestock grazing, recreation, watershed, and wildlife habitat

## 405—Sacheen loamy sand, dry, 20 to 40 percent slopes

### Composition

*Sacheen soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Kames and terrace escarpments

*Parent material:* Sandy glacial outwash

*Slope range:* 20 to 40 percent

*Elevation:* 1,700 to 4,600 feet

*Average annual precipitation:* 16 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 8 inches—dark grayish brown and grayish brown loamy sand

*Upper part of substratum:*

8 to 25 inches—brown and pale brown loamy sand

*Lower part of substratum:*

25 to 60 inches—light brownish gray sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Karamin and Torboy soils
- Wapal soils

- Scrabblers soils
- Stapaloop soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* None

## 406—Sacheen loamy sand, dry, 40 to 70 percent slopes

### Composition

*Sacheen soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments

*Parent material:* Sandy glacial outwash

*Slope range:* 40 to 70 percent

*Elevation:* 1,700 to 4,300 feet

*Average annual precipitation:* 16 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 8 inches—dark grayish brown and grayish brown loamy sand

*Upper part of substratum:*

8 to 25 inches—brown and pale brown loamy sand

*Lower part of substratum:*

25 to 60 inches—light brownish gray sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Karamin and Torboy soils
- Wapal soils
- Scrabblers soils
- Goddard soils
- Stapaloop soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically  
*Limitation for planting:* Steepness of slope

## 407—Sacheen loamy fine sand, dry, 0 to 20 percent slopes

### Composition

*Sacheen soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces and kames  
*Parent material:* Sandy glacial outwash  
*Slope range:* 0 to 20 percent  
*Elevation:* 1,700 to 3,500 feet  
*Average annual precipitation:* 16 to 20 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick  
*Surface layer:*  
 0 to 4 inches—dark grayish brown loamy fine sand  
*Upper part of substratum:*  
 4 to 20 inches—pale brown loamy sand

*Lower part of substratum:*  
 20 to 60 inches—light gray gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Karamin and Torboy soils
- Wapal soils
- Scrabblers soils
- Goddard soils
- Stapaloop soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically  
*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by droughtiness, wind erosion, and fast infiltration.

## 408—Sanpoil silt loam, 0 to 2 percent slopes

### Composition

*Sanpoil soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Flood plains and low stream terraces

*Parent material:* Recent alluvium  
*Slope range:* 0 to 2 percent  
*Elevation:* 1,600 to 3,800 feet  
*Average annual precipitation:* 15 to 20 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Upper part of surface layer:*  
 0 to 12 inches—mottled, dark grayish brown silt loam

*Lower part of surface layer:*  
 12 to 28 inches—mottled, dark grayish brown loam

*Upper part of substratum:*  
 28 to 41 inches—mottled, brown and grayish brown fine sandy loam

*Lower part of substratum:*  
 41 to 60 inches—multicolored very gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Poorly drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* High  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very slow  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight; forestland—slight  
*Hazard of wind erosion (bare surface):* Slight  
*Water table:* Present in November through September (see “Water Features” table)  
*Frequency, duration, and period of flooding:*  
 Occasional, brief periods in March through June

### Contrasting Inclusions

- Boesel and Cubcreek soils
- Sanpoil soils, ponded
- Aquic Xerofluvents

### Major Uses

Nonirrigated hay and pasture, livestock grazing, wildlife habitat, wetland wildlife habitat, and watershed

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable during periods when the soil is dry; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Quaking aspen, paper birch, and thinleaf alder—readily; Douglas-fir and western larch—periodically  
*Limitation for planting:* Seasonal high water table

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wetness.

## 409—Sanpoil silt loam, ponded, 0 to 2 percent slopes

### Composition

*Sanpoil soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Flood plains and low stream terraces

*Parent material:* Recent alluvium  
*Slope range:* 0 to 2 percent  
*Elevation:* 2,500 to 3,800 feet  
*Average annual precipitation:* 15 to 20 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Upper part of surface layer:*  
 0 to 20 inches—mottled, dark gray and dark grayish brown silt loam

*Lower part of surface layer:*  
 20 to 28 inches—mottled, grayish brown loam

*Upper part of substratum:*  
 28 to 34 inches—mottled, brown gravelly loam

*Middle part of substratum:*  
 34 to 45 inches—mottled, pale brown gravelly sandy loam

*Lower part of substratum:*  
 45 to 60 inches—mottled, very pale brown very gravelly coarse sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Very poorly drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* High  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Ponded for long periods in February through June

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in January through December (see “Water Features” table)

*Frequency, duration, and period of flooding:* Occasional, brief periods in March through June

### Contrasting Inclusions

- Boesel and Cubcreek soils
- Histosols, ponded
- Borosaprists that formed in organic material
- Aquic Xerofluvents

### Major Uses

Nonirrigated hay and pasture, livestock grazing, wildlife habitat, wetland wildlife habitat, and watershed

### Use and Management

#### Timber Production

#### Harvesting

- Because the soil in this unit has a seasonal ponded water table and is saturated in summer and fall, logging generally is feasible only when the soil is frozen.

#### Silviculture

*Potential for natural regeneration:* Quaking aspen, paper birch, and thinleaf alder—periodically

*Limitation for planting:* Seasonal ponded water table

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wetness.

## 410—Scala very fine sandy loam, 0 to 5 percent slopes

### Composition

*Scala soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Sandy glacial outwash mixed with volcanic ash and loess

*Slope range:* 0 to 5 percent

*Elevation:* 1,400 to 2,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 6 inches—grayish brown very fine sandy loam

*Upper part of subsoil:*

6 to 28 inches—pale brown very fine sandy loam

*Lower part of subsoil:*

28 to 60 inches—light brownish gray very fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* High

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow or slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Bisbee soils
- Cedonia and Hunters soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wind erosion.

### 411—Sclome silty clay loam, 0 to 3 percent slopes

#### Composition

*Sclome soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Valley flats

*Parent material:* Alluvium over volcanic ash and valley fill

*Slope range:* 0 to 3 percent

*Elevation:* 2,400 to 2,700 feet

*Average annual precipitation:* 18 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Surface layer:*

0 to 13 inches—very dark gray silty clay loam

*Subsoil:*

13 to 18 inches—grayish brown and pale brown silt loam

*Buried surface layer:*

18 to 28 inches—grayish brown and light brownish gray clay loam

*Buried subsoil:*

28 to 50 inches—mottled, light brownish gray and light gray sandy loam

*Substratum:*

50 to 60 inches—mottled, light gray silty clay loam

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Poorly drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

*Water table:* Present in February through June (see “Water Features” table)

*Frequency, duration, and period of flooding:*

Occasional, brief periods in March through May

#### Contrasting Inclusions

- Soils that are very poorly drained

- Brushcreek and Friedlander soils
- Soils that are moderately well drained
- Ret soils

#### Major Uses

Livestock grazing, timber production, nonirrigated hay and pasture, wildlife habitat, wetland wildlife habitat, and watershed

#### Use and Management

##### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Ponderosa pine, Douglas-fir, and western larch—periodically

*Limitation for planting:* High clay content

##### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wetness.

### 412—Scoop silt loam, 5 to 20 percent slopes

#### Composition

*Scoop soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Alluvial fans and toeslopes of hills and mountains

*Parent material:* Colluvium, glacial till, and slope alluvium derived from volcanic and metamorphic rock mixed with volcanic ash and loess

*Slope range:* 5 to 20 percent

*Elevation:* 1,600 to 3,600 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*

0 to 3 inches—dark grayish brown silt loam

*Lower part of surface layer:*

3 to 12 inches—dark grayish brown gravelly loam

*Upper part of subsoil:*

12 to 25 inches—brown very gravelly loam

*Lower part of subsoil:*

25 to 36 inches—yellowish brown very gravelly loam

*Substratum:*

36 to 60 inches—light yellowish brown very gravelly loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Inkler soils
- Wells creek soils
- Nevine soils
- Republic soils
- Lost creek soils
- Aquic Xerofluvents and Ret soils

### Major Uses

Timber production, livestock grazing, nonirrigated cropland, nonirrigated hay and pasture, watershed, and recreation

### Use and Management

#### Timber Production

##### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

##### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 413—Scoop gravelly loam, 20 to 40 percent slopes

### Composition

*Scoop soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Footslopes and backslopes of hills and mountains

*Parent material:* Colluvium and glacial till derived from volcanic and metamorphic rock mixed with volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 1,600 to 4,200 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 14 inches—dark brown gravelly loam

*Upper part of subsoil:*

14 to 22 inches—brown gravelly loam

*Lower part of subsoil:*

22 to 36 inches—pale brown very gravelly loam

*Substratum:*

36 to 60 inches—very pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate to severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Inkler soils
- Oxerine and Thout soils
- Nevine soils
- Republic soils
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

## 414—Scoop gravelly loam, 40 to 65 percent slopes

### Composition

*Scoop soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and glacial till derived from volcanic and metamorphic rock mixed with volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 1,600 to 4,200 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 14 inches—dark brown gravelly loam

*Upper part of subsoil:*

14 to 22 inches—brown gravelly loam

*Lower part of subsoil:*

22 to 36 inches—pale brown very gravelly loam

*Substratum:*

36 to 60 inches—very pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Inkler soils
- Oxerine and Thout soils
- Nevine soils
- Republic soils
- Soils that have a very stony surface
- Rock outcrop
- Rubble land

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

## 415—Scoop-Rock outcrop complex, 20 to 40 percent slopes

### Composition

*Scoop soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Footslopes and backslopes of hills and mountains

*Parent material:* Colluvium and glacial till derived from volcanic and metamorphic rock mixed with volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 4,800 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### **Scoap Soil**

#### **Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 14 inches—dark brown gravelly loam

*Upper part of subsoil:*  
14 to 22 inches—brown gravelly loam

*Lower part of subsoil:*  
22 to 36 inches—pale brown very gravelly loam

*Substratum:*  
36 to 60 inches—very pale brown very gravelly sandy loam

#### **Soil properties and qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate or severe

### **Rock Outcrop**

*Kind of rock:* Rhyodacite, phyllite, schist, slate, and graywacke

#### **Contrasting Inclusions**

- Inkler soils
- Oxerine and Thout soils
- Nevine soils
- Republic soils
- Soils that have a very stony surface
- Rubble land

#### **Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### **Use and Management**

##### **Timber Production**

##### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

### **Silviculture**

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

### **416—Scoap-Rock outcrop complex, 40 to 65 percent slopes**

#### **Composition**

*Scoap soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

#### **Setting**

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and glacial till derived from volcanic and metamorphic rock mixed with volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 1,800 to 4,800 feet

*Average annual precipitation:* 18 to 22 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### **Scoap Soil**

#### **Typical profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
0 to 14 inches—dark brown gravelly loam

*Upper part of subsoil:*  
14 to 22 inches—brown gravelly loam

*Lower part of subsoil:*  
22 to 36 inches—pale brown very gravelly loam

*Substratum:*  
36 to 60 inches—very pale brown very gravelly sandy loam

#### **Soil properties and qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

### Rock Outcrop

*Kind of rock:* Rhyodacite, phyllite, schist, slate, and graywacke

### Contrasting Inclusions

- Inkler soils
- Oxerine and Thout soils
- Nevine soils
- Republic soils
- Soils that have a very stony surface
- Rubble land

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically  
*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

### 417—Scrabblers silt loam, dry, 0 to 20 percent slopes

#### Composition

*Scrabblers soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Terraces, terrace escarpments, and toeslopes of hills and mountains  
*Parent material:* Mantle of volcanic ash over sandy glacial outwash  
*Slope range:* 0 to 20 percent  
*Elevation:* 2,600 to 4,600 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 41 to 43 degrees F  
*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 2 inches thick

#### Surface layer:

0 to 3 inches—yellowish brown silt loam

#### Subsoil:

3 to 11 inches—light yellowish brown silt loam

#### Upper part of substratum:

11 to 24 inches—pale brown gravelly sandy loam

#### Lower part of substratum:

24 to 60 inches—pale brown and brown gravelly loamy coarse sand and gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Martella soils
- Newbell soils
- Kiehl soils
- Apex, Aits, and Stapaloo soils

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch, lodgepole pine, and ponderosa pine—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and droughtiness.

## 418—Scrabblers silt loam, dry, 20 to 40 percent slopes

### Composition

*Scrabblers soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments and toeslopes and footslopes of hills and mountains

*Parent material:* Mantle of volcanic ash over sandy glacial outwash

*Slope range:* 20 to 40 percent

*Elevation:* 2,600 to 4,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 41 to 43 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 3 inches—yellowish brown silt loam

*Subsoil:*

3 to 11 inches—light yellowish brown silt loam

*Upper part of substratum:*

11 to 24 inches—pale brown gravelly sandy loam

*Lower part of substratum:*

24 to 60 inches—pale brown and brown gravelly loamy coarse sand and gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe

### Contrasting Inclusions

- Martella soils
- Newbell soils
- Kiehl soils
- Apex, Aits, and Stapaloo soils that are sandy loam throughout the substratum

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch, lodgepole pine, and ponderosa pine—periodically

*Limitations for planting:* None

## 419—Scrabblers loam, warm, 0 to 20 percent slopes

### Composition

*Scrabblers soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces, terrace escarpments, and toeslopes of hills and mountains

*Parent material:* Mantle of volcanic ash over sandy glacial outwash

*Slope range:* 0 to 20 percent

*Elevation:* 2,600 to 4,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 5 inches—brown loam

*Subsoil:*

5 to 13 inches—pale brown and light yellowish brown loam

*Upper part of substratum:*

13 to 20 inches—light gray sandy loam

*Lower part of substratum:*

20 to 60 inches—light gray gravelly loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Kiehl soils
- Stepstone soils
- Nevine soils
- Apex and Stapaloop soils
- Louploup soils

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and droughtiness.

## 420—Scrabblers loam, warm, 20 to 40 percent slopes

### Composition

*Scrabblers soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments and toeslopes and footslopes of hills and mountains

*Parent material:* Mantle of volcanic ash over sandy glacial outwash

*Slope range:* 20 to 40 percent

*Elevation:* 2,600 to 4,600 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
0 to 5 inches—brown loam

*Subsoil:*  
5 to 13 inches—pale brown and light yellowish brown loam

*Upper part of substratum:*  
13 to 20 inches—light gray sandy loam

*Lower part of substratum:*  
20 to 60 inches—light gray gravelly loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Kiehl soils
- Stepstone soils
- Nevine soils
- Apex and Stapaloop soils
- Louploup soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—readily; western larch—periodically

*Limitations for planting:* None

## 421—Sitdown gravelly loam, 40 to 70 percent slopes

### Composition

*Sitdown soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of mountains, and terrace escarpments

*Parent material:* Mantle of volcanic ash over glacial outwash

*Slope range:* 40 to 70 percent

*Elevation:* 2,800 to 4,600 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 2.5 inches thick

*Surface layer:*

0 to 4 inches—brown gravelly loam

*Subsoil:*

4 to 13 inches—pale brown gravelly loam

*Upper part of substratum:*

13 to 29 inches—pale brown very gravelly loamy sand

*Lower part of substratum:*

29 to 60 inches—light brownish gray very gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Parmenter soils
- Manley soils
- Torboy soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Western larch, lodgepole pine, and subalpine fir—readily; Douglas-fir and Engelmann spruce—periodically

*Limitation for planting:* Steepness of slope

## 422—Skaha loamy sand, 0 to 10 percent slopes

### Composition

*Skaha soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash

*Slope range:* 0 to 10 percent

*Elevation:* 800 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 7 inches—pale brown loamy sand

*Upper part of substratum:*

7 to 19 inches—light yellowish brown gravelly loamy sand

*Middle part of substratum:*

19 to 35 inches—pale brown very gravelly coarse sand

*Lower part of substratum:*

35 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow or slow

*Hazard of water erosion:* Cropland—slight;  
rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a stony or very stony surface
- Quincy and Winchester soils
- Beverly soils
- Cashmont soils
- Cashmere soils
- Aeneas, Pogue, and Strat soils

### Major Uses

Irrigated hay and pasture, irrigated orchards, livestock grazing, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration.

## 423—Skaha gravelly loamy sand, 0 to 10 percent slopes

### Composition

*Skaha soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash

*Slope range:* 0 to 10 percent

*Elevation:* 800 to 1,600 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*

0 to 8 inches—brown gravelly loamy sand

*Upper part of substratum:*

8 to 18 inches—yellowish brown and light yellowish brown very gravelly loamy sand

*Lower part of substratum:*

18 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow or slow

*Hazard of water erosion:* Cropland—slight;  
rangeland—slight

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Soils that have a stony or very stony surface
- Quincy and Winchester soils
- Beverly soils
- Cashmont soils
- Cashmere soils
- Aeneas, Pogue, and Strat soils

### Major Uses

Livestock grazing, irrigated hay and pasture, irrigated orchards, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration.

## 424—Skaha extremely gravelly loamy sand, 30 to 65 percent slopes

### Composition

*Skaha soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments

*Parent material:* Glacial outwash

*Slope range:* 30 to 65 percent

*Elevation:* 800 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
 0 to 10 inches—brown extremely gravelly loamy sand

*Upper part of substratum:*  
 10 to 18 inches—pale brown gravelly loamy sand

*Middle part of substratum:*  
 18 to 24 inches—light gray very gravelly coarse sand

*Lower part of substratum:*  
 24 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Quincy and Winchester soils
- Pogue and Strat soils
- Peshastin soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This unit is very gravelly, which results in seepage and limits the potential for ponds.
- This unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.
- This unit is limited by the restricted available soil moisture. Seeding is not recommended.

## 425—Skaha very stony sandy loam, 5 to 30 percent slopes

### Composition

*Skaha soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments  
*Parent material:* Glacial outwash  
*Slope range:* 5 to 30 percent  
*Elevation:* 800 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Stones cover 3 to 15 percent

### Typical Profile

*Surface layer:*  
 0 to 7 inches—brown very stony sandy loam

*Substratum:*  
 7 to 60 inches—multicolored extremely gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Rangeland—slight  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Quincy and Winchester soils
- Pogue and Strat soils
- Peshastin soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond

installation unless special liners or sealants are used to reduce seepage.

### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, large stones, and droughtiness.

## 426—Skaha very stony sandy loam, 30 to 65 percent slopes

### Composition

*Skaha soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash  
*Slope range:* 30 to 65 percent  
*Elevation:* 800 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Stones cover 3 to 15 percent

### Typical Profile

*Surface layer:*  
0 to 7 inches—brown very stony sandy loam

*Substratum:*  
7 to 60 inches—multicolored extremely gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium  
*Hazard of water erosion:* Rangeland—moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Quincy and Winchester soils
- Pogue and Strat soils
- Peshastin soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 427—Skaha-Rock outcrop complex, 30 to 65 percent slopes

### Composition

*Skaha soil and similar soils:* 60 percent  
*Rock outcrop:* 20 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash  
*Slope range:* 30 to 65 percent  
*Elevation:* 800 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Stones cover 3 to 15 percent

### Skaha Soil

### Typical profile

*Surface layer:*  
0 to 7 inches—brown very stony sandy loam

*Substratum:*  
7 to 60 inches—multicolored extremely gravelly loamy coarse sand

### Soil properties and qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium  
*Hazard of water erosion:* Rangeland—moderate  
*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Couleedam and Soaplake soils
- Roosevelt soils that have bedrock at a depth of 20 to 40 inches
- Quincy and Winchester soils
- Pogue and Strat soils
- Peshastin soils
- Rubble land

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### 428—Skanid gravelly sandy loam, 5 to 20 percent slopes

#### Composition

*Skanid soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Ridges, summits, and shoulders of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 1,900 to 4,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 9 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

9 to 14 inches—brown very gravelly coarse sandy loam

*Bedrock:*

14 to 24 inches—highly weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Forestland—slight or moderate

### Contrasting Inclusions

- Spokane soils
- Soils that have a stony or very stony surface
- Swakane soils
- Vanbrunt soils
- Soils that are sandy below the surface layer
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

### 429—Skanid gravelly sandy loam, 20 to 40 percent slopes

#### Composition

*Skanid soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Shoulders and backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,900 to 4,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 9 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

9 to 14 inches—brown very gravelly coarse sandy loam

*Bedrock:*

14 to 24 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Spokane soils
- Swakane soils
- Vanbrunt soils
- Mineral soils
- Soils that have a stony or very stony surface
- Soils that are sandy below the surface layer
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir

and ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

### 430—Skanid gravelly sandy loam, 40 to 65 percent slopes

#### Composition

*Skanid soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 40 to 65 percent

*Elevation:* 1,900 to 4,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 9 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

9 to 14 inches—brown very gravelly coarse sandy loam

*Bedrock:*

14 to 24 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Spokane soils
- Swakane soils
- Vanbrunt soils

- Mineral soils
- Soils that are sandy below the surface layer
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

## 431—Skanid gravelly sandy loam, warm, 5 to 20 percent slopes

### Composition

*Skanid soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges, summits, and shoulders of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 1,700 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 2.5 inches thick

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown gravelly sandy loam

*Lower part of surface layer:*

5 to 11 inches—brown gravelly sandy loam

*Substratum:*

11 to 18 inches—brown very gravelly coarse sandy loam

*Bedrock:*

18 to 28 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

### Contrasting Inclusions

- Spokane soils
- Swakane soils
- Vanbrunt soils
- Soils that have a very stony surface
- Soils that are sandy below the surface layer
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

## 432—Skanid gravelly sandy loam, warm, 20 to 40 percent slopes

### Composition

*Skanid soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders and backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,700 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 2.5 inches thick

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown gravelly sandy loam

*Lower part of surface layer:*

5 to 11 inches—brown gravelly sandy loam

*Substratum:*

11 to 18 inches—brown very gravelly coarse sandy loam

*Bedrock:*

18 to 28 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Spokane soils
- Vanbrunt soils
- Swakane soils
- Soils that have a very stony surface
- Soils that are sandy below the surface layer
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

## 433—Skanid gravelly sandy loam, warm, 40 to 65 percent slopes

### Composition

*Skanid soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 40 to 65 percent

*Elevation:* 1,700 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 2.5 inches thick

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown gravelly sandy loam

*Lower part of surface layer:*

5 to 11 inches—brown gravelly sandy loam

*Substratum:*

11 to 18 inches—brown very gravelly coarse sandy loam

*Bedrock:*

18 to 28 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Spokane soils

- Vanbrunt soils
- Swakane soils
- Soils that have a very stony surface
- Soils that are sandy below the surface layer
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

### 434—Skand-Rock outcrop complex, 20 to 40 percent slopes

#### Composition

*Skand soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Shoulders and backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,900 to 4,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Skand Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 9 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

9 to 14 inches—brown very gravelly coarse sandy loam

*Bedrock:*

14 to 24 inches—weathered granitic rock

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

#### Rock Outcrop

*Kind of rock:* Granitic rock

#### Contrasting Inclusions

- Spokane soils
- Vanbrunt soils
- Swakane soils
- Soils that have a very stony surface
- Soils that are sandy below the surface layer

#### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

#### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

### 435—Skand-Rock outcrop complex, 40 to 65 percent slopes

#### Composition

*Skand soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 40 to 65 percent

*Elevation:* 1,900 to 4,200 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Skamid Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 9 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

9 to 14 inches—brown very gravelly coarse sandy loam

*Bedrock:*

14 to 24 inches—weathered granitic rock

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Spokane soils
- Vanbrunt soils
- Swakane soils
- Mineral soils
- Soils that have a very stony surface
- Soils that are sandy below the surface layer

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

### 436—Skamid, warm-Rock outcrop complex, 40 to 65 percent slopes

#### Composition

*Skamid soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock mixed with a component of loess and volcanic ash

*Slope range:* 40 to 65 percent

*Elevation:* 1,700 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Skamid Soil

#### Typical profile

*Organic mat on surface:* 2.5 inches thick

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown gravelly sandy loam

*Lower part of surface layer:*

5 to 11 inches—brown gravelly sandy loam

*Substratum:*

11 to 18 inches—brown very gravelly coarse sandy loam

*Bedrock:*

18 to 28 inches—weathered granitic rock

**Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

**Rock Outcrop**

*Kind of rock:* Granitic rock

**Contrasting Inclusions**

- Spokane soils
- Swakane soils
- Vanbrunt soils
- Soils that have a very stony surface
- Soils that are sandy below the surface layer
- Whitestone soils that are very deep

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

**437—Spens very stony loamy sand, dry, 20 to 40 percent slopes****Composition**

*Spens soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

**Setting**

*Position on landscape:* Terrace escarpments and kames

*Parent material:* Glacial outwash

*Slope range:* 20 to 40 percent

*Elevation:* 1,300 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Stones cover 3 to 15 percent

**Typical Profile**

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 3 inches—grayish brown very stony loamy sand

*Upper part of substratum:*

3 to 15 inches—light brownish gray gravelly loamy sand

*Lower part of substratum:*

15 to 60 inches—multicolored very cobbly coarse sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Rapid

*Available water capacity:* Very low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

**Contrasting Inclusions**

- Dart and Ewall soils
- Springdale soils
- Soils that do not have stones in the surface
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

### 438—Spens very stony loamy sand, dry, 40 to 65 percent slopes

#### Composition

*Spens soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

#### Setting

*Position on landscape:* Terrace escarpments and kames

*Parent material:* Glacial outwash

*Slope range:* 40 to 65 percent

*Elevation:* 1,300 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Stones cover 3 to 15 percent

#### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 3 inches—grayish brown very stony loamy sand

*Upper part of substratum:*

3 to 15 inches—light brownish gray gravelly loamy sand

*Lower part of substratum:*

15 to 60 inches—multicolored very cobbly coarse sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Rapid

*Available water capacity:* Very low

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate

#### Contrasting Inclusions

- Dart and Ewall soils
- Springdale soils
- Soils that do not have stones in the surface
- Rock outcrop

#### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

### 439—Spokane loam, 5 to 20 percent slopes

#### Composition

*Spokane soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Ridges, summits, and toeslopes of hills and mountains

*Parent material:* Loess and volcanic ash over residuum and colluvium derived from granitic rock

*Slope range:* 5 to 20 percent

*Elevation:* 1,800 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 10 inches—grayish brown loam

*Upper part of subsoil:*

10 to 19 inches—brown gravelly loam

*Lower part of subsoil:*

19 to 25 inches—light yellowish brown gravelly loam

*Bedrock:*

25 to 35 inches—weathered granitic rock

#### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none  
*Hazard of water erosion:* Cropland—slight or  
 moderate; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Skanid soils
- Vanbrunt and Northstar soils
- Centralpeak soils
- Dinkelman soils
- Soils that are sandy below the surface layer
- Georgecreek soils
- Mineral soils
- Soils that have a very stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat,  
 watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked  
 equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and  
 Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by  
 steepness of slope, water erosion, rooting depth, and  
 droughtiness.

## 440—Spokane loam, 20 to 40 percent slopes

### Composition

*Spokane soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Shoulders, backslopes, and  
 footslopes of hills and mountains  
*Parent material:* Loess and volcanic ash over  
 residuum and colluvium derived from granitic rock  
*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 4,000 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*  
 0 to 10 inches—grayish brown loam

*Upper part of subsoil:*  
 10 to 19 inches—brown gravelly loam

*Lower part of subsoil:*  
 19 to 25 inches—light yellowish brown gravelly loam

*Bedrock:*  
 25 to 35 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to  
 bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February;  
 more than 3 feet—none

*Hazard of water erosion:* Cropland—severe or very  
 severe; forestland—moderate or severe

### Contrasting Inclusions

- Skanid soils
- Vanbrunt and Northstar soils
- Centralpeak soils
- Dinkelman soils
- Soils that are sandy below the surface layer
- Georgecreek soils
- Mineral soils
- Soils that are very deep and have more rock  
 fragments
- Soils that have a very stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat,  
 watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked  
 equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* None

**441—Spokane loam, 40 to 65 percent slopes****Composition**

*Spokane soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Loess and volcanic ash over colluvium and residuum derived from granitic rock

*Slope range:* 40 to 65 percent

*Elevation:* 1,800 to 4,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

**Typical Profile**

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 10 inches—grayish brown loam

*Upper part of subsoil:*

10 to 19 inches—brown gravelly loam

*Lower part of subsoil:*

19 to 25 inches—light yellowish brown gravelly loam

*Bedrock:*

25 to 35 inches—weathered granitic rock

**Soil Properties and Qualities**

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

**Contrasting Inclusions**

- Skanid soils
- Vanbrunt and Northstar soils

- Centralpeak soils
- Dinkelman soils
- Soils that are sandy below the surface layer
- Mineral soils
- Soils that are very deep and have more rock fragments
- Soils that have a very stony surface
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* Steepness of slope

**442—Spokane loam, warm, 20 to 40 percent slopes****Composition**

*Spokane soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Shoulders, backslopes, and footslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

**Typical Profile**

*Organic mat on surface:* 0.5 inch thick

*Upper part of surface layer:*

0 to 4 inches—dark grayish brown loam

*Middle part of surface layer:*

4 to 9 inches—dark brown loam

*Lower part of surface layer:*  
9 to 12 inches—brown sandy loam

*Upper part of subsoil:*  
12 to 22 inches—yellowish brown sandy loam

*Lower part of subsoil:*  
22 to 30 inches—yellowish brown gravelly coarse sandy loam

*Substratum:*  
30 to 33 inches—very pale brown gravelly loamy coarse sand

*Bedrock:*  
33 to 43 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Skanid and Tyee soils
- Vanbrunt soils
- Ginnis soils
- Hellgate soils
- Whitestone soils
- Soils that have a very stony surface
- Georgecreek soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

## 443—Spokane loam, warm, 40 to 65 percent slopes

### Composition

*Spokane soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 40 to 65 percent

*Elevation:* 2,000 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 0.5 inch thick

*Upper part of surface layer:*  
0 to 4 inches—dark grayish brown loam

*Middle part of surface layer:*  
4 to 9 inches—dark brown loam

*Lower part of surface layer:*  
9 to 12 inches—brown sandy loam

*Upper part of subsoil:*  
12 to 22 inches—yellowish brown sandy loam

*Lower part of subsoil:*  
22 to 30 inches—yellowish brown gravelly coarse sandy loam

*Substratum:*  
30 to 33 inches—very pale brown gravelly loamy coarse sand

*Bedrock:*  
33 to 43 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Steepness of slope

### 444—Spokane-Rock outcrop complex, 5 to 20 percent slopes

#### Composition

*Spokane soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Ridges and summits of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 2,200 to 3,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Spokane Soil

#### Typical profile

*Organic mat on surface:* 3 inches thick

*Surface layer:*

0 to 10 inches—grayish brown loam

*Upper part of subsoil:*

10 to 19 inches—brown gravelly loam

*Lower part of subsoil:*

19 to 25 inches—light yellowish brown gravelly loam

*Bedrock:*

25 to 35 inches—weathered granitic rock

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Skanid soils
- Vanbrunt and Northstar soils
- Centralpeak soils
- Dinkelman soils
- Soils that are sandy below the surface layer
- Georgecreek soils
- Mineral soils
- Soils that have a very stony surface

*Kind of rock:* Granitic rock

**Contrasting Inclusions**

- Skanid soils
- Vanbrunt and Northstar soils
- Centralpeak soils
- Dinkelman soils
- Soils that are sandy below the surface layer
- Georgecreek soils
- Mineral soils
- Soils that are very deep and have more rock fragments
- Soils that have a very stony surface

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* Rock outcrop

### **446—Spokane, warm-Skanid, warm complex, 5 to 20 percent slopes**

**Composition**

*Spokane soil and similar soils:* 60 percent

*Skanid soil and similar soils:* 25 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Summits, ridges, and shoulders of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 1,800 to 3,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

#### Spokane

*Organic mat on surface:* 0.5 inch thick

*Upper part of surface layer:*

0 to 4 inches—dark grayish brown loam

*Middle part of surface layer:*

4 to 9 inches—dark brown loam

*Lower part of surface layer:*

9 to 12 inches—brown sandy loam

*Upper part of subsoil:*

12 to 22 inches—yellowish brown sandy loam

*Lower part of subsoil:*

22 to 30 inches—yellowish brown gravelly coarse sandy loam

*Substratum:*

30 to 33 inches—very pale brown gravelly loamy coarse sand

*Bedrock:*

33 to 43 inches—weathered granitic rock

#### Skamid

*Organic mat on surface:* 2.5 inches thick

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown gravelly sandy loam

*Lower part of surface layer:*

5 to 11 inches—brown gravelly sandy loam

*Substratum:*

11 to 18 inches—brown very gravelly coarse sandy loam

*Bedrock:*

18 to 28 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Spokane—moderately deep (20 to 40 inches to bedrock); Skamid—shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Spokane—moderate; Skamid—moderately rapid

*Available water capacity:* Spokane—low; Skamid—very low

*Potential rooting depth:* Spokane—20 to 40 inches; Skamid—10 to 20 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—slight

### Contrasting Inclusions

- Vanbrunt and Northstar soils
- Swakane soils
- Soils that are sandy below the surface layer
- Georgecreek soils
- Ginnis and Tye soils
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Spokane—none; Skamid—rock fragments in the soil

### 447—Spokane, warm-Skamid, warm complex, 20 to 40 percent slopes

#### Composition

*Spokane soil and similar soils:* 60 percent

*Skamid soil and similar soils:* 25 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Footslopes, backslopes, and shoulders of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 3,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 46 to 48 degrees F

*Frost-free period:* 100 to 130 days

11 to 18 inches—brown very gravelly coarse sandy loam

*Bedrock:*

18 to 28 inches—weathered granitic rock

**Soil Properties and Qualities**

*Depth class:* Spokane—moderately deep (20 to 40 inches to bedrock); Skamid—shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Spokane—moderate; Skamid—moderately rapid

*Available water capacity:* Spokane—low; Skamid—very low

*Potential rooting depth:* Spokane—20 to 40 inches; Skamid—10 to 20 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

**Contrasting Inclusions**

- Vanbrunt and Northstar soils
- Swakane soils
- Whitestone soils
- Soils that are sandy below the surface layer
- Ginnis and Tye soils
- Soils that have a very stony surface
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Spokane—steepness of slope; Skamid—rock fragments in the soil and steepness of slope

**449—Springdale gravelly sandy loam, 0 to 15 percent slopes****Composition**

*Springdale soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Terraces

*Parent material:* Glacial outwash with a component of loess and volcanic ash

*Slope range:* 0 to 15 percent

*Elevation:* 1,400 to 3,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

**Typical Profile**

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown gravelly sandy loam

*Subsoil:*

4 to 11 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

11 to 17 inches—very pale brown gravelly sand

*Lower part of substratum:*

17 to 60 inches—multicolored extremely gravelly sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* More than 60 inches

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Cropland—slight;  
forestland—slight

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Bisbee and Dart soils
- Hallcreek soils
- Spens soils
- Garrison soils
- Phoebe soils

### Major Uses

Timber production, livestock grazing, watershed,  
wildlife habitat, and building site development

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
tracked equipment—suitable; cable yarding—  
suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—  
periodically

*Limitation for planting:* Rock fragments in the soil

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

## 450—Springdale gravelly sandy loam, 15 to 30 percent slopes

### Composition

*Springdale soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments

*Parent material:* Glacial outwash with a component of  
loess and volcanic ash

*Slope range:* 15 to 30 percent

*Elevation:* 1,400 to 3,500 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown gravelly sandy loam

*Subsoil:*

4 to 11 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

11 to 17 inches—very pale brown gravelly sand

*Lower part of substratum:*

17 to 60 inches—multicolored extremely gravelly  
sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate;  
forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Bisbee and Dart soils
- Spens soils
- Garrison soils
- Phoebe soils

### Major Uses

Timber production, livestock grazing, watershed,  
wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and  
tracked equipment—suitable; cable yarding—  
suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—  
periodically

*Limitation for planting:* Rock fragments in the soil

## 451—Springdale gravelly sandy loam, 30 to 65 percent slopes

### Composition

*Springdale soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash with a component of loess and volcanic ash  
*Slope range:* 30 to 65 percent  
*Elevation:* 1,400 to 3,500 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 4 inches—grayish brown gravelly sandy loam  
*Subsoil:*  
 4 to 11 inches—pale brown gravelly sandy loam  
*Upper part of substratum:*  
 11 to 17 inches—very pale brown gravelly sand  
*Lower part of substratum:*  
 17 to 60 inches—multicolored extremely gravelly sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—January and February; more than 3 feet—none  
*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Spens soils
- Bisbee and Dart soils
- Phoebe soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically  
*Limitations for planting:* Rock fragments in the soil and steepness of slope

### 452—Stapaloo fine sandy loam, 0 to 20 percent slopes

### Composition

*Stapaloo soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces, and toeslopes and footslopes of hills and mountains  
*Parent material:* Glaciofluvial deposits and glacial till with a component of loess and volcanic ash  
*Slope range:* 0 to 20 percent  
*Elevation:* 2,700 to 4,800 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 7 inches—light brownish gray fine sandy loam  
*Subsoil:*  
 7 to 22 inches—light gray fine sandy loam  
*Upper part of substratum:*  
 22 to 31 inches—light gray fine sandy loam  
*Lower part of substratum:*  
 31 to 60 inches—white very fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Torboy soils

- Scrabblers soils
- Louploup soils
- Nevine soils
- Merkel soils
- Sacheen soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, recreation, and building site development

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, western larch, and ponderosa pine—readily

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

## 453—Stapaloop fine sandy loam, 20 to 40 percent slopes

### Composition

*Stapaloop soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of hills and mountains

*Parent material:* Glaciofluvial deposits and glacial till with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 2,700 to 4,800 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 7 inches—light brownish gray fine sandy loam

*Subsoil:*

7 to 22 inches—light gray fine sandy loam

*Upper part of substratum:*

22 to 31 inches—light gray fine sandy loam

*Lower part of substratum:*

31 to 60 inches—white very fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Torboy soils
- Scrabblers soils
- Louploup soils
- Nevine soils
- Merkel soils
- Sacheen soils that are sandy throughout

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir, western larch, and ponderosa pine—readily

*Limitations for planting:* None

## 454—Stapaloop fine sandy loam, dry, 0 to 20 percent slopes

### Composition

*Stapaloop soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Terraces, and toeslopes of hills and mountains

*Parent material:* Glaciofluvial deposits with a component of loess and volcanic ash  
*Slope range:* 0 to 20 percent  
*Elevation:* 1,900 to 3,100 feet  
*Average annual precipitation:* 16 to 20 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 2 inches—grayish brown fine sandy loam  
*Subsoil:*  
 2 to 17 inches—light brownish gray and pale brown fine sandy loam  
*Upper part of substratum:*  
 17 to 38 inches—pale brown and very pale brown sandy loam  
*Lower part of substratum:*  
 38 to 60 inches—very pale brown loamy fine sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight to severe; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Torboy soils
- Scrabblers soils
- Hudnut soils
- Phoebe soils
- Merkel soils
- Sacheen soils
- Louploup soils

### Major Uses

Timber production, livestock grazing, watershed, wildlife habitat, recreation, and building site development

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir and western larch—periodically  
*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind erosion.

## 455—Stepstone loam, 5 to 20 percent slopes

### Composition

*Stepstone soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of mountains  
*Parent material:* Mantle of volcanic ash 14 to 30 inches thick over glacial till derived from granitic rock  
*Slope range:* 5 to 20 percent  
*Elevation:* 2,500 to 5,000 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 0.75 inch thick  
*Surface layer:*  
 0 to 0.5 inch—light brownish gray loam  
*Upper part of subsoil:*  
 0.5 inch to 18 inches—yellowish brown and light yellowish brown loam  
*Lower part of subsoil:*  
 18 to 22 inches—very pale brown gravelly sandy loam  
*Upper part of substratum:*  
 22 to 34 inches—light gray very stony loamy sand

*Lower part of substratum:*

34 to 60 inches—white extremely stony loamy sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—moderate or severe; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Nevine soils
- Manley and Resner soils
- Mineral soils
- Soils that have a very stony or bouldery surface

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir and western larch—readily; ponderosa pine and lodgepole pine—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**456—Stepstone loam, 20 to 40 percent slopes****Composition**

*Stepstone soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Backslopes and footslopes of mountains

*Parent material:* Mantle of volcanic ash 14 to 30 inches thick over glacial till derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 2,500 to 5,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 0.75 inch thick

*Surface layer:*

0 to 0.5 inch—light brownish gray loam

*Upper part of subsoil:*

0.5 inch to 18 inches—yellowish brown and light yellowish brown loam

*Lower part of subsoil:*

18 to 22 inches—very pale brown gravelly sandy loam

*Upper part of substratum:*

22 to 34 inches—light gray very stony loamy sand

*Lower part of substratum:*

34 to 60 inches—white extremely stony loamy sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—severe

*Hazard of wind erosion (bare surface):* Slight

**Contrasting Inclusions**

- Nevine soils
- Manley and Resner soils
- Mineral soils
- Soils that have a very stony or bouldery surface
- Rock outcrop

**Major Uses**

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and western larch—readily; ponderosa pine and lodgepole pine—periodically

*Limitations for planting:* None

## 457—Stepstone loam, 40 to 65 percent slopes

### Composition

*Stepstone soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Mantle of volcanic ash 14 to 30 inches thick over glacial till derived from granitic rock

*Slope range:* 40 to 65 percent

*Elevation:* 2,500 to 5,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 0.75 inch thick

*Surface layer:*

0 to 0.5 inch—light brownish gray loam

*Upper part of subsoil:*

0.5 inch to 18 inches—yellowish brown and light yellowish brown loam

*Lower part of subsoil:*

18 to 22 inches—very pale brown gravelly sandy loam

*Upper part of substratum:*

22 to 34 inches—light gray very stony loamy sand

*Lower part of substratum:*

34 to 60 inches—white extremely stony loamy sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through

March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Nevine soils
- Manley and Resner soils
- Mineral soils
- Soils that have a very stony or bouldery surface
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and western larch—readily; ponderosa pine and lodgepole pine—periodically

*Limitation for planting:* Steepness of slope

## 458—Stepstone bouldery loam, 20 to 40 percent slopes

### Composition

*Stepstone soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Footslopes and backslopes of mountains

*Parent material:* Mantle of volcanic ash 14 to 30 inches thick over glacial till derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 3,800 to 5,000 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

*Rock fragments on surface:* Boulders cover 0.1 to 3.0 percent

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 9 inches—brown bouldery loam

*Subsoil:*

9 to 29 inches—yellowish brown cobbly loam

*Substratum:*

29 to 60 inches—pale brown very gravelly loamy coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Merkel soils
- Mineral soils
- Nevine soils
- Manley and Resner soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and western larch—readily; ponderosa pine and lodgepole pine—periodically

*Limitations for planting:* None

## 459—Stevens silt loam, 0 to 8 percent slopes

### Composition

*Stevens soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Toeslopes and summits of hills

*Parent material:* Glacial till with a component of loess and volcanic ash

*Slope range:* 0 to 8 percent

*Elevation:* 1,600 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*

0 to 22 inches—dark grayish brown silt loam

*Upper part of subsoil:*

22 to 30 inches—brown silt loam

*Lower part of subsoil:*

30 to 38 inches—light brownish gray gravelly loam

*Substratum:*

38 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches over dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Very high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Garrison soils
- Borgeau soils
- Goldlake soils
- Donovan soils

### Major Uses

Nonirrigated cropland, nonirrigated and irrigated hay and pasture, building site development, timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and

tracked equipment—suitable; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and rooting depth.

## 460—Stevens silt loam, 8 to 15 percent slopes

### Composition

*Stevens soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and toeslopes of hills

*Parent material:* Glacial till with a component of loess and volcanic ash

*Slope range:* 8 to 15 percent

*Elevation:* 1,600 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*

0 to 22 inches—dark grayish brown silt loam

*Upper part of subsoil:*

22 to 30 inches—brown silt loam

*Lower part of subsoil:*

30 to 38 inches—light brownish gray gravelly loam

*Substratum:*

38 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Very high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Borgeau soils
- Glenrose soils
- Donovan soils
- Soils that are fine sandy loam throughout

### Major Uses

Nonirrigated cropland, nonirrigated hay and pasture (fig. 15), irrigated orchards at elevations of less than 1,800 feet, building site development, timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and rooting depth.

## 461—Stevens silt loam, 15 to 30 percent slopes

### Composition

*Stevens soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes and backslopes of hills

*Parent material:* Glacial till with a component of loess and volcanic ash

*Slope range:* 15 to 30 percent

*Elevation:* 1,600 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*

0 to 22 inches—dark grayish brown silt loam

Figure 15.—Area of Stevens silt loam, 8 to 15 percent slopes, used for hay production. Borgeau, Raisio, and Rufus soils are in background.

*Upper part of subsoil:*

22 to 30 inches—brown silt loam

*Lower part of subsoil:*

30 to 38 inches—light brownish gray gravelly loam

*Substratum:*

38 to 60 inches—light brownish gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* Very high

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Borgeau soils
- Glenrose soils

- Donavan soils
- Soils that have a dark surface layer less than 7 inches thick
- Soils that have a stony surface

### Similar Inclusions

- Soils that have a gravelly silt loam surface layer

### Major Uses

Nonirrigated hay and pasture, timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and rooting depth.

## 462—Stevens gravelly silt loam, 30 to 65 percent slopes

### Composition

*Stevens soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes of hills

*Parent material:* Glacial till with a component of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 1,600 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Surface layer:*

0 to 15 inches—very dark grayish brown gravelly silt loam

*Subsoil:*

15 to 31 inches—dark brown gravelly loam

*Substratum:*

31 to 60 inches—brown dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Borgeau soils
- Donavan soils
- Dehart soils
- Rock outcrop
- Soils that have a very stony surface

### Major Use

Timber production and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitation for planting:* Steepness of slope

## 463—Strat gravelly fine sandy loam, 0 to 10 percent slopes

### Composition

*Strat soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash with loess in the upper part

*Slope range:* 0 to 10 percent

*Elevation:* 1,000 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Surface layer:*  
 0 to 11 inches—brown gravelly fine sandy loam

*Subsoil:*  
 11 to 24 inches—yellowish brown very gravelly fine sandy loam

*Upper part of substratum:*  
 24 to 31 inches—light brownish gray, calcareous extremely gravelly loamy sand

*Middle part of substratum:*  
 31 to 39 inches—light brownish gray, calcareous extremely gravelly sand

*Lower part of substratum:*  
 39 to 60 inches—multicolored, calcareous extremely cobbly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Skaha soils
- Peshastin soils
- Pogue soils
- Soils that have a very stony or very cobbly surface

### Major Uses

Livestock grazing, irrigated hay and pasture, building site development, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by droughtiness and steepness of slope.

### 464—Stubblefield stony loam, 3 to 25 percent slopes

#### Composition

*Stubblefield soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Ground moraines and glaciated hills

*Parent material:* Glacial till derived from basalt with some loess

*Slope range:* 3 to 25 percent

*Elevation:* 1,200 to 1,950 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Surface layer:*  
 0 to 9 inches—grayish brown stony loam

*Upper part of subsoil:*  
 9 to 24 inches—pale brown very gravelly loam

*Lower part of subsoil:*  
 24 to 28 inches—light brownish gray hardpan

*Substratum:*  
 28 to 60 inches—light brownish gray dense glacial till that crushes to very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate above the hardpan and slow below the hardpan

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Strat soils

- Cashmont soils
- Malott and Timentwa soils
- Soils that have a very stony or extremely stony surface

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by rooting depth, large stones, steepness of slope, and water erosion.

## 465—Swakane cobbly loam, 25 to 65 percent slopes

### Composition

*Swakane soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Ridges and backslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 25 to 65 percent

*Elevation:* 1,500 to 3,000 feet

*Average annual precipitation:* 12 to 16 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Upper part of surface layer:*

0 to 6 inches—grayish brown cobbly loam

*Lower part of surface layer:*

6 to 11 inches—grayish brown very gravelly loam

*Substratum:*

11 to 14 inches—brown extremely gravelly sandy loam

*Bedrock:*

14 to 18 inches—granitic rock

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Conconully and Donovan soils
- Vanbrunt and Wynhoff soils
- Ginnis and Spokane soils
- Pole soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

## 466—Swakane-Rock outcrop complex, 5 to 30 percent slopes

### Composition

*Swakane soil and similar soils:* 50 percent

*Rock outcrop:* 30 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Ridges and shoulders of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 5 to 30 percent

*Elevation:* 1,500 to 3,000 feet

*Average annual precipitation:* 12 to 16 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Swakane—stones cover 3 to 15 percent

### Swakane Soil

#### Typical profile

*Upper part of surface layer:*  
0 to 7 inches—dark brown very stony loam

*Lower part of surface layer:*  
7 to 11 inches—brown very gravelly loam

*Subsoil:*  
11 to 14 inches—yellowish brown very cobbly loam

*Bedrock:*  
14 to 18 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Granitic rock

#### Contrasting Inclusions

- Conconully and Donovan soils
- Vanbrunt and Wynhoff soils
- Ginnis and Spokane soils
- Pole soils
- Soils that have bedrock at a depth of 4 to 10 inches

#### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

#### Use and Management

##### Livestock grazing

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 467—Swakane-Rock outcrop complex, 30 to 70 percent slopes

#### Composition

*Swakane soil and similar soils:* 45 percent

*Rock outcrop:* 35 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Shoulders and backslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 30 to 70 percent

*Elevation:* 1,500 to 3,000 feet

*Average annual precipitation:* 12 to 16 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Swakane—stones cover 3 to 15 percent

### Swakane Soil

#### Typical profile

*Upper part of surface layer:*  
0 to 7 inches—dark brown very stony loam

*Lower part of surface layer:*  
7 to 11 inches—brown very gravelly loam

*Subsoil:*  
11 to 14 inches—yellowish brown very cobbly loam

*Bedrock:*  
14 to 18 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Granitic rock

#### Contrasting Inclusions

- Conconully and Donovan soils
- Vanbrunt and Wynhoff soils
- Ginnis and Spokane soils
- Pole soils

- Soils that have bedrock at a depth of 4 to 10 inches

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

## 468—Swipkin silt loam, 0 to 5 percent slopes

### Composition

*Swipkin soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Lake plains and terraces  
*Parent material:* Glacial lake sediment with a component of loess and volcanic ash  
*Slope range:* 0 to 5 percent  
*Elevation:* 1,450 to 2,800 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
0 to 16 inches—dark grayish brown and brown silt loam  
*Subsoil:*  
16 to 21 inches—light yellowish brown silt loam  
*Substratum:*  
21 to 60 inches—light brownish gray silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February;  
more than 3 feet—none

*Hazard of water erosion:* Cropland—slight;  
forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Cedonia soils
- Scala soils
- Phoebe soils
- Donavan soils
- Bernhill soils

### Major Uses

Nonirrigated cropland, nonirrigated hay and pasture, timber production, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically  
*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by water erosion.

## 469—Swipkin silt loam, 5 to 10 percent slopes

### Composition

*Swipkin soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Lake plains and terraces  
*Parent material:* Glacial lake sediment with a component of loess and volcanic ash  
*Slope range:* 5 to 10 percent  
*Elevation:* 1,450 to 2,800 feet  
*Average annual precipitation:* 15 to 18 inches  
*Average annual air temperature:* 45 to 47 degrees F  
*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 16 inches—dark grayish brown and brown silt loam

*Subsoil:*

16 to 21 inches—light yellowish brown silt loam

*Substratum:*

21 to 60 inches—light brownish gray silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Cedonia soils
- Scala soils
- Phoebe soils
- Donavan soils
- Bernhill soils

### Major Uses

Nonirrigated cropland, nonirrigated hay and pasture, timber production, livestock grazing, building site development, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitations for planting:* None

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

### 470—Thout gravelly loam, dry, 20 to 40 percent slopes

#### Composition

*Thout soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains

*Parent material:* Residuum and colluvium derived from rhyodacite and quartz latite with some glacial till and a minor amount of volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 2,200 to 4,200 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown gravelly loam

*Subsoil:*

4 to 26 inches—pale brown very gravelly loam

*Bedrock:*

26 to 30 inches—rhyodacite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Baldknob soils
- Inkler and Scoap soils
- Centralpeak soils
- Northstar soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

### 471—Thout, dry-Rock outcrop complex, 8 to 20 percent slopes

#### Composition

*Thout soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Shoulders and ridges of hills and mountains

*Parent material:* Residuum and colluvium derived from rhyodacite and quartz latite with some glacial till and a minor amount of volcanic ash and loess

*Slope range:* 8 to 20 percent

*Elevation:* 2,200 to 4,200 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Thout Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown gravelly loam

*Subsoil:*

4 to 26 inches—pale brown very gravelly loam

*Bedrock:*

26 to 30 inches—rhyodacite

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Rock Outcrop

*Kind of rock:* Rhyodacite and quartz latite

### Contrasting Inclusions

- Baldknob soils
- Inkler and Scoap soils
- Centralpeak soils
- Northstar soils
- Soils that have a very stony surface

### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

### 472—Thout, dry-Rock outcrop complex, 20 to 40 percent slopes

#### Composition

*Thout soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Backslopes and shoulders of hills and mountains

*Parent material:* Residuum and colluvium derived from rhyodacite and quartz latite with some glacial till and a minor amount of volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 2,200 to 4,200 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

## Thout Soil

### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown gravelly loam

*Subsoil:*

4 to 26 inches—pale brown very gravelly loam

*Bedrock:*

26 to 30 inches—rhyodacite

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

## Rock Outcrop

*Kind of rock:* Rhyodacite and quartz latite

### Contrasting Inclusions

- Baldknob soils
- Inkler and Scoap soils
- Centralpeak soils
- Northstar soils
- Soils that have a very stony surface

### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

## 473—Thout, dry-Rock outcrop complex, 40 to 65 percent slopes

### Composition

*Thout soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from rhyodacite and quartz latite with some glacial till and a minor amount of volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 2,200 to 4,200 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

## Thout Soil

### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 4 inches—grayish brown gravelly loam

*Subsoil:*

4 to 26 inches—pale brown very gravelly loam

*Bedrock:*

26 to 30 inches—rhyodacite

### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe or very severe

## Rock Outcrop

*Kind of rock:* Rhyodacite and quartz latite

### Contrasting Inclusions

- Baldknob soils
- Inkler and Scoap soils
- Centralpeak soils
- Northstar soils

- Soils that have a very stony surface
- Rubble land

### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

## 474—Timentwa loam, 0 to 8 percent slopes

### Composition

*Timentwa soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Glacial till plains on basalt plateaus

*Parent material:* Glacial till derived mainly from basalt with a mantle of loess and volcanic ash

*Slope range:* 0 to 8 percent

*Elevation:* 2,200 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Surface layer:*

0 to 18 inches—dark grayish brown and grayish brown loam

*Upper part of subsoil:*

18 to 28 inches—brown gravelly loam

*Middle part of subsoil:*

28 to 41 inches—pale brown gravelly loam

*Lower part of subsoil:*

41 to 56 inches—light brownish gray and pale brown, calcareous cobbly sandy loam

*Substratum:*

56 to 60 inches—light brownish gray hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow

*Hazard of water erosion:* Cropland—slight; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have a bouldery or stony surface
- Emdent soils
- Picard soils
- Bakeoven soils
- Duleylake soils
- Colockum soils
- Soils that have a hardpan at a depth of 20 to 40 inches
- Haley soils

### Major Uses

Livestock grazing, nonirrigated cropland, nonirrigated hay and pasture (fig. 16), recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 475—Timentwa loam, 8 to 15 percent slopes

### Composition

*Timentwa soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Glacial till plains on basalt plateaus

*Parent material:* Glacial till derived mainly from basalt with a mantle of loess and volcanic ash

*Slope range:* 8 to 15 percent

Figure 16.—Winter wheat stubble with glacial erratic boulders in an area of Timentwa loam, 0 to 8 percent slopes.

*Elevation:* 2,200 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

#### Typical Profile

*Surface layer:*

0 to 18 inches—dark grayish brown and grayish brown loam

*Upper part of subsoil:*

18 to 28 inches—brown gravelly loam

*Middle part of subsoil:*

28 to 41 inches—pale brown gravelly loam

*Lower part of subsoil:*

41 to 56 inches—light brownish gray and pale brown, calcareous cobbly sandy loam

*Substratum:*

56 to 60 inches—light brownish gray hardpan

#### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium

*Hazard of water erosion:* Cropland—moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have a bouldery or stony surface
- Picard soils
- Emdent soils
- Bakeoven soils
- Duleylake soils
- Colockum soils
- Soils that have a hardpan at a depth of 20 to 40 inches
- Haley soils

### Major Uses

Nonirrigated cropland, livestock grazing, recreation, watershed, wildlife habitat, and building site development

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 476—Timentwa very bouldery loam, 0 to 30 percent slopes

### Composition

*Timentwa soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Glacial till plains and moraines on basalt plateaus

*Parent material:* Glacial till derived mainly from basalt with a mantle of loess and volcanic ash

*Slope range:* 0 to 30 percent

*Elevation:* 2,200 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Boulders and stones cover 3 to 15 percent

### Typical Profile

*Upper part of surface layer:*

0 to 12 inches—dark brown very bouldery loam

*Upper part of subsoil:*

12 to 20 inches—yellowish brown gravelly loam

*Middle part of subsoil:*

20 to 37 inches—light brownish gray gravelly loam

*Lower part of subsoil:*

37 to 52 inches—pale brown, calcareous gravelly sandy loam

*Substratum:*

52 to 60 inches—light brown hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Picard soils
- Emdent soils
- Bakeoven soils
- Colockum soils
- Soils that have a hardpan at a depth of 20 to 40 inches
- Haley soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by large stones, steepness of slope, and water erosion.

## 477—Timentwa loams complex, 30 to 65 percent slopes

### Composition

*Timentwa soil, south slopes, and similar soils:*

50 percent

*Timentwa soil, north slopes, and similar soils:*  
35 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Glacial till plain escarpments, and footslopes and backslopes of moraines

*Parent material:* Glacial till derived mainly from basalt with a mantle of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 2,200 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

#### Timentwa, south slopes

*Surface layer:*

0 to 18 inches—dark grayish brown and grayish brown loam

*Upper part of subsoil:*

18 to 28 inches—brown gravelly loam

*Middle part of subsoil:*

28 to 41 inches—pale brown gravelly loam

*Lower part of subsoil:*

41 to 56 inches—light brownish gray and pale brown, calcareous cobbly sandy loam

*Substratum:*

56 to 60 inches—light brownish gray hardpan

#### Timentwa, north slopes

*Surface layer:*

0 to 20 inches—dark grayish brown and dark brown loam

*Upper part of subsoil:*

20 to 29 inches—brown loam

*Middle part of subsoil:*

29 to 37 inches—yellowish brown loam

*Lower part of the subsoil:*

37 to 42 inches—very pale brown, calcareous cobbly sandy loam

*Substratum:*

42 to 60 inches—brown and very pale brown hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Rapid or very rapid

*Hazard of water erosion:* Rangeland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have a very bouldery or very stony surface
- Bakeoven soils
- Colockum soils
- Soils that have a hardpan at a depth of 20 to 40 inches
- Badge soils
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

### 478—Timentwa very bouldery loams complex, 30 to 65 percent slopes

#### Composition

*Timentwa soil, south slopes, and similar soils:*  
50 percent

*Timentwa soil, north slopes, and similar soils:*  
35 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Footslopes and backslopes of dissected glacial till plains and moraines on basalt plateaus

*Parent material:* Glacial till derived mainly from basalt with a mantle of loess and volcanic ash

*Slope range:* 30 to 65 percent

*Elevation:* 2,200 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Boulders and stones cover 3 to 15 percent

### Typical Profile

#### Timentwa, south slopes

*Surface layer:*

0 to 8 inches—dark brown very bouldery loam

*Upper part of subsoil:*

8 to 20 inches—yellowish brown gravelly loam

*Middle part of subsoil:*

20 to 37 inches—light brownish gray gravelly loam

*Lower part of subsoil:*

37 to 52 inches—pale brown, calcareous gravelly sandy loam

*Substratum:*

52 to 60 inches—light brown hardpan

#### Timentwa, north slopes

*Upper part of surface layer:*

0 to 4 inches—dark gray very bouldery loam

*Lower part of surface layer:*

4 to 26 inches—dark gray and dark grayish brown loam

*Upper part of subsoil:*

26 to 36 inches—brown loam

*Middle part of subsoil:*

36 to 42 inches—grayish brown gravelly loam

*Lower part of subsoil:*

42 to 56 inches—light brownish gray, calcareous gravelly sandy loam

*Substratum:*

56 to 60 inches—grayish brown hardpan

### Soil Properties and Qualities

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Bakeoven soils
- Colockum soils
- Soils that have a hardpan at a depth of 20 to 40 inches
- Badge soils
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

#### 479—Timentwa-Bakeoven-Rock outcrop complex, 0 to 30 percent slopes

### Composition

*Timentwa soil and similar soils:* 50 percent

*Bakeoven soil and similar soils:* 20 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Timentwa—glacial till plains and moraines on basalt plateaus; Bakeoven—glacially scoured areas on basalt plateaus

*Parent material:* Timentwa—glacial till derived mainly from basalt with a mantle of loess and volcanic ash; Bakeoven—colluvium and residuum derived from basalt with some loess

*Slope range:* Timentwa—0 to 25 percent;

Bakeoven—0 to 30 percent

*Elevation:* 2,200 to 2,900 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Timentwa Soil

#### Typical profile

*Surface layer:*

0 to 18 inches—dark grayish brown and grayish brown loam

*Upper part of subsoil:*

18 to 28 inches—brown gravelly loam

*Middle part of subsoil:*

28 to 41 inches—pale brown gravelly loam

*Lower part of subsoil:*

41 to 56 inches—light brownish gray and pale brown, calcareous cobbly sandy loam

*Substratum:*

56 to 60 inches—light brownish gray hardpan

**Soil properties and qualities**

*Depth class:* Deep (40 to 60 inches to a hardpan)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* 40 to 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Bakeoven Soil****Typical profile**

*Surface layer:*

0 to 3 inches—brown very cobbly silt loam

*Subsoil:*

3 to 7 inches—brown very cobbly silt loam

*Bedrock:*

7 to 11 inches—basalt

**Soil properties and qualities**

*Depth class:* Very shallow (4 to 10 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Very low

*Potential rooting depth:* 4 to 10 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

**Rock Outcrop**

*Kind of rock:* Basalt

**Contrasting Inclusions**

- Soils that are moderately well drained
- Emdent soils
- Soils that have a very bouldery surface

**Major Uses**

Livestock grazing, recreation, watershed, wildlife habitat, and building site development

**Use and Management****Livestock grazing**

- The Bakeoven soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The Bakeoven soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

**480—Togo silt loam, 5 to 20 percent slopes****Composition**

*Togo soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Toeslopes and footslopes of mountains

*Parent material:* Mantle of volcanic ash 14 to 20 inches thick over residuum and colluvium derived from granitic rock

*Slope range:* 5 to 20 percent

*Elevation:* 4,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

**Typical Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—yellowish brown silt loam

*Upper part of subsoil:*

4 to 15 inches—yellowish brown silt loam

*Lower part of subsoil:*

15 to 28 inches—light yellowish brown very cobbly sandy loam

*Substratum:*

28 to 60 inches—light yellowish brown very cobbly sandy loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—November through

May; more than 3 feet—December through April

*Hazard of water erosion:* Forestland—slight or moderate

**Contrasting Inclusions**

- Buhrig and Moses soils
- Manley soils
- Codylake soils
- Ohscow soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Western larch and lodgepole pine—readily; subalpine fir and Engelmann spruce—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

## 481—Togo silt loam, 20 to 40 percent slopes

### Composition

*Togo soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Foothills and backslopes of mountains

*Parent material:* Mantle of volcanic ash 14 to 20 inches thick over residuum and colluvium derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 4,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—yellowish brown silt loam

*Upper part of subsoil:*

4 to 15 inches—yellowish brown silt loam

*Lower part of subsoil:*

15 to 28 inches—light yellowish brown very cobbly sandy loam

*Substratum:*

28 to 60 inches—light yellowish brown very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through May; more than 3 feet—December through April

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Buhrig and Moses soils
- Manley soils
- Codylake soils
- Ohscow soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Western larch and lodgepole pine—readily; subalpine fir and Engelmann spruce—periodically

*Limitations for planting:* None

## 482—Togo silt loam, 40 to 65 percent slopes

### Composition

*Togo soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Mantle of volcanic ash 14 to 20 inches thick over residuum and colluvium derived from granitic rock

*Slope range:* 40 to 65 percent

*Elevation:* 4,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 4 inches—yellowish brown silt loam

*Upper part of subsoil:*

4 to 15 inches—yellowish brown silt loam

*Lower part of subsoil:*

15 to 28 inches—light yellowish brown very cobbly sandy loam

*Substratum:*

28 to 60 inches—light yellowish brown very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very rapid

*Snowpack:* More than 1 foot—November through May; more than 3 feet—December through April

*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Buhrig and Moses soils
- Manley soils
- Codylake soils
- Ohscow soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Western larch and lodgepole pine—readily; subalpine fir and Engelmann spruce—periodically

*Limitation for planting:* Steepness of slope

### 483—Togo silt loam, warm, 20 to 40 percent slopes

#### Composition

*Togo soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes of mountains

*Parent material:* Mantle of volcanic ash 14 to 20 inches thick over residuum and colluvium derived from granitic rock

*Slope range:* 20 to 40 percent

*Elevation:* 4,000 to 5,500 feet

*Average annual precipitation:* 20 to 25 inches

*Average annual air temperature:* 40 to 42 degrees F

*Frost-free period:* 90 to 110 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 5 inches—yellowish brown silt loam

*Upper part of subsoil:*

5 to 16 inches—yellowish brown silt loam

*Lower part of subsoil:*

16 to 29 inches—pale brown very gravelly sandy loam

*Substratum:*

29 to 60 inches—pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Buhrig and Moses soils
- Manley soils
- Codylake soils
- Ohscow soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Lodgepole pine—readily; subalpine fir, Douglas-fir, and western larch—periodically

*Limitations for planting:* None

## 484—Togo-Rock outcrop complex, 5 to 30 percent slopes

### Composition

*Togo soil and similar soils:* 65 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes and footslopes of mountains

*Parent material:* Mantle of volcanic ash 14 to 20 inches thick over residuum and colluvium derived from granitic rock

*Slope range:* 5 to 30 percent

*Elevation:* 4,000 to 6,000 feet

*Average annual precipitation:* 20 to 30 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

*Rock fragments on surface:* Togo—stones cover 3 to 15 percent

### Togo Soil

#### Typical profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 6 inches—brown very stony silt loam

*Upper part of subsoil:*

6 to 16 inches—yellowish brown cobbly silt loam

*Lower part of subsoil:*

16 to 30 inches—pale brown very gravelly sandy loam

*Substratum:*

30 to 60 inches—pale brown very gravelly sandy loam

#### Soil properties and qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—November through

May; more than 3 feet—December through April

*Hazard of water erosion:* Forestland—slight or moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Buhrig and Moses soils
- Manley soils
- Codylake soils
- Ohscow soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

- Rock outcrop and stones on the surface restrict the movement of ground equipment.

#### Silviculture

*Potential for natural regeneration:* Western larch and lodgepole pine—readily; subalpine fir and Engelmann spruce—periodically

*Limitations for planting:* Rock outcrop and very stony surface layer

## 485—Torboy fine sandy loam, 0 to 20 percent slopes

### Composition

*Torboy soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces and toeslopes of mountains

*Parent material:* Glacial outwash with a component of loess and volcanic ash in the upper part

*Slope range:* 0 to 20 percent

*Elevation:* 2,800 to 3,900 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*  
 0 to 4 inches—pale brown fine sandy loam

*Subsoil:*  
 4 to 16 inches—pale brown fine sandy loam

*Upper part of substratum:*  
 16 to 20 inches—light gray gravelly loamy sand

*Middle part of substratum:*  
 20 to 33 inches—very pale brown gravelly sand

*Lower part of substratum:*  
 33 to 60 inches—light gray gravelly fine sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Scabblers soils
- Stapaloo soils
- Wapal soils
- Goddard and Kiehl soils
- Sacheen soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and

lodgepole pine—readily; Douglas-fir and western larch—periodically  
*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wind erosion, droughtiness, and steepness of slope.

### 486—Torboy fine sandy loam, 20 to 40 percent slopes

#### Composition

*Torboy soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terrace escarpments, and footslopes and backslopes of mountains  
*Parent material:* Glacial outwash with a component of loess and volcanic ash in the upper part  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,800 to 4,500 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1 inch thick  
*Surface layer:*  
 0 to 4 inches—pale brown fine sandy loam

*Subsoil:*  
 4 to 16 inches—pale brown fine sandy loam

*Upper part of substratum:*  
 16 to 20 inches—light gray gravelly loamy sand

*Middle part of substratum:*  
 20 to 33 inches—very pale brown gravelly sand

*Lower part of substratum:*  
 33 to 60 inches—light gray gravelly fine sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Wapal soils
- Stapaloop soils
- Scrabblers soils
- Goddard and Kiehl soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and lodgepole pine—readily; Douglas-fir and western larch—periodically

### 487—Torrifluentic Haploxerolls, 0 to 3 percent slopes

#### Composition

*Torrifluentic Haploxerolls and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Stream terraces  
*Parent material:* Alluvium  
*Slope range:* 0 to 3 percent  
*Elevation:* 800 to 2,000 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

#### Reference Profile

*Surface layer:*  
0 to 11 inches—gray, calcareous loamy coarse sand

*Upper part of substratum:*  
11 to 26 inches—brown and pale brown, calcareous coarse sand

*Lower part of substratum:*  
26 to 60 inches—light brownish gray and multicolored, stratified, calcareous silt loam to coarse sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Rapid

*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe  
*Frequency, duration, and period of flooding:*  
Occasional, brief periods in February through May

### Contrasting Inclusions

- Skaha soils
- Soils that have a stony or very stony surface
- Quincy soils
- Farrell and Cashmere soils

### Major Uses

Livestock grazing, irrigated hay and pasture, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this unit is used for irrigated crops, it is limited by droughtiness and fast infiltration.

### 488—Tunkcreek fine sandy loam, 5 to 20 percent slopes

#### Composition

*Tunkcreek soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Terraces and toeslopes of mountains  
*Parent material:* Glacial outwash with a mantle of volcanic ash and loess 14 to 20 inches thick  
*Slope range:* 5 to 20 percent  
*Elevation:* 3,500 to 4,600 feet  
*Average annual precipitation:* 22 to 28 inches  
*Average annual air temperature:* 39 to 41 degrees F  
*Frost-free period:* 80 to 100 days

#### Typical Profile

*Organic mat on surface:* 1.5 inches thick  
*Surface layer:*  
0 to 0.75 inch—light gray very fine sandy loam

**Subsoil:**

0.75 inch to 16 inches—light yellowish brown fine sandy loam

**Upper part of substratum:**

16 to 31 inches—light gray loamy sand

**Lower part of substratum:**

31 to 60 inches—light gray gravelly coarse sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—slight or moderate

**Contrasting Inclusions**

- Manley and Resner soils
- Scrabblers and Torboy soils
- Stapaloop soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Subalpine fir, western larch, and lodgepole pine—readily; Douglas-fir and Engelmann spruce—periodically

*Limitations for planting:* None

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and wind and water erosion.

**489—Tunkcreek fine sandy loam, 20 to 40 percent slopes****Composition**

*Tunkcreek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Foothills of mountains

*Parent material:* Glacial outwash with a mantle of volcanic ash and loess 14 to 20 inches thick

*Slope range:* 20 to 40 percent

*Elevation:* 3,500 to 4,600 feet

*Average annual precipitation:* 22 to 28 inches

*Average annual air temperature:* 39 to 41 degrees F

*Frost-free period:* 80 to 100 days

**Typical Profile**

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 0.75 inch—light gray very fine sandy loam

*Subsoil:*

0.75 inch to 16 inches—light yellowish brown fine sandy loam

*Upper part of substratum:*

16 to 31 inches—light gray loamy sand

*Lower part of substratum:*

31 to 60 inches—light gray gravelly coarse sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—November through

April; more than 3 feet—December through March

*Hazard of water erosion:* Forestland—moderate or severe

**Contrasting Inclusions**

- Manley and Resner soils
- Scrabblers and Torboy soils
- Stapaloop soils

**Major Uses**

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Subalpine fir,

western larch, and lodgepole pine—readily;  
Douglas-fir and Engelmann spruce—periodically  
*Limitations for planting:* None

### 490—Tyee gravelly loam, 5 to 30 percent slopes

#### Composition

*Tyee soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Summits and shoulders of hills  
*Parent material:* Residuum and colluvium derived from granitic rock with some loess  
*Slope range:* 5 to 30 percent  
*Elevation:* 2,000 to 3,200 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

#### Typical Profile

*Upper part of surface layer:*  
0 to 5 inches—dark grayish brown gravelly loam

*Lower part of surface layer:*  
5 to 11 inches—brown gravelly loam

*Subsoil:*  
11 to 17 inches—brown gravelly loam

*Bedrock:*  
17 to 27 inches—weathered granitic rock

#### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Low  
*Potential rooting depth:* 10 to 20 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Rangeland—slight or moderate  
*Hazard of wind erosion (bare surface):* Slight

#### Contrasting Inclusions

- Ginnis soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Swakane soils
- Morical soils
- Soils that have a very stony surface
- Rock outcrop

#### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

## Use and Management

### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 491—Tyee gravelly loam, 30 to 65 percent slopes

#### Composition

*Tyee soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Mainly south-facing backslopes of hills  
*Parent material:* Residuum and colluvium derived from granitic rock with some loess  
*Slope range:* 30 to 65 percent  
*Elevation:* 2,000 to 3,200 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

#### Typical Profile

*Upper part of surface layer:*  
0 to 3 inches—grayish brown gravelly loam

*Lower part of surface layer:*  
3 to 13 inches—brown gravelly loam

*Subsoil:*  
13 to 16 inches—pale brown gravelly loam

*Bedrock:*  
16 to 26 inches—weathered granitic rock

#### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)  
*Drainage class:* Well drained  
*Permeability:* Moderate  
*Available water capacity:* Low  
*Potential rooting depth:* 10 to 20 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Rangeland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

#### Contrasting Inclusions

- Ginnis soils

- Soils that have bedrock at a depth of 4 to 10 inches
- Swakane soils
- Morical soils
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 492—Tyee gravelly loam, 30 to 65 percent north slopes

#### Composition

*Tyee soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Mainly north-facing backslopes of hills

*Parent material:* Colluvium and residuum derived from granitic rock with some loess

*Slope range:* 30 to 65 percent

*Elevation:* 2,000 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

#### Typical Profile

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown gravelly loam

*Lower part of surface layer:*

5 to 11 inches—brown gravelly loam

*Subsoil:*

11 to 17 inches—brown gravelly loam

*Bedrock:*

17 to 27 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Ginnis soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Swakane soils
- Morical soils
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Livestock grazing, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This soil is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 493—Tyee-Morical-Tyee complex, 30 to 60 percent slopes

#### Composition

*Tyee soil, north slopes, and similar soils:* 30 percent

*Morical soil and similar soils:* 30 percent

*Tyee soil, south slopes, and similar soils:* 25 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Tyee—convex backslopes and shoulders of hills; Morical—linear and concave backslopes of hills

*Parent material:* Tyee—colluvium derived from granitic rock with some loess; Morical—residuum and colluvium derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 30 to 60 percent

*Elevation:* 2,400 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days

### Typical Profile

#### Tyee, north slopes

*Upper part of surface layer:*

0 to 5 inches—dark grayish brown gravelly loam

*Lower part of surface layer:*

5 to 11 inches—brown gravelly loam

*Subsoil:*

11 to 17 inches—brown gravelly loam

*Bedrock:*

17 to 27 inches—weathered granitic rock

#### Morical

*Surface layer:*

0 to 17 inches—grayish brown silt loam

*Upper part of subsoil:*

17 to 28 inches—light yellowish brown silt loam

*Lower part of subsoil:*

28 to 33 inches—light yellowish brown gravelly loam

*Bedrock:*

33 to 43 inches—weathered granitic rock

#### Tyee, south slopes

*Upper part of surface layer:*

0 to 3 inches—grayish brown gravelly loam

*Lower part of surface layer:*

3 to 13 inches—brown gravelly loam

*Subsoil:*

13 to 16 inches—pale brown gravelly loam

*Bedrock:*

16 to 26 inches—weathered granitic rock

### Soil Properties and Qualities

*Depth class:* Tyee—shallow (10 to 20 inches to bedrock); Morical—moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Tyee—low; Morical—moderately high

*Potential rooting depth:* Tyee—10 to 20 inches; Morical—20 to 40 inches

*Runoff:* Tyee—medium or rapid; Morical—rapid or very rapid

*Hazard of water erosion (Tyee):* Rangeland—moderate or severe

*Hazard of water erosion (Morical):* Rangeland—severe or very severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Soils that have bedrock at a depth of 4 to 10 inches
- Soils that have a very stony surface
- Rock outcrop

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soils in this unit are too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

### 494—Tyee-Rock outcrop complex, 8 to 30 percent slopes

#### Composition

*Tyee soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Summits and shoulders of hills

*Parent material:* Residuum and colluvium derived from granitic rock with some loess

*Slope range:* 8 to 30 percent

*Elevation:* 2,000 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Tyee Soil

#### Typical profile

*Upper part of surface layer:*

0 to 3 inches—grayish brown gravelly loam

*Lower part of surface layer:*

3 to 13 inches—brown gravelly loam

*Subsoil:*

13 to 16 inches—pale brown gravelly loam

**Bedrock:**

16 to 26 inches—weathered granitic rock

**Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

**Rock Outcrop**

*Kind of rock:* Granitic rock

**Contrasting Inclusions**

- Ginnis soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Swakane soils
- Morical soils
- Soils that have a very stony surface

**Major Uses**

Livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Livestock grazing**

- This unit is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

**495—Tyee-Rock outcrop complex,  
30 to 65 percent slopes****Composition**

*Tyee soil and similar soils:* 60 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Mainly south-facing backslopes of hills

*Parent material:* Colluvium derived from granitic rock with some loess

*Slope range:* 30 to 65 percent

*Elevation:* 2,000 to 3,200 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

**Tyee Soil****Typical profile**

*Upper part of surface layer:*

0 to 3 inches—grayish brown gravelly loam

*Lower part of surface layer:*

3 to 13 inches—brown gravelly loam

*Subsoil:*

13 to 16 inches—pale brown gravelly loam

*Bedrock:*

16 to 26 inches—weathered granitic rock

**Soil properties and qualities**

*Depth class:* Shallow (10 to 20 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 10 to 20 inches

*Runoff:* Medium or rapid

*Hazard of water erosion:* Rangeland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

**Rock Outcrop**

*Kind of rock:* Granitic rock

**Contrasting Inclusions**

- Ginnis soils
- Soils that have bedrock at a depth of 4 to 10 inches
- Swakane soils
- Morical soils
- Soils that have a very stony surface

**Major Uses**

Livestock grazing, recreation, watershed, and wildlife habitat

**Use and Management****Livestock grazing**

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- The soil in this unit is too shallow for most uses. Fences require special designs, pipelines cannot be buried below the frostline, ponds are not feasible, and seeding and brush management are not practical.

## 496—Typic Haplaquolls, 0 to 2 percent slopes

### Composition

*Typic Haplaquolls and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Low terraces and flood plains

*Parent material:* Alluvium and glacial outwash

*Slope range:* 0 to 2 percent

*Elevation:* 740 to 800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Reference Profile

*Surface layer:*

0 to 8 inches—brown fine sandy loam

*Subsoil:*

8 to 24 inches—mottled, light brownish gray fine sandy loam

*Substratum:*

24 to 60 inches—mottled, light brownish gray fine sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Poorly drained

*Permeability:* Moderate to rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Very slow

*Hazard of water erosion:* Cropland—none or slight; rangeland—none

*Hazard of wind erosion (bare surface):* Severe when the soils are dry

*Water table:* Present in December through August (see "Water Features" table)

*Frequency, duration, and period of flooding:*

Occasional, long periods in January through June

### Contrasting Inclusions

- Quincy soils
- Aeneas, Skaha, and Strat soils
- Monse soils
- Okanogan and Cashmere soils
- Ellisforde soils

### Major Uses

Nonirrigated hay and pasture and wildlife habitat

### Use and Management

#### Nonirrigated hay and pasture

- The soils in this unit are affected by a high water table that limits use of the soils at certain times of the year.

#### Irrigated cropland

- If the soils in this unit are used for irrigated crops, they are limited by wetness.

## 497—Typic Xerorthents-Typic Xerochrepts complex, 5 to 50 percent slopes

### Composition

*Typic Xerorthents and similar soils:* 40 percent

*Typic Xerochrepts and similar soils:* 40 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Typic Xerorthents—unstable terrace escarpments and slopes associated with recent landslides; Typic Xerochrepts—unstable terrace escarpments and hummocky metastable slopes associated with landslides

*Parent material:* Glacial outwash, glaciofluvial material, glacial lake sediment, and mixed material from landslides and debris flows

*Slope range:* 5 to 50 percent

*Elevation:* 1,300 to 1,900 feet

*Average annual precipitation:* 15 to 17 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Reference Profile

#### Typic Xerorthents

*Surface layer:*

0 to 5 inches—dark grayish brown loam

*Upper part of subsoil:*

5 to 9 inches—grayish brown loam

*Middle part of subsoil:*

9 to 49 inches—light gray and pale yellow, calcareous gravelly sandy loam and sandy loam

*Lower part of subsoil:*

49 to 60 inches—mottled, light gray and white, calcareous silty clay loam

**Typic Xerochrepts***Surface layer:*

0 to 7 inches—grayish brown gravelly sandy loam

*Upper part of subsoil:*

7 to 22 inches—light brownish gray very gravelly coarse sandy loam

*Middle part of subsoil:*

22 to 31 inches—light gray, calcareous very gravelly loam

*Lower part of subsoil:*

31 to 60 inches—light brownish gray, calcareous silt loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Typic Xerorthents—well drained and somewhat excessively drained; Typic Xerochrepts—well drained

*Permeability:* Moderately slow

*Available water capacity:* Typic Xerorthents—moderate or moderately high; Typic Xerochrepts—moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate or severe

**Contrasting Inclusions**

- Soils that have a very stony surface
- Soils in drainageways that have a colder soil temperature regime
- Soils that are moderately well drained or somewhat poorly drained

**Major Uses**

Livestock grazing, wildlife habitat, and watershed

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically

*Limitation for planting:* Steepness of slope in some areas

**498—Ultic Haploxerolls, 40 to 70 percent slopes****Composition**

*Ultic Haploxerolls and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Terrace escarpments that have dominantly north- and east-facing aspects

*Parent material:* Glacial outwash, glaciofluvial material, and glacial lake sediment that commonly are mixed or stratified

*Slope range:* 40 to 70 percent

*Elevation:* 1,400 to 2,800 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

**Reference Profile**

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 13 inches—grayish brown and brown gravelly loam

*Subsoil:*

13 to 28 inches—pale brown gravelly sandy loam

*Upper part of substratum:*

28 to 42 inches—light brownish gray gravelly sandy loam

*Lower part of substratum:*

42 to 60 inches—light brownish gray gravelly loamy sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained and somewhat excessively drained

*Permeability:* Moderately slow

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe

**Contrasting Inclusions**

- Soils that are sandy throughout

- Soils that have a very stony surface
- Soils in seep areas that are moderately well drained

### Major Uses

Timber production, livestock grazing, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—readily; Douglas-fir—periodically  
*Limitation for planting:* Steepness of slope

## 499—Uncas muck, 0 to 2 percent slopes

### Composition

*Uncas soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Backswamps and valley flats  
*Parent material:* Alluvium derived dominantly from volcanic ash overlain by decomposed organic material  
*Slope range:* 0 to 2 percent  
*Elevation:* 1,900 to 2,600 feet  
*Average annual precipitation:* 18 to 22 inches  
*Average annual air temperature:* 42 to 45 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Upper part of surface layer:*  
 0 to 7 inches—dark gray muck

*Middle part of surface layer:*  
 7 to 11 inches—gray silt loam

*Lower part of surface layer:*  
 11 to 21 inches—light gray silt loam

*Upper part of substratum:*  
 21 to 48 inches—white silt loam

*Middle part of substratum:*  
 48 to 52 inches—white very fine sandy loam

*Lower part of substratum:*  
 52 to 60 inches—light gray silt loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Very poorly drained

*Permeability:* Moderately slow

*Available water capacity:* Very high

*Potential rooting depth:* More than 60 inches

*Runoff:* None

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—none; forestland—none

*Hazard of wind erosion (bare surface):* None

*Water table:* Present in December through August (see “Water Features” table)

*Frequency, duration, and period of flooding:* Frequent, long periods in March through May

### Contrasting Inclusions

- Soils that are poorly drained
- Soils that are somewhat poorly drained and formed in glacial lake sediment and alluvium

### Major Uses

Nonirrigated hay and pasture, wetland wildlife habitat, watershed, livestock grazing, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable during the short periods when the soil is dry; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Quaking aspen and black cottonwood—readily

*Limitations for planting:* Periods of flooding

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by wetness.

## 500—Vanbrunt-Rock outcrop complex, 5 to 20 percent slopes

### Composition

*Vanbrunt soil and similar soils:* 70 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Ridges and summits of hills and mountains

*Parent material:* Colluvium, residuum, and glacial till derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 1,800 to 4,400 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Vanbrunt—stones and boulders cover 3 to 15 percent

### Vanbrunt Soil

#### Typical profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*  
0 to 3 inches—brown very stony sandy loam

*Lower part of surface layer:*  
3 to 10 inches—brown very gravelly sandy loam

*Subsoil:*  
10 to 19 inches—light yellowish brown extremely cobbly sandy loam

*Substratum:*  
19 to 25 inches—very pale brown very cobbly sandy loam

*Bedrock:*  
25 to 29 inches—granitic rock

#### Soil properties and qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Very low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—slight

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Skanid soils
- Swakane soils
- Spokane soils
- Whitestone soils

### Major Uses

Livestock grazing, marginal timber production, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

### 501—Vanbrunt-Rock outcrop complex, 20 to 40 percent slopes

#### Composition

*Vanbrunt soil and similar soils:* 70 percent

*Rock outcrop:* 15 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Shoulders, backslopes, and footslopes of hills and mountains

*Parent material:* Colluvium, residuum, and glacial till derived from granitic rock with a component of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,800 to 4,400 feet

*Average annual precipitation:* 15 to 20 inches

*Average annual air temperature:* 45 to 48 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Vanbrunt—stones and boulders cover 3 to 15 percent

### Vanbrunt Soil

#### Typical profile

*Organic mat on surface:* 2 inches thick

*Upper part of surface layer:*  
0 to 3 inches—brown very stony sandy loam

*Lower part of surface layer:*  
3 to 10 inches—brown very gravelly sandy loam

*Subsoil:*  
10 to 19 inches—light yellowish brown extremely cobbly sandy loam

**Substratum:**

19 to 25 inches—very pale brown very cobbly sandy loam

**Bedrock:**

25 to 29 inches—granitic rock

**Soil properties and qualities**

**Depth class:** Moderately deep (20 to 40 inches to bedrock)

**Drainage class:** Well drained

**Permeability:** Moderately rapid

**Available water capacity:** Very low

**Potential rooting depth:** 20 to 40 inches

**Runoff:** Medium

**Snowpack:** More than 1 foot—January and February; more than 3 feet—none

**Hazard of water erosion:** Forestland—moderate

**Rock Outcrop**

**Kind of rock:** Granitic rock

**Contrasting Inclusions**

- Skanid soils
- Swakane soils
- Spokane soils
- Whitestone soils

**Major Uses**

Marginal timber production (fig. 17), wildlife habitat, watershed, and recreation

**Use and Management****Timber Production****Harvesting**

**Suitability of logging systems:** Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

**Potential for natural regeneration:** Ponderosa pine—periodically

**Limitations for planting:** Rock outcrop and rock fragments in the soil

**502—Vanbrunt-Rock outcrop complex, 40 to 65 percent slopes****Composition**

**Vanbrunt soil and similar soils:** 55 percent

**Rock outcrop:** 30 percent

**Contrasting inclusions:** 15 percent

**Setting**

**Position on landscape:** Backslopes of hills and mountains

**Parent material:** Colluvium, residuum, and glacial till derived from granitic rock with a component of loess and volcanic ash

**Slope range:** 40 to 65 percent

**Elevation:** 1,800 to 4,000 feet

**Average annual precipitation:** 15 to 20 inches

**Average annual air temperature:** 45 to 48 degrees F

**Frost-free period:** 100 to 130 days

**Rock fragments on surface:** Vanbrunt—stones and boulders cover 3 to 15 percent

**Vanbrunt Soil****Typical profile**

**Organic mat on surface:** 2 inches thick

**Upper part of surface layer:**

0 to 3 inches—brown very stony sandy loam

**Lower part of surface layer:**

3 to 10 inches—brown very gravelly sandy loam

**Subsoil:**

10 to 19 inches—light yellowish brown extremely cobbly sandy loam

**Substratum:**

19 to 25 inches—very pale brown very cobbly sandy loam

**Bedrock:**

25 to 29 inches—granitic rock

**Soil properties and qualities**

**Depth class:** Moderately deep (20 to 40 inches to bedrock)

**Drainage class:** Well drained

**Permeability:** Moderately rapid

**Available water capacity:** Very low

**Potential rooting depth:** 20 to 40 inches

**Runoff:** Rapid

**Snowpack:** More than 1 foot—January and February; more than 3 feet—none

**Hazard of water erosion:** Forestland—severe

**Rock Outcrop**

**Kind of rock:** Granitic rock

**Contrasting Inclusions**

- Skanid soils
- Swakane soils

Figure 17.—Area of Vanbrunt-Rock outcrop complex, 20 to 40 percent slopes, that supports a ponderosa pine/antelope bitterbrush-Idaho fescue ecological site.

- Spokane soils
- Whitestone soils
- Rubble land

### Major Uses

Marginal timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive

soil damage and erosion; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock outcrop, rock fragments in the soil, and steepness of slope

## 503—Wannacott silt loam, 0 to 8 percent slopes

### Composition

*Wannacott soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Undulating till plains

*Parent material:* Intermixed glacial lake sediment and glacial till with loess in the upper part

*Slope range:* 0 to 8 percent

*Elevation:* 2,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Upper part of surface layer:*

0 to 10 inches—grayish brown silt loam

*Lower part of surface layer:*

10 to 15 inches—light yellowish brown silt loam

*Upper part of subsoil:*

15 to 22 inches—light brownish gray silt loam

*Lower part of subsoil:*

22 to 29 inches—light yellowish brown, calcareous silty clay loam

*Upper part of substratum:*

29 to 35 inches—light yellowish gray gravelly sandy loam

*Lower part of substratum:*

35 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Disautel soils
- Conconully soils
- Nespelem soils

### Major Uses

Livestock grazing, nonirrigated cropland, building site development, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, rooting depth, and water erosion.

## 504—Wannacott silt loam, 8 to 15 percent slopes

### Composition

*Wannacott soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Undulating till plains

*Parent material:* Intermixed glacial lake sediment and glacial till with loess in the upper part

*Slope range:* 8 to 15 percent

*Elevation:* 2,200 to 2,700 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

### Typical Profile

*Upper part of surface layer:*

0 to 10 inches—grayish brown silt loam

*Lower part of surface layer:*

10 to 15 inches—light yellowish brown silt loam

*Upper part of subsoil:*

15 to 22 inches—light brownish gray silt loam

*Lower part of subsoil:*

22 to 29 inches—light yellowish brown, calcareous silty clay loam

*Upper part of substratum:*  
29 to 35 inches—light brownish gray gravelly sandy loam

*Lower part of substratum:*  
35 to 60 inches—light gray dense glacial till that crushes to gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to dense glacial till)

*Drainage class:* Well drained

*Permeability:* Moderate over slow

*Available water capacity:* High

*Effective rooting depth:* 20 to 40 inches

*Runoff:* Medium

*Hazard of water erosion:* Cropland—moderate; rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Disautel soils
- Conconully soils
- Nespelem soils

### Major Uses

Livestock grazing, nonirrigated cropland, building site development, watershed, wildlife habitat, and recreation

### Use and Management

#### Livestock grazing

- There are no significant limitations for management of this soil for this use.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and rooting depth.

## 505—Wapal gravelly sandy loam, 0 to 15 percent slopes

### Composition

*Wapal soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash with a component of volcanic ash and loess

*Slope range:* 0 to 15 percent

*Elevation:* 1,600 to 3,200 feet

*Average annual precipitation:* 16 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 5 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

5 to 11 inches—yellowish brown gravelly sandy loam

*Substratum:*

11 to 60 inches—multicolored very gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Goddard and Kiehl soils
- Parmenter soils
- Karamin and Torboy soils
- Merkel soils
- Soils that have a stony surface

### Major Uses

Timber production, livestock grazing, nonirrigated hay and pasture, building site development, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* Rock fragments in the soil

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

## 506—Wapal cobbly sandy loam, 0 to 15 percent slopes

### Composition

*Wapal soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Glacial outwash with a component of volcanic ash and loess

*Slope range:* 0 to 15 percent

*Elevation:* 1,600 to 3,500 feet

*Average annual precipitation:* 16 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 7 inches—grayish brown cobbly sandy loam

*Subsoil:*

7 to 15 inches—brown cobbly sandy loam

*Substratum:*

15 to 60 inches—multicolored extremely gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow

*Snowpack:* More than 1 foot—December through March; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Goddard and Kiehl soils
- Parmenter soils
- Karamin and Torboy soils
- Merkel soils
- Soils that have a very stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitation for planting:* Rock fragments in the soil

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope and droughtiness.

## 507—Wapal gravelly sandy loam, 15 to 30 percent slopes

### Composition

*Wapal soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terraces and terrace escarpments

*Parent material:* Glacial outwash with a component of volcanic ash and loess

*Slope range:* 15 to 30 percent

*Elevation:* 1,600 to 3,500 feet

*Average annual precipitation:* 16 to 24 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 5 inches—dark grayish brown gravelly sandy loam

*Subsoil:*

5 to 11 inches—yellowish brown gravelly sandy loam

*Substratum:*

11 to 60 inches—multicolored very gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—none  
*Hazard of water erosion:* Cropland—moderate or severe; forestland—moderate  
*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Goddard and Kiehl soils
- Parmenter soils
- Karamin and Torboy soils
- Sacheen soils
- Merkel soils
- Soils that have a stony surface

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically  
*Limitation for planting:* Rock fragments in the soil

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and droughtiness.

## 508—Wapal gravelly sandy loam, 30 to 65 percent slopes

### Composition

*Wapal soil and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash with a component of volcanic ash and loess

*Slope range:* 30 to 65 percent  
*Elevation:* 1,600 to 3,500 feet  
*Average annual precipitation:* 16 to 24 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Upper part of surface layer:*  
 0 to 5 inches—dark grayish brown gravelly sandy loam

*Lower part of surface layer:*  
 5 to 11 inches—light brownish gray gravelly sandy loam

*Substratum:*  
 11 to 60 inches—pale brown very gravelly coarse sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Somewhat excessively drained  
*Permeability:* Moderately rapid over very rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—none  
*Hazard of water erosion:* Forestland—moderate or severe

### Contrasting Inclusions

- Goddard and Kiehl soils
- Parmenter soils
- Karamin and Torboy soils
- Sacheen soils
- Merkel soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Ponderosa pine and Douglas-fir—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

**509—Wells creek channery loam, 5 to 20 percent slopes****Composition**

*Wells creek soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

**Setting**

*Position on landscape:* Fans, and toeslopes and footslopes of hills and mountains

*Parent material:* Colluvium derived from metasedimentary rock with a small amount of volcanic ash and loess

*Slope range:* 5 to 20 percent

*Elevation:* 2,000 to 3,200 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 4 inches thick

*Surface layer:*

0 to 10 inches—dark brown channery loam

*Subsoil:*

10 to 24 inches—light yellowish brown very channery loam

*Substratum:*

24 to 60 inches—pale brown very channery loam

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate

**Contrasting Inclusions**

- Henneway soils

- Wilmont soils

- Oxerine soils

**Major Uses**

Timber production (fig. 18), livestock grazing, nonirrigated hay and pasture, recreation, watershed, and wildlife habitat

**Use and Management****Timber Production****Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

**Irrigated Cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope and water erosion.

**510—Wells creek channery loam, 20 to 40 percent slopes****Composition**

*Wells creek soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

**Setting**

*Position on landscape:* Footslopes and backslopes of hills and mountains

*Parent material:* Colluvium derived from metasedimentary rock with a small amount of volcanic ash and loess

*Slope range:* 20 to 40 percent

*Elevation:* 2,000 to 3,200 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

**Typical Profile**

*Organic mat on surface:* 4 inches thick

*Surface layer:*

0 to 10 inches—dark brown channery loam

*Subsoil:*

10 to 24 inches—light yellowish brown very channery loam

Figure 18.—Area of Wells creek channery loam, 5 to 20 percent slopes, that supports ponderosa pine in the young forest successional stage. The ecological site is Douglas-fir/mallow ninebark.

*Substratum:*  
24 to 60 inches—pale brown very channery loam

#### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderately slow  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

#### **Contrasting Inclusions**

- Henneway soils

- Wilmont soils
- Oxerine soils

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

### 511—Wells creek very channery loam, 40 to 65 percent slopes

#### Composition

*Wells creek soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium derived from metasedimentary rock with a small amount of volcanic ash and loess

*Slope range:* 40 to 65 percent

*Elevation:* 2,000 to 3,200 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 4 inches thick

*Upper part of surface layer:*

0 to 6 inches—dark grayish brown very channery loam

*Lower part of surface layer:*

6 to 14 inches—brown very channery loam

*Upper part of subsoil:*

14 to 26 inches—yellowish brown extremely cobbly silt loam

*Lower part of subsoil:*

26 to 42 inches—light yellowish brown extremely channery loam

*Substratum:*

42 to 60 inches—light yellowish brown extremely channery loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately slow

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—severe or very severe

### Contrasting Inclusions

- Henneway soils
- Wilmont soils
- Oxerine soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

### 512—Whitestone loam, 5 to 20 percent slopes

#### Composition

*Whitestone soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Toeslopes and footslopes of hills and mountains

*Parent material:* Colluvium derived from granitic rock

and granitic glacial till with a small amount of loess and volcanic ash

*Slope range:* 5 to 20 percent

*Elevation:* 1,700 to 3,000 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Upper part of surface layer:*

0 to 6 inches—grayish brown loam

*Lower part of surface layer:*

6 to 14 inches—brown gravelly sandy loam

*Subsoil:*

14 to 29 inches—pale brown very gravelly sandy loam

*Substratum:*

29 to 60 inches—light brownish gray very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight or moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Donavan and Hellgate soils
- Spokane soils
- Vanbrunt soils
- Soils that have a very stony surface
- Bearspring soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* None

### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, and droughtiness.

## 513—Whitestone gravelly sandy loam, 20 to 40 percent slopes

### Composition

*Whitestone soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Backslopes and footslopes of hills and mountains

*Parent material:* Colluvium derived from granitic rock and granitic glacial till with a small amount of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,700 to 3,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 16 inches—grayish brown and brown gravelly sandy loam

*Subsoil:*

16 to 32 inches—pale brown very gravelly sandy loam

*Substratum:*

32 to 60 inches—pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—moderate or severe; forestland—moderate

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Donovan and Hellgate soils
- Spokane soils
- Vanbrunt soils
- Swakane soils
- Soils that have a very stony surface
- Bearspring soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

### 514—Whitestone gravelly sandy loam, 40 to 65 percent slopes

#### Composition

*Whitestone soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium derived from granitic rock and granitic glacial till with a small amount of loess and volcanic ash

*Slope range:* 40 to 65 percent

*Elevation:* 1,700 to 3,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

#### Typical Profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 16 inches—grayish brown and brown gravelly sandy loam

*Subsoil:*

16 to 32 inches—pale brown very gravelly sandy loam

*Substratum:*

32 to 60 inches—pale brown very gravelly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—severe

### Contrasting Inclusions

- Donovan and Hellgate soils
- Spokane soils
- Vanbrunt soils
- Swakane soils
- Soils that have a very stony surface
- Bearspring soils
- Rock outcrop

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock fragments in the soil and steepness of slope

### 515—Whitestone very stony sandy loam, 20 to 40 percent slopes

#### Composition

*Whitestone soil and similar soils:* 85 percent

*Contrasting inclusions:* 15 percent

#### Setting

*Position on landscape:* Footslopes, backslopes, and toeslopes of hills and mountains

*Parent material:* Colluvium derived from granitic rock

and granitic glacial till with a small amount of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,700 to 3,700 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Stones and boulders cover 3 to 15 percent

### Typical Profile

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*

0 to 10 inches—grayish brown very stony sandy loam

*Subsoil:*

10 to 27 inches—pale brown very cobbly sandy loam

*Substratum:*

27 to 60 inches—light gray very cobbly sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate

### Contrasting Inclusions

- Donovan and Hellgate soils
- Spokane soils
- Vanbrunt soils
- Swakane soils
- Bearspring soils
- Rock outcrop

### Major Uses

Livestock grazing, timber production, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

## 516—Whitestone-Rock outcrop complex, 20 to 40 percent slopes

### Composition

*Whitestone soil and similar soils:* 65 percent

*Rock outcrop:* 20 percent

*Contrasting inclusions:* 15 percent

### Setting

*Position on landscape:* Footslopes, backslopes, and shoulders of hills and mountains

*Parent material:* Colluvium derived from granitic rock and granitic glacial till with a small amount of loess and volcanic ash

*Slope range:* 20 to 40 percent

*Elevation:* 1,700 to 3,400 feet

*Average annual precipitation:* 15 to 18 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

### Whitestone Soil

#### Typical profile

*Organic mat on surface:* 1 inch thick

*Surface layer:*

0 to 16 inches—grayish brown and brown gravelly sandy loam

*Subsoil:*

16 to 32 inches—pale brown very gravelly sandy loam

*Substratum:*

32 to 60 inches—pale brown very gravelly sandy loam

#### Soil properties and qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderately rapid

*Available water capacity:* Moderate

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Forestland—moderate

### Rock Outcrop

*Kind of rock:* Granitic rock

### Contrasting Inclusions

- Donovan and Hellgate soils
- Spokane soils
- Vanbrunt soils
- Swakane soils
- Soils that have a very stony surface
- Bearspring soils

### Major Uses

Timber production, livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitations for planting:* Rock outcrop and rock fragments in the soil

## 517—Wilmont silt loam, 20 to 40 percent slopes

### Composition

*Wilmont soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Toe slopes, footslopes, and backslopes of hills and mountains

*Parent material:* Residuum and colluvium derived from metasedimentary rock with a mantle of volcanic ash 7 to 14 inches thick

*Slope range:* 20 to 40 percent

*Elevation:* 2,200 to 3,300 feet

*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 42 to 44 degrees F

*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*

0 to 5 inches—brown silt loam

*Upper part of subsoil:*

5 to 12 inches—yellowish brown silt loam

*Lower part of subsoil:*

12 to 27 inches—light yellowish brown very channery sandy loam

*Upper part of substratum:*

27 to 47 inches—brown extremely channery loamy sand

*Lower part of substratum:*

47 to 60 inches—dark grayish brown extremely channery sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate over rapid

*Available water capacity:* Moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Rapid or very rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Oxerine soils
- Wells creek soils
- Henneway soils
- Soils that do not have a mantle of volcanic ash

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically

*Limitations for planting:* None

## 518—Wilmont silt loam, 40 to 65 percent slopes

### Composition

*Wilmont soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains  
*Parent material:* Residuum and colluvium derived from metasedimentary rock with a mantle of volcanic ash 7 to 14 inches thick  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,200 to 3,300 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 5 inches—brown silt loam  
*Upper part of subsoil:*  
 5 to 12 inches—yellowish brown silt loam  
*Lower part of subsoil:*  
 12 to 27 inches—light yellowish brown very channery sandy loam  
*Upper part of substratum:*  
 27 to 47 inches—brown extremely channery loamy sand  
*Lower part of substratum:*  
 47 to 60 inches—dark grayish brown extremely channery sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* Moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Oxerine soils
- Wells creek soils
- Henneway soils
- Soils that do not have a mantle of volcanic ash

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir—readily; ponderosa pine and western larch—periodically  
*Limitation for planting:* Steepness of slope

### 519—Wilmont silt loam, cool, 20 to 40 percent slopes

#### Composition

*Wilmont soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* North-facing footslopes and backslopes of hills and mountains  
*Parent material:* Residuum and colluvium derived from metasedimentary rock with a mantle of volcanic ash 7 to 14 inches thick  
*Slope range:* 20 to 40 percent  
*Elevation:* 2,200 to 3,300 feet  
*Average annual precipitation:* 18 to 25 inches  
*Average annual air temperature:* 41 to 43 degrees F  
*Frost-free period:* 90 to 120 days

#### Typical Profile

*Organic mat on surface:* 2 inches thick  
*Surface layer:*  
 0 to 4 inches—brown silt loam  
*Upper part of subsoil:*  
 4 to 11 inches—light yellowish brown silt loam  
*Lower part of subsoil:*  
 11 to 21 inches—light yellowish brown very channery loam  
*Upper part of substratum:*  
 21 to 36 inches—light yellowish brown extremely channery loam  
*Lower part of substratum:*  
 36 to 60 inches—light yellowish brown extremely channery sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Rapid or very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Cropland—severe or very severe; forestland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Hartill and Oxerine soils
- Wells creek soils
- Henneway soils
- Soils that do not have a mantle of volcanic ash

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch—periodically  
*Limitations for planting:* None

### 520—Wilmont silt loam, cool, 40 to 65 percent slopes

#### Composition

*Wilmont soil and similar soils:* 80 percent  
*Contrasting inclusions:* 20 percent

#### Setting

*Position on landscape:* North-facing backslopes of hills and mountains  
*Parent material:* Residuum and colluvium derived from metasedimentary rock with a mantle of volcanic ash  
*Slope range:* 40 to 65 percent  
*Elevation:* 2,200 to 3,300 feet  
*Average annual precipitation:* 18 to 25 inches

*Average annual air temperature:* 41 to 43 degrees F  
*Frost-free period:* 90 to 120 days

### Typical Profile

*Organic mat on surface:* 2 inches thick

*Surface layer:*  
 0 to 4 inches—brown silt loam

*Upper part of subsoil:*  
 4 to 11 inches—light yellowish brown silt loam

*Lower part of subsoil:*  
 11 to 21 inches—light yellowish brown very channery loam

*Upper part of substratum:*  
 21 to 36 inches—light yellowish brown extremely channery loam

*Lower part of substratum:*  
 36 to 60 inches—light yellowish brown extremely channery sandy loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained  
*Permeability:* Moderate over rapid  
*Available water capacity:* Moderate  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Very rapid  
*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February  
*Hazard of water erosion:* Forestland—very severe

### Contrasting Inclusions

- Hartill and Oxerine soils
- Wells creek soils
- Henneway soils
- Soils that do not have a mantle of volcanic ash

### Major Uses

Timber production, livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion; cable yarding—suitable

**Silviculture**

*Potential for natural regeneration:* Douglas-fir and grand fir—readily; western larch—periodically  
*Limitations for planting:* None

**521—Winchester loamy coarse sand, 0 to 10 percent slopes****Composition**

*Winchester soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

**Setting**

*Position on landscape:* Terraces and dunes  
*Parent material:* Glacial outwash sand reworked by wind in some areas  
*Slope range:* 0 to 10 percent  
*Elevation:* 900 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

**Typical Profile**

*Upper part of surface layer:*  
 0 to 9 inches—grayish brown loamy coarse sand

*Lower part of surface layer:*  
 9 to 15 inches—brown sand

*Upper part of substratum:*  
 15 to 48 inches—yellowish brown and pale brown sand

*Lower part of substratum:*  
 48 to 60 inches—multicolored sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow  
*Hazard of water erosion:* Cropland—slight; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

**Contrasting Inclusions**

- Skaha and Strat soils
- Cashmere and Farrell soils
- Aeneas soils that have a fine sandy loam surface layer and subsoil

**Major Uses**

Livestock grazing, irrigated hay and pasture, building site development, wildlife habitat, watershed, and recreation

**Use and Management****Livestock grazing**

- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

**Irrigated cropland**

- If this soil is used for irrigated crops, it is limited by steepness of slope, droughtiness, and fast infiltration.

**522—Winchester loamy coarse sand, 10 to 25 percent slopes****Composition**

*Winchester soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

**Setting**

*Position on landscape:* Terraces, terrace escarpments, and dunes  
*Parent material:* Glacial outwash sand reworked by wind in some areas  
*Slope range:* 10 to 25 percent  
*Elevation:* 900 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

**Typical Profile**

*Upper part of surface layer:*  
 0 to 9 inches—grayish brown loamy coarse sand

*Lower part of surface layer:*  
 9 to 15 inches—brown sand

*Upper part of substratum:*  
 15 to 48 inches—yellowish brown and pale brown sand

*Lower part of substratum:*  
 48 to 60 inches—multicolored sand

**Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained  
*Permeability:* Rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Slow or medium  
*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Skaha and Strat soils
- Cashmere and Farrell soils
- Aeneas soils

### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

#### Irrigated cropland

- If this soil is used for irrigated crops, it is limited by steepness of slope, water erosion, droughtiness, and fast infiltration.

## 523—Winchester loamy coarse sand, 25 to 60 percent slopes

### Composition

*Winchester soil and similar soils:* 90 percent  
*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash sand reworked by wind in some areas  
*Slope range:* 25 to 60 percent  
*Elevation:* 900 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days

### Typical Profile

*Upper part of surface layer:*  
 0 to 9 inches—grayish brown loamy coarse sand

*Lower part of surface layer:*  
 9 to 15 inches—brown sand

*Upper part of substratum:*  
 15 to 48 inches—yellowish brown and pale brown sand

*Lower part of substratum:*  
 48 to 60 inches—multicolored sand

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Excessively drained  
*Permeability:* Rapid  
*Available water capacity:* Low  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium  
*Hazard of water erosion:* Rangeland—moderate  
*Hazard of wind erosion (bare surface):* Severe

### Contrasting Inclusions

- Skaha soils
- Rock outcrop

### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.
- This soil is too sandy to support the sidewalls of trenches for conventional pipeline installation.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 524—Winchester-Rock outcrop complex, 0 to 25 percent slopes

### Composition

*Winchester soil and similar soils:* 70 percent  
*Rock outcrop:* 20 percent  
*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terraces, terrace escarpments, and dunes

*Parent material:* Glacial outwash sand reworked by wind in some areas

*Slope range:* 0 to 25 percent

*Elevation:* 900 to 1,800 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Winchester Soil

#### Typical profile

*Upper part of surface layer:*

0 to 9 inches—grayish brown loamy coarse sand

*Lower part of surface layer:*

9 to 15 inches—brown sand

*Upper part of substratum:*

15 to 48 inches—yellowish brown and pale brown sand

*Lower part of substratum:*

48 to 60 inches—multicolored sand

#### Soil properties and qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Excessively drained

*Permeability:* Rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Rangeland—slight or moderate

*Hazard of wind erosion (bare surface):* Severe

### Rock Outcrop

*Kind of rock:* Granitic rock and gneiss

#### Contrasting Inclusions

- Skaha and Strat soils
- Roosevelt soils
- Couleedam and Soaplake soils
- Cashmere soils

#### Major Uses

Livestock grazing, wildlife habitat, watershed, and recreation

#### Use and Management

##### Livestock grazing

- The soil in this unit is too sandy to support the

sidewalls of trenches for conventional pipeline installation.

- The soil in this unit is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

### 525—Winthrop stony sandy loam, 0 to 20 percent slopes

#### Composition

*Winthrop soil and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

#### Setting

*Position on landscape:* Alluvial fans and terraces

*Parent material:* Mixed alluvium and glacial outwash

*Slope range:* 0 to 20 percent

*Elevation:* 1,300 to 2,700 feet

*Average annual precipitation:* 14 to 16 inches

*Average annual air temperature:* 45 to 47 degrees F

*Frost-free period:* 100 to 130 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

#### Typical Profile

*Surface layer:*

0 to 10 inches—very dark grayish brown stony sandy loam

*Upper part of substratum:*

10 to 21 inches—light brownish gray extremely gravelly sand

*Lower part of substratum:*

21 to 60 inches—light brownish gray extremely gravelly coarse sand

#### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Somewhat excessively drained

*Permeability:* Moderately rapid over very rapid

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Snowpack:* More than 1 foot—January and February; more than 3 feet—none

*Hazard of water erosion:* Cropland—slight or moderate; forestland—slight

*Hazard of wind erosion (bare surface):* Moderate

#### Contrasting Inclusions

- Bisbee and Dart soils

- Hudnut soils
- Donavan soils
- Soils that have a very stony surface

### Major Uses

Livestock grazing, marginal timber production, watershed, and wildlife habitat

### Use and Management

#### Timber Production

#### Harvesting

*Suitability of logging systems:* Wheeled and tracked equipment—suitable; cable yarding—suitable

#### Silviculture

*Potential for natural regeneration:* Ponderosa pine—periodically

*Limitation for planting:* Rock fragments in the soil

#### Irrigated Cropland

- If this soil is used for irrigated crops, it is limited by large stones, steepness of slope, and droughtiness.

## 526—Wynhoff stony loam, 8 to 30 percent slopes

### Composition

*Wynhoff soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Footslopes, backslopes, and shoulders of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock, rhyodacite porphyry, and some metasedimentary rock with an admixture of loess

*Slope range:* 8 to 30 percent

*Elevation:* 1,400 to 3,400 feet

*Average annual precipitation:* 12 to 15 inches

*Average annual air temperature:* 47 to 49 degrees F

*Frost-free period:* 110 to 150 days

*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*

0 to 7 inches—brown stony loam

*Lower part of surface layer:*

7 to 12 inches—yellowish brown gravelly loam

*Subsoil:*

12 to 28 inches—light yellowish brown very gravelly loam

*Substratum:*

28 to 34 inches—light yellowish brown extremely gravelly coarse sandy loam

*Bedrock:*

34 to 38 inches—rhyodacite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Cropland—slight or moderate; rangeland—slight

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Johntom and Swakane soils
- Tyee soils
- Ginnis soils
- Conconully soils
- Soils that have a very stony surface

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction.
- This soil is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 527—Wynhoff stony loam, 30 to 65 percent slopes

### Composition

*Wynhoff soil and similar soils:* 80 percent

*Contrasting inclusions:* 20 percent

### Setting

*Position on landscape:* Backslopes of hills and mountains

*Parent material:* Colluvium and residuum derived from granitic rock, rhyodacite porphyry, and some metasedimentary rock with an admixture of loess

*Slope range:* 30 to 65 percent  
*Elevation:* 1,400 to 3,400 feet  
*Average annual precipitation:* 12 to 15 inches  
*Average annual air temperature:* 47 to 49 degrees F  
*Frost-free period:* 110 to 150 days  
*Rock fragments on surface:* Stones cover 0.1 to 3.0 percent

### Typical Profile

*Upper part of surface layer:*  
 0 to 7 inches—brown stony loam

*Lower part of surface layer:*  
 7 to 12 inches—yellowish brown gravelly loam

*Subsoil:*  
 12 to 28 inches—light yellowish brown very gravelly loam

*Substratum:*  
 28 to 34 inches—light yellowish brown extremely gravelly coarse sandy loam

*Bedrock:*  
 34 to 38 inches—rhyodacite

### Soil Properties and Qualities

*Depth class:* Moderately deep (20 to 40 inches to bedrock)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* 20 to 40 inches

*Runoff:* Medium

*Hazard of water erosion:* Rangeland—moderate

*Hazard of wind erosion (bare surface):* Slight

### Contrasting Inclusions

- Johntom and Swakane soils
- Tyee soils
- Ginnis soils
- Conconully soils

### Major Uses

Livestock grazing, recreation, watershed, and wildlife habitat

### Use and Management

#### Livestock grazing

- This soil is too steep for pond construction.
- This soil is too shallow for pond construction. Water tanks, springs, wells, or pipeline systems are more effective than ponds for providing water for livestock.
- This soil is too permeable for successful pond installation unless special liners or sealants are used to reduce seepage.

## 528—Xeric Torriorthents, fill, 0 to 15 percent slopes

### Composition

*Xeric Torriorthents and similar soils:* 90 percent

*Contrasting inclusions:* 10 percent

### Setting

*Position on landscape:* Terraces

*Parent material:* Fill material derived mainly from glacial outwash and glaciofluvial material

*Slope range:* 0 to 15 percent

*Elevation:* 800 to 1,600 feet

*Average annual precipitation:* 9 to 12 inches

*Average annual air temperature:* 49 to 51 degrees F

*Frost-free period:* 140 to 180 days

### Reference Profile

*Surface layer:*

0 to 19 inches—light brownish gray gravelly fine sandy loam

*Substratum:*

19 to 60 inches—light gray very cobbly coarse sand to silty clay loam

### Soil Properties and Qualities

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained to excessively drained

*Permeability:* Moderately slow to rapid

*Available water capacity:* Moderate to moderately high

*Potential rooting depth:* More than 60 inches

*Runoff:* Slow or medium

*Hazard of water erosion:* Slight or moderate

*Hazard of wind erosion (bare surface):* Moderate

### Contrasting Inclusions

- Soils that have an extremely stony surface
- Soils that have slopes of more than 15 percent and are in the Coulee Dam area

### Major Uses

Building site development and recreation

### Use and Management

#### Building site development

- Some areas have moderately slow permeability, which restricts the movement of effluent from septic tank absorption fields. This limitation can be minimized by installing a larger than normal absorption field or a mound system.
- Frost action can affect local roads and streets. Damage to roads and streets can be reduced by using coarse material that has low frost action potential for

the subbase and base and by installing impermeable cutoff blankets between the subgrade and the subbase.

- Some areas have a sandy substratum, which can hamper excavation. Cutbanks are subject to caving unless they are sloped or shored.
- Excavations and other disturbances can expose soil material that has moderate hazards of water and wind erosion. These hazards can be minimized by preserving as much of the existing plant cover as possible and by revegetating disturbed areas.

### **529—Xeric Torriorthents, escarpments, 30 to 65 percent slopes**

#### **Composition**

*Xeric Torriorthents and similar soils:* 85 percent  
*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Terrace escarpments  
*Parent material:* Glacial outwash, glaciofluvial material, and glacial lake sediment  
*Slope range:* 30 to 65 percent  
*Elevation:* 800 to 1,800 feet  
*Average annual precipitation:* 9 to 12 inches  
*Average annual air temperature:* 49 to 51 degrees F  
*Frost-free period:* 140 to 180 days  
*Rock fragments on surface:* Cobbles and stones cover 0.01 to 15 percent

#### **Reference Profile**

*Surface layer:*  
0 to 8 inches—brown extremely cobbly loamy sand

*Upper part of substratum:*  
8 to 33 inches—pale brown cobbly loamy sand

*Middle part of substratum:*  
33 to 45 inches—very pale brown silty clay loam

*Lower part of substratum:*  
45 to 60 inches—light gray sand

#### **Soil Properties and Qualities**

*Depth class:* Very deep (more than 60 inches)  
*Drainage class:* Well drained to excessively drained  
*Permeability:* Moderately slow to rapid  
*Available water capacity:* Low to moderately high  
*Potential rooting depth:* More than 60 inches  
*Runoff:* Medium or rapid  
*Hazard of water erosion:* Rangeland—moderate or severe  
*Hazard of wind erosion (bare surface):* Slight or moderate

#### **Contrasting Inclusions**

- Soils that have an extremely stony surface
- Rock outcrop
- Rubble land

#### **Major Uses**

Livestock grazing, watershed, and wildlife habitat

#### **Use and Management**

##### **Livestock grazing**

- This unit is too steep for pond construction, range seeding, brush management using ground equipment, or normal fencing practices. Livestock tend to concentrate in the less steep areas of the unit.

### **530—Xerochrepts-Rubble land-Rock outcrop complex, 40 to 90 percent slopes**

#### **Composition**

*Xerochrepts and similar soils:* 45 percent  
*Rubble land:* 25 percent  
*Rock outcrop:* 15 percent  
*Contrasting inclusions:* 15 percent

#### **Setting**

*Position on landscape:* Backslopes of mountains  
*Parent material:* Colluvium derived from rhyodacite, metasedimentary rock, and granitic rock with an admixture of volcanic ash in some areas  
*Slope range:* 40 to 90 percent  
*Elevation:* 1,800 to 4,000 feet  
*Average annual precipitation:* 17 to 25 inches  
*Average annual air temperature:* 42 to 44 degrees F  
*Frost-free period:* 90 to 120 days

#### **Xerochrepts**

##### **Reference profile**

*Organic mat on surface:* 1.5 inches thick

*Surface layer:*  
0 to 3 inches—brown very cobbly loam

*Subsoil:*  
3 to 24 inches—pale brown and very pale brown extremely cobbly loam

*Substratum:*  
24 to 60 inches—very pale brown extremely cobbly sandy loam

##### **Soil properties and qualities**

*Depth class:* Very deep (more than 60 inches)

*Drainage class:* Well drained

*Permeability:* Moderate

*Available water capacity:* Low

*Potential rooting depth:* More than 60 inches

*Runoff:* Medium or rapid

*Snowpack:* More than 1 foot—December through March; more than 3 feet—January and February

*Hazard of water erosion:* Forestland—moderate or severe

### **Rubble land**

Rubble land consists of areas of unconsolidated rock debris, commonly known as talus, on backslopes of mountains. Rock fragments are angular, and they range in size from gravel to boulders. Rubble land commonly is barren, but small areas where soil material has accumulated between rock fragments support a very sparse cover of shrubs, grasses, and forbs.

### **Rock Outcrop**

*Kind of rock:* Granitic rock, rhyodacite, phyllite, schist, graywacke, and quartzite

### **Contrasting Inclusions**

- Mineral, Oxequine, and Thout soils
- Baldknob, Pole, and Rufus soils

### **Major Uses**

Wildlife habitat, marginal timber production, limited livestock grazing, and watershed

### **Use and Management**

#### **Timber Production**

#### **Harvesting**

*Suitability of logging systems:* Wheeled and tracked equipment—unsafe because of steepness of slope and results in excessive soil damage and erosion

#### **Silviculture**

*Potential for natural regeneration:* Douglas-fir and ponderosa pine—periodically

*Limitations for planting:* Rock outcrop, Rubble land (talus), rock fragments in the soil, and steepness of slope

# Use and Management of the Soils

---

This soil survey is an inventory and evaluation of the soils in the survey area. It can be used to adjust land uses to the limitations and potentials of natural resources and the environment. Also, it can help to prevent soil-related failures in land uses.

In preparing a soil survey, soil scientists, conservationists, engineers, and others collect extensive field data about the nature and behavioral characteristics of the soils. They collect data on erosion, droughtiness, flooding, and other factors that affect various soil uses and management. Field experience and collected data on soil properties and performance are used as a basis in predicting soil behavior.

Information in this section can be used to plan the use and management of soils for crops and pasture; as rangeland and woodland; and as sites for buildings, sanitary facilities, and highways and other transportation systems. It can be used to identify the potentials and limitations of each soil for specific land uses and to help prevent construction failures caused by unfavorable soil properties.

Planners and others using soil survey information can evaluate the effect of specific land uses on productivity and on the environment in all or part of the survey area. The survey can help planners to maintain or create a land use pattern in harmony with the natural soil.

Contractors can use this survey to locate sources of sand and gravel, roadfill, and topsoil. They can use it to identify areas where bedrock, wetness, or very firm soil layers can cause difficulty in excavation.

Health officials, highway officials, engineers, and others may also find this survey useful. The survey can help them plan the safe disposal of wastes.

## Interpretive Ratings

The interpretive tables in this survey rate the soils in the survey area for various uses. Many of the tables identify the limitations that affect specified uses and indicate the severity of those limitations. The ratings in these tables are both verbal and numerical.

## Rating Class Terms

Rating classes are expressed in the tables in terms that indicate the extent to which the soils are limited by all of the soil features that affect a specified use or in terms that indicate the suitability of the soils for the use. Thus, the tables may show limitation classes or suitability classes. Terms for the limitation classes are *not limited*, *somewhat limited*, and *very limited*. The suitability ratings are expressed as *well suited*, *moderately suited*, *poorly suited*, and *unsuited* or as *good*, *fair*, and *poor*.

## Numerical Ratings

Numerical ratings in the tables indicate the relative severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.00 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use and the point at which the soil feature is not a limitation. The limitations appear in order from the most limiting to the least limiting. Thus, if more than one limitation is identified, the most severe limitation is listed first and the least severe one is listed last.

## Crops and Pasture

By Karl A. Kler, agronomist, Natural Resources Conservation Service.

General management needed for crops and pasture is suggested in this section. The estimated yields of the main crops and pasture plants are listed, the system of land capability classification used by the Natural Resources Conservation Service is explained, and prime farmland is described.

Planners of management systems for individual fields or farms should consider the detailed information given in the description of each soil under the heading "Detailed Soil Map Units." Specific information can be obtained from the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

Each area of cropland is a unique combination of soils, slopes, elevation, climate, and other

characteristics. Management should consist of a system that takes into consideration all of these characteristics. The objectives of a cropland management system are to maintain or improve crop production while conserving energy resources and to protect the soil from erosion.

Management practices that enhance the environment may include developing watering facilities, planting hedgerows, leaving some standing grain, and establishing permanent cover for wildlife in odd areas. Other environmental concerns such as properly using pesticides, properly disposing of empty containers, trapping sediment in debris basins, and properly disposing of animal waste should also be considered.

Management practices that protect the soil from erosion can also provide additional environmental, production, and energy benefits. Erosion control practices include using an adapted crop rotation that includes cover crops, green manure crops, or grasses and legumes; using conservation tillage systems; seeding early in fall; divided-slope farming; fall chiseling; and using terraces, field windbreaks, and grassed waterways.

Approximately 5,540 acres of this survey area are used as irrigated cropland. A wide variety of crops are grown under irrigation, including apples, cherries, peaches, pears, apricots, plums, nectarines, sweet corn, corn for silage, grapes, hay and pasture, wheat, and oats. About 15,775 acres of the survey area are used as nonirrigated cropland. The main nonirrigated crop is wheat, which is grown in a wheat-summer fallow cropping system. Some barley, oats, and alfalfa are also grown.

Most of the well drained soils in the irrigated areas along the Columbia and Okanogan Rivers are suited to orchard and vegetable crops. Frost control is needed in areas of these soils where frosts occur late in spring as a result of poor air drainage. Suitable practices for frost control include use of orchard heaters, wind machines, and over-tree or under-tree sprinklers. Fruit trees that develop later in spring are less subject to frost damage. If possible, trees should be planted up and down the slope to allow air to drain freely.

Most of the crops grown in the survey area respond well to nitrogen, phosphorus, and potassium. Ammonium nitrate, ammonium sulfate, and urea fertilizers commonly are used. Periodic applications of lime are needed because of the acidifying effect of ammonium fertilizer. In areas where leaching has occurred, applications of boron may be needed. Some areas are low in content of sulfur. Some foliar applications of micronutrients are used in orchards.

The soils in the survey area range from moderately acid to very strongly alkaline. The soils that have an inherent high content of free lime should be leached with elemental sulfur or sulfuric acid. Gypsum is needed if the content of free lime is not adequate. For soils that have a water table at a relatively shallow depth, drainage should be improved before the soils are leached.

The amount of lime, gypsum, fertilizer, and other amendments applied should be based on soil tests, on the needs of the crop grown, and on the expected yields. Help in determining the kind and amount of amendments to apply can be obtained from the local office of the Cooperative Extension Service.

For the soils in the survey area that are poorly drained or somewhat poorly drained and have a high water table, drainage is needed for maximum crop production. Many of these wet soils provide critical habitat for wildlife.

Generally, soils relatively high in organic matter content have good tilth. As tilth increases, soil erosion and surface crusting decrease and the water intake rate increases. The organic matter content can be maintained by incorporating as much residue as possible into the soil and by rotating high-residue crops, such as grain, grasses, legumes, and corn, with low-residue row crops. Adequate nitrogen fertilizer is needed to facilitate the decomposition of residue to organic matter.

Proper irrigation water management and proper use of agronomic practices, such as seeding early in fall, using cover crops, and applying conservation tillage, minimize the risk of erosion. Applications of irrigation water should be adjusted to the available water capacity, the water intake rate, and the needs of the crop grown to conserve water, minimize leaching of plant nutrients, and minimize erosion.

In nonirrigated areas, using practices such as seeding fall grain early, conservation tillage, divided-slope farming, and tilling on the contour or across the slope can minimize wind and water erosion. Terraces and diversions, which are best suited to deep and moderately deep soils, reduce the length of the slopes and thus minimize runoff and erosion.

Wind erosion is a hazard on many soils in the survey area. Use of winter cover crops, strip tillage, and windbreaks help to minimize wind erosion. Maintaining crop residue on the surface or using straw, manure, and other material as a mulch minimize wind erosion, help to maintain or improve organic matter content, and conserve moisture.

Compaction and the resulting destruction of soil structure caused by excessive tillage and continuous use of heavy equipment are most severe on soils that

have a silt loam or loam surface layer. Soil compaction reduces the water intake rate and increases the risk of erosion. Compaction can be minimized through the use of minimum tillage, proper timing of tillage in relation to moisture content, close-growing crops, and crop residue. Subsoiling or chiseling when the soil is dry in fall can be used to break up a tillage pan. Use of minimum tillage and crop residue also helps to maintain soil structure.

Sprinkler and drip irrigation systems are used in the survey area. These systems permit an even, controlled application of irrigation water and, if managed properly, reduce the risk of erosion and minimize leaching of plant nutrients. Using a cropping system that provides continuous plant cover, such as hay and pasture, and growing perennial cover crops in orchards help to minimize erosion. When rejuvenating old stands of hay with a 1- to 2-year rotation of grain, conservation tillage methods should be used to reduce the risk of erosion.

### **Yields per Acre**

The average yields per acre that can be expected of the principal crops under a high level of management are shown in table 5. In any given year, yields may be higher or lower than those indicated in the table because of variations in rainfall and other climatic factors. The land capability classification of map units in the survey area also is shown in the table (USDA, 1961).

The yields are based mainly on the experience and records of farmers, conservationists, and extension agents. Available yield data from nearby counties and results of field trials and demonstrations also are considered.

The management needed to obtain the indicated yields of the various crops depends on the kind of soil and the crop. Management can include drainage, erosion control, and protection from flooding; the proper planting and seeding rates; suitable high-yielding crop varieties; appropriate and timely tillage; control of weeds, plant diseases, and harmful insects; favorable soil reaction and optimum levels of nitrogen, phosphorus, potassium, and trace elements for each crop; effective use of crop residue, barnyard manure, and green manure crops; and harvesting that ensures the smallest possible loss.

For yields of irrigated crops, it is assumed that the irrigation system is adapted to the soils and to the crops grown, that good-quality irrigation water is uniformly applied as needed, and that tillage is kept to a minimum.

The estimated yields reflect the productive capacity of each soil for each of the principal crops. Yields are

likely to increase as new production technology is developed. The productivity of a given soil compared with that of other soils, however, is not likely to change.

Crops other than those shown in table 5 are grown in the survey area, but estimated yields are not listed because the acreage of such crops is small. The local office of the Natural Resources Conservation Service or of the Cooperative Extension Service can provide information about the management and productivity of the soils for those crops.

### **Land Capability Classification**

Land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. Crops that require special management are excluded. The soils are grouped according to their limitations for field crops, the risk of damage if they are used for crops, and the way they respond to management. The criteria used in grouping the soils do not include major and generally expensive landforming that would change slope, depth, or other characteristics of the soils, nor do they include possible but unlikely major reclamation projects. Capability classification is not a substitute for interpretations designed to show suitability and limitations of groups of soils for rangeland, for forestland, or for engineering purposes.

In the capability system, soils are generally grouped at three levels—capability class, subclass, and unit.

*Capability classes*, the broadest groups, are designated by the numbers 1 through 8. The numbers indicate progressively greater limitations and narrower choices for practical use. The classes are defined as follows:

Class 1 soils have slight limitations that restrict their use.

Class 2 soils have moderate limitations that restrict the choice of plants or that require moderate conservation practices.

Class 3 soils have severe limitations that restrict the choice of plants or that require special conservation practices, or both.

Class 4 soils have very severe limitations that restrict the choice of plants or that require very careful management, or both.

Class 5 soils are subject to little or no erosion but have other limitations, impractical to remove, that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 6 soils have severe limitations that make them generally unsuitable for cultivation and that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 7 soils have very severe limitations that make

them unsuitable for cultivation and that restrict their use mainly to grazing, forestland, or wildlife habitat.

Class 8 soils and miscellaneous areas have limitations that preclude commercial plant production and that restrict their use to recreational purposes, wildlife habitat, watershed, or esthetic purposes.

*Capability subclasses* are soil groups within one class. They are designated by adding a small letter, *e*, *w*, *s*, or *c*, to the class numeral, for example, 2*e*. The letter *e* shows that the main hazard is the risk of erosion unless close-growing plant cover is maintained; *w* shows that water in or on the soil interferes with plant growth or cultivation (in some soils the wetness can be partly corrected by artificial drainage); *s* shows that the soil is limited mainly because it is shallow, droughty, or stony; and *c*, used in only some parts of the United States, shows that the chief limitation is climate that is very cold or very dry.

In class 1 there are no subclasses because the soils of this class have few limitations. Class 5 contains only the subclasses indicated by *w*, *s*, or *c* because the soils in class 5 are subject to little or no erosion. They have other limitations that restrict their use to pasture, rangeland, forestland, wildlife habitat, or recreation.

The capability classification of map units in this survey area is given in table 5.

### Prime Farmland

Prime farmland is one of several kinds of important farmland defined by the U.S. Department of Agriculture. It is of major importance in meeting the Nation's short- and long-range needs for food and fiber. Because the supply of high-quality farmland is limited, the U.S. Department of Agriculture recognizes that responsible levels of government, as well as individuals, should encourage and facilitate the wise use of our Nation's prime farmland.

Prime farmland, as defined by the U.S. Department of Agriculture, is land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oilseed crops and is available for these uses. It could be cultivated land, pastureland, forestland, or other land, but it is not urban or built-up land or water areas. The soil qualities, growing season, and moisture supply are those needed for the soil to economically produce sustained high yields of crops when proper management, including water management, and acceptable farming methods are applied. In general, prime farmland has an adequate and dependable supply of moisture from precipitation or irrigation, a favorable temperature and growing season, acceptable acidity or alkalinity, an acceptable salt and

sodium content, and few or no rocks. It is permeable to water and air. It is not excessively erodible or saturated with water for long periods, and it either is not frequently flooded during the growing season or is protected from flooding. Slope ranges mainly from 0 to 8 percent. More detailed information about the criteria for prime farmland is available at the local office of the Natural Resources Conservation Service.

A recent trend in land use in some parts of the survey area has been the loss of some prime farmland to industrial and urban uses. The loss of prime farmland to other uses puts pressure on marginal lands, which generally are more erodible, droughty, and less productive and cannot be easily cultivated.

About 43,000 acres, or 3 percent of the survey area, meet the requirements for prime farmland. The map units in the survey area that are considered prime farmland are listed at the end of this section. This list does not constitute a recommendation for a particular land use. On some soils included in the list, measures that overcome a hazard or limitation, such as wetness and droughtiness, are needed. Onsite evaluation is needed to determine whether or not the hazard or limitation has been overcome by corrective measures. The extent of each listed map unit is shown in table 4. The location is shown on the detailed soil maps. The soil qualities that affect use and management are described under the heading "Detailed Soil Map Units."

The map units that meet the requirements for prime farmland are:

- 1 Achimin silt loam, 0 to 8 percent slopes
- 3 Aeneas fine sandy loam, 0 to 5 percent slopes (if irrigated)
- 8 Aits silt loam, sandy substratum, 0 to 8 percent slopes
- 34 Bernhill loam, dry, 0 to 5 percent slopes
- 39 Boesel fine sandy loam, 0 to 3 percent slopes
- 42 Bong sandy loam, cool, 0 to 8 percent slopes (if irrigated)
- 48 Broadax silt loam, dry, 0 to 8 percent slopes
- 67 Cashmere fine sandy loam, 0 to 5 percent slopes (if irrigated)
- 73 Cedonia silt loam, 0 to 5 percent slopes
- 104 Coxlake silt loam, 0 to 3 percent slopes (if drained)
- 106 Cubcreek fine sandy loam, 0 to 3 percent slopes
- 120 Disautel very fine sandy loam, 0 to 8 percent slopes
- 139 Duleylake loam, 0 to 8 percent slopes
- 146 Ellisforde silt loam, 0 to 5 percent slopes (if irrigated)

- 160 Farrell fine sandy loam, 0 to 5 percent slopes (if irrigated)
- 172 Garrison loam, 0 to 5 percent slopes (if irrigated)
- 192 Goldlake silt loam, 0 to 8 percent slopes
- 195 Haden creek silt loam, 0 to 8 percent slopes
- 196 Haley fine sandy loam, 0 to 5 percent slopes (if irrigated)
- 199 Hallcreek loam, 0 to 10 percent slopes (if irrigated)
- 212 Hodgson silt loam, 0 to 5 percent slopes
- 218 Hunters silt loam, 0 to 5 percent slopes
- 220 Inchelium silt loam, 0 to 5 percent slopes
- 234 Kartar sandy loam, warm, 0 to 10 percent slopes (if irrigated)
- 238 Kewach silt loam, 0 to 5 percent slopes
- 242 Kiehl silt loam, 0 to 8 percent slopes (if irrigated)
- 245 Kiehl silt loam, cool, 0 to 8 percent slopes (if irrigated)
- 259 Malott very fine sandy loam, 0 to 5 percent slopes (if irrigated)
- 273 Martella silt loam, 0 to 8 percent slopes
- 274 Martella silt loam, dry, 0 to 8 percent slopes
- 288 Mitchellpoint silt loam, 0 to 5 percent slopes
- 289 Monse silt loam, 0 to 8 percent slopes (if irrigated)
- 299 Narcisse silt loam, 0 to 3 percent slopes
- 300 Narcisse silt loam, dry, 0 to 3 percent slopes
- 301 Nespelem silt loam, 0 to 5 percent slopes
- 326 Okanogan loam, 0 to 5 percent slopes (if irrigated)
- 327 Omak silt loam, 0 to 8 percent slopes
- 328 Owhi loam, 0 to 8 percent slopes (if irrigated)
- 336 Parmenter silt loam, 0 to 8 percent slopes (if irrigated)
- 343 Phoebe fine sandy loam, 0 to 5 percent slopes
- 347 Phoebe fine sandy loam, dry, 0 to 5 percent slopes
- 351 Picard very fine sandy loam, 0 to 8 percent slopes
- 354 Pogue fine sandy loam, 0 to 5 percent slopes (if irrigated)
- 357 Pogue gravelly fine sandy loam, 0 to 10 percent slopes (if irrigated)
- 376 Ralsen silt loam, 0 to 3 percent slopes (if drained)
- 378 Reardan silt loam, 0 to 8 percent slopes
- 380 Rebecca fine sandy loam, 0 to 5 percent slopes
- 390 Ret silt loam, 0 to 3 percent slopes (if drained)
- 408 Sanpoil silt loam, 0 to 2 percent slopes (if drained)
- 409 Sanpoil silt loam, ponded, 0 to 2 percent slopes (if drained)

- 410 Scala very fine sandy loam, 0 to 5 percent slopes
- 459 Stevens silt loam, 0 to 8 percent slopes
- 468 Swipkin silt loam, 0 to 5 percent slopes
- 474 Timentwa loam, 0 to 8 percent slopes
- 503 Wannacott silt loam, 0 to 8 percent slopes

## Rangeland

By Marc A. Pointel, Kevin L. Guinn, and Gerald Rouse, range conservationists, Natural Resources Conservation Service.

Rangeland makes up about 436,000 acres, or 32 percent of the survey area. Livestock operations include both Indian and non-Indian owners and operators. Herds are mainly cow-calf or cow-calf-yearling operations. Several Indian ranchers also raise a substantial number of horses.

The grazing season begins in April on the low-elevation bunchgrass-shrub range along the Columbia and Okanogan Rivers. In June and July, the livestock are moved to mixed conifer forest range in the mountains. By November the livestock have been moved to winter feeding areas near the home ranch or along the Columbia and Okanogan Rivers. Most operators produce meadow grass and/or alfalfa hay for the feeding season. During long winters or after poor hay-producing summers, additional hay is purchased from producers in the Columbia Basin.

Two major native rangeland vegetation zones are in survey area—shrub-steppe and steppe. The average annual precipitation in the shrub-steppe zone is 9 to 12 inches. The major plant community on the sandy soils in this zone and the soils in this zone that have sandy loam surface texture is antelope bitterbrush/bluebunch wheatgrass-needleandthread. The major plant community on the soils that have silt loam, loam, very fine sandy loam, or fine sandy loam surface texture is bluebunch wheatgrass/Sandberg bluegrass.

The average annual precipitation in the steppe zone is 12 to 15 inches. The major plant communities on the soils in this zone that have silt loam, loam, very fine sandy loam, or fine sandy loam surface texture are bluebunch wheatgrass/Sandberg bluegrass and Idaho fescue/bluebunch wheatgrass. The major plant community on the sandy soils and the soils that have sandy loam surface texture is antelope bitterbrush/bluebunch wheatgrass. Idaho fescue is restricted mainly to the north-facing slopes, and it rarely occurs in areas that receive less than 12 inches of precipitation annually.

The very shallow Bakeoven soils in both the shrub-steppe and steppe zones support a stiff sagebrush/

Sandberg bluegrass plant community. The shallow, granitic, moderately coarse textured Couleedam soils in the shrub-steppe zone support an antelope bitterbrush/bluebunch wheatgrass-needleandthread plant community. The shallow, granitic, moderately coarse textured Swakane soils in the steppe zone support an antelope bitterbrush/bluebunch wheatgrass plant community. The shallow Baldknob and Rufus soils that receive more than 15 inches of precipitation and are associated with forested plant communities support an Idaho fescue/bluebunch wheatgrass plant community.

The wet bottomland areas dominantly support basin wildrye. The presence of inland saltgrass generally indicates a moist, saline soil condition. In the basin wildrye/black greasewood plant community, inland saltgrass generally is absent, possibly because of the dry soil conditions in midsummer to fall. The black greasewood/inland saltgrass plant community occurs on soils that are strongly saline and sodic.

The focal point in range management is a planned grazing system. A properly designed grazing system incorporates proper timing and use of forage plants with proper stocking rates and distribution of livestock. Also, cross-fencing and water developments commonly are needed. Brush management, range seeding, and weed control can accelerate range improvement if combined with periods of rest and a planned grazing system.

Table 6 contains useful information for range development. The soils of the survey area are rated according to limitations that affect pipelines, ponds, seeding, brush management, and fences. The degree of limitation is expressed as slight, moderate, or severe. *Slight* means that the soil properties and site features are generally favorable for the indicated development. *Moderate* means that the soil properties and site features are not favorable for the indicated development and special planning, design, equipment, or maintenance is needed. *Severe* means that the soil properties or site features are so unfavorable or difficult to overcome that special planning and design, significant increases in cost, and possibly much increased maintenance are required. More information on these important range developments is given under the heading "Detailed Soil Map Units."

The rating for *pipelines* refers to the degree of difficulty in installing and maintaining pipelines for livestock water developments. The limitations are based on soil properties, site features, and observed performance of the soils. The ease of excavating, filling, and compacting a pipeline trench is affected by depth to bedrock, dense material, or a hardpan; rock fragments; soil texture; and steepness of slope. The

depth to a seasonal high water table and the hazard of flooding affect the time of year that excavations can be made. Soil texture and depth to the water table affect the resistance of the excavation walls to sloughing or caving. Corrosivity to uncoated steel and concrete can affect the selection of pipeline material.

The rating for *ponds* refers to the degree of difficulty that can be expected in constructing and maintaining small ponds for watering livestock. The limitations are based on soil properties, site features, and observed performance of the soils. The ease of excavating is affected by depth to bedrock, dense material, or a thick hardpan and by steepness of slope. Soil permeability affects the seepage potential; ponds constructed in soils that have moderate permeability or higher may need linings or clay blankets to reduce the risk of seepage. Excessive slope can affect the storage capacity of ponds. Corrosivity to uncoated steel and concrete can affect the types of material that can be used to construct ponds.

The rating for *seeding* refers to the degree of difficulty that can be expected in seeding an area of rangeland with mechanical ground equipment such as a rangeland drill, disc drill, or deep furrow drill. Soil properties that restrict the types of adapted plant species are also considered. The suitability of a soil for broadcast seeding is not considered. The limitations are based on soil properties, site features, and observed performance of the soils. Mechanical seedbed preparation and planting operations are affected by steepness of slope, soil texture, stones and boulders on or near the soil surface, rock fragments in the surface layer, and depth to bedrock. The time of year when seeding can be done is affected by a seasonal high water table and the hazard of flooding.

The selection of adapted plant species is an important consideration for successful seeding. Soil properties that affect species selection are depth to bedrock, dense material, or a hardpan; available water capacity; excessive salinity and sodicity; a seasonal high water table; and hazard of flooding.

The rating for *brush management* refers to the degree of difficulty that can be expected in using mechanical methods to control brush. Mechanical brush management methods include chaining, railing, disking, and using rollers or brush beaters. The ratings are based on soil properties and site features. Steepness of slope and the presence of surface stones and boulders are the main soil properties that limit the operation of brush management equipment. The presence of a seasonal high water table and the hazard of flooding affect the time of year when brush management operations are suitable.

The rating for *fences* refers to the degree of difficulty that can be expected in installing and maintaining fencelines for livestock control. The limitations are based on soil properties, site features, and observed performance of the soils. The ease of digging, filling, and compacting fencepost holes is affected by depth to bedrock, dense material, or a hardpan; rock fragments; soil texture; and steepness of slope. The depth to a seasonal high water table and the hazard of flooding affect the time of year when fences can be installed. Maintenance costs and fence design are affected by the amount of snow damage expected. Corrosivity to uncoated steel can affect the selection of fencepost material.

## Ecological Site

In areas that have similar climate and topography, differences in the kind and amount of rangeland or forest understory vegetation are closely related to the kind of soil. Effective management is based on the relationship between the soils and vegetation and water.

Table 7 shows, for each soil that supports vegetation, the ecological site; the total annual production of vegetation in favorable, normal, and unfavorable years; the characteristic vegetation; and the average percentage of each species. An explanation of the column headings in the table follows.

An *ecological site* is the product of all the environmental factors responsible for its development. It has characteristic soils that have developed over time throughout the soil development process; a characteristic hydrology, particularly infiltration and runoff, that has developed over time; and a characteristic plant community (kind and amount of vegetation). The hydrology of the site is influenced by development of the soil and plant community. The vegetation, soils, and hydrology are all interrelated. Each is influenced by the others and influences the development of the others. The plant community on an ecological site is typified by an association of species that differs from that of other ecological sites in the kind and/or proportion of species or in total production. Descriptions of rangeland ecological sites, commonly referred to as range sites, are provided in the Field Office Technical Guide, which is available in local offices of the Natural Resources Conservation Service. Descriptions of forest ecological sites, commonly referred to as habitat types, are given in "Forest Habitat Types of the Colville Indian Reservation" (Clausnitzer and Zamora, 1987).

*Total dry-weight production* is the amount of

vegetation that can be expected to grow annually in a well managed area that is supporting the plant community. It includes all vegetation, whether or not it is palatable to grazing animals. It includes the current year's growth of leaves, twigs, and fruits of woody plants. It does not include the increase in stem diameter of trees and shrubs. It is expressed in pounds per acre of air-dry vegetation for favorable, normal, and unfavorable years. In a favorable year, the amount and distribution of precipitation and the temperatures make growing conditions substantially better than average. In a normal year, growing conditions are about average. In an unfavorable year, growing conditions are well below average, generally because of low available soil moisture. Yields are adjusted to a common percent of air-dry moisture content. Total dry-weight production has not been estimated for forest ecological sites. Production values for these sites are based on a climax plant community condition, which is rare in the survey area. Production values for forestland sites under four successional stages of development are given in table 11.

*Characteristic vegetation*—the grasses, forbs, and shrubs that make up most of the plant community on each soil—is listed by common name. Under *composition*, the expected percentage of the total annual production is given for each species making up the characteristic vegetation. The amount that can be used as forage depends on the kinds of grazing animals and on the grazing season.

Ecological site management requires a knowledge of the kinds of soil and of the plant community. It also requires an evaluation of the present vegetative condition and trend. Vegetative condition is determined by comparing the present plant community with the climax plant community on a particular ecological site. The more closely the existing community resembles the climax community, the higher the vegetation condition rating. Trend is defined as the direction of change in an existing plant community relative to the climax plant community. Further information about the vegetative condition and trend is available in the "National Range and Pasture Handbook" (<http://www.ftw.nrcs.usda.gov/glti/NRPH.html>).

The objective in ecological site management is to control grazing so that the plants growing on a site are about the same in kind and amount as the climax plant community for that site. Such management generally results in the optimum production of vegetation, control of undesirable brush species, conservation of water, and control of erosion. Sometimes, however, an area with a vegetative condition somewhat below the

climax meets grazing needs, provides wildlife habitat, and protects soil and water resources.

## Forest Overstory Vegetation, Management, and Productivity

By Timothy Leadingham, forester, Bureau of Indian Affairs.

Approximately 66 percent of the survey area is forested. Of this total, about 73 percent is classified as commercial forestland. The remaining 27 percent is classified as either biologically or economically marginal or is inoperable under current or contemplated harvest methods. Of the total commercial forestland, about 84 percent is owned by the Colville Confederated Tribes and the remainder is owned by private industry, private nontribal individuals, or individual tribal members. Two wood products manufacturing facilities are in the survey area at Omak, Washington. Three facilities that are outside the survey area but use material from the area are at Republic, Kettle Falls, and Arden, Washington. The Colville Tribe also operates a treated post and pole plant at Inchelium, Washington, that processes mostly lodgepole pine.

The average annual precipitation on the forestland varies from 15 inches to more than 30 inches. Most of the precipitation is received in the form of snow. Very little rain falls during June through September. The high temperature in summer often exceeds 100 degrees F, and the low temperature in winter often is below zero.

Fires caused by lightning and man are common in summer.

### Forest Overstory Vegetation

The survey area can be divided into four broad vegetative zones based on a combination of the potential climax overstory tree species and the associated understory vegetation. This combination is called a forest ecological site. Several related ecological sites, all of which have the same climax overstory tree species, are within each of the four zones. Although the tree species in the zone name may be dominant in many areas, other species occur in nearly pure stands or mixed stands. Boundary lines between zones are gradual transitions rather than sharp divisions.

Several forest management practices and associated concerns generally apply to all of the zones. These include use of cable logging systems in areas that have slopes of more than 30 to 40 percent to prevent excessive soil erosion; restriction of harvesting operations in spring and use of designated

skid trails to reduce soil compaction; thinning to control stocking; use of adapted species; sanitation for control of dwarf mistletoe; and salvage of dead trees. Broadcast burning or machine piling and burning commonly are used to treat slash and prepare a site for regeneration harvests.

*Ponderosa pine zone.*—Elevation of this zone is 1,400 to 3,000 feet. The average annual precipitation is 15 to 18 inches, the frost-free period is 100 to 130 days, and the average annual air temperature is 45 to 48 degrees F. Typical soils include those of the Donovan (warm phase), Northstar, Raisio (dry phase), Spokane (warm phase), and Vanbrunt series.

This zone dominantly supports ponderosa pine with only minor amounts of Douglas-fir. Quaking aspen is on the wetter soils. Forest ecological sites include ponderosa pine/common snowberry, ponderosa pine/Idaho fescue, ponderosa pine/antelope bitterbrush, and ponderosa pine/bluebunch wheatgrass. Common understory plants include common snowberry, bluebunch wheatgrass, Idaho fescue, antelope bitterbrush, saskatoon serviceberry, arrowleaf balsamroot, white spirea, snowbrush ceanothus, rose, creeping Oregon grape, and common yarrow.

This zone commonly is affected by dwarf mistletoe and by mountain pine beetle and other bark beetle species. High seedling mortality as a result of competition from brush and grass, low available water capacity, and high temperatures in summer also are concerns.

The soils in this zone have the lowest forest productivity. The planned rotation age for harvesting usually is 100 to 140 years. The most desirable management techniques include seed-tree and shelterwood regeneration harvests. A group selection technique may be needed to produce natural regeneration in the drier areas. Ponderosa pine regenerates well naturally, and small site-specific areas are suited to Douglas-fir regeneration. Artificial regeneration may be needed in small clearcuts in areas infested with disease and insects.

*Douglas-fir zone.*—Elevation of this zone is 2,000 to 4,000 feet. The average annual precipitation is 16 to 25 inches, the frost-free period is 90 to 120 days, and the average annual air temperature is 42 to 46 degrees F. Typical soils include those of the Nevine, Republic, Parmenter, Mineral, Inkler, and Centralpeak series.

Tree species in this zone include Douglas-fir, ponderosa pine, western larch, lodgepole pine, and quaking aspen. Forest ecological sites include Douglas-fir/mallow ninebark, Douglas-fir/common snowberry, and Douglas-fir/pinegrass. Common understory plants include common snowberry, mallow

ninebark, creambush oceanspray, pinegrass, white spirea, kinnikinnick, common chokecherry, rose, longtube twinflower, saskatoon serviceberry, and myrtle pachystima.

The Douglas-fir, ponderosa pine, and western larch in this zone are affected by dwarf mistletoe. Root rot is also a concern in Douglas-fir. Insects that are a concern include mountain pine beetle in ponderosa pine and lodgepole pine and periodic outbreaks of tussock moth and spruce budworm in Douglas-fir.

The rotation age for harvesting in this zone ranges from 80 years for lodgepole pine to 120 years for ponderosa pine, western larch, and Douglas-fir. Seed-tree, shelterwood, or clearcut harvesting methods are most commonly used to promote regeneration of desired species. Group selection harvesting may be used in warmer, drier areas to promote natural regeneration. Ponderosa pine is most favorable for natural or artificial regeneration followed by western larch on cooler, moister sites and then Douglas-fir and lodgepole pine. Competition from brush and grass is a concern for regeneration, and control of competing vegetation may be necessary.

*Grand fir zone.*—Elevation in this zone is 2,000 to 4,000 feet. The average annual precipitation is 18 to 25 inches. The frost-free period is 90 to 120 days. The average annual air temperature is 42 to 44 degrees F. Typical soils include those of the Elbowlake, Aits, Kiehl (cool phase), Martella, Wilmont (cool phase), and Henneway series.

This zone has the greatest diversity of tree species and other plants. Trees include grand fir, Douglas-fir, western larch, ponderosa pine, lodgepole pine, and Englemann spruce and on more moist soils, western redcedar. Sitka alder, paper birch, and quaking aspen also are present. Forest ecological sites include grand fir/longtube twinflower and grand fir/Oregon fairybells and in more moist areas, western redcedar/longtube twinflower. Common understory plants include longtube twinflower, queencup beadlily, myrtle pachystima, pinegrass, Oregon fairybells, starry false Solomon's-seal, dwarf rose, mallow ninebark, creambush oceanspray, thimbleberry, black mountain huckleberry, prince's pine, and sidebells pyrola.

Douglas-fir and western larch in this zone are affected by dwarf mistletoe, and Douglas-fir and grand fir are affected by root rot. Insects, including mountain pine beetle, which affects ponderosa pine and lodgepole pine, and periodic outbreaks of tussock moth and spruce budworm in Douglas-fir and western larch, are a concern.

The rotation age for harvesting in this zone is 80 years for lodgepole pine and as high as 120 years for Douglas-fir, western larch, and ponderosa pine.

Seed-tree, shelterwood, and clearcut harvest methods commonly are used to promote regeneration of desired species. Western larch and ponderosa pine are most favorable for natural and artificial regeneration in the warmer areas followed by Douglas-fir, lodgepole pine, and grand fir. Control of competing brush and grass species may be necessary to ensure the establishment of natural and artificial regeneration.

*Subalpine fir zone.*—Elevation of this zone is 3,500 to 6,700 feet. The average annual precipitation is 20 to 35 inches. The frost-free period is 70 to 100 days. The average annual air temperature is 37 to 41 degrees F. Typical soils include those of the Manley, Moses, Resner, Togo, and Buhrig series.

Tree species in this zone include subalpine fir, Douglas-fir, western larch, lodgepole pine, Engelmann spruce, quaking aspen, and paper birch. Forest ecological sites include subalpine fir/longtube twinflower, subalpine fir/black mountain huckleberry, and subalpine fir/pinegrass. Subalpine fir-whitebark pine/cascade azalea is at the highest elevations. Forest understory species include longtube twinflower, queencup beadlily, myrtle pachystima, Utah honeysuckle, pinegrass, Rocky Mountain maple, sidebells pyrola, black mountain huckleberry, prince's pine, bunchberry dogwood, prickly currant, and thimbleberry.

Douglas-fir and subalpine fir in this zone are affected by root rot, and Douglas-fir and western larch are affected by dwarf mistletoe. Mountain pine beetle in lodgepole pine and periodic outbreaks of spruce budworm are concerns.

Seed-tree, shelterwood, and clearcut harvest methods can be used to promote natural regeneration. Western larch is the most favorable species for both natural and artificial regeneration followed by Douglas-fir, Engelmann spruce in the moister areas, and lodgepole pine. Competition from brush and pinegrass can delay or prevent natural and artificial regeneration.

### Forest Overstory Management

Tables 8 and 9 show, for each soil that supports forestland, the interpretive ratings for various aspects of forest management (USDA, 1985). Table 8 gives interpretive ratings for onsite use, trafficability, mass movement, and damage by fire.

*Physical limitations* refer to the most limiting soil and site characteristics or properties that impact onsite use.

*Compaction hazard (moist)* is the susceptibility of the soil, under moist conditions, to compaction as a result of equipment use. Soil compaction can have a

long-term detrimental effect on site quality. The ratings of *slight*, *moderate*, and *severe* are based on observations, characteristics of the organic surface material, and properties of the upper 12 inches of the mineral soil. The soil properties considered in the ratings include soil texture; thickness of the O horizon; rock fragment content, size, and shape; and soil structure. In areas that have slopes of more than 35 percent, equipment use is limited and thus the compaction hazard rating is based on the effect, at impact point, of falling trees.

*Puddling hazard (wet)* is the susceptibility of the soil, under wet conditions, to puddling as a result of equipment use. The ratings of *slight*, *moderate*, and *severe* are based on characteristics of the organic surface material and properties of the upper 12 inches of the mineral soil. The soil properties considered in the ratings include soil texture; thickness of the O horizon; rock fragment content, size, and shape; and soil structure. A *moderate* rating may indicate a need to restrict equipment use to designated skid trails. A *severe* rating may indicate a need to limit equipment use to drier periods or to areas that are covered with snow or are frozen.

*Displacement hazard (dry)* is the susceptibility of the soil surface, under dry conditions, to displacement as a result of equipment use. The soil properties considered in the ratings include soil texture, thickness of the O horizon, and rock fragment content. A *slight* rating indicates that equipment use would displace a minimal amount of the soil surface, a *moderate* rating indicates that equipment use should be restricted to designated areas, and a *severe* rating indicates that all equipment use should be limited to specific periods, such as when the soil is covered with snow.

*Mass movement potential* is the susceptibility of the soil to mass movement. The ratings are based on observations only. *Stable* indicates that the soils are not subject to mass movement. Most of the soils rated as stable have slopes of less than 50 percent. *Surficial landslides* indicates fast mass movement of the upper layers only, generally those to a depth of 5 to 10 feet. *Deep-seated landslides* indicates fast mass movement of both the upper layers and the material at a depth more than 5 to 10 feet. *Soil creep* indicates very slow mass movement of surficial or deep-seated material.

*Soil damage by fire* is the susceptibility of the soil to damage by fire. The ratings of *slight*, *moderate*, and *severe* are based on observations, characteristics of the organic surface material, and properties of the upper 8 inches of the mineral soil. The soil properties considered in the ratings include soil texture, steepness and aspect of slope, and thickness of the

O and A horizons. A *slight* rating indicates there is minimal concern for soil damage resulting from normal prescribed burning for slash reduction, *moderate* indicates a need for careful planning with consideration of soil protection and offsite effects of fire, and *severe* indicates a very high potential for degradation of the soil and the quality of the site. If slash is highly concentrated, burns should be initiated only when the moisture content of the fuel is high.

Table 9 gives interpretive ratings for roads and skid trails, road rock, cut and fill erosion, cut and fill slope stability, and dust hazard.

*Roads and skid trails* refers to use of unsurfaced roads or skid trails, under wet or nearly saturated conditions, by rubber-tired skidders, pickup trucks, and log trucks. The rating is based on the soil material only, without the addition of base rock. The ratings are *soft*, *slippery*, *sticky*, and *firm*. A rating of *firm* indicates that there is sufficient rock and soil material to provide an adequate surface for vehicles and that there is adequate soil drainage throughout the upper 12 inches of the soil.

*Road rock* refers to the accessibility and grade of the underlying material or bedrock for use as base rock for road construction. A rating of *readily available* indicates that the soil material above the bedrock is less than 10 feet thick and that the rock is of sufficient strength or grade to be used as base rock for roads. The kind of rock, such as granitic, volcanic, or metamorphic rock or rounded gravel and cobbles, is also given. A rating of *not readily available* indicates that the soil is not suitable as a source of base rock for road construction.

*Cut and fill erosion* refers to the susceptibility of the exposed soil material to erosion. The ratings of *slight*, *moderate*, and *severe* are based on the erodibility of all soil horizons to a depth of 60 inches (see table 18, Kw factor), percent slope, and the intensity and duration of rainfall. A rating of *slight* indicates that erosion control measures generally are not needed. A rating of *moderate* indicates a need for site assessment to determine whether erosion control measures should be implemented. A rating of *severe* indicates that erosion control measures probably are needed and should be implemented as soon as practical.

*Cut and fill slope stability* refers to the susceptibility of the exposed soil to raveling when dry and to slumping or sloughing when wet. The ratings are based on observation of road cut and fill slopes. A rating of *stable* indicates that raveling, slumping, and sloughing were not apparent or were observed only occasionally. Stability typically is a concern in areas that have slopes of 50 percent or more.

*Dust hazard* refers to the risk of particles becoming airborne during periods of disturbance when the soil is dry. The ratings are based on observation and are strictly subjective. A *slight* rating indicates that vehicular traffic would produce minimal amounts of airborne particulates. A *moderate* rating indicates that vehicular traffic should be restricted unless dust abatement measures are applied. A *severe* rating indicates that vehicular traffic should be restricted and dust abatement measures are needed.

In the section "Detailed Soil Map Units," each soil that supports forestland is rated for its potential for natural regeneration. The rating assumes that a suitable seed source is available. *Readily* indicates that the stated species can regenerate naturally within 2 to 5 years after seedbed disturbance. *Periodically* indicates that the stated species can regenerate naturally within 5 to 10 years after seedbed disturbance.

### Forest Overstory Productivity

Table 10 shows, for each soil that supports forestland, the potential production for dominant and codominant tree species.

*Mean site index* refers to the height, in feet, that the dominant and codominant trees can be expected to reach in 50 or 100 years. It is measured at breast height, or 4.5 feet above the ground. Site index indicates site quality. The site index for Douglas-fir, grand fir, and western larch is based on a 50-year site curve (Cochran, 1979, PNW-251; Cochran, 1979, PNW-252; Schmidt, 1976). The site index for ponderosa pine, lodgepole pine, Engelmann spruce, and subalpine fir is based on a 100-year site curve (Meyer, 1961; Alexander, 1966; Alexander, 1967). The site index for quaking aspen is based on an 80-year site curve (Baker, 1925). Generally, the higher the site index, the higher the potential of the soil to produce wood fiber. A site index for a specific species on one soil should only be compared to site indexes for the same species on other soils. Site indexes for 50-year breast height age should not be compared with those for 100-year total age.

*Typical basal area* refers to the percentage of normal basal area present in stands of the indicated species. The normal basal area of a stand is that which can be expected under optimum growing and competition conditions.

*Estimated growth at culmination*, expressed in cubic feet per acre at the indicated age, refers to the growth of fully stocked, even-aged, unmanaged stands. Estimated growth at culmination is given for the most productive tree species, and it is adjusted for basal area percentage.

*Estimated yield at age 100* is given for the dominant and codominant species. It is expressed in cubic feet per acre, and it is adjusted for basal area percentage.

## Forest Understory Vegetation, Management, and Productivity

By Kevin J Hanley, range conservationist, Natural Resources Conservation Service.

### Forest Understory Vegetation and Management

The soils, climate, geology, and topography of the survey area are diverse, and they support a wide variety of forested plant communities. These communities encompass a wide array of species composition, vegetative structure, and productivity potential for understory forage. To minimize the complexity of these plant communities and to aid in management of them, the forest vegetation in the survey area has been classified into units called habitat types. A habitat type is defined as all land capable of producing a similar climax plant association (Daubenmire, 1968). For the purposes of this survey, the habitat types are referred to as ecological sites. These sites are described in "Forest Habitat Types of the Colville Indian Reservation" (Clausnitzer and Zamora, 1987). The ecological sites that are correlated to each soil in the survey area are shown in table 7. Plant codes are used to name the ecological sites; for example, the Douglas-fir/common snowberry site is PSME/SYAL. The names are assigned according to the most competitive overstory tree species and the characteristic shrub or herb species that most typifies the undergrowth in the climax plant community (Clausnitzer and Zamora, 1987). The competitive ability of a coniferous tree species generally refers to its shade tolerance. The most competitive tree species is that which is the most tolerant of shade and thus is capable of perpetuating itself in closed stands. It is also considered to be the climax dominant species.

Plant communities are classified on the basis of climax condition. Climax conditions rarely occur in the survey area because of past disturbances such as timber harvesting and wildfire. The forested areas occur as a mosaic of successional vegetative stages. Each stage is unique as far as structure, species composition, and biomass production and the management needed.

Nearly all the forested ecological sites in the survey area are considered suitable for grazing; however, the suitability is directly related to the successional vegetative stage. Not all ecological sites are suitable for grazing during each successional stage.

Understory forage production and livestock accessibility are influenced by the density of the overstory tree canopy and the stem density. The density of the canopy determines the amount and quality of light that understory plants receive, and the stem density affects livestock movement and distribution. Because the density of the canopy and the stem density vary according to the successional stage, understory species composition and forage production also vary. It is important for managers to understand the successional stages of each ecological site in order to predict changes in the vegetation.

Forest succession is dynamic, and it can follow multiple pathways during its movement toward the climax plant community. The composition and structure of the overstory trees and the biomass production and species composition of the understory plants identify each successional stage. The forested ecological sites in the survey area typically follow the seven generalized sequential stages of forest succession of northern Rocky Mountain coniferous forests. The successional progression of the vegetative stages begins after a disturbance such as timber harvesting or fire. It begins with an initial herbaceous stage characterized by a dominance of grasses and forbs. A small number of tree seedlings and regenerating shrubs also are present during this stage. On most ecological sites, this stage is the most suitable for grazing because the production of palatable forage is high and accessibility to animals is least limited. This stage, however, is of short duration.

As the shrub component develops, the herbaceous stage gives way to the shrub stage. The tree seedlings that were present in the herbaceous stage continue to increase both in diameter and height, eventually reaching sapling size (2 to 5 inches in diameter at breast height), to form the sapling stage. The production and coverage of shrubs peak midway through the sapling stage and begin to decrease as the saplings continue to develop.

By the time the saplings have reached pole size (5 to 9 inches in diameter at breast height), the stature of the shrub component has become severely reduced as a result of the increased amount of shade from the dense overstory tree canopy. For all ecological sites, the pole stage is the least suitable for grazing because the understory vegetation commonly is very sparse to nearly nonexistent and livestock movement is severely hindered by the high stem density. As the pole stage progresses, shade-tolerant trees (usually a representation of the climax plant community) occur as seedlings scattered throughout the understory.

As the vigorous dominant pole-sized trees mature

and the stand is thinned through attrition of the less vigorous trees, the pole stage eventually deteriorates and gives way to the young forest stage. At the onset of the young forest stage, the stand is characterized by an overstory of mature (10 inches in diameter or more at breast height), light-loving, shade-intolerant successional trees. The understory vegetation has stabilized, and the species composition and structure resemble those before the disturbance. The shade-tolerant trees scattered throughout the understory during the pole stage have developed into saplings and poles. As the young forest stage progresses, these trees continue to develop, reach maturity, and reproduce. The composition of the overstory includes mature representatives of the climax species as well as those of the existing successional species. Overstory shading hinders the reproduction of the shade-intolerant successional species and favors that of the shade-tolerant climax species.

The transition from the young forest stage to the mature forest stage occurs when the composition of the overstory is 50 percent or more shade-tolerant climax species. As the mature forest stage progresses, the remaining successional trees degenerate and die. The understory vegetation is stable, and the species composition and structure are similar to those before the disturbance. Eventually, the successional pathway culminates with the climax forest stage in which all age classes of the climax tree species are represented and the successional species are absent.

The suitability of the young forest, mature forest, and climax forest stages for grazing varies according to the ecological site. The ponderosa pine and Douglas-fir sites generally are suitable for grazing during all stages except the pole stage. The grand fir, western redcedar, and subalpine fir sites generally are suitable for grazing only during the shrub stage because the production of palatable forage is limited during the other stages. An exception is the subalpine fir/pinegrass site, which generally produces a relatively high amount of forage and is suitable for grazing during all stages except the pole stage.

In order to characterize the seven generalized stages, this discussion of forest succession has been greatly oversimplified. Not all forested ecological sites follow the herbaceous-shrub-sapling-pole-young forest-mature forest-climax forest successional pathway. The pathway that a particular ecological site takes after a disturbance depends on the interaction of site-specific factors such as the nature and severity of the disturbance, the species structure and composition of the stand prior to the disturbance, the environmental conditions inherent to the area, the

structure and composition of the vegetation surrounding the area, and the history of disturbances in the area (Zamora, 1982).

Not all forested ecological sites are capable of exhibiting all seven successional stages. The ponderosa pine sites in the survey area, for example, do not exhibit a young forest stage because ponderosa pine is both the climax tree species and the only native conifer on these sites.

Moisture limitations prevent the development of a truly uniform pole stage on the ponderosa pine/bluebunch wheatgrass, ponderosa pine/Idaho fescue, and ponderosa pine/antelope bitterbrush sites. Abundant ponderosa pine seedlings become established on these sites in an episodic manner, and they develop into small thickets of even-aged saplings and poles. Because of the severe competition for the available soil moisture, relatively few of these trees survive and reach maturity. Successionally, these sites proceed directly from a sapling/pole or pole stage to a mature forest stage.

Distinct sapling and pole stages rarely occur on the ponderosa pine/common snowberry and Douglas-fir/common snowberry sites. Rather, a transitional sapling/pole stage most commonly occurs and it consists of a pole-sized overstory canopy in combination with sapling-sized understory.

Similarly, a true distinct shrub stage rarely occurs on the ecological sites characterized by herbaceous understory, such as ponderosa pine/bunchgrass, Douglas-fir/pinegrass, and subalpine fir/pinegrass sites. Although snowbrush ceanothus has the potential to sprout prolifically on pinegrass sites following fire, its extent in a true uniform shrub stage is limited.

### Forest Understory Productivity

Table 11 provides forage understory productivity for four successional stages. It is given in pounds of dry weight vegetation per acre. *Mature forest* refers to a forest that has reached an age class at which the growth and vigor of the trees begins to decline. Mature forests generally are a mixture of species that are intolerant of shade with understory species consisting of grasses and shade-tolerant forbs and shrubs. *Young forest* refers to a forest that supports a mixture of both shade-tolerant and shade-intolerant species of varying age classes. The forest canopy may be very dense, limiting the growth of shade-intolerant grasses, forbs, and shrubs. *Pole* refers to stands that consist of diverse species, a variety of age classes, and a variety of densities. The trees generally have stems that range from 2 to 8 inches in diameter at breast height. The rate of height growth begins to decline during this stage. Understory vegetation may consist

primarily of low-growing, shade-tolerant grasses and forbs and very few shrubs. *Shrub* refers to the early secondary succession of forestland in which the productivity of grasses, forbs, and shrubs is highest.

The mean annual production of understory vegetation includes all herbaceous plants and the leaves, twigs, and fruit of woody plants to a maximum height of 4.5 feet. Production values are given only for the four successional stages that are of sufficient extent and duration that specific management is needed. Although areas of herbaceous stage and sapling stage vegetation are present, they are of such limited extent and short duration that they have not been included as important successional stages. The production values for the climax forest stage have not been provided because true climax forest conditions rarely occur in the survey area.

### Windbreaks and Environmental Plantings

Windbreaks protect livestock, buildings, yards, fruit trees, gardens, and cropland from wind and snow; help to keep snow on fields; and provide food and cover for wildlife. Field windbreaks are narrow plantings made at right angles to the prevailing wind and at specific intervals across the field. The interval depends on the erodibility of the soil.

Environmental plantings help to beautify and screen houses and other buildings and to abate noise. The plants, mostly evergreen shrubs and trees, are closely spaced. To ensure plant survival, a healthy planting stock of suitable species should be planted properly on a well prepared site and maintained in good condition. Because the soils in this survey area are droughty in summer, irrigation is needed after seedling development to ensure survival of the plantings and for optimal plant growth.

Table 12 shows the height that locally grown trees and shrubs are expected to reach in 20 years on various soils. The estimates in the table are based on measurements and observation of established plantings that have been given adequate care. They can be used as a guide in planning windbreaks and screens. Additional information on planning windbreaks and screens and planting and caring for trees and shrubs can be obtained from the local office of the Natural Resources Conservation Service or of the Cooperative Extension Service or from a commercial nursery.

### Recreation

The survey area offers many diverse outdoor recreational opportunities. The Coulee Dam National

Recreation Area extends along the eastern and southeastern borders of the area, along the shores of Franklin Roosevelt Lake. This recreational area is used for boating, fishing, swimming, and camping, with developed campgrounds at the Sanpoil River arm and Wilmont Creek arm.

Bridgeport State Park, near Chief Joseph Dam, on Rufus Woods Lake, has a golf course as well as camping and boating facilities. Campgrounds for tribal members are at Owhi and Gold Lakes. Two resorts that are open to the public are at North Twin and South Twin Lakes.

Hunting is a popular activity in fall. White-tailed deer and mule deer are the main big game species. A limited number of elk permits are issued each year. Upland game birds include pheasant, quail, chukar, and grouse. Waterfowl are common in the Goose Lake and Timentwa Flats areas.

The extensive network of logging roads in the survey area offers excellent opportunities for cross-country skiing and snowmobiling in winter.

## Wildlife Habitat

The survey area supports a wide variety of habitats that support a wide diversity of wildlife, including big game, upland game birds, waterfowl raptors, and numerous small birds and mammals. Most of the streams and lakes support game fish. Hunting and fishing has been important in the heritage of the Colville Indians, and it is still widely practiced.

Mule deer and white-tailed deer are abundant throughout the survey area in summer. In winter they feed on bitterbrush and redstem ceanothus on south- and west-facing slopes at elevations below 3,600 feet. Their primary winter range is in general soil map units 1, 2, 3, 5, 6, 7, 8, 10, 11, 13, 15, 16, and 18. Elk recently have been reintroduced in the survey area, and their numbers are increasing. In winter the elk feed on bunchgrass-covered slopes in general soil map units 1, 6, 7, 15, and 18. Snow depths seldom limit elk movement; therefore, they winter at higher elevations than do deer. Winter range for deer and elk has been adversely affected in several areas by human activity, including home construction and replacement of native shrub plant communities with orchards. Black bear are throughout the timbered areas of the survey area, and they generally avoid the more open rangeland plant communities.

Ruffed, blue, and Franklin's grouse are in the coniferous forests and along stream bottoms that have abundant woody riparian vegetation. Remnant flocks of Columbian sharp-tailed grouse are in isolated areas of general soil map units 1, 2, 3, 5, 6, and 7 that

support shrub-steppe plant communities. Game birds, including pheasant, gray partridge, chukar partridge, mourning dove, and California quail, are in areas of shrub-steppe plant communities that are interspersed with areas of cropland and riparian vegetation.

The most common fur-bearing animal in the survey area is the coyote. It is throughout the area. Although much less abundant, cougar, bobcat, and lynx also are common inhabitants of the coniferous forests, some of which are interspersed with areas of grassland. Badger are common in areas that support shrub-steppe plant communities. Wolverine and fisher marten and other marten occur rarely in densely forested areas. Muskrat, beaver, mink, and raccoon are common in or near streams, lakes, and wetlands.

Aquatic habitats in the survey area support all of the waterfowl common to the interior areas of the Pacific Flyway. Abundant breeding populations of Canada geese inhabit the Okanogan and Columbia Rivers and some of the larger lakes. Other water-dependent birds include great blue heron, belted kingfisher, snipe, osprey, and dipper. Waterfowl and water birds are in all of the lakes, rivers, and wetlands in the area, particularly the wetlands in general soil map units 3, 4, and 5.

Bald eagles winter along the Columbia, Sanpoil, and Okanogan Rivers. Peregrine falcon occasionally pass through the area during migration.

The Okanogan River supports small runs of anadromous steelhead trout and summer chinook, sockeye, and coho salmon. Resident game fish in the streams and lakes include rainbow, brook, and brown trout as well as large-mouthed and small-mouthed bass and whitefish. The introduction of walleye into the Columbia River has created an important opportunity for sport fishing. Some of the more important lake fisheries include North Twin, South Twin, Owhi, McGinnis, Buffalo, Round, and Simpson Lakes. Omak Lake supports a thriving population of Lahontan cutthroat trout, a species introduced from the alkaline waters of Nevada.

## Engineering

This section provides information for planning land uses related to urban development and to water management. Soils are rated for various uses, and the most limiting features are identified. Ratings are given for building site development, sanitary facilities, construction materials, and water management. The ratings are based on observed performance of the soils and on the data in the tables described under the heading "Soil Properties."

*Information in this section is intended for land use*

*planning, for evaluating land use alternatives, and for planning site investigations prior to design and construction. The information, however, has limitations. For example, estimates and other data generally apply only to that part of the soil between the surface and a depth of 5 to 7 feet. Because of the map scale, small areas of different soils may be included within the mapped areas of a specific soil.*

*The information is not site specific and does not eliminate the need for onsite investigation of the soils or for testing and analysis by personnel experienced in the design and construction of engineering works.*

Government ordinances and regulations that restrict certain land uses or impose specific design criteria were not considered in preparing the information in this section. Local ordinances and regulations should be considered in planning, in site selection, and in design.

Soil properties, site features, and observed performance were considered in determining the ratings in this section. During the fieldwork for this soil survey, determinations were made about particle-size distribution, liquid limit, plasticity index, soil reaction, depth to bedrock, hardness of bedrock within 5 to 7 feet of the surface, soil wetness, depth to a water table, ponding, slope, likelihood of flooding, natural soil structure aggregation, and soil density. Data were collected about kinds of clay minerals, mineralogy of the sand and silt fractions, and the kinds of adsorbed cations. Estimates were made for erodibility, permeability, corrosivity, shrink-swell potential, available water capacity, and other behavioral characteristics affecting engineering uses.

This information can be used to evaluate the potential of areas for residential, commercial, industrial, and recreational uses; make preliminary estimates of construction conditions; evaluate alternative routes for roads, streets, highways, pipelines, and underground cables; evaluate alternative sites for sanitary landfills, septic tank absorption fields, and sewage lagoons; plan detailed onsite investigations of soils and geology; locate potential sources of gravel, sand, earthfill, and topsoil; plan drainage systems, irrigation systems, ponds, terraces, and other structures for soil and water conservation; and predict performance of proposed small structures and pavements by comparing the performance of existing similar structures on the same or similar soils.

The information in the tables, along with the soil maps, the soil descriptions, and other data provided in this survey, can be used to make additional interpretations.

Some of the terms used in this soil survey have a special meaning in soil science and are defined in the Glossary.

### **Building Site Development**

Soil properties influence the development of building sites, including the selection of the site, the design of the structure, construction, performance after construction, and maintenance. Table 13 shows the degree and kind of soil limitations that affect dwellings with and without basements and small commercial buildings.

The ratings in the table are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect building site development. *Not limited* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Somewhat limited* indicates that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Very limited* indicates that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the table indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

*Dwellings* are single-family houses of three stories or less. For dwellings without basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. For dwellings with basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of about 7 feet. The ratings for dwellings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table, ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility. Compressibility is inferred from the

Unified classification. The properties that affect the ease and amount of excavation include depth to a water table, ponding, flooding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

*Small commercial buildings* are structures that are less than three stories high and do not have basements. The foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. The ratings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table, ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility (which is inferred from the Unified classification). The properties that affect the ease and amount of excavation include flooding, depth to a water table, ponding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

### Sanitary Facilities

Table 14 shows the degree and kind of soil limitations that affect septic tank absorption fields and sewage lagoons. The ratings are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect these uses. *Not limited* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Somewhat limited* indicates that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Very limited* indicates that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the table indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use

(1.00) and the point at which the soil feature is not a limitation (0.00).

*Septic tank absorption fields* are areas in which effluent from a septic tank is distributed into the soil through subsurface tiles or perforated pipe. Only that part of the soil between depths of 24 and 60 inches is evaluated. The ratings are based on the soil properties that affect absorption of the effluent, construction and maintenance of the system, and public health. Permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, and flooding affect absorption of the effluent. Stones and boulders, ice, and bedrock or a cemented pan interfere with installation. Subsidence interferes with installation and maintenance. Excessive slope may cause lateral seepage and surfacing of the effluent in downslope areas.

Some soils are underlain by loose sand and gravel or fractured bedrock at a depth of less than 4 feet below the distribution lines. In these soils the absorption field may not adequately filter the effluent, particularly when the system is new. As a result, the ground water may become contaminated.

*Sewage lagoons* are shallow ponds constructed to hold sewage while aerobic bacteria decompose the solid and liquid wastes. Lagoons should have a nearly level floor surrounded by cut slopes or embankments of compacted soil. Nearly impervious soil material for the lagoon floor and sides is required to minimize seepage and contamination of ground water. Considered in the ratings are slope, permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, flooding, large stones, and content of organic matter.

Soil permeability is a critical property affecting the suitability for sewage lagoons. Most porous soils eventually become sealed when they are used as sites for sewage lagoons. Until sealing occurs, however, the hazard of pollution is severe. Soils that have a permeability rate of more than 2 inches per hour are too porous for the proper functioning of sewage lagoons. In these soils, seepage of the effluent can result in contamination of the ground water. Ground-water contamination is also a hazard if fractured bedrock is within a depth of 40 inches, if the water table is high enough to raise the level of sewage in the lagoon, or if floodwater overtops the lagoon.

A high content of organic matter is detrimental to proper functioning of the lagoon because it inhibits aerobic activity. Slope, bedrock, and cemented pans can cause construction problems, and large stones can hinder compaction of the lagoon floor. If the

lagoon is to be uniformly deep throughout, the slope must be gentle enough and the soil material must be thick enough over bedrock or a cemented pan to make land smoothing practical.

### Construction Materials

Tables 15 and 16 give information about the soils as potential sources of gravel, sand, reclamation material, roadfill, and topsoil. Normal compaction, minor processing, and other standard construction practices are assumed.

*Sand* and *gravel* are natural aggregates suitable for commercial use with a minimum of processing. They are used in many kinds of construction. Specifications for each use vary widely. In table 15, only the likelihood of finding material in suitable quantity is evaluated. The suitability of the material for specific purposes is not evaluated, nor are factors that affect excavation of the material. The properties used to evaluate the soil as a source of sand or gravel are gradation of grain sizes (as indicated by the Unified classification of the soil), the thickness of suitable material, and the content of rock fragments. If the bottom layer of the soil contains sand or gravel, the soil is considered a likely source regardless of thickness. The assumption is that the sand or gravel layer below the depth of observation exceeds the minimum thickness.

The soils are rated *good*, *fair*, or *poor* as potential sources of sand and gravel. A rating of *good* or *fair* means that the source material is likely to be in or below the soil. The bottom layer and the thickest layer of the soils are assigned numerical ratings. These ratings indicate the likelihood that the layer is a source of sand or gravel. The number 0.00 indicates that the layer is a poor source. The number 1.00 indicates that the layer is a good source. A number between 0.00 and 1.00 indicates the degree to which the layer is a likely source.

The soils are rated *good*, *fair*, or *poor* as potential sources of reclamation material, roadfill, and topsoil. The features that limit the soils as sources of these materials are specified in the tables. The numerical ratings given after the specified features indicate the degree to which the features limit the soils as sources of reclamation material, roadfill, or topsoil. The lower the number, the greater the limitation.

*Reclamation material* is used in areas that have been drastically disturbed by surface mining or similar activities. When these areas are reclaimed, layers of soil material or unconsolidated geological material, or both, are replaced in a vertical sequence. The reconstructed soil favors plant growth. The

ratings in table 16 do not apply to quarries and other mined areas that require an offsite source of reconstruction material. The ratings are based on the soil properties that affect erosion and stability of the surface and the productive potential of the reconstructed soil. These properties include the content of sodium, salts, and calcium carbonate; reaction; available water capacity; erodibility; texture; content of rock fragments; and content of organic matter and other features that affect fertility.

*Roadfill* is soil material that is excavated in one place and used in road embankments in another place. In table 16, the soils are rated as a source of roadfill for low embankments, generally less than 6 feet high and less exacting in design than higher embankments.

The ratings are for the whole soil, from the surface to a depth of about 5 feet. It is assumed that soil layers will be mixed when the soil material is excavated and spread.

The ratings are based on the amount of suitable material and on soil properties that affect the ease of excavation and the performance of the material after it is in place. The thickness of the suitable material is a major consideration. The ease of excavation is affected by large stones, depth to a water table, and slope. How well the soil performs in place after it has been compacted and drained is determined by its strength (as inferred from the AASHTO classification of the soil) and linear extensibility (shrink-swell potential).

*Topsoil* is used to cover an area so that vegetation can be established and maintained. The upper 40 inches of a soil is evaluated for use as topsoil. Also evaluated is the reclamation potential of the borrow area. The ratings are based on the soil properties that affect plant growth; the ease of excavating, loading, and spreading the material; and reclamation of the borrow area. Toxic substances, soil reaction, and the properties that are inferred from soil texture, such as available water capacity and fertility, affect plant growth. The ease of excavating, loading, and spreading is affected by rock fragments, slope, depth to a water table, soil texture, and thickness of suitable material. Reclamation of the borrow area is affected by slope, depth to a water table, rock fragments, depth to bedrock or a cemented pan, and toxic material.

The surface layer of most soils is generally preferred for topsoil because of its organic matter content. Organic matter greatly increases the absorption and retention of moisture and nutrients for plant growth.

# Soil Properties

---

Data relating to soil properties are collected during the course of the soil survey.

Soil properties are ascertained by field examination of the soils and by testing of some benchmark soils. Established standard procedures are followed. During the survey, many shallow borings are made and examined to identify and classify the soils and to delineate them on the soil maps. Samples are taken from some typical profiles and tested in the laboratory to determine physical and chemical properties.

Estimates of soil properties are based on field examinations, on laboratory tests of samples from the survey area, and on laboratory tests of samples of similar soils in nearby areas. Tests verify field observations, verify properties that cannot be estimated accurately by field observation, and help to characterize key soils.

The estimates of soil properties are shown in tables. They include engineering index properties, physical and chemical properties, and pertinent soil and water features.

## Engineering Index Properties

Table 17 gives the engineering classifications and the range of index properties for the layers of each soil in the survey area.

*Depth* to the upper and lower boundaries of each layer is indicated.

*Texture* is given in the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter. "Loam," for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is 15 percent or more, an appropriate modifier is added, for example, "gravelly." Textural terms are defined in the Glossary.

*Classification* of the soils is determined according to the Unified soil classification system (ASTM, 2001) and the system adopted by the American Association of State Highway and Transportation Officials (AASHTO, 2000).

The Unified system classifies soils according to

properties that affect their use as construction material. Soils are classified according to particle-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, CL-ML.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of particle-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

*Rock fragments* larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages are estimates determined mainly by converting volume percentage in the field to weight percentage.

*Percentage (of soil particles) passing designated sieves* is the percentage of the soil fraction less than 3 inches in diameter based on an oven-dry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420, and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field.

*Liquid limit and plasticity index (Atterberg limits)* indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination.

The estimates of particle-size distribution, liquid limit, and plasticity index are generally rounded to the nearest 5 percent. Thus, if the ranges of gradation and Atterberg limits extend a marginal amount (1 or 2 percentage points) across classification boundaries,

the classification in the marginal zone is generally omitted in the table.

## Physical Properties

Table 18 shows estimates of some physical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

*Depth* to the upper and lower boundaries of each layer is indicated.

Particle size is the effective diameter of a soil particle as measured by sedimentation, sieving, or micrometric methods. Particle sizes are expressed as classes with specific effective diameter class limits. The broad classes are sand, silt, and clay, ranging from the larger to the smaller.

*Clay* as a soil separate consists of mineral soil particles that are less than 0.002 millimeter in diameter. In table 18, the estimated clay content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The amount and kind of clay affect the fertility and physical condition of the soil and the ability of the soil to adsorb cations and to retain moisture. They influence shrink-swell potential, permeability, plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earthmoving operations.

*Moist bulk density* is the weight of soil (oven-dry) per unit volume. Volume is measured when the soil is at field moisture capacity, that is, the moisture content at  $1/3$ - or  $1/10$ -bar (33kPa or 10kPa) moisture tension. Weight is determined after the soil is dried at 105 degrees C. In the table, the estimated moist bulk density of each soil horizon is expressed in grams per cubic centimeter of soil material that is less than 2 millimeters in diameter. Bulk density data are used to compute shrink-swell potential, available water capacity, total pore space, and other soil properties. The moist bulk density of a soil indicates the pore space available for water and roots. Depending on soil texture, a bulk density of more than 1.4 can restrict water storage and root penetration. Moist bulk density is influenced by texture, kind of clay, content of organic matter, and soil structure.

*Permeability* ( $K_{sat}$ ) refers to the ability of a soil to transmit water or air. The term "permeability," as used in soil surveys, indicates saturated hydraulic conductivity ( $K_{sat}$ ). The estimates in the table indicate the rate of water movement, in inches per hour, when

the soil is saturated. They are based on soil characteristics observed in the field, particularly structure, porosity, and texture. Permeability is considered in the design of soil drainage systems and septic tank absorption fields.

*Available water capacity* refers to the quantity of water that the soil is capable of storing for use by plants. The capacity for water storage is given in inches of water per inch of soil for each soil layer. The capacity varies, depending on soil properties that affect retention of water. The most important properties are the content of organic matter, soil texture, bulk density, and soil structure. Available water capacity is an important factor in the choice of plants or crops to be grown and in the design and management of irrigation systems. Available water capacity is not an estimate of the quantity of water actually available to plants at any given time.

*Linear extensibility* refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. It is an expression of the volume change between the water content of the clod at  $1/3$ - or  $1/10$ -bar tension (33kPa or 10kPa tension) and oven dryness. The volume change is reported in the table as percent change for the whole soil. Volume change is influenced by the amount and type of clay minerals in the soil.

Linear extensibility is used to determine the shrink-swell potential of soils. The shrink-swell potential is low if the soil has a linear extensibility of less than 3 percent; moderate if 3 to 6 percent; high if 6 to 9 percent; and very high if more than 9 percent. If the linear extensibility is more than 3, shrinking and swelling can cause damage to buildings, roads, and other structures and to plant roots. Special design commonly is needed.

*Organic matter* is the plant and animal residue in the soil at various stages of decomposition. In table 18, the estimated content of organic matter is expressed as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of organic matter in a soil can be maintained by returning crop residue to the soil. Organic matter has a positive effect on available water capacity, water infiltration, soil organism activity, and tilth. It is a source of nitrogen and other nutrients for crops and soil organisms.

*Erosion factors* are shown in table 18 as the K factor ( $K_w$  and  $K_f$ ) and the T factor. Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of several factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet

and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and permeability. Values of  $K$  range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.

*Erosion factor  $K_w$*  indicates the erodibility of the whole soil. The estimates are modified by the presence of rock fragments.

*Erosion factor  $K_f$*  indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

*Erosion factor  $T$*  is an estimate of the maximum average annual rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. The rate is in tons per acre per year.

*Wind erodibility groups* are made up of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible. The groups are as follows:

1. Coarse sands, sands, fine sands, and very fine sands.
2. Loamy coarse sands, loamy sands, loamy fine sands, loamy very fine sands, ash material, and sapric soil material.
3. Coarse sandy loams, sandy loams, fine sandy loams, and very fine sandy loams.
- 4L. Calcareous loams, silt loams, clay loams, and silty clay loams.
4. Clays, silty clays, noncalcareous clay loams, and silty clay loams that are more than 35 percent clay.
5. Noncalcareous loams and silt loams that are less than 20 percent clay and sandy clay loams, sandy clays, and hemic soil material.
6. Noncalcareous loams and silt loams that are more than 20 percent clay and noncalcareous clay loams that are less than 35 percent clay.
7. Silts, noncalcareous silty clay loams that are less than 35 percent clay, and fibric soil material.
8. Soils that are not subject to wind erosion because of rock fragments on the surface or because of surface wetness.

*Wind erodibility index* is a numerical value indicating the susceptibility of soil to wind erosion, or the tons per acre per year that can be expected to be lost to wind erosion. There is a close correlation between wind erosion and the texture of the surface layer, the size and durability of surface clods, rock fragments, organic matter, and a calcareous reaction.

Soil moisture and frozen soil layers also influence wind erosion.

## Chemical Properties

Table 19 shows estimates of some chemical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

*Depth* to the upper and lower boundaries of each layer is indicated.

*Cation-exchange capacity* is the total amount of extractable bases that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. Soils having a low cation-exchange capacity hold fewer cations and may require more frequent applications of fertilizer than soils having a high cation-exchange capacity. The ability to retain cations reduces the hazard of ground-water pollution.

*Soil reaction* is a measure of acidity or alkalinity. The pH of each soil horizon is based on many field tests. For many soils, values have been verified by laboratory analyses. Soil reaction is important in selecting crops and other plants, in evaluating soil amendments for fertility and stabilization, and in determining the risk of corrosion.

*Calcium carbonate equivalent* is the percent of carbonates, by weight, in the fraction of the soil less than 2 millimeters in size. The availability of plant nutrients is influenced by the amount of carbonates in the soil. Incorporating nitrogen fertilizer into calcareous soils helps to prevent nitrite accumulation and ammonium-N volatilization.

*Salinity* is a measure of soluble salts in the soil at saturation. It is expressed as the electrical conductivity of the saturation extract, in millimhos per centimeter at 25 degrees C. Estimates are based on field and laboratory measurements at representative sites of nonirrigated soils. The salinity of irrigated soils is affected by the quality of the irrigation water and by the frequency of water application. Hence, the salinity of soils in individual fields can differ greatly from the value given in the table. Salinity affects the suitability of a soil for crop production, the stability of soil if used as construction material, and the potential of the soil to corrode metal and concrete.

*Sodium adsorption ratio (SAR)* is a measure of the amount of sodium (Na) relative to calcium (Ca) and magnesium (Mg) in the water extract from saturated soil paste. It is the ratio of the Na concentration divided by the square root of one-half of the Ca + Mg

concentration. Soils that have SAR values of 13 or more may be characterized by an increased dispersion of organic matter and clay particles, reduced permeability and aeration, and a general degradation of soil structure.

## Soil Features

Table 20 gives estimates of various soil features. The estimates are used in land use planning that involves engineering considerations.

A *restrictive layer* is a nearly continuous layer that has one or more physical, chemical, or thermal properties that significantly impede the movement of water and air through the soil or that restrict roots or otherwise provide an unfavorable root environment. Examples are bedrock, duripans, and layers of dense material. The table indicates the hardness and thickness of the restrictive layer, both of which significantly affect the ease of excavation. *Depth to top* is the vertical distance from the mineral soil surface to the upper boundary of the restrictive layer.

*Subsidence* is the settlement of organic soils or of saturated mineral soils of very low density. Subsidence generally results from either desiccation and shrinkage or oxidation of organic material, or both, following drainage. Subsidence takes place gradually, usually over a period of several years. The table shows the expected initial subsidence, which usually is a result of drainage, and total subsidence, which results from a combination of factors.

*Potential for frost action* is the likelihood of upward or lateral expansion of the soil caused by the formation of segregated ice lenses (frost heave) and the subsequent collapse of the soil and loss of strength on thawing. Frost action occurs when moisture moves into the freezing zone of the soil. Temperature, texture, density, permeability, content of organic matter, and depth to the water table are the most important factors considered in evaluating the potential for frost action. It is assumed that the soil is not insulated by vegetation or snow and is not artificially drained. Silty and highly structured, clayey soils that have a high water table in winter are the most susceptible to frost action. Well drained, very gravelly, or very sandy soils are the least susceptible. Frost heave and low soil strength during thawing cause damage to pavements and other rigid structures.

*Risk of corrosion* pertains to potential soil-induced electrochemical or chemical action that corrodes or weakens uncoated steel or concrete. The rate of corrosion of uncoated steel is related to such factors as soil moisture, particle-size distribution, acidity, and

electrical conductivity of the soil. The rate of corrosion of concrete is based mainly on the sulfate and sodium content, texture, moisture content, and acidity of the soil. Special site examination and design may be needed if the combination of factors results in a severe hazard of corrosion. The steel or concrete in installations that intersect soil boundaries or soil layers is more susceptible to corrosion than the steel or concrete in installations that are entirely within one kind of soil or within one soil layer.

For uncoated steel, the risk of corrosion, expressed as *low*, *moderate*, or *high*, is based on soil drainage class, total acidity, electrical resistivity near field capacity, and electrical conductivity of the saturation extract.

For concrete, the risk of corrosion also is expressed as *low*, *moderate*, or *high*. It is based on soil texture, acidity, and amount of sulfates in the saturation extract.

## Water Features

Table 21 gives estimates of various water features. The estimates are used in land use planning that involves engineering considerations.

*Hydrologic soil groups* are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The four hydrologic soil groups are:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious

material. These soils have a very slow rate of water transmission.

The *months* in the table indicate the portion of the year in which the feature is most likely to be a concern.

*Water table* refers to a saturated zone in the soil. Table 21 indicates, by month, depth to the top (*upper limit*) and base (*lower limit*) of the saturated zone in most years. Estimates of the upper and lower limits are based mainly on observations of the water table at selected sites and on evidence of a saturated zone, namely grayish colors or mottles (redoximorphic features) in the soil. A saturated zone that lasts for less than a month is not considered a water table.

*Ponding* is standing water in a closed depression. Unless a drainage system is installed, the water is removed only by percolation, transpiration, or evaporation. Table 21 indicates *surface water depth* and the *duration* and *frequency* of ponding. Duration is expressed as *very brief* if less than 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, rare, occasional, and frequent. *None* means that ponding is not probable; *rare* that it is unlikely but possible under unusual weather conditions (the chance of ponding is nearly 0 percent to 5 percent in any year); *occasional* that it occurs, on the average, once or less in 2 years (the chance of ponding is 5 to 50 percent in any year); and *frequent* that it occurs, on the average, more than once in 2 years (the chance of ponding is more than 50 percent in any year).

*Flooding* is the temporary inundation of an area caused by overflowing streams, by runoff from adjacent slopes, or by tides. Water standing for short periods after rainfall or snowmelt is not considered

flooding, and water standing in swamps and marshes is considered ponding rather than flooding.

*Duration* and *frequency* are estimated. Duration is expressed as *extremely brief* if 0.1 hour to 4 hours, *very brief* if 4 hours to 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, very rare, rare, occasional, frequent, and very frequent. *None* means that flooding is not probable; *very rare* that it is very unlikely but possible under extremely unusual weather conditions (the chance of flooding is less than 1 percent in any year); *rare* that it is unlikely but possible under unusual weather conditions (the chance of flooding is 1 to 5 percent in any year); *occasional* that it occurs infrequently under normal weather conditions (the chance of flooding is 5 to 50 percent in any year); *frequent* that it is likely to occur often under normal weather conditions (the chance of flooding is more than 50 percent in any year but is less than 50 percent in all months in any year); and *very frequent* that it is likely to occur very often under normal weather conditions (the chance of flooding is more than 50 percent in all months of any year).

The information is based on evidence in the soil profile, namely thin strata of gravel, sand, silt, or clay deposited by floodwater; irregular decrease in organic matter content with increasing depth; and little or no horizon development.

Also considered are local information about the extent and levels of flooding and the relation of each soil on the landscape to historic floods. Information on the extent of flooding based on soil data is less specific than that provided by detailed engineering surveys that delineate flood-prone areas at specific flood frequency levels.

# Classification of the Soils

---

The system of soil classification used by the National Cooperative Soil Survey has six categories (Soil Survey Staff, 1975 and 1987). Beginning with the broadest, these categories are the order, suborder, great group, subgroup, family, and series. Classification is based on soil properties observed in the field or inferred from those observations or from laboratory measurements. Table 22 shows the classification of the soils in the survey area. The categories are defined in the following paragraphs.

**ORDER.** Ten soil orders are recognized. The differences among orders reflect the dominant soil-forming processes and the degree of soil formation. Each order is identified by a word ending in *sol*. An example is Alfisol.

**SUBORDER.** Each order is divided into suborders primarily on the basis of properties that influence soil genesis and are important to plant growth or properties that reflect the most important variables within the orders. The last syllable in the name of a suborder indicates the order. An example is Xeralf (*Xer*, meaning dry, plus *alf*, from Alfisol).

**GREAT GROUP.** Each suborder is divided into great groups on the basis of close similarities in kind, arrangement, and degree of development of pedogenic horizons; soil moisture and temperature regimes; type of saturation; and base status. Each great group is identified by the name of a suborder and by a prefix that indicates a property of the soil. An example is Haploxeralfs (*Hapl*, meaning minimal horizonation, plus *xeralf*, the suborder of the Alfisols that has a xeric moisture regime).

**SUBGROUP.** Each great group has a typic subgroup. Other subgroups are intergrades or extragrades. The typic subgroup is the central concept of the great group; it is not necessarily the most extensive. Intergrades are transitions to other orders, suborders, or great groups. Extragrades have some properties that are not representative of the great group but do not indicate transitions to any other taxonomic class. Each subgroup is identified by one or more adjectives preceding the name of the great group. The adjective *Typic* identifies the subgroup that typifies the great group. An example is Typic Haploxeralfs.

**FAMILY.** Families are established within a subgroup on the basis of physical and chemical properties and other characteristics that affect management. Generally, the properties are those of horizons below plow depth where there is much biological activity. Among the properties and characteristics considered are particle-size class, mineralogy class, soil temperature regime, soil depth, and reaction class. A family name consists of the name of a subgroup preceded by terms that indicate soil properties. An example is fine-loamy, mixed, mesic Typic Haploxeralfs.

**SERIES.** The series consists of soils within a family that have horizons similar in color, texture, structure, reaction, consistence, mineral and chemical composition, and arrangement in the profile.

## Soil Series and Their Morphology

In this section, each soil series recognized in the survey area is described. Characteristics of the soil and the material in which it formed are identified for each series. A pedon, a small three-dimensional area of soil, that is typical of the series in the survey area is described. The detailed description of each soil horizon follows standards in the "Soil Survey Manual" (Soil Survey Staff, 1951). Many of the technical terms used in the descriptions are defined in "Soil Taxonomy" (Soil Survey Staff, 1975) and in "Keys to Soil Taxonomy" (Soil Survey Staff, 1987). Unless otherwise indicated, colors in the descriptions are for dry soil. Following the pedon description is the range of important characteristics of the soils in the series.

### Achimin Series

The Achimin series consists of very deep, well drained soils on toeslopes, footslopes, and backslopes of foothills and in depressions on till plains. These soils formed in loess overlying siltstone residuum. Slopes are 0 to 30 percent. Elevation is 1,500 to 2,600 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Achimin silt loam in an area of Achimin-Calcic Pachic Haploxerolls complex, 3 to 30 percent slopes, about 18 miles west of Nespelem; 2,100 feet south and 600 feet west of the northeast corner of sec. 31, T. 31 N., R. 28 E., W.M.:

- A1—0 to 7 inches; brown (10YR 4/3) silt loam, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common fine vesicular pores; 5 percent pebbles; neutral; gradual smooth boundary.
- A2—7 to 18 inches; brown (10YR 4/3) silt loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; slightly hard, friable, sticky and slightly plastic; many very fine and common fine roots; common fine vesicular pores; 5 percent pebbles; neutral; clear smooth boundary.
- Bt1—18 to 24 inches; yellowish brown (10YR 5/4) silty clay loam, dark yellowish brown (10YR 4/3) moist; moderate fine subangular blocky structure; hard, friable, sticky and plastic; common very fine roots; common fine vesicular pores; common distinct brown (10YR 3/4) clay films on faces of peds; 5 percent pebbles; mildly alkaline; abrupt smooth boundary.
- 2Bt2—24 to 29 inches; dark yellowish brown (10YR 4/6) silty clay loam, dark yellowish brown (10YR 3/4) moist; moderate fine angular blocky structure; hard, firm, sticky and plastic; few very fine roots; common fine vesicular pores; many distinct brown (10YR 4/3) clay films on faces of peds; 2 percent pebbles; moderately alkaline; clear smooth boundary.
- 2Bt3—29 to 34 inches; yellowish brown (10YR 5/6) silty clay loam, dark yellowish brown (10YR 4/6) moist; massive; slightly hard, friable, sticky and plastic; few very fine roots; few fine irregular pores; few faint brown (10YR 4/3) clay films on faces of peds; moderately alkaline; abrupt smooth boundary.
- 2Bk1—34 to 40 inches; 70 percent yellowish brown (10YR 5/6) and 30 percent very pale brown (10YR 7/4) silt loam, dark yellowish brown (10YR 4/6) moist; massive; slightly hard, very friable, sticky and plastic; very few fine roots; few fine irregular pores; common fine lime filaments; strongly effervescent; moderately alkaline; abrupt smooth boundary.
- 2Bk2—40 to 48 inches; pale yellow (2.5Y 7/4) silt loam, light olive brown (2.5Y 5/6) moist; massive; slightly hard, friable, sticky and slightly plastic;

common fine lime filaments; strongly effervescent; moderately alkaline; gradual smooth boundary.

2Bk3—48 to 60 inches; pale yellow (2.5Y 7/4) silt loam, light olive brown (2.5Y 5/6) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few fine lime filaments; slightly effervescent; moderately alkaline.

The mollic epipedon is 10 to 18 inches thick. The particle-size control section is 35 to 45 percent clay.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 5 percent pebbles.

An E horizon is present in some pedons.

The Bt horizon has value of 4 to 6 dry and 3 to 5 moist, and it has chroma of 4 to 6 dry or moist. It is silty clay loam or silty clay with 0 to 5 percent pebbles. It is mildly alkaline or moderately alkaline.

The 2Bt horizon has hue of 10YR or 2.5Y, value of 4 or 5 dry and 3 or 4 moist, and chroma of 4 to 6 dry or moist. It is silty clay loam or silty clay with 0 to 5 percent pebbles. It is mildly alkaline or moderately alkaline. This horizon is absent in some pedons.

A 2Btk horizon is present in some pedons.

The 2Bk horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 3 to 6 dry or moist. It is 0 to 5 percent pebbles. It is mildly alkaline to strongly alkaline.

## Aeneas Series

The Aeneas series consists of very deep, well drained soils on terraces and in depressions between dunes. These soils formed in glacial outwash with loess in the upper part. Slopes are 0 to 10 percent. Elevation is 800 to 1,900 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Aeneas fine sandy loam, 0 to 5 percent slopes, about 2 miles southeast of Monse; 500 feet east and 500 feet north of the southwest corner of sec. 2, T. 30 N., R. 25 E., W.M.:

- A1—0 to 2 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many fine roots; common fine interstitial pores; mildly alkaline; clear smooth boundary.
- A2—2 to 10 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; common fine

roots; common fine interstitial pores; mildly alkaline; gradual wavy boundary.

Bw—10 to 27 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine roots; few medium and fine interstitial and tubular pores; 5 percent gravel; mildly alkaline; clear wavy boundary.

2C1—27 to 38 inches; light brownish gray (10YR 6/2) sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; 5 percent gravel; mildly alkaline; gradual wavy boundary.

2C2—38 to 60 inches; multicolored sand; single grain; loose, nonsticky and nonplastic; 5 percent gravel; mildly alkaline.

The mollic epipedon is 9 to 12 inches thick. Depth to the 2C horizon is 24 to 38 inches. The profile is neutral or mildly alkaline.

The A horizon has chroma of 2 or 3 dry or moist.

The Bw horizon has value of 5 or 6 dry and chroma of 3 or 4 dry or moist. It is fine sandy loam or sandy loam with 0 to 10 percent gravel.

The 2C horizon has hue of 10YR or 2.5Y. It has value of 6 or 7 dry and 5 or 6 moist and chroma of 2 or 3 moist. It is sand, loamy sand, or loamy fine sand with 0 to 10 percent gravel.

## Ahtanum Series

The Ahtanum series consists of soils that are moderately deep to a strongly cemented duripan and are somewhat poorly drained. These soils are on flood plains and in depressions, including backswamps of streams. The soils formed in alluvium derived from volcanic ash and loess. Slopes are 0 to 3 percent. Elevation is 1,100 to 2,800 feet. The average annual precipitation is 10 to 14 inches, the average annual air temperature is 47 to 51 degrees F, and the frost-free season is 110 to 150 days.

Typical pedon of Ahtanum silt loam, 0 to 3 percent slopes, about 5 miles northeast of Coulee Dam; 1,500 feet north and 1,550 feet west of the southeast corner of sec. 22, T. 29 N., R. 31 E., W.M.:

Akn1—0 to 6 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure parting to moderate medium platy; hard, firm, slightly sticky and plastic; many very fine, fine, and medium roots; common very fine tubular pores; few very fine soft masses of lime; violently effervescent; strongly alkaline; clear smooth boundary.

Akn2—6 to 12 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; many dark brown (10YR 3/3) organic stains on faces of peds; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; many very fine tubular pores; few very fine soft masses of lime; violently effervescent; strongly alkaline; clear smooth boundary.

Bkn1—12 to 16 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common very fine tubular pores; few very fine soft masses of lime; violently effervescent; strongly alkaline; gradual smooth boundary.

Bkn2—16 to 20 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common very fine tubular pores; few very fine soft masses of lime; violently effervescent; strongly alkaline; abrupt smooth boundary.

2Abkn—20 to 24 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; few very fine roots; few very fine tubular pores; few very fine soft masses of lime; violently effervescent; strongly alkaline; abrupt smooth boundary.

2Bkqm—24 to 25 inches; light brownish gray (10YR 6/2) strongly lime- and silica-cemented duripan that crushes to silt loam, dark grayish brown (10YR 4/2) moist; common grayish brown (10YR 4/2) organic stains on surface of duripan; massive; very hard, extremely firm, nonsticky and nonplastic; abrupt smooth boundary.

2Bkg1—25 to 30 inches; gray (10YR 5/1) silt loam, dark grayish brown (10YR 4/2) moist; common fine and medium faint mottles that are grayish brown (10YR 5/2) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; violently effervescent; strongly alkaline; clear smooth boundary.

2Bkg2—30 to 60 inches; light gray (5Y 7/1) silt loam, light olive gray (2.5Y 6/2) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; slightly effervescent; strongly alkaline.

Depth to the duripan is 20 to 40 inches. The particle-size control section is less than 5 percent rock

fragments, 5 to 15 percent clay, and less than 15 percent material that is coarser than very fine sand. The sodium adsorption ratio is 15 to 35 in more than one-half of the upper 20 inches, and it decreases as depth increases. A perched water table is present in November through August.

The Akn horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 1 or 2 moist or dry.

The Bkn horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist.

The 2Abkn horizon is absent in some pedons.

The 2Bkqm horizon typically is strongly cemented, but it is weakly cemented in some areas. It is 1 to 8 inches thick.

The 2Bkg horizon has hue of 10YR, 2.5Y, or 5Y, value of 5 to 7 dry and 4 to 6 moist, and chroma of 1 or 2 dry or moist. It is silt loam, very fine sandy loam, or loam.

### Aits Series

The Aits series consists of soils that are moderately deep to very deep to dense glacial till and are well drained. These soils are on terraces and on backslopes, footslopes, and toeslopes of hills and mountains. The soils formed dominantly in glacial till with a mantle of volcanic ash, but some areas formed in alluvium derived from glacial till with a mantle of volcanic ash and loess. Slopes are 0 to 40 percent. Elevation is 2,000 to 4,000 feet. The average annual precipitation is 20 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free season is 90 to 120 days.

Typical pedon of Aits silt loam, dry, 5 to 20 percent slopes, about 11 miles southwest of Inchelium; 1,750 feet south and 500 feet west of the northeast corner of sec. 26, T. 32 N., R. 35 E.:

Oe—1.5 inches to 0; partially decomposed organic matter consisting of needles and twigs.

A—0 to 4 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 3/4) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; many fine pores; 5 percent pebbles; slightly acid; clear smooth boundary.

Bw1—4 to 13 inches; light yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; few very fine, fine, and coarse roots; many fine pores; 5 percent pebbles; slightly acid; clear wavy boundary.

2Bw2—13 to 27 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 4/3) moist; weak

fine and medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few fine and medium roots; many fine pores; 20 percent pebbles; slightly acid; gradual wavy boundary.

2Cd—27 to 60 inches; yellowish brown (10YR 5/4) dense glacial till that crushes to gravelly sandy loam, dark brown (10YR 4/3) moist; massive; hard, very friable, nonsticky and nonplastic; few medium roots; few very fine pores; 20 percent pebbles; slightly acid.

The mantle of volcanic ash is 7 to 14 inches thick. The particle-size control section is 5 to 35 percent rock fragments. Depth to dense glacial till is 20 to 60 inches or more. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is silt loam, loam, or very fine sandy loam with 0 to 10 percent pebbles.

The 2Bw horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam, loam, or sandy loam with 5 to 35 percent pebbles and 0 to 5 percent cobbles.

The 2Cd horizon has hue of 2.5Y or 10YR, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is silt loam, sandy loam, or loam with 5 to 35 percent pebbles and 0 to 5 percent cobbles. The sandy substratum phase below a depth of 40 inches is sand or loamy coarse sand and is 15 to 50 percent pebbles and 0 to 5 percent cobbles.

### Anders Series

The Anders series consists of moderately deep, well drained soils on plateaus. These soils formed in loess. Slopes are 0 to 8 percent. Elevation is 1,900 to 2,700 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free season is 110 to 150 days.

Typical pedon of Anders silt loam, 0 to 8 percent slopes, about 3 miles northeast of Coulee Dam; 1,800 feet north and 450 feet east of the southwest corner of sec. 33, T. 29 N., R. 31 E., W.M.:

A1—0 to 3 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots; common fine irregular pores; 3 percent pebbles; neutral; clear smooth boundary.

A2—3 to 14 inches; brown (10YR 5/3) silt loam, dark

brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine roots; common fine irregular pores; 3 percent pebbles; mildly alkaline; clear wavy boundary.

Bw—14 to 23 inches; yellowish brown (10YR 5/4) gravelly silt loam, brown (10YR 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common fine irregular pores; 25 percent pebbles; mildly alkaline; abrupt wavy boundary.

2R—23 to 27 inches; basalt bedrock.

Depth to bedrock is 20 to 40 inches. The particle-size control section is 10 to 18 percent clay with 5 to 25 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 15 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam or very fine sandy loam with 5 to 25 percent pebbles and 0 to 15 percent cobbles. It is neutral to moderately alkaline.

## Andic Cryaquepts

Andic Cryaquepts consist of very deep, poorly drained soils in depressions on moraines on mountains. These soils formed in alluvium with a component of volcanic ash. Slopes are 0 to 3 percent. Elevation is 3,000 to 5,000 feet. The average annual precipitation is 20 to 30 inches, the average annual air temperature is 40 to 42 degrees F, and the frost-free period is 80 to 100 days.

Reference pedon of Andic Cryaquepts, 0 to 3 percent slopes, about 17 miles north of Nespelem; 2,200 feet north and 300 feet west of the southeast corner of sec. 28, T. 34 N., R. 31 E., W.M.:

Oi—1 inch to 0; needles, twigs, leaves, and mosses.

A—0 to 9 inches; grayish brown (10YR 5/2) silt loam, very dark brown (10YR 2/2) moist; common medium distinct mottles that are dark brown (7.5YR 3/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; common fine irregular pores; medium acid; clear wavy boundary.

2Ab—9 to 17 inches; gray (10YR 5/1) fine sandy loam, very dark gray (10YR 3/1) moist; common fine distinct mottles that are dark yellowish brown (10YR 3/6) moist; weak medium subangular blocky structure; slightly hard, friable, slightly

sticky and slightly plastic; few very fine roots; common fine irregular pores; 5 percent pebbles; slightly acid; clear wavy boundary.

2Bg—17 to 22 inches; grayish brown (10YR 5/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine roots; few fine pores; 30 percent pebbles; medium acid; abrupt wavy boundary.

2C1—22 to 28 inches; gray (10YR 6/1) loamy sand, gray (10YR 5/1) moist; massive; soft, very friable, nonsticky and nonplastic; 10 percent pebbles; slightly acid; abrupt wavy boundary.

2C2—28 to 60 inches; multicolored extremely gravelly sand; 1-inch-thick strata of dark gray (10YR 4/1) loamy fine sand at a depth of 30 inches, black (10YR 2/1) moist; single grain; loose, nonsticky and nonplastic; 65 percent pebbles; slightly acid.

These soils have an umbric epipedon or an ochric epipedon. The mantle of material influenced by volcanic ash is 7 to 30 inches thick. The profile is medium acid or slightly acid. An apparent water table is present in December through August.

The A horizon has value of 4 to 6 dry and 2 to 4 moist, and it has chroma of 1 or 2 dry or moist. It is 0 to 10 percent rock fragments.

The 2Ab horizon has value of 4 to 6 dry and 2 to 4 moist, and it has chroma of 1 or 2 dry or moist. It is silt loam, loam, or fine sandy loam with 0 to 15 percent rock fragments. This horizon is absent in some pedons.

The 2Bg horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 1 or 2 dry or moist. It is loam, fine sandy loam, or sandy loam with 0 to 35 percent rock fragments.

The 2C horizon has hue of 10YR or 2.5Y, value of 7 or 8 dry and 3 to 5 moist, and chroma of 1 or 2 dry or moist. Individual sand grains may have chroma of more than 2. The horizon is stratified sand to fine sandy loam with 5 to 70 percent rock fragments.

## Annum Series

The Annum series consists of deep, well drained soils on broad summits and shoulders of hills. These soils formed in residuum derived from granitic rock with a mantle of loess. Slopes are 8 to 25 percent. Elevation is 2,400 to 3,200 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Annum silt loam, 8 to 25 percent

slopes, about 7 miles northeast of Coulee Dam; 1,850 feet east and 300 feet south of the northwest corner of sec. 30, T. 29 N., R. 32 E., W.M.:

A1—0 to 8 inches; dark grayish brown (10YR 4/2) silt loam, black (10YR 2/1) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common fine irregular pores; neutral; gradual smooth boundary.

A2—8 to 12 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak moderate and coarse subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common fine irregular pores; neutral; clear smooth boundary.

BA—12 to 18 inches; brown (10YR 5/3) silt loam, dark brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, sticky and plastic; few very fine roots; common fine irregular pores; very few thin clay films lining pores; neutral; abrupt smooth boundary.

Bt1—18 to 24 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure parting to very fine subangular blocky; hard, friable, sticky and plastic; few very fine roots; few fine tubular pores; few faint clay films on faces of peds; neutral; clear smooth boundary.

2Bt2—24 to 46 inches; strong brown (7.5YR 5/6) clay loam, brown (7.5YR 4/4) moist; moderate fine subangular blocky structure; hard, firm, sticky and plastic; few very fine roots; few fine tubular pores; common faint clay films lining pores and on faces of peds; mildly alkaline; clear smooth boundary.

2Bk—46 to 53 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; few fine tubular pores; few soft masses and filaments of secondary lime; violently effervescent; 20 percent fine granitic pebbles; moderately alkaline; clear smooth boundary.

2Cr—53 to 63 inches; weathered granitic rock.

The mollic epipedon is 10 to 20 inches thick. Depth to weathered bedrock is 40 to 60 inches. The particle-size control section is 0 to 10 percent pebbles and 18 to 35 percent clay.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist.

The BA and Bt horizons have value of 5 or 6 dry

and chroma of 3 or 4 dry or moist. They are silt loam or loam.

The 2Bt horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry, and chroma of 4 or 6 dry. It is loam, clay loam, or sandy clay loam with 0 to 10 percent pebbles. It is neutral or mildly alkaline.

The 2Bk horizon has value of 6 or 7 dry and 4 to 6 moist, and it has chroma of 3 or 4 dry or moist. It is loam or sandy loam with 10 to 25 percent pebbles. It is mildly alkaline or moderately alkaline. Some pedons do not have secondary carbonates.

## Apex Series

The Apex series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on backslopes, footslopes, and toeslopes of hills and mountains. They formed in glacial till with a mantle of volcanic ash. Slopes are 0 to 65 percent. Elevation is 2,000 to 4,000 feet. The average annual precipitation is 15 to 22 inches, the average annual air temperature is 42 to 46 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Apex silt loam, 5 to 20 percent slopes, about 8 miles northwest of Inchelium; 900 feet north and 100 feet east of the southwest corner of sec. 33, T. 34 N., R. 36 E., W.M.:

Oi—1 inch to 0; needles, twigs, bark, and cones.

A—0 to 3 inches; dark brown (10YR 4/3) silt loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common fine irregular pores; 5 percent pebbles; slightly acid (NaF pH 9.8); clear wavy boundary.

Bw1—3 to 8 inches; brown (10YR 4/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common fine irregular pores; 5 percent pebbles; slightly acid (NaF pH 9.8); clear wavy boundary.

Bw2—8 to 13 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common fine irregular pores; 5 percent pebbles; slightly acid (NaF pH 9.8); clear wavy boundary.

2Bw3—13 to 30 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few

fine, medium, and coarse roots; few fine tubular pores; 20 percent pebbles; slightly acid; gradual wavy boundary.

2Cd—30 to 60 inches; brown (10YR 5/3) dense glacial till that crushes to gravelly sandy loam, dark brown (10YR 4/3) moist; massive; hard, friable, nonsticky and nonplastic; few fine roots; few fine irregular pores; 30 percent pebbles; slightly acid.

The mantle of volcanic ash is 7 to 14 inches thick. The profile is slightly acid or neutral. Depth to dense glacial till is 20 to 40 inches.

The A horizon has value of 3 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam or loam.

The Bw horizon has value of 4 to 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam or loam with 0 to 10 percent pebbles.

The 2Bw horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam, loam, or sandy loam with 5 to 30 percent pebbles and 0 to 5 percent cobbles. This horizon is absent in some pedons.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 5 to 35 percent pebbles and 0 to 15 percent cobbles and stones.

### Aquic Xerofluvents

Aquic Xerofluvents consist of very deep, moderately well drained and somewhat poorly drained soils on flood plains and low stream terraces. These soils formed in recent alluvium that has been reworked by glacial outwash in some areas. Slopes are 0 to 3 percent. Elevation is 1,300 to 4,000 feet. The average annual precipitation is 14 to 25 inches, the average annual air temperature is 43 to 49 degrees F, and the frost-free period is 90 to 130 days.

Reference pedon of Aquic Xerofluvents, moist, 0 to 3 percent slopes, about 13 miles northwest of Inchelium; 1,700 feet north and 1,600 feet east of the southwest corner of sec. 12, T. 34 N., R. 35 E., W.M.:

A—0 to 1 inch; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; 5 percent pebbles; slightly acid; abrupt wavy boundary.

AC—1 inch to 5 inches; grayish brown (10YR 5/2) sandy loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine

roots; few fine tubular pores; 5 percent pebbles; slightly acid; clear wavy boundary.

C1—5 to 15 inches; multicolored very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine roots; 50 percent pebbles; neutral; abrupt smooth boundary.

C2—15 to 25 inches; light gray (10YR 7/2) sand, dark grayish brown (2.5Y 4/2) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; 10 percent pebbles; neutral; abrupt smooth boundary.

C3—25 to 35 inches; light gray (2.5Y 7/2) silt loam, dark grayish brown (2.5Y 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; 5 percent pebbles; neutral; abrupt smooth boundary.

C4—35 to 40 inches; light brownish gray (2.5Y 6/2) very gravelly loamy sand, dark grayish brown (2.5Y 4/2) moist; single grain; loose, nonsticky and nonplastic; 35 percent pebbles; neutral; abrupt smooth boundary.

C5—40 to 52 inches; light brownish gray (2.5Y 6/2) gravelly loamy sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; 15 percent pebbles; neutral; abrupt smooth boundary.

C6—52 to 60 inches; brown (10YR 5/3) very gravelly loamy coarse sand, dark brown (10YR 3/3) moist; single grain; loose, nonsticky and nonplastic; 40 percent pebbles; neutral.

Depth to the stratified C horizon is 5 to 50 inches or more. The profile is slightly acid or neutral. An apparent water table is present in January through July. Occasional periods of flooding occur in February through May.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam, fine sandy loam, or sandy loam with 0 to 15 percent pebbles.

The C horizon has hue of 10YR, 2.5Y, or 5Y, value of 5 to 7 dry and 3 to 6 moist, and chroma of 1 to 4 dry and 2 to 6 moist. Some pedons have mottles below a depth of 15 inches. The horizon is stratified silt loam to coarse sand with 5 to 60 percent pebbles and 0 to 10 percent cobbles.

### Badge Series

The Badge series consists of very deep, well drained soils on footslopes and backslopes of plateau escarpments. These soils formed in colluvium derived from basalt mixed with loess. Slopes are 25 to 65

percent. Elevation is 1,500 to 2,200 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 51 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Badge very stony silt loam, 25 to 65 percent slopes, about 6 miles northeast of Bridgeport; 2,000 feet south and 150 feet east of the northwest corner of sec. 30, T. 30 N., R. 26 E.:

A—0 to 10 inches; dark grayish brown (10YR 4/2) very stony silt loam, very dark brown (10YR 2/2) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots; many very fine tubular pores; 15 percent pebbles, 5 percent cobbles, and 15 percent stones; mildly alkaline; clear wavy boundary.

Bt1—10 to 23 inches; yellowish brown (10YR 5/4) very gravelly clay loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; hard, firm, sticky and plastic; common fine and very fine roots; many very fine tubular and interstitial pores; few faint clay films on faces of peds; 30 percent pebbles, 5 percent cobbles, and 5 percent stones; mildly alkaline; gradual wavy boundary.

Bt2—23 to 38 inches; brown (10YR 5/3) very stony clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; hard, firm, sticky and plastic; few fine roots; common fine and medium tubular and interstitial pores; few faint clay films on faces of peds; 35 percent pebbles, 10 percent cobbles, and 10 percent stones; mildly alkaline; gradual wavy boundary.

C—38 to 60 inches; light yellowish brown (10YR 6/4) extremely cobbly silt loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; few very fine and fine tubular pores; 40 percent pebbles, 20 percent cobbles, 5 percent stones, and 5 percent boulders; mildly alkaline.

The mollic epipedon is 10 to 14 inches thick. The particle-size control section is 35 to 60 percent rock fragments, dominantly basalt. The solum is neutral or mildly alkaline.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist.

The Bt horizon has value of 4 or 5 dry and chroma of 3 dry or moist. It is clay loam or loam with 30 to 40 percent pebbles, 0 to 35 percent cobbles, and 5 to 15 percent stones.

The C horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 4 or 5 moist, and chroma of 2 to 4 dry or

moist. It is loam or silt loam with 10 to 35 percent cobbles and 25 to 40 percent pebbles.

### Bakeoven Series

The Bakeoven series consists of very shallow, well drained soils on plateaus. These soils formed in residuum and colluvium derived from basalt with a component of loess. Elevation is 1,800 to 2,900 feet. Slopes are 0 to 30 percent. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Bakeoven very cobbly silt loam, 2 to 25 percent slopes, about 1.5 miles east of Coulee Dam; 50 feet south and 1,600 feet west of the northeast corner of sec. 5, T. 28 N., R. 31 E.:

A—0 to 3 inches; brown (10YR 5/3) very cobbly silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; common fine tubular pores; 15 percent pebbles and 35 percent cobbles; neutral; clear wavy boundary.

Bw—3 to 7 inches; brown (10YR 5/3) very cobbly silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; common fine tubular pores; 20 percent pebbles and 25 percent cobbles; neutral; abrupt wavy boundary.

R—7 to 11 inches; basalt bedrock.

Depth to bedrock is 4 to 10 inches. The profile is 40 to 75 percent rock fragments. It is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 10 to 20 percent pebbles, 25 to 40 percent cobbles, and 0 to 5 percent stones.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is loam or silt loam with 0 to 30 percent pebbles, 25 to 50 percent cobbles, and 0 to 5 percent stones.

### Baldknob Series

The Baldknob series consists of shallow, well drained soils on glacially scoured summits, shoulders, and backslopes of hills and mountains. These soils formed in residuum and colluvium derived dominantly from rhyodacite and quartz latite with some glacial till and a component of volcanic ash and loess. Slopes are 5 to 70 percent. Elevation is 2,200 to 4,200 feet.

The average annual precipitation is 15 to 22 inches, the average annual air temperature is 42 to 46 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Baldknob very stony loam in an area of Baldknob-Thout, dry-Rock outcrop complex, 20 to 65 percent slopes, about 15 miles northeast of Nespelem; 2,000 feet north and 400 feet east of the southwest corner of sec. 13, T. 33 N., R. 31 E., W.M.:

A—0 to 4 inches; brown (10YR 5/3) very stony loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine and fine roots; common fine tubular pores; 30 percent pebbles, 5 percent cobbles, and 10 percent stones; slightly acid; clear wavy boundary.

Bw1—4 to 9 inches; brown (10YR 5/3) very gravelly loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common fine tubular pores; 40 percent pebbles and 15 percent cobbles; slightly acid; gradual wavy boundary.

Bw2—9 to 14 inches; yellowish brown (10YR 5/4) extremely gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few fine roots; common fine tubular pores; 45 percent pebbles and 20 percent cobbles; slightly acid; abrupt wavy boundary.

R—14 to 18 inches; rhyodacite.

Depth to bedrock is 10 to 20 inches. The mollic epipedon is 7 to 12 inches thick. The particle-size control section is 8 to 18 percent clay with 35 to 70 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has hue of 7.5YR or 10YR, value of 4 or 5 dry and 2 or 3 moist, and chroma of 2 to 4 dry and 2 or 3 moist. It is 10 to 30 percent pebbles, 5 to 15 percent cobbles, and 5 to 15 percent stones.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is 25 to 50 percent pebbles, 5 to 20 percent cobbles, and 0 to 5 percent stones.

### **Barnellcreek Series**

The Barnellcreek series consists of soils that are deep to dense glacial till and are moderately well drained. These soils are on footslopes and toeslopes of mountains. They formed in volcanic ash over glacial till. Slopes are 5 to 15 percent. Elevation is 3,200 to 4,600 feet. The average annual precipitation is 18 to

25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free season is 90 to 120 days.

Typical pedon of Barnellcreek silt loam, 5 to 15 percent slopes, about 8 miles northeast of Disautel; 2,400 feet south and 1,900 feet east of the northwest corner of sec. 11, T. 34 N., R. 29 E., W.M.:

Oi—1 inch to 0; needles, leaves, twigs, and cones.

A1—0 to 5 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; common fine irregular pores; 10 percent pebbles; neutral; clear wavy boundary.

A2—5 to 26 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, medium, and coarse roots; common fine irregular pores; 10 percent pebbles; neutral; gradual wavy boundary.

2Bw—26 to 42 inches; yellowish brown (10YR 5/4) gravelly sandy loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; few fine tubular pores; 20 percent pebbles; neutral; clear wavy boundary.

2Cd—42 to 60 inches; light gray (2.5Y 7/2) dense glacial till that crushes to very gravelly sandy loam, grayish brown (2.5Y 5/2) moist; few fine faint mottles that are strong brown (7.5YR 4/6) when moist; massive; slightly hard, very friable, slightly sticky and nonplastic; few very fine and fine roots; few fine tubular pores; 30 percent pebbles and 10 percent cobbles; neutral.

Depth to dense glacial till is 40 to 60 inches. The mollic epipedon is 20 to 35 inches thick. The upper part of the particle-size control section is 8 to 15 percent clay and 0 to 15 percent rock fragments, and the lower part is 5 to 15 percent clay and 15 to 35 percent rock fragments. An apparent water table is present in January through May.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 15 percent pebbles.

The 2Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry. It is loam or sandy loam with 15 to 25 percent pebbles and 0 to 5 percent cobbles.

The 2Cd horizon has value of 5 or 6 moist and chroma of 2 or 3 dry or moist. It is 20 to 40 percent

pebbles, 5 to 20 percent cobbles, and 0 to 5 percent stones. It is slightly acid or neutral.

### Bearspring Series

The Bearspring series consists of very deep, well drained soils on footslopes and backslopes of hills and mountains. These soils formed in colluvium and residuum derived from granitic rock with some loess and volcanic ash. Slopes are 20 to 65 percent. Elevation is 1,900 to 4,600 feet. The average annual precipitation is 15 to 20 inches, the average annual air temperature is 43 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Bearspring cobbly loam, 40 to 65 percent slopes, about 7 miles northeast of Nespelem; 2,300 feet south and 400 feet west of the northeast corner of sec. 12, T. 30 N., R. 31 E., W.M.:

- Oi—1 inch to 0; needles, leaves, and bark.
- A1—0 to 6 inches; grayish brown (10YR 5/2) cobbly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common fine irregular pores; 15 percent pebbles and 15 percent cobbles; neutral; clear wavy boundary.
- A2—6 to 11 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common fine irregular pores; 25 percent pebbles; slightly acid; clear wavy boundary.
- Bw1—11 to 19 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common fine irregular pores; 30 percent pebbles; slightly acid; abrupt wavy boundary.
- Bw2—19 to 27 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common fine roots; common fine irregular pores; 35 percent pebbles and 5 percent cobbles; slightly acid; gradual wavy boundary.
- C1—27 to 50 inches; pale brown (10YR 6/3) very cobbly sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; common fine roots; few fine tubular pores; 10 percent pebbles and 40 percent cobbles; slightly acid; clear wavy boundary.
- C2—50 to 60 inches; light yellowish brown (10YR 6/9)

extremely gravelly coarse sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; 75 percent pebbles; neutral.

The profile is slightly acid or neutral. The particle-size control section is 7 to 15 percent clay with 35 to 50 percent angular granitic rock fragments.

The A horizon has value of 4 or 5 dry and chroma of 1 to 3 dry or moist. It is loam or cobbly loam with 5 to 25 percent pebbles, 0 to 25 percent cobbles, and 0 to 5 percent stones.

The Bw horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is loam or sandy loam with 15 to 45 percent pebbles, 0 to 20 percent cobbles, and 0 to 5 percent stones.

The C horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is dominantly sandy loam or coarse sandy loam with 5 to 75 percent pebbles, 0 to 40 percent cobbles, and 0 to 5 percent stones. The lower part is loamy coarse sand in some pedons.

### Bernhill Series

The Bernhill series consists of very deep, well drained soils on ground moraines, till plains, and toeslopes of hills. These soils formed in glacial till derived from mixed sources, including glacial lake sediment, with some volcanic ash and loess. Slopes are 0 to 20 percent. Elevation is 1,500 to 3,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Bernhill loam, dry, 5 to 20 percent slopes, about 2 miles northeast of Disautel; 1,900 feet north and 2,000 feet west of the southeast corner of sec. 8, T. 33 N., R. 29 E., W.M.:

- Oi—1 inch to 0; ponderosa pine needles, twigs, and cones.
- A—0 to 4 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.
- Bw—4 to 14 inches; pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, medium, and coarse roots; common fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

2EB—14 to 27 inches; light gray (10YR 7/2) loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; few fine tubular pores; 10 percent pebbles; neutral; clear wavy boundary.

2Bt—27 to 36 inches; light yellowish brown (2.5Y 6/4) clay loam, olive brown (2.5Y 4/4) moist; moderate medium angular blocky structure; hard, firm, sticky and slightly plastic; common moderately thick clay films on faces of peds and in pores; common very fine and fine roots and few medium and coarse roots; few fine tubular pores; 10 percent pebbles; neutral; clear wavy boundary.

2C—36 to 60 inches; light gray (2.5Y 7/2) gravelly sandy loam, grayish brown (2.5Y 5/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 20 percent pebbles and 10 percent cobbles; neutral.

The particle-size control section is 18 to 35 percent clay and 10 to 20 percent rock fragments. It is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam, fine sandy loam, or silt loam with 0 to 15 percent pebbles.

The 2EB horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 or 3 dry or moist. It is loam or fine sandy loam with 5 to 25 percent pebbles.

The 2Bt horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loam, silt loam, or clay loam with 10 to 35 percent pebbles.

The 2C horizon has value of 6 or 7 dry and 5 or 6 moist, and it has chroma of 2 to 4 dry or moist. It is loam, fine sandy loam, or sandy loam with 15 to 30 percent pebbles and 0 to 10 percent cobbles.

## Beverly Series

The Beverly series consists of very deep, somewhat excessively drained soils on alluvial fans. These soils formed in recent alluvium. Slopes are 2 to 25 percent. Elevation is 800 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Beverly gravelly loamy sand, 2 to 25 percent slopes, about 13 miles southwest of

Nespelem; 1,050 feet east and 1,400 feet north of the southwest corner of sec. 12, T. 30 N., R. 28 E., W.M.:

A—0 to 6 inches; brown (10YR 5/3) gravelly loamy sand, dark brown (10YR 3/3) moist; weak coarse granular structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; few fine tubular and interstitial pores; 20 percent pebbles; neutral; clear smooth boundary.

C1—6 to 17 inches; pale brown (10YR 6/3) gravelly loamy sand, dark brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; few fine tubular and interstitial pores; 30 percent pebbles; neutral; clear smooth boundary.

C2—17 to 31 inches; pale brown (10YR 6/3) very gravelly sand, dark brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; common fine and medium tubular pores; 45 percent pebbles and 5 percent cobbles; neutral; gradual wavy boundary.

C3—31 to 60 inches; multicolored extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; 65 percent pebbles and 5 percent cobbles; neutral.

The particle-size control section is 40 to 70 percent rock fragments. It is neutral or mildly alkaline.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is 15 to 30 percent pebbles and 0 to 10 percent cobbles.

The C1 horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loamy sand or loamy fine sand with 15 to 30 percent pebbles and 0 to 10 percent cobbles.

The C2 has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. The C3 horizon is multicolored. They are sand or coarse sand with 40 to 65 percent pebbles, 5 to 25 percent cobbles, and 0 to 5 percent stones.

## Bisbee Series

The Bisbee series consists of very deep, somewhat excessively drained soils on terraces and terrace escarpments. These soils formed in sandy glacial outwash locally reworked by wind. Slopes are 0 to 40 percent. Elevation is 1,400 to 3,400 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 46 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Bisbee loamy fine sand, warm, 0 to 20 percent slopes, about 9 miles northeast of Nespelem; 10 feet south and 2,200 feet west of the northeast corner of sec. 2, T. 31 N., R. 30 E., W.M.:

Oi—1 inch to 0; twigs, needles, and leaves.

A—0 to 5 inches; brown (10YR 5/3) loamy fine sand, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine and fine interstitial pores; 5 percent pebbles; slightly acid; clear wavy boundary.

C1—5 to 22 inches; pale brown (10YR 6/3) loamy fine sand, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; common fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

C2—22 to 40 inches; very pale brown (10YR 7/3) loamy fine sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; common very fine, fine, and medium roots; 5 percent pebbles; neutral; clear wavy boundary.

C3—40 to 60 inches; light gray (2.5Y 7/2) loamy fine sand, light brownish gray (2.5Y 6/2) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; 5 percent pebbles; neutral.

The particle-size control section is 0 to 10 percent pebbles, and the fine-earth fraction averages less than 15 percent coarse sand and very coarse sand. The profile is slightly acid or neutral.

The A horizon has chroma of 2 or 3 moist or dry.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is loamy fine sand, fine sand, or sand.

## Boesel Series

The Boesel series consists of very deep, moderately well drained soils on stream terraces and flood plains. These soils formed in recent alluvium. Slopes are 0 to 3 percent. Elevation is 1,600 to 3,200 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Boesel fine sandy loam, 0 to 3 percent slopes, about 23 miles northeast of Nespelem; 500 feet north and 2,300 feet east of the southwest corner of sec. 11, T. 34 N., R. 32 E., W.M.:

Ap—0 to 8 inches; dark brown (10YR 4/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; many very fine and fine roots, common medium roots, and few coarse roots; common fine tubular pores; 5 percent pebbles; neutral; clear smooth boundary.

A—8 to 13 inches; dark brown (10YR 4/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; many very fine and fine roots, common medium roots, and few coarse roots; common fine tubular pores; 10 percent pebbles; neutral; clear wavy boundary.

AC—13 to 20 inches; brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; weak medium prismatic structure; slightly hard, friable, slightly sticky and nonplastic; many very fine roots, common fine roots, and few medium roots; few fine tubular pores; 10 percent pebbles; neutral; abrupt wavy boundary.

C1—20 to 29 inches; brown (10YR 5/3) gravelly loamy sand, dark brown (10YR 3/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; 25 percent pebbles; neutral; clear wavy boundary.

C2—29 to 60 inches; brown (10YR 5/3) very gravelly loamy sand, dark brown (10YR 3/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; 50 percent pebbles; neutral.

Depth to the C horizon is 20 to 33 inches. The upper part of the particle-size control section is 0 to 15 percent pebbles, and the lower part is 35 to 50 percent rock fragments. An apparent water table is present in February through May. Occasional periods of flooding occur in February through May.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles.

The AC horizon has chroma of 2 or 3 dry or moist. It is fine sandy loam or sandy loam with 0 to 10 percent pebbles.

The C horizon has hue of 10YR and value of 5 or 6 dry and 3 or 4 moist. The upper part of the horizon is loamy sand with 5 to 25 percent pebbles, and the lower part is loamy sand, sand, or coarse sand with 35 to 60 percent pebbles and 0 to 5 percent cobbles. The lower part has faint to prominent mottles in some pedons.

## Bong Series

The Bong series consists of very deep, somewhat excessively drained soils on terraces and terrace escarpments. These soils formed in glacial outwash with a minor amount of loess. Slopes are 0 to 70 percent. Elevation is 1,500 to 3,700 feet. The average annual precipitation is 15 to 18 inches, the average

annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Bong sandy loam, 0 to 30 percent slopes, about 10 miles northeast of Omak; 1,050 feet south and 1,575 feet east of the northwest corner of sec. 8, T. 34 N., R. 28 E., W.M.:

Oi—1 inch to 0; needles, twigs, and cones.

A—0 to 8 inches; dark grayish brown (10YR 4/2) sandy loam, black (10YR 2/1) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; common fine tubular pores; 2 percent pebbles; neutral; abrupt smooth boundary.

Bw—8 to 17 inches; yellowish brown (10YR 5/4) sandy loam, dark yellowish brown (10YR 3/4) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; many very fine roots, common fine roots, and few medium roots; common fine tubular pores; 10 percent pebbles; neutral; abrupt smooth boundary.

BC—17 to 24 inches; light yellowish brown (10YR 6/4) gravelly loamy coarse sand, dark yellowish brown (10YR 4/4) moist; moderate fine subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; many very fine roots and few fine and medium roots; common fine tubular pores; 25 percent pebbles and 5 percent cobbles; neutral; abrupt smooth boundary.

C—24 to 60 inches; light yellowish brown (10YR 6/4) sand, yellowish brown (10YR 5/4) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 5 percent pebbles; neutral.

The mollic epipedon is 8 to 16 inches thick. Depth to the BC or C horizon is 15 to 24 inches. The particle-size control section is 5 to 30 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 to 3 moist. It is 0 to 10 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. The horizon is sandy loam or coarse sandy loam with 0 to 10 percent pebbles.

The BC horizon has hue of 10YR or 2.5Y and chroma of 3 or 4 dry or moist. It is loamy sand, loamy coarse sand, or sand with 5 to 25 percent pebbles and 0 to 15 percent cobbles. This horizon is absent in some pedons.

The C horizon has hue of 10YR or 2.5Y, value of 6

or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loamy sand, loamy coarse sand, or sand with 5 to 25 percent pebbles and 0 to 15 percent cobbles.

## Borgeau Series

The Borgeau series consists of very deep, well drained soils on backslopes and footslopes of hills. These soils formed in glacial till and colluvium derived from metamorphic rock with some loess and volcanic ash. Slopes are 8 to 65 percent. Elevation is 1,700 to 3,000 feet. The average annual precipitation is 15 to 18 inches, the average air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Borgeau loam, 8 to 30 percent slopes, about 12 miles north of Inchelium; 2,000 feet south and 1,500 feet west of the northeast corner of sec. 9, T. 34 N., R. 36 E.:

Oe—1 inch to 0; partially decomposed organic material.

A—0 to 9 inches; very dark grayish brown (10YR 3/2) loam, black (10YR 2/1) moist; moderate very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; common fine irregular pores; 10 percent pebbles; neutral; clear smooth boundary.

Bw—9 to 17 inches; brown (10YR 4/3) very gravelly loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common fine irregular pores; 35 percent pebbles and 10 percent cobbles; slightly acid; gradual wavy boundary.

C1—17 to 34 inches; light yellowish brown (2.5Y 6/4) very gravelly loam, olive brown (2.5Y 4/4) moist; massive; soft, very friable, slightly sticky and slightly plastic; few fine roots; few fine tubular pores; 40 percent pebbles and 15 percent cobbles; medium acid; gradual wavy boundary.

C2—34 to 60 inches; light yellowish brown (2.5Y 6/4) extremely gravelly loam, light olive brown (2.5Y 5/4) moist; massive; soft, very friable, slightly sticky and slightly plastic; few fine roots; few fine tubular pores; 50 percent pebbles and 15 percent cobbles; slightly acid.

The mollic epipedon is 7 to 17 inches thick. The particle-size control section is 40 to 65 percent rock fragments and 10 to 18 percent clay.

The A horizon has value of 3 or 4 dry and chroma of

1 to 3 dry or moist. It is 0 to 15 percent rock fragments.

The Bw horizon has hue of 10YR or 2.5Y, value of 4 or 5 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is loam or sandy loam with 20 to 40 percent pebbles and 5 to 10 percent cobbles.

The C horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is loam or sandy loam with 35 to 50 percent pebbles, 15 to 25 percent cobbles, and 0 to 5 percent stones.

## Borosaprists

Borosaprists consist of very deep, very poorly drained soils in lake basins and depressions on till plains, ground moraines, and terraces. These soils formed in decomposed organic material over alluvium or glacial lake sediment. Slopes are 0 to 2 percent. Elevation is 2,800 to 5,000 feet. The average annual precipitation is 17 to 30 inches, the average annual air temperature is 41 to 44 degrees F, and the frost-free period is 80 to 100 days.

Reference pedon of Borosaprists, 0 to 2 percent slopes, about 21 miles north of Nespelem; 1,700 feet north and 1,000 feet west of the southeast corner of sec. 11, T. 34 N., R. 31 E., W.M.:

Oe—0 to 8 inches; grayish brown (10YR 5/2) mucky peat, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; 75 percent fiber, 40 percent rubbed; many very fine, fine, and medium roots; few fine tubular pores; slightly acid; clear smooth boundary.

Oa—8 to 18 inches; very dark gray (10YR 3/1) muck, black (10YR 2/1) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; 45 percent fiber, 15 percent rubbed; many very fine, fine, and medium roots; few fine tubular pores; slightly acid; abrupt smooth boundary.

A—18 to 34 inches; very dark brown (10YR 2/2) silt loam, dark grayish brown (10YR 4/2) dry; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; neutral; abrupt smooth boundary.

C1g—34 to 44 inches; light brownish gray (10YR 6/2) silt loam, very dark grayish brown (10YR 3/2) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; neutral; abrupt smooth boundary.

C2g—44 to 55 inches; light gray (10YR 7/2) fine sandy loam, grayish brown (10YR 5/2) moist; massive;

soft, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; neutral; abrupt smooth boundary.

Oa—55 to 60 inches; black (10YR 2/1) muck, black (10YR 2/1) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; 30 percent fiber, 10 percent rubbed; few very fine roots; few fine tubular pores; neutral.

These soils are saturated in the moisture control section in winter through midsummer. Depth to mineral soil material is 16 to 60 inches or more. The profile is slightly acid or neutral. These soils are ponded in February through May. An apparent water table is present throughout the year.

The Oe horizon is absent in some pedons.

The Oa horizon has value of 2 or 3 dry and chroma of 1 or 2 dry or moist.

The A horizon has value of 3 or 4 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist. It is stratified silt loam to coarse sand with 0 to 45 percent rock fragments, most of which are gravel-sized. This horizon is absent in some pedons.

The Cg horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 1 or 2 dry or moist. It is stratified silt loam to coarse sand with 0 to 45 percent pebbles.

## Bossburg Series

The Bossburg series consists of very deep, very poorly drained soils in backswamps of flood plains and in depressions. These soils formed in alluvium derived from volcanic ash. Slopes are 0 to 2 percent. Elevation is 1,600 to 2,800 feet. The average annual precipitation is 12 to 18 inches, the average annual air temperature is 45 to 49 degrees F, and the frost-free period is 100 to 150 days.

Typical pedon of Bossburg muck, 0 to 2 percent slopes, about 3 miles east of Elmer City; 1,100 feet south and 500 feet east of the northwest corner of sec. 23, T. 29 N., R. 31 E., W.M.:

Oap—0 to 6 inches; dark gray (10YR 4/1) muck, black (10YR 2/1) moist; about 15 percent fiber, less than 5 percent rubbed; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine tubular pores; neutral; abrupt smooth boundary.

2Ag—6 to 13 inches; gray (10YR 5/1) silt loam, dark gray (10YR 4/1) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common fine roots;

common fine tubular pores; neutral; clear smooth boundary.

2C1g—13 to 18 inches; light gray (10YR 7/1) silt loam, dark grayish brown (10YR 4/2) moist; massive; hard, friable, slightly sticky and nonplastic; few fine roots; few fine tubular pores; neutral; clear smooth boundary.

2C2g—18 to 24 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; common medium distinct mottles that are light yellowish brown (2.5Y 6/4) moist; massive; slightly hard, friable, slightly sticky and nonplastic; few fine roots; few fine tubular pores; neutral; clear wavy boundary.

2C3g—24 to 29 inches; white (2.5Y 8/2) silt loam, light brownish gray (2.5Y 6/2) moist; common medium faint mottles that are light yellowish brown (2.5Y 6/4) moist; massive; slightly hard, friable, slightly sticky and nonplastic; neutral; clear wavy boundary.

2C4g—29 to 45 inches; light gray (10YR 7/2) fine sandy loam, pale brown (10YR 6/3) moist; common medium distinct mottles that are yellowish brown (10YR 6/4) moist; massive; soft, very friable, nonsticky and nonplastic; neutral; clear wavy boundary.

2C5g—45 to 60 inches; white (10YR 8/2) very fine sandy loam, light gray (10YR 7/2) moist; massive; slightly hard, friable, nonsticky and nonplastic; neutral.

These soils are saturated in the moisture control section in winter through midsummer. The organic surface horizon is 6 to 10 inches thick. The profile is neutral or mildly alkaline. An apparent water table is present throughout the year. Frequent periods of flooding occur in February through May.

The 2A horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 1 or 2 dry or moist.

The 2C horizon has hue of 10YR or 2.5Y, value of 7 or 8 dry and 4 to 7 moist, and chroma of 1 to 3 dry or moist. It is stratified fine sandy loam to silt loam.

## Broadax Series

The Broadax series consists of very deep, well drained soils on broad summits of hills and plateaus. These soils formed in loess. Elevation is 2,500 to 2,900 feet. Slopes are 0 to 15 percent. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Broadax silt loam, dry, 0 to 8 percent slopes, about 6 miles east of Coulee Dam; 1,950 feet north and 550 feet west of the southeast corner of sec. 25, T. 29 N., R. 31 E., W.M.:

Ap1—0 to 3 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; common fine tubular pores; neutral; clear smooth boundary.

Ap2—3 to 11 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots; common fine tubular pores; neutral; abrupt smooth boundary.

BA—11 to 17 inches; brown (10YR 5/3) silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; common fine tubular pores; mildly alkaline; clear smooth boundary.

Btk1—17 to 28 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/4) moist; moderate medium subangular blocky structure; very hard, very firm, sticky and slightly plastic; common very fine roots; few fine tubular pores; common very fine continuous pores; common faint clay films on faces of peds and in pores; thin lime accumulations on faces of peds; violently effervescent; moderately alkaline; clear smooth boundary.

Btk2—28 to 38 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, friable, sticky and slightly plastic; few very fine roots; few fine tubular pores; common very fine and few fine continuous pores; common faint clay films on faces of peds and in pores; thin lime accumulations on faces of peds; slightly effervescent; mildly alkaline; clear wavy boundary.

Bk1—38 to 53 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; few fine tubular pores; common very fine tubular pores; strongly effervescent; few soft powdery lime accumulations in cracks and seams; moderately alkaline; clear wavy boundary.

Bk2—53 to 60 inches; yellowish brown (10YR 5/4) silt loam, brown (10YR 4/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine irregular pores; violently effervescent; few soft powdery lime accumulations in cracks and seams; mildly alkaline.

The mollic epipedon is 10 to 20 inches thick.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is slightly acid or neutral.

The BA horizon is absent in some pedons. This horizon, where present, has chroma of 3 or 4 dry or moist. It is moderately alkaline or mildly alkaline.

The Btk horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 to 6 dry and 3 or 4 moist. It is silt loam or silty clay loam with 15 to 30 percent clay. It is mildly alkaline or moderately alkaline.

The Bk horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is mildly alkaline or moderately alkaline.

## Brusher Series

The Brusher series consists of very deep, well drained soils on footslopes and toeslopes of hills and mountains. These soils formed in highly weathered colluvium, residuum, and valley fill derived from granitic rock or porphyritic volcanic rock with a mantle of volcanic ash. Slopes are 0 to 40 percent. Elevation is 2,300 to 4,000 feet. The average annual precipitation is 16 to 25 inches, the average annual air temperature is 42 to 45 degrees F, and the frost-free period is 90 to 120 day.

Typical pedon of Brusher silt loam, moist, 5 to 35 percent slopes, about 5 miles northwest of Keller; 1,600 feet south and 1,000 feet east of the northwest corner of sec. 35, T. 31 N., R. 32 E., W.M.:

Oi—5 inches to 0; needles, leaves, and twigs.

A1—0 to 1 inch; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots and common coarse roots; common fine tubular pores; neutral (NaF pH 10.5); abrupt smooth boundary.

A2—1 inch to 5 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium and coarse roots; common fine tubular pores; neutral (NaF pH 11.0); clear wavy boundary.

Bw—5 to 17 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots; common fine tubular pores; neutral (NaF pH 10.5); clear irregular boundary.

2E—17 to 24 inches; pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; weak medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine

roots and few medium and coarse roots; few fine tubular pores; neutral (NaF pH 9.6); neutral; abrupt wavy boundary.

2B/E—24 to 37 inches; 60 percent yellowish brown (10YR 5/4) loam (B part), dark brown (10YR 3/3) moist, and 40 percent pale brown (10YR 6/3) sandy loam (E part), brown (10YR 4/3) moist; moderate medium subangular blocky structure; hard, friable, slightly sticky and plastic; few very fine, fine, and medium roots; few fine tubular pores; common faint clay films on faces of pedis; neutral (NaF pH less than 9.2); clear wavy boundary.

2E/B—37 to 51 inches; 80 percent very pale brown (10YR 7/3) sandy loam (E part), brown (10YR 4/3) moist, and 20 percent yellowish brown (10YR 5/4) sandy loam (B part), dark yellowish brown (10YR 4/9) moist; weak medium platy structure; slightly hard, very friable, slightly sticky and slightly plastic; few very fine and fine roots; few fine tubular pores; colloid stains on mineral grains; neutral (NaF pH less than 9.2); clear wavy boundary.

2Bt—51 to 56 inches; pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; moderate medium and thick platy structure; hard, firm, sticky and plastic; few fine roots; few fine tubular pores; many distinct dark yellowish brown (10YR 4/4) clay films on faces of pedis and lining pores; neutral (NaF pH less than 9.2); abrupt smooth boundary.

2C—56 to 60 inches; multicolored gravelly coarse sand; massive; soft, very friable, nonsticky and nonplastic; few fine roots; few fine tubular pores; 25 percent fine pebbles; neutral (NaF pH less than 9.2).

The mantle of volcanic ash is 14 to 26 inches thick. The solum is more than 40 inches thick. The particle-size control section is 18 to 35 percent clay and 0 to 25 percent rock fragments, mostly fine pebbles. The profile is slightly acid or neutral.

The A horizon has value of 4 to 6 dry and chroma of 2 or 3 dry or moist. It is 0 to 15 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam, loam, or very fine sandy loam with 0 to 15 percent pebbles.

The 2E horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. It is loam or sandy loam with 0 to 20 percent pebbles. This horizon is absent in some pedons.

The B part of the 2B/E and 2E/B horizons has value of 5 or 6 dry and 3 to 6 moist, and it has chroma of 3 to 6 dry or moist. The E part has value of 6 or 7 dry and 4 to 6 moist, and it has chroma of 2 or 3 dry or

moist. The 2B/E and 2E/B horizons are loam or sandy loam with 0 to 20 percent pebbles. These horizons are absent in some pedons.

The 2Bt horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 3 to 6 dry or moist. It is clay loam, loam, or sandy loam with 0 to 30 percent pebbles.

A 2BCt or 2BC horizon is present in some pedons.

The 2C horizon is multicolored. It is coarse sandy loam, loamy coarse sand, or coarse sand with 5 to 30 percent pebbles.

## Buhrig Series

The Buhrig series consists of moderately deep, well drained soils on ridges, shoulders, and backslopes of mountains. These soils formed in residuum and colluvium derived from granitic and metasedimentary rock with a mantle of volcanic ash and loess. Slopes are 20 to 65 percent. Elevation is 4,000 to 6,500 feet. The average annual precipitation is 20 to 30 inches, the average annual air temperature is 39 to 41 degrees F, and the frost-free period is 80 to 100 days.

Typical pedon of Buhrig very stony loam, 40 to 65 percent slopes, about 7 miles northwest of Disautel; 1,700 feet east and 2,300 feet south of the northwest corner of sec. 14, T. 34 N., R. 28 E., W.M.:

Oi—2 inches to 1 inch; needles, mosses, and twigs.

Oe—1 inch to 0; partially decomposed organic matter.

A—0 to 7 inches; light yellowish brown (10YR 6/4) very stony loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots; common fine irregular pores; 20 percent pebbles, 25 percent cobbles, and 5 percent stones; medium acid; clear wavy boundary.

Bw—7 to 18 inches; light yellowish brown (10YR 6/4) very cobbly loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots; few fine tubular pores; 15 percent pebbles, 25 percent cobbles, and 15 percent stones; medium acid; clear wavy boundary.

C—18 to 32 inches; light yellowish brown (2.5Y 6/4) very cobbly sandy loam, olive brown (2.5Y 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; few fine tubular pores; 10 percent pebbles, 25 percent cobbles, and

15 percent stones; medium acid; abrupt wavy boundary.

R—32 to 36 inches; gneiss bedrock.

Depth to bedrock is 20 to 40 inches. The particle-size control section is 5 to 15 percent clay and 35 to 80 percent rock fragments. The profile is medium acid to neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is very stony loam or silt loam with 0 to 15 percent stones, 0 to 5 percent cobbles, and 0 to 30 percent pebbles.

The Bw horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is loam, silt loam, or sandy loam with 10 to 40 percent pebbles, 10 to 25 percent cobbles, and 15 to 25 percent stones.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is loam or sandy loam with 10 to 30 percent pebbles, 15 to 35 percent cobbles, and 15 to 25 percent stones. The shaly substratum phase is 10 to 35 percent pebbles, 20 to 50 percent channers, and 5 to 20 percent flagstones.

## Calcic Pachic Haploxerolls

Calcic Pachic Haploxerolls consist of deep and very deep, moderately well drained soils in closed depressions. These soils formed in loess-influenced slope alluvium that overlies reworked glaciofluvial deposits in some areas. Slopes are 3 to 20 percent. Elevation is 1,500 to 2,600 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Reference pedon of Calcic Pachic Haploxerolls in an area of Achimin-Calcic Pachic Haploxerolls complex, 3 to 30 percent slopes, about 16 miles northeast of Bridgeport; 500 feet south and 50 feet east of the northwest corner of sec. 6, T. 30 N., R. 28 E., W.M.:

A—0 to 10 inches; dark grayish brown (10YR 3/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and few fine roots; 5 percent pebbles; neutral; clear wavy boundary.

AB—10 to 24 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine and few fine roots; common fine irregular pores;

5 percent pebbles; neutral; gradual wavy boundary.

Bw1—24 to 36 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine and few fine roots; common fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

Bw2—36 to 42 inches; brown (10YR 5/3) fine sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; few very fine and fine roots; few fine tubular pores; 5 percent pebbles; mildly alkaline; clear wavy boundary.

Bk1—42 to 50 inches; yellowish brown (10YR 5/4) fine sandy loam, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, slightly sticky and nonplastic; few very fine roots; few fine tubular pores; 5 percent pebbles; slightly effervescent; soft powdery lime filaments lining pores and in seams; strongly alkaline; clear wavy boundary.

Bk2—50 to 60 inches; light yellowish brown (10YR 6/4) fine sandy loam, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, slightly sticky and nonplastic; 5 percent pebbles; slightly effervescent; soft powdery lime filaments lining pores and in seams; moderately alkaline.

The mollic epipedon is 20 to 28 inches thick. Depth to secondary carbonates is 20 to 43 inches. Depth to bedrock is 40 to 60 inches or more. The particle-size control section is coarse-loamy, coarse-silty, fine-silty, or fine-loamy. An apparent water table is present in February through July.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 15 percent pebbles.

The AB horizon is absent in some pedons.

The Bw horizon, where present, has value of 4 to 6 dry and 3 or 4 moist. It is fine sandy loam, loam, or silt loam with 0 to 15 percent pebbles. It is neutral or mildly alkaline.

The Bk horizon has hue of 10YR or 2.5Y, value of 4 to 6 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. Mottles are present below a depth of about 30 inches. The horizon is silt loam, fine sandy loam, or silty clay loam with 0 to 25 percent pebbles. A weakly cemented hardpan is at a depth of 40 to 60 inches in some pedons. The horizon is moderately alkaline or strongly alkaline.

## Canteen Series

The Canteen series consists of deep, well drained soils on footslopes and backslopes of hills and mountains. These soils formed in colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess. Slopes are 20 to 65 percent. Elevation is 2,100 to 4,600 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 41 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Canteen silt loam, 40 to 65 percent slopes, about 4 miles west of Keller; 1,050 feet north and 1,750 feet east of the southwest corner of sec. 22, T. 30 N., R. 34 E., W.M.:

Oi—1 inch to 0; needles, twigs, and cones.

A—0 to 5 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine granular structure; soft, very friable, slightly sticky and nonplastic; many very fine, fine, and medium roots; common fine tubular pores; neutral (NaF pH 10.1); clear wavy boundary.

Bw1—5 to 13 inches; pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots and common medium roots; common fine tubular pores; neutral (NaF pH 9.8); clear smooth boundary.

2Bw2—13 to 21 inches; very pale brown (10YR 7/3) sandy loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and coarse roots; common fine irregular pores; 5 percent pebbles; slightly acid; clear wavy boundary.

2Bw3—21 to 34 inches; very pale brown (10YR 7/3) coarse sandy loam, brown (10YR 5/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots; common fine irregular pores; 5 percent pebbles; slightly acid; gradual wavy boundary.

2C—34 to 45 inches; very pale brown (10YR 7/4) loamy coarse sand, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; few fine, medium, and coarse roots; few fine tubular pores; 10 percent pebbles; slightly acid; clear wavy boundary.

2Cr—45 to 55 inches; weathered granitic rock.

Depth to weathered bedrock is 40 to 60 inches. The mantle of volcanic ash is 7 to 14 inches thick.

The particle-size control section is 6 to 15 percent clay and 5 to 35 percent angular rock fragments. The profile is medium acid to neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles.

The AB horizon, where present, has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is silt loam or loam with 0 to 10 percent pebbles.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry and 3 to 6 moist. It is silt loam, loam, or fine sandy loam with 0 to 20 percent pebbles.

The 2Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam, sandy loam, or coarse sandy loam with 5 to 30 percent pebbles and 0 to 5 percent cobbles.

The 2C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is coarse sandy loam, loamy sand, or loamy coarse sand with 10 to 30 percent pebbles and 0 to 5 percent cobbles.

### Capoose Series

The Capoose series consists of moderately deep, well drained soils on shoulders and backslopes of mountains (fig. 19). These soils formed in volcanic ash over colluvium and glacial till derived from granitic rock. Slopes are 20 to 65 percent. Elevation is 3,000 to 4,800 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Capoose silt loam, 40 to 65 percent slopes, about 4 miles east of Keller; 350 feet north and 900 feet west of the southeast corner of sec. 24, T. 30 N., R. 33 E., W.M.:

Oi—5 inches to 0; needles, bark, twigs, wood, and cones.

A—0 to 2 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common medium roots; common fine tubular pores; 10 percent fine pebbles; medium acid; abrupt smooth boundary.

Bw1—2 to 7 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 3/4) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common fine

Figure 19.—Typical pedon of a Capoose soil that has granitic bedrock at a depth of about 26 inches. (Numbers on tape represent feet.)

irregular pores; few medium and coarse roots; 10 percent fine pebbles; neutral; clear smooth boundary.

Bw2—7 to 17 inches; light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, and medium roots and few coarse roots; common fine irregular pores; 10 percent fine pebbles; slightly acid; clear smooth boundary.

2Bw3—17 to 25 inches; light yellowish brown (10YR 6/4) very gravelly sandy loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; few very fine and fine roots and common medium roots; common fine irregular pores; 40 percent angular pebbles and 15 percent cobbles; medium acid; clear smooth boundary.

2C—25 to 35 inches; very pale brown (10YR 7/4) extremely gravelly sandy loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, friable, slightly sticky and nonplastic; few very fine and fine roots and common medium roots; few fine tubular pores; 65 percent angular pebbles and 15 percent cobbles; medium acid; gradual smooth boundary.

R—35 to 39 inches; granitic bedrock.

Depth to bedrock is 20 to 40 inches. The mantle of volcanic ash is 14 to 25 inches thick. The profile is medium acid to neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. In some places this horizon consists largely of Mt. St. Helens "T" ash with 0 to 15 percent pebbles. This horizon is absent in some pedons.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 to 6 dry or moist. It is silt loam or loam with 5 to 10 percent pebbles and 0 to 5 percent cobbles.

The 2Bw horizon has value of 4 or 5 moist and chroma of 3 or 4 dry or moist. It is 40 to 50 percent pebbles, 15 to 30 percent cobbles, and 0 to 5 percent stones. This horizon is absent in some pedons.

The 2C horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is 40 to 70 percent pebbles, 10 to 30 percent cobbles, and 0 to 5 percent stones.

## Cashmere Series

The Cashmere series consist of very deep, well drained soils on terraces and terrace escarpments. These soils formed in glaciofluvial material with a

component of loess. Slopes are 0 to 50 percent. Elevation is 800 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Cashmere fine sandy loam, 5 to 10 percent slopes, about 4 miles south of Nespelem; 600 feet north and 1,700 feet east of the southwest corner of sec. 12, T. 30 N., R. 30 E., W.M.:

A—0 to 10 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; common fine tubular pores; neutral; clear wavy boundary.

Bw1—10 to 22 inches; brown (10YR 5/3) fine sandy loam, dark brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

Bw2—22 to 36 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine roots; common fine irregular pores; 5 percent pebbles; neutral; gradual wavy boundary.

C1—36 to 46 inches; pale brown (10YR 6/3) sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; common fine irregular pores; 10 percent pebbles; mildly alkaline; abrupt wavy boundary.

C2—46 to 60 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; 5 percent pebbles; mildly alkaline.

The particle-size control section is 0 to 10 percent rock fragments. The solum is 24 to 38 inches thick. The mollic epipedon is 9 to 14 inches thick.

The A horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. The horizon is 0 to 5 percent pebbles. It is neutral or slightly acid.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is fine sandy loam, sandy loam, or very fine sandy loam with 0 to 10 percent pebbles and 0 to 5 percent cobbles. It is neutral or mildly alkaline.

The C horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is fine sandy loam, sandy loam, or coarse sandy loam with 0 to 10 percent pebbles and 0 to 5

percent cobbles. It is mildly alkaline or moderately alkaline.

### Cashmont Series

The Cashmont series consists of very deep, well drained soils on alluvial fans. These soils formed in alluvium with an admixture of loess. Slopes are 3 to 30 percent. Elevation is 850 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Cashmont gravelly sandy loam, fan, 15 to 30 percent slopes, about 6 miles south of Nespelem; 1,000 feet north and 1,600 feet west of the southeast corner of sec. 24, T. 30 N., R. 30 E., W.M.:

- A1—0 to 6 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; few fine tubular pores; 25 percent pebbles; slightly acid; abrupt wavy boundary.
- A2—6 to 14 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, very dark gray (10YR 3/1) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; few fine tubular pores; 20 percent pebbles; slightly acid; clear wavy boundary.
- AB—14 to 19 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; few fine tubular pores; 25 percent pebbles; neutral; clear wavy boundary.
- Bw1—19 to 30 inches; brown (10YR 5/3) gravelly coarse sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; few fine tubular pores; 25 percent pebbles; neutral; gradual wavy boundary.
- Bw2—30 to 38 inches; yellowish brown (10YR 5/4) gravelly sandy loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 20 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.
- C—38 to 60 inches; very pale brown (10YR 7/3) very gravelly sandy loam, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and

nonplastic; few very fine roots; few fine tubular pores; 30 percent pebbles and 15 percent cobbles; neutral.

The solum is 20 to 38 inches thick. The mollic epipedon is 9 to 19 inches thick. The particle-size control section is 5 to 12 percent clay and 15 to 35 percent rock fragments.

The A and AB horizons have value of 4 or 5 dry and chroma of 2 or 3 dry and 1 to 3 moist. They are 15 to 30 percent pebbles and 0 to 5 percent cobbles. The horizons are slightly acid to mildly alkaline.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is fine sandy loam, sandy loam, or coarse sandy loam with 15 to 30 percent pebbles and 0 to 5 percent cobbles. The horizon is neutral or mildly alkaline.

The C horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 3 to 5 dry or moist. It is sandy loam, loamy sand, or sand with 20 to 50 percent pebbles and 0 to 5 percent cobbles. The horizon is neutral or mildly alkaline.

### Cedonia Series

The Cedonia series consists of very deep, well drained soils on terraces and terrace escarpments. These soils formed in glacial lake sediment with a component of loess and volcanic ash. Slopes are 0 to 65 percent. Elevation is 1,300 to 2,700 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Cedonia silt loam, 5 to 15 percent slopes, about 9 miles south of Inchelium; 550 feet north and 300 feet east of the southwest corner of sec. 24, T. 31 N., R. 36 E., W.M.:

- Oi—1 inch to 0; needles and twigs.
- A—0 to 2 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; neutral; clear smooth boundary.
- Bw1—2 to 10 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; neutral; clear wavy boundary.
- Bw2—10 to 24 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; moderate fine and medium subangular blocky

structure; hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; neutral; clear wavy boundary.

BC—24 to 40 inches; light gray (10YR 7/2) silt loam, grayish brown (10YR 5/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; neutral; clear wavy boundary.

C—40 to 60 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; laminated; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; few fine tubular pores; slightly effervescent; moderately alkaline.

The particle-size control section is 18 to 35 percent clay and less than 15 percent fine or coarse sand.

The A horizon has hue of 10YR or 2.5Y and value of 5 or 6 dry and 3 or 4 moist. It is neutral or slightly acid.

The Bw1 horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 or 3 dry or moist. It is silt loam or silty clay loam. It is neutral to moderately alkaline.

The Bw2 horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 or 3 dry or moist. It is silt loam or silty clay loam. It is neutral to moderately alkaline.

The BC horizon, where present, has hue of 10YR or 2.5Y and value of 6 or 7 dry and 5 or 6 moist. It is silt loam or silty clay loam. It is moderately alkaline or strongly alkaline.

The C horizon has hue of 10YR, 2.5Y, or 5Y, value of 6 or 7 dry, and chroma of 2 or 3 dry or moist. It is silt loam or silty clay loam. It is moderately alkaline or strongly alkaline.

## Centralpeak Series

The Centralpeak series consists of moderately deep, well drained soils on ridges, shoulders, backslopes, and footslopes of hills and mountains (fig. 20). These soils formed in colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess. Slopes are 5 to 65 percent. Elevation is 2,200 to 4,500 feet. The average annual precipitation is 16 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Centralpeak loam, warm, 5 to 20 percent slopes, about 6 miles northwest of Keller; 1,500 feet south and 1,700 feet west of the northeast corner of sec. 35, T. 31 N., R. 32 E., W.M.:

Oi—2 inches to 0; needles, twigs, and cones.

A—0 to 4 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, medium, and coarse roots; common fine tubular pores; 5 percent fine pebbles; neutral (NaF pH 10.5); abrupt wavy boundary.

Bw1—4 to 12 inches; yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 3/4) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, medium, and coarse roots; common fine tubular pores; 5 percent fine pebbles; neutral (NaF pH 10.0); abrupt wavy boundary.

2Bw2—12 to 20 inches; light yellowish brown (2.5Y 6/4) coarse sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common fine irregular pores; 5 percent fine pebbles; slightly acid; clear wavy boundary.

2C—20 to 29 inches; light olive brown (2.5Y 5/4) gravelly loamy coarse sand, olive brown (2.5Y 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; common fine irregular pores; 15 percent pebbles; slightly acid; abrupt smooth boundary.

2Cr—29 to 39 inches; weathered granitic bedrock.

Depth to weathered bedrock is 20 to 40 inches. The mantle of volcanic ash is 7 to 14 inches thick. The particle-size control section is 5 to 25 percent rock fragments. The profile is medium acid to neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles. This horizon is absent in some pedons.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry and 3 to 6 moist. It is silt loam, loam, or fine sandy loam with 0 to 25 percent pebbles and 0 to 5 percent cobbles.

The 2Bw horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 4 or 5 dry or moist. It is loam or coarse sandy loam with 5 to 25 percent pebbles and 0 to 5 percent cobbles.

The 2C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is sandy loam, coarse sandy loam, or loamy coarse sand with 5 to 30 percent pebbles and 0 to 5 percent cobbles.

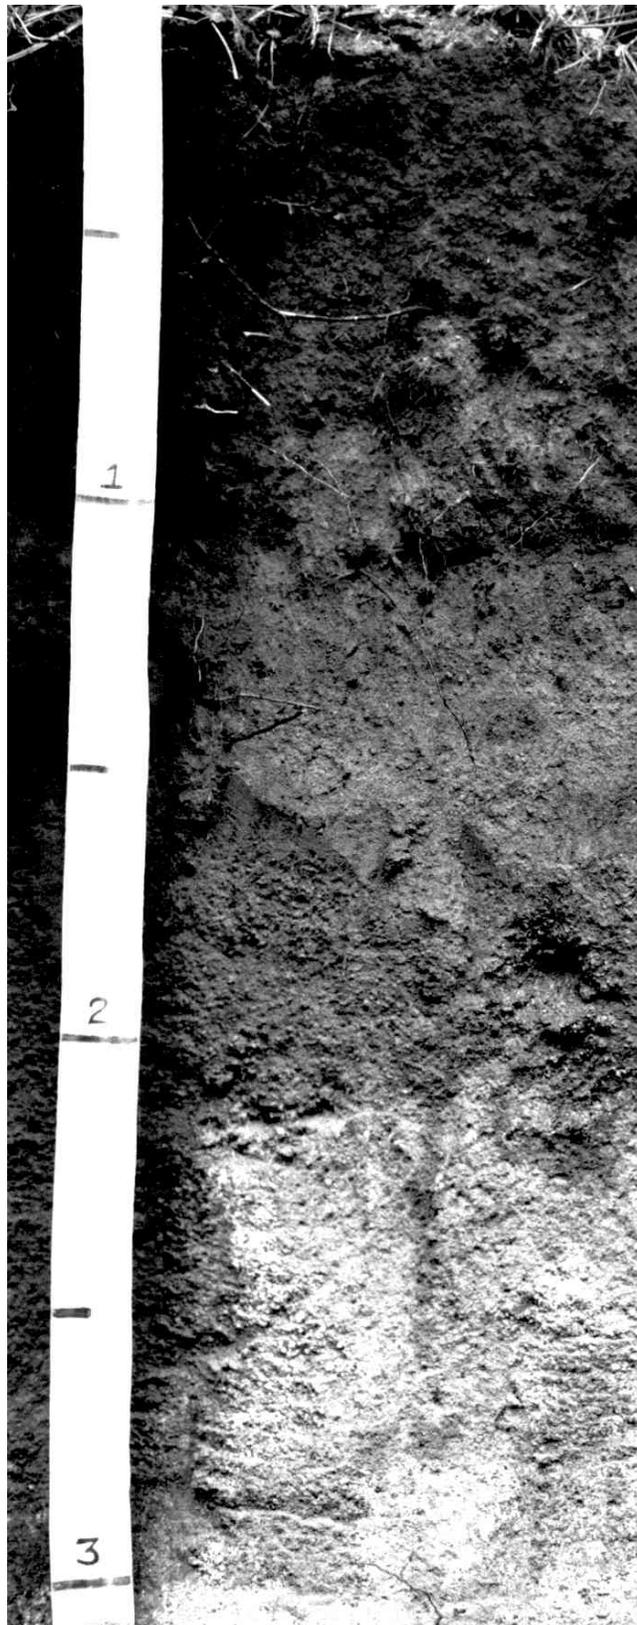

Figure 20.—Typical pedon of a Centralpeak soil that has weathered granitic bedrock at a depth of about 26 inches. (Numbers on tape represent feet.)

### Chumstick Series

The Chumstick series consists of soils that are shallow and well drained. These soils are on ridges, shoulders, and backslopes of mountains. They formed in colluvium and residuum derived from granitic rock with a component of loess and volcanic ash. Slopes are 5 to 65 percent. Elevation is 3,500 to 5,800 feet. The average annual precipitation is 20 to 28 inches, the average annual air temperature is 41 to 44 degrees F, and the frost-free period is 85 to 120 days.

Typical pedon of Chumstick extremely bouldery loam in an area of Rock outcrop-Chumstick, cold complex, 20 to 65 percent slopes, about 6 miles northeast of Disautel; 2,400 feet east and 2,400 feet south of the northwest corner of sec. 16, T. 34 N., R. 28 E., W.M.:

- O<sub>i</sub>—1 inch to 0; leaves and dead grasses.
- A—0 to 5 inches; grayish brown (10YR 5/2) extremely bouldery loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine, fine, and medium roots; few fine tubular pores; 30 percent pebbles, 10 percent cobbles, and 20 percent stones and boulders; medium acid; clear wavy boundary.
- B<sub>w</sub>—5 to 12 inches; brown (10YR 5/3) very cobbly sandy loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; 20 percent pebbles and 25 percent cobbles; medium acid; abrupt wavy boundary.
- R—12 to 16 inches; granitic bedrock.

Depth to bedrock is 10 to 20 inches. The particle-size control section is 35 to 70 percent rock fragments. The profile is medium acid or slightly acid.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 or 2 moist. It is very stony loam or extremely bouldery loam with 15 to 40 percent pebbles, 5 to 25 percent cobbles, and 5 to 25 percent stones and boulders.

The B<sub>w</sub> horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is 20 to 70 percent pebbles, 10 to 25 percent cobbles, and 0 to 5 percent stones.

### Codylake Series

The Codylake series consists of deep, well drained soils on backslopes, shoulders, footslopes, and ridges of mountains. These soils formed in volcanic ash over colluvium and residuum derived from granitic rock. Slopes are 5 to 65 percent. Elevation is 3,800 to 6,000

feet. The average annual precipitation is 20 to 30 inches, the average annual air temperature is 38 to 41 degrees F, and the frost-free period is 80 to 100 days.

Typical pedon of Codylake loam, 5 to 20 percent slopes, about 10 miles east of Disautel; 1,650 feet west and 950 feet south of the northeast corner of sec. 15, T. 33 N., R. 30 E., W.M.:

- Oi—1 inch to 0; needles, twigs, and leaves.
- A—0 to 5 inches; yellowish brown (10YR 5/4) loam, dark brown (10YR 4/3) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic, many very fine, fine, and medium roots; common fine irregular pores; 10 percent pebbles; neutral; clear smooth boundary.
- Bw1—5 to 13 inches; yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common fine irregular pores; 10 percent pebbles; medium acid; clear smooth boundary.
- Bw2—13 to 24 inches; light yellowish brown (10YR 6/4) gravelly fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic, common very fine and fine roots and few medium roots; common fine irregular pores; 20 percent fine pebbles; medium acid; clear smooth boundary.
- 2C—24 to 43 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, yellowish brown (10YR 5/6) moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; few fine tubular pores; 25 percent fine pebbles; medium acid; gradual smooth boundary.
- 2Cr—43 to 53 inches; weathered granitic bedrock.

The mantle of volcanic ash is 14 to 24 inches thick. Depth to weathered bedrock is 40 to 60 inches. The profile is medium acid to neutral.

The A horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is loam, fine sandy loam, or sandy loam with 0 to 20 percent pebbles.

The 2C horizon has hue of 10YR or 2.5Y, value of 4 to 6 moist and 6 to 8 dry, and chroma of 3 to 6 dry or moist. It is sandy loam or coarse sandy loam with 10 to 30 percent pebbles and 0 to 5 percent cobbles.

## Colockum Series

The Colockum series consists of very deep, well drained soils on moraines and in depressions on till plains. These soils formed in old glacial till with a mantle of loess. Slopes are 3 to 65 percent. Elevation is 1,900 to 2,800 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Colockum stony loam, 3 to 25 percent slopes, about 13 miles southeast of Okanogan; 250 feet east and 925 feet south of the northwest corner of sec. 2, T. 31 N., R. 27 E., W.M.:

- A—0 to 11 inches; brown (10YR 4/3) stony loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and common fine roots; few very fine irregular and tubular pores; 5 percent pebbles, 5 percent cobbles, and 5 percent stones; mildly alkaline; abrupt wavy boundary.
- Bt1—11 to 22 inches; yellowish brown (10YR 5/6) silty clay loam, dark yellowish brown (10YR 4/6) moist; strong fine and medium subangular blocky structure; hard, friable, sticky and plastic; common very fine roots and few fine and medium roots; common very fine and fine irregular pores; common distinct clay films on faces of peds and lining pores; 5 percent pebbles; neutral; clear smooth boundary.
- 2Bt2—22 to 36 inches; olive yellow (2.5Y 6/6) loam, light olive brown (2.5Y 5/6) moist; moderate fine and medium subangular blocky structure; hard, friable, sticky and plastic; common very fine and few fine roots; common very fine and fine irregular pores; common faint clay films on faces of peds and lining pores; 10 percent pebbles; neutral; abrupt wavy boundary.
- 2Btk—36 to 46 inches; brownish yellow (10YR 6/6) silty clay loam, dark yellowish brown (10YR 4/6) moist; moderate fine and medium subangular blocky structure; hard, friable, sticky and plastic; few very fine and fine roots; common fine irregular pores; common distinct clay films on faces of peds and lining pores; common medium irregularly shaped soft calcium carbonate accumulations in filaments and masses; violently effervescent; 10 percent pebbles; moderately alkaline; clear wavy boundary.
- 2Bk—46 to 60 inches; yellow (10YR 7/6) gravelly loam, yellowish brown (10YR 5/6) moist; massive; slightly hard, friable, slightly sticky and slightly

plastic; few fine roots; common fine irregular pores; few fine irregularly shaped soft calcium carbonate accumulations in filaments; strongly effervescent; 15 percent pebbles and 5 percent cobbles; moderately alkaline.

The mollic epipedon is 10 to 15 inches thick. Depth to secondary carbonates is 24 to 38 inches. The particle-size control section is 5 to 20 percent rock fragments and 25 to 32 percent clay.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. It is loam, stony loam, or bouldery loam with 0 to 25 percent pebbles, 0 to 10 percent cobbles, and 0 to 10 percent stones. It is neutral or mildly alkaline.

An E horizon is present in some pedons.

The Bt1 horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 to 6 dry or moist. It is loam, clay loam, silt loam, or silty clay loam with 0 to 10 percent pebbles and 0 to 15 percent cobbles.

The 2Bt2 horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 to 5 moist, and chroma of 4 to 6 dry or moist. It is loam or clay loam with 5 to 20 percent pebbles and 5 to 15 percent cobbles. It is neutral or mildly alkaline.

The 2Btk horizon has chroma of 4 to 6 dry or moist. It is loam, silt loam, or silty clay loam with 5 to 20 percent pebbles and 0 to 5 percent cobbles. It is mildly alkaline or moderately alkaline.

The 2Bk horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 4 to 6 dry or moist. It is silty clay loam or loam with 15 to 35 percent pebbles and 5 to 15 percent cobbles. It is mildly alkaline or moderately alkaline. This horizon is absent in some pedons.

## Conconully Series

The Conconully series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on undulating ground moraines on foothills, plateaus, and glacially scoured ridges, shoulders, and backslopes of hills. The soils formed in glacial till with a component of loess and volcanic ash. Slopes are 3 to 65 percent. Elevation is 1,400 to 2,900 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Conconully stony fine sandy loam, 25 to 65 percent north slopes, about 2 miles east of Elmer City; 2,100 feet south and 1,050 feet east of the northwest corner of sec. 22, T. 29 N., R. 31 E., W.M.:

A1—0 to 2 inches; grayish brown (10YR 5/2) stony fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate very fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; many very fine, common fine, and few medium roots; common fine irregular pores; 5 percent stones and 10 percent pebbles; neutral; clear smooth boundary.

A2—2 to 12 inches; grayish brown (10YR 5/2) stony fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common very fine and fine roots; common fine irregular pores; 1 percent stones and 15 percent pebbles; neutral; clear smooth boundary.

Bw—12 to 21 inches; light yellowish brown (10YR 6/4) gravelly fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common fine irregular pores; 25 percent pebbles and 3 percent cobbles; neutral; clear wavy boundary.

2Cd—21 to 60 inches; light brownish gray (2.5Y 6/2) dense glacial till that crushes to gravelly sandy loam, dark grayish brown (2.5Y 4/2) moist; massive; 30 percent pebbles and 5 percent cobbles; neutral.

Depth to dense glacial till is 20 to 40 inches. The mollic epipedon is 9 to 20 inches thick. The particle-size control section is 3 to 10 percent clay and 15 to 35 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is fine sandy loam, stony or very stony fine sandy loam, or bouldery fine sandy loam with 0 to 15 percent stones, 0 to 5 percent cobbles, and 5 to 15 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is fine sandy loam or sandy loam with 5 to 35 percent pebbles and 0 to 10 percent cobbles.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is sandy loam, coarse sandy loam, or fine sandy loam with 15 to 35 percent pebbles and 0 to 10 percent cobbles. It is neutral or mildly alkaline.

## Couleedam Series

The Couleedam series consists of shallow, well drained soils on shoulders and backslopes of foothills. These soils formed in colluvium derived from granitic

rock and gneiss with a component of loess. Slopes are 30 to 70 percent. Elevation is 1,000 to 2,200 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Couleedam very stony sandy loam in an area of Couleedam-Rock outcrop complex, 30 to 70 percent slopes, about 1 mile southeast of Coulee Dam; 2,000 feet north and 350 feet east of the southwest corner of sec. 5, T. 28 N., R. 31 E., W.M.:

- A1—0 to 3 inches; brown (10YR 4/3) very stony sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; common fine irregular pores; 10 percent pebbles, 15 percent cobbles, and 10 percent stones and boulders; neutral; clear wavy boundary.
- A2—3 to 8 inches; brown (10YR 5/3) very cobbly sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common fine irregular pores; 20 percent pebbles and 20 percent cobbles; neutral; clear wavy boundary.
- Bw—8 to 15 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 5/3) dry; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common fine irregular pores; 30 percent pebbles and 10 percent cobbles; neutral; abrupt irregular boundary.
- R—15 to 19 inches; granitic bedrock.

Depth to bedrock is 10 to 20 inches. The mollic epipedon is 7 to 11 inches thick. The particle-size control section is 5 to 15 percent clay and 35 to 60 percent rock fragments. The profile is neutral or mildly alkaline.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is 10 to 30 percent pebbles, 5 to 25 percent cobbles, and 0 to 15 percent stones and boulders.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or coarse sandy loam with 25 to 45 percent pebbles, 5 to 20 percent cobbles, and 0 to 5 percent stones and boulders.

### Coxlake Series

The Coxlake series consists of very deep, somewhat poorly drained soils on low stream terraces

and flood plains. These soils formed in alluvium of mixed mineralogy. Slopes are 0 to 3 percent. Elevation is 1,700 to 2,600 feet. The average annual precipitation is 12 to 16 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 140 days.

Typical pedon of Coxlake silt loam, 0 to 3 percent slopes, about 5 miles northwest of Nespelem; 1,700 feet south and 700 feet west of the northeast corner of sec. 2, T. 31 N., R. 30 E., W.M.:

- Ap—0 to 6 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; moderate medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine roots; common very fine tubular pores; neutral; clear wavy boundary.
- A—6 to 29 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; few fine faint brown (7.5YR 5/4) mottles, dark brown (7.5YR 4/4) moist; moderate fine subangular blocky structure; slightly sticky and slightly plastic; common very fine roots; common very fine tubular pores; 5 percent fine pebbles; neutral; clear wavy boundary.
- AC—29 to 38 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; common medium distinct light brown (7.5YR 6/4) mottles, brown (7.5YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; 10 percent fine pebbles; neutral; clear wavy boundary.
- C1—38 to 48 inches; light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; common medium distinct light brown (7.5YR 6/4) mottles, brown (7.5YR 4/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; 10 percent pebbles; neutral; clear wavy boundary.
- C2—48 to 60 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 4/3) moist; many medium distinct reddish yellow (7.5YR 6/6) mottles, strong brown (7.5YR 4/6) moist; massive; soft, very friable, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; 30 percent pebbles and 10 percent cobbles; neutral.

The mollic epipedon is 20 to 40 inches thick. The particle-size control section is 5 to 15 percent clay and 0 to 15 percent rock fragments. An apparent water table is present in November through August.

Occasional periods of flooding occur in February through May.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam, loam, or very fine sandy loam with 0 to 15 percent pebbles.

The AC and C1 horizons have value of 5 or 6 dry and 3 or 4 moist, and they have chroma of 2 or 3 dry or moist. They are silt loam, loam, or sandy loam with 0 to 20 percent pebbles.

The C2 horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 or 3 dry or moist. It is stratified fine sandy loam to sand with 0 to 5 percent stones, 0 to 10 percent cobbles, and 5 to 40 percent pebbles.

## Cryofluvents

Cryofluvents consist of very deep, moderately well drained and somewhat poorly drained soils on narrow flood plains and low terraces along mountain streams. These soils formed in alluvium derived from mixed sources with a component of volcanic ash. Slopes are 0 to 8 percent. Elevation is 2,800 to 4,800 feet. The average annual precipitation is 20 to 30 inches, the average annual air temperature is 40 to 42 degrees F, and the frost-free period is 80 to 100 days.

Reference pedon of Cryofluvents, 0 to 8 percent slopes, about 16 miles north of Nespelem; 1,500 feet west and 500 feet south of the northeast corner of sec. 5, T. 33 N., R. 31 E., W. M.:

Oi—3 to 2 inches; needles, twigs, and mosses.

Oe—2 inches to 0; partially decomposed wood, needles, and twigs.

A—0 to 5 inches; brown (10YR 5/3) loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots and common medium and coarse roots; common fine irregular pores; 2 percent pebbles; medium acid; clear smooth boundary.

AC—5 to 12 inches; brown (10YR 5/3) sandy loam with few thin strata of silt loam 5 to 10 millimeters thick, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common fine irregular pores; 5 percent pebbles; medium acid; clear smooth boundary.

2C1—12 to 21 inches; pale brown (10YR 6/3) gravelly coarse sandy loam, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and

few medium and coarse roots; few fine tubular pores; 30 percent pebbles; slightly acid; abrupt smooth boundary.

2C2—21 to 30 inches; multicolored very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 50 percent pebbles and 5 percent cobbles; neutral; gradual smooth boundary.

2C3—30 to 60 inches; multicolored extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine roots; 65 percent pebbles and 5 percent cobbles; neutral.

The particle-size control section is 10 to 60 percent rock fragments and 3 to 10 percent clay by weighted average. Depth to sandy or sandy-skeletal material is 15 to 60 inches or more. Some pedons have one or more layers of volcanic ash 7 to 20 inches thick in the upper 30 inches. An apparent water table is present in March through June. Occasional periods of flooding occur in March through June.

The A horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 15 percent pebbles. It is medium acid or slightly acid.

The AC horizon has value of 4 to 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is stratified silt loam to sandy loam with 0 to 15 percent pebbles. It is medium acid or slightly acid. This horizon is absent in some pedons.

The upper part of the 2C horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 1 to 4 moist or dry. The lower part is multicolored. The horizon is stratified very fine sandy loam to coarse sand with 5 to 75 percent pebbles, 0 to 10 percent cobbles, and 0 to 5 percent stones. It is medium acid to neutral.

## Cubcreek Series

The Cubcreek series consists of very deep, moderately well drained soils on stream terraces and flood plains. These soils formed in recent alluvium. Slopes are 0 to 3 percent. Elevation is 1,500 to 2,100 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Cubcreek fine sandy loam, 0 to 3 percent slopes, about 9 miles north of Keller; 1,500 feet south and 1,000 feet east of the northwest corner of sec. 7, T. 31 N., R. 33 E., W.M.:

Oi—3 to 2 inches; needles, leaves, twigs, and cones.

Oe—2 inches to 0; partially decomposed needles, leaves, and twigs.

A1—0 to 3 inches; dark gray (10YR 4/1) fine sandy

loam, black (10YR 2/1) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots, common medium roots, and few coarse roots; common fine irregular pores; 10 percent fine pebbles; neutral; abrupt smooth boundary.

A2—3 to 10 inches; dark gray (10YR 4/1) fine sandy loam, very dark gray (10YR 3/1) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common fine irregular pores; 10 percent fine pebbles; neutral; abrupt wavy boundary.

AC—10 to 15 inches; grayish brown (2.5Y 5/2) gravelly loamy sand, very dark grayish brown (2.5Y 3/2) moist; massive with weak fine subangular blocky structure in places; slightly hard, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; few fine tubular pores; 20 percent pebbles; neutral; clear wavy boundary.

Ab—15 to 19 inches; gray (10YR 5/1) sandy loam, very dark gray (10YR 3/1) moist; weak medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots; few fine tubular pores; 5 percent cobbles and 5 percent pebbles; neutral; abrupt wavy boundary.

ACb—19 to 25 inches; light brownish gray (10YR 6/2) sandy loam, dark grayish brown (10YR 4/2) moist; massive; slightly hard, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots; few fine tubular pores; 10 percent pebbles; neutral; clear smooth boundary.

C1—25 to 44 inches; light gray (10YR 7/2) gravelly fine sandy loam with thin strata of loam and loamy fine sand, grayish brown (10YR 5/2) moist; few medium faint brown (10YR 5/3) mottles; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 20 percent pebbles; mildly alkaline; clear smooth boundary.

C2—44 to 60 inches; light brownish gray (2.5Y 6/2) gravelly fine sandy loam and loamy fine sand with thin strata of loam, dark grayish brown (2.5Y 4/2) moist; common medium distinct very pale brown (10YR 7/4) mottles; massive; hard, friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 20 percent pebbles; mildly alkaline.

The particle-size control section is 5 to 25 percent rock fragments. An apparent water table is present in January through June. Occasional periods of flooding occur in February through May.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. It is 0 to 10 percent pebbles. It is slightly acid or neutral.

The AC and Ab horizons are stratified fine sandy loam to loamy sand with 0 to 5 percent stones and cobbles and 0 to 20 percent pebbles. The Ab horizon is absent in some pedons.

The ACb and C horizons have hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. They are stratified loamy fine sand to loam with 5 to 20 percent pebbles. They are neutral or mildly alkaline. The ACb horizon is absent in some pedons.

### Cumulic Haploxerolls

Cumulic Haploxerolls consist of very deep, moderately well drained soils on alluvial fans. These soils formed in alluvium of mixed mineralogy. Slopes are 3 to 10 percent. Elevation is 1,700 to 2,800 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees, and the frost-free period is 110 to 150 days.

Reference pedon of Cumulic Haploxerolls, 3 to 10 percent slopes, about 6 miles northeast of Elmer City; 1,300 feet south and 400 feet east of the northwest corner of sec. 27, T. 30 N., R. 31 E., W.M.:

A1—0 to 11 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and common fine roots; common fine tubular pores; 15 percent pebbles; neutral; gradual wavy boundary.

A2—11 to 30 inches; dark grayish brown (10YR 4/2) gravelly loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine roots and common fine roots; common fine tubular pores; 15 percent pebbles; neutral; clear wavy boundary.

AC—30 to 48 inches; dark brown (10YR 4/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine and few fine roots; common fine irregular pores; 20 percent pebbles; neutral; gradual wavy boundary.

C—48 to 60 inches; dark brown (10YR 4/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; massive; slightly hard, friable, slightly sticky and nonplastic; common very fine and few fine roots; common fine irregular pores; 20 percent pebbles; neutral.

The mollic epipedon is 24 to 40 inches thick. The particle-size control section is 5 to 18 percent clay and 15 to 50 percent rock fragments. It is neutral or mildly alkaline. An apparent water table is present in February through May.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 30 percent pebbles.

The AC horizon has value of 4 to 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is loam or sandy loam with 5 to 50 percent pebbles and 0 to 5 percent cobbles. This horizon is absent in some pedons.

The C horizon has hue of 10YR or 2.5Y, value of 4 to 7 dry and 3 to 5 moist, and chroma of 2 or 3 dry or moist. It is loam or sand with 5 to 60 percent pebbles and 0 to 10 percent cobbles.

### Dart Series

The Dart series consists of very deep, somewhat excessively drained soils on terraces, terrace escarpments, and backslopes of hills. These soils formed in sandy glacial outwash. Slopes are 0 to 65 percent. Elevation is 1,400 to 2,800 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Dart loamy sand, warm, 0 to 15 percent slopes, about 5 miles northeast of Nespelem; 1,000 feet south and 2,100 feet east of the northwest corner of sec. 3, T. 31 N., R. 31 E., W.M.:

- A—0 to 3 inches; grayish brown (10YR 5/2) loamy sand, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine tubular pores; 5 percent pebbles; neutral; clear wavy boundary.
- Bw—3 to 14 inches; pale brown (10YR 6/3) loamy sand, dark brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; common fine tubular pores; 5 percent pebbles; neutral; clear wavy boundary.
- C1—14 to 32 inches; pale brown (10YR 6/3) loamy sand, dark brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; common fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.
- C2—32 to 60 inches; pale brown (10YR 6/3) sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 5 percent pebbles; neutral.

The particle-size control section is 0 to 15 percent pebbles, and the fine-earth fraction averages 15 to 50 percent coarse and very coarse sand. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is loamy sand or loamy coarse sand with 0 to 10 percent pebbles.

The Bw and C1 horizons have value of 5 or 6 dry. They are loamy sand or loamy coarse sand with 0 to 15 percent pebbles.

The C2 horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is sand, loamy coarse sand, or coarse sand with 0 to 15 percent pebbles.

### Dehart Series

The Dehart series consists of very deep, well drained soils on toeslopes, backslopes, and shoulders of hills. These soils formed in glacial till and colluvium derived from metamorphic rock with a component of loess and volcanic ash. Slopes are 8 to 65 percent. Elevation is 1,300 to 3,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost free period is 100 to 130 days.

Typical pedon of Dehart gravelly loam in an area of Dehart-Rock outcrop complex, 30 to 65 percent slopes, about 5 miles south of Inchelium; 2,640 feet south and 300 feet west of the northeast corner of sec. 1, T. 31 N., R. 36 E., W.M.:

- Oi—1 inch to 0; needles, twigs, and leaves.
- A1—0 to 3 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine and medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common fine irregular pores; 20 percent pebbles; neutral; clear wavy boundary.
- A2—3 to 8 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common fine irregular pores; 20 percent pebbles; neutral; clear wavy boundary.
- Bw1—8 to 16 inches; pale brown (10YR 6/3) very gravelly loam, dark brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common fine irregular pores; 40 percent pebbles; neutral; clear wavy boundary.

Bw2—16 to 30 inches; pale brown (10YR 6/3) very gravelly loam, dark brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine, fine, and medium roots; common fine irregular pores; 45 percent pebbles; neutral; clear wavy boundary.

C—30 to 60 inches; very pale brown (10YR 7/3) very gravelly loam, brown (10YR 5/3) moist; massive; slightly hard, firm, slightly sticky and slightly plastic; few very fine, fine, and medium roots; few fine tubular pores; 45 percent pebbles; slightly acid.

The particle-size control section is 35 to 60 percent rock fragments.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is 15 to 20 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist. It is loam or sandy loam with 30 to 50 percent pebbles and 5 to 15 percent cobbles. It is slightly acid or neutral.

The C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 3 or 4 moist. It is loam or sandy loam with 35 to 50 percent pebbles, 5 to 25 percent cobbles, and 0 to 5 percent stones. It is slightly acid or neutral.

## Dinkelman Series

The Dinkelman series consists of deep, well drained soils on backslopes, footslopes, and shoulders of hills and mountains. These soils formed in residuum and colluvium derived from granitic rock with a component of loess and volcanic ash in the upper part. Slopes are 5 to 65 percent. Elevation is 2,000 to 3,800 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Dinkelman gravelly loam, 40 to 65 percent slopes, about 3 miles east of Elmer City; 1,400 feet east and 1,200 feet south of the northwest corner of sec. 23, T. 29 N., R. 31 E., W M.:

Oi—2 inches to 1 inch; needles, cones, and twigs.

Oe—1 inch to 0; partially decomposed needles.

A—0 to 10 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many fine and medium roots; common fine irregular pores; 20 percent pebbles; neutral; clear smooth boundary.

BA—10 to 17 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common fine and medium roots; common fine irregular pores; 20 percent pebbles; slightly acid; clear wavy boundary.

Bw1—17 to 29 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, brown (10YR 4/3) dry; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; few fine and medium roots; common fine irregular pores; 25 percent pebbles; slightly acid; gradual wavy boundary.

Bw2—29 to 43 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark yellowish brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; few fine and medium roots; common fine irregular pores; 30 percent pebbles; slightly acid; clear wavy boundary.

Cr—43 to 53 inches; weathered granitic bedrock.

Depth to weathered bedrock is 40 to 60 inches. The mollic epipedon is 10 to 20 inches thick. The particle-size control section is 15 to 30 percent rock fragments. It is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 or 2 moist. It is loam or gravelly loam with 5 to 25 percent pebbles and 0 to 15 percent cobbles.

The BA horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is coarse sandy loam, sandy loam, or loam with 10 to 25 percent pebbles and 0 to 15 percent cobbles. This horizon is absent in some pedons.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or coarse sandy loam with 15 to 45 percent pebbles and 0 to 15 percent cobbles.

## Disautel Series

The Disautel series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on ground moraines on foothills. They formed in glacial till with a mantle of loess. Slopes are 0 to 30 percent. Elevation is 1,600 to 2,400 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Disautel very fine sandy loam in an area of Disautel-Rock outcrop complex, 3 to 30

percent slopes, about 5 miles southeast of Okanogan; 1,100 feet east and 400 feet north of the southwest corner of sec. 3, T. 33 N., R. 27 E., W.M.:

A1—0 to 7 inches; dark grayish brown (10YR 4/2) very fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; many fine roots; many fine and medium tubular pores; 5 percent pebbles; neutral; gradual wavy boundary.

A2—7 to 15 inches; brown (10YR 5/3) very fine sandy loam, dark brown (10YR 3/3) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; common fine roots; many fine and medium tubular pores; 5 percent pebbles; mildly alkaline; clear wavy boundary.

Bw—15 to 32 inches; pale brown (10YR 6/3) very fine sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, friable, nonsticky and nonplastic; few fine roots; common fine tubular pores; 5 percent pebbles; mildly alkaline; clear wavy boundary.

2Bkd1—32 to 42 inches; light gray (10YR 7/1) dense glacial till that crushes to very gravelly fine sandy loam, light brownish gray (10YR 6/2) moist; massive; hard, friable, nonsticky and nonplastic; common medium tubular pores; 35 percent pebbles, 5 percent cobbles, and 5 percent stones; violently effervescent; few filaments of soft powdery lime; moderately alkaline; gradual wavy boundary.

2Bkd2—42 to 60 inches; light gray (10YR 7/1) dense glacial till that crushes to very gravelly fine sandy loam, light brownish gray (10YR 6/2) moist; massive; hard, friable, nonsticky and nonplastic; common medium tubular pores; 20 percent pebbles, 5 percent cobbles, 5 percent stones, and 5 percent boulders; violently effervescent; common filaments of soft powdery lime; strongly alkaline.

Depth to dense glacial till is 20 to 40 inches. The mollic epipedon is 10 to 16 inches thick. Depth to secondary carbonates is 30 to 40 inches. The particle-size control section is 10 to 20 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles. It is neutral or mildly alkaline.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is loam, very fine sandy loam, or silt loam with 5 to 10 percent pebbles and 0 to 5 percent cobbles. It is neutral or mildly alkaline.

The 2Bkd horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 1 to 4 dry or moist. It is loam or fine sandy loam with 10 to 35 percent pebbles, 5 to 20 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders. It is mildly alkaline to strongly alkaline.

## Donavan Series

The Donovan series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on till plains and summits, toeslopes, footslopes, and backslopes of hills and mountains. They formed in glacial till with a component of loess and volcanic ash. Slopes are 5 to 65 percent. Elevation is 1,500 to 4,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Donovan loam, dry, 5 to 15 percent slopes, about 4 miles northeast of Nespelem; 2,000 feet north and 1,500 east of the southwest corner of sec. 32, T. 32 N., R. 31 E., W.M.:

Oi—2 inches to 1 inch; needles, twigs, leaves, and cones.

Oe—1 inch to 0; partially decomposed organic material.

A—0 to 5 inches; dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; 2 percent pebbles; medium acid; clear smooth boundary.

AB—5 to 11 inches; brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium and coarse roots; 10 percent pebbles; slightly acid; gradual wavy boundary.

Bw—11 to 21 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; 15 percent pebbles and 5 percent cobbles; slightly acid; gradual wavy boundary.

2Cd1—21 to 41 inches; light gray (10YR 7/2) dense glacial till that crushes to gravelly sandy loam, brown (10YR 5/3) moist; massive; hard, friable, slightly sticky and slightly plastic; very few very fine, fine, and medium roots; 20 percent pebbles

and 2 percent cobbles; slightly acid; gradual wavy boundary.

2Cd2—41 to 60 inches; light gray (10YR 7/2) dense glacial till that crushes to gravelly sandy loam, grayish brown (10YR 5/2) moist; massive; hard, friable, nonsticky and nonplastic; very few very fine, fine, and medium roots; 25 percent pebbles and 2 percent cobbles; neutral.

Depth to dense glacial till is 20 to 40 inches. The particle-size control section is 10 to 35 percent rock fragments with 5 to 15 percent clay. The mollic epipedon is 7 to 14 inches thick.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is loam, sandy loam, bouldery loam, or bouldery sandy loam with 0 to 15 percent pebbles, 0 to 15 percent cobbles, and 0 to 5 percent stones and boulders. It is medium acid to neutral.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is loam or sandy loam with 5 to 25 percent pebbles and 0 to 15 percent cobbles. It is slightly acid or neutral.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is sandy loam or loam with 10 to 30 percent pebbles, 0 to 15 percent cobbles, and 0 to 5 percent stones.

## Duleylake Series

The Duleylake series consists of very deep, moderately well drained soils in basins on glacial till plains. These soils formed in alluvium with a component of loess. Slopes are 0 to 8 percent. Elevation is 2,200 to 2,700 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Duleylake loam, 0 to 8 percent slopes, about 11 miles south of Okanogan; 1,320 feet east and 1,575 feet north of the southwest corner of sec. 1, T. 31 N., R. 26 E., W. M.:

A1—0 to 5 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots and few fine and medium roots; common very fine and fine irregular pores; neutral; clear smooth boundary.

A2—5 to 17 inches; brown (10YR 4/3) loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic;

common very fine and few fine roots; common very fine and fine irregular pores; neutral; clear wavy boundary.

BA1—17 to 23 inches; yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 3/4) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine and fine irregular and tubular pores; neutral; clear wavy boundary.

BA2—23 to 31 inches; pale brown (10YR 6/3) sandy loam, dark yellowish brown (10YR 4/3) moist; moderate medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; common very fine and fine irregular and tubular pores; mildly alkaline; clear wavy boundary.

Btk—31 to 37 inches; light brownish yellow (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; moderate medium and coarse subangular blocky structure; hard, firm, sticky and plastic; few very fine and fine roots; common very fine and fine irregular and tubular pores; common thin and moderately thick clay films on faces of peds and in pores; slightly effervescent; moderately alkaline; abrupt wavy boundary.

Bk—37 to 60 inches; very pale brown (10YR 7/4) silt loam, yellowish brown (10YR 5/4) moist; many medium prominent brownish yellow (10YR 6/8) mottles and common fine distinct light gray (10YR 7/1) mottles, yellowish brown (10YR 5/8) and gray (10YR 5/1) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine irregular pores; few soft powdery masses of lime; slightly effervescent; mildly alkaline.

The mollic epipedon is 15 to 20 inches thick. The particle-size control section is 25 to 30 percent clay and 0 to 10 percent pebbles. An apparent water table is present in January through June.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry.

The BA horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loam or sandy loam. It is neutral or mildly alkaline.

The Btk horizon has value of 5 or 6 dry and 4 to 6 moist, and it has chroma of 4 to 6 dry or moist. It is loam or clay loam. It is mildly alkaline or moderately alkaline.

The Bk horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It has common fine distinct to many medium prominent mottles. It is silt loam, loam, or sandy loam. It is mildly alkaline or moderately alkaline.

## Elbowlake Series

The Elbowlake series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on backslopes, footslopes, and toeslopes of hills and mountains. They formed in volcanic ash over glacial till derived dominantly from metasedimentary rock. Slopes are 5 to 65 percent. Elevation is 2,100 to 4,100 feet. The average annual precipitation is 18 to 24 inches, the average annual air temperature is 42 to 45 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Elbowlake silt loam, 40 to 65 percent slopes, about 12 miles northwest of Inchelium; 850 feet north and 2,125 feet east of the southwest corner of sec. 13, T. 34 N., R. 35 E., W.M.:

Oi—2 inches to 0; needles and twigs.

A—0 to 2 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium and coarse roots; common fine irregular pores; 5 percent pebbles; neutral (NaF pH 10.5); clear smooth boundary.

Bw1—2 to 15 inches; light yellowish brown (10YR 6/4) silt loam, dark brown (10YR 3/3) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium and coarse roots; common fine irregular pores; 5 percent pebbles; neutral (NaF pH 10.5); abrupt wavy boundary.

2Bw2—15 to 20 inches; pale brown (10YR 6/3) very gravelly loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common fine irregular pores; 25 percent pebbles and 15 percent channers; neutral; clear wavy boundary.

2Cd1—20 to 43 inches; light brownish gray (2.5Y 6/2) dense glacial till that crushes to very channery sandy loam, dark grayish brown (2.5Y 4/2) moist; massive; hard, friable, nonsticky and slightly plastic; many very fine and fine roots; few fine tubular pores; 20 percent channers, 10 percent pebbles, and 10 percent cobbles; neutral; gradual wavy boundary.

2Cd2—43 to 60 inches; light brownish gray (2.5Y 6/2) dense glacial till that crushes to very gravelly sandy loam, dark grayish brown (2.5Y 4/2) moist; massive; hard, friable, nonsticky and slightly plastic; few very fine roots; 20 percent pebbles, 15 percent channers, and 5 percent cobbles; neutral.

Depth to dense glacial till is 20 to 40 inches. The mantle of volcanic ash is 14 to 20 inches thick. The upper part of the particle-size control section is 5 to 10 percent rock fragments, and the lower part is 12 to 18 percent clay, 30 to 50 percent silt, and 35 to 60 percent rock fragments, dominantly pebbles, channers, and cobbles. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles. This horizon is absent in some pedons.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 moist. It is 5 to 10 percent pebbles.

The 2Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or loam with 5 to 30 percent channers, 10 to 40 percent pebbles, and 5 to 10 percent cobbles and stones. This horizon is absent in some pedons.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 5 to 40 percent channers, 10 to 40 percent pebbles, and 5 to 10 percent cobbles and stones.

## Ellisforde Series

The Ellisforde series consists of very deep, well drained soils on terraces and terrace escarpments. These soils formed in glacial lake sediment with a mantle of loess. Slopes are 0 to 25 percent. Elevation is 750 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Ellisforde silt loam, 0 to 5 percent slopes, about 8 miles north of Bridgeport; 2,000 feet east and 700 feet south of the northwest corner of sec. 10, T. 30 N., R. 25 E., W.M.:

A—0 to 12 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, friable, nonsticky and nonplastic; many very fine, fine, and medium roots; few very fine interstitial and tubular pores; neutral; gradual wavy boundary.

Bw—12 to 18 inches; light brownish gray (10YR 6/2) silt loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine roots; few fine and very fine interstitial and tubular pores; mildly alkaline; gradual wavy boundary.

2C1—18 to 30 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 3/3) moist; massive;

slightly hard, friable, nonsticky and slightly plastic; common very fine and fine roots; few fine and very fine interstitial and tubular pores; mildly alkaline; gradual wavy boundary.

2Ck1—30 to 48 inches; very pale brown (10YR 7/3) silt loam, grayish brown (10YR 5/2) moist; massive; hard, firm, nonsticky and slightly plastic; few very fine roots; few fine interstitial and tubular pores; few very fine soft masses of lime; strongly effervescent; moderately alkaline; gradual wavy boundary.

2Ck2—48 to 60 inches; pale brown (10YR 6/3) silt loam, brown (10YR 5/3) moist; few fine distinct reddish brown mottles; massive; slightly hard, firm, nonsticky and nonplastic; few very fine roots; few fine interstitial and tubular pores; few very fine soft masses of lime; violently effervescent; moderately alkaline.

Depth to secondary carbonates is 20 to 40 inches. The mollic epipedon is 9 to 14 inches thick.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is neutral or mildly alkaline.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 to 4 dry or moist. It is silt loam or very fine sandy loam. It is mildly alkaline or moderately alkaline.

The 2C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 or 3 dry or moist. The horizon is silt loam or very fine sandy loam with thin strata of fine sandy loam, fine sand, or silty clay loam in some pedons. It is mildly alkaline or moderately alkaline.

The 2Ck horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 5 or 6 moist, and chroma of 2 or 3 dry or moist. The horizon is stratified very fine sandy loam to silt loam with thin strata of fine sand to silty clay loam. It is strongly effervescent or violently effervescent. It is moderately alkaline or strongly alkaline.

## Elvedere Series

The Elvedere series consists of very deep, well drained soils on undulating terraces and terrace escarpments. These soils formed in glacial lake sediment. Slopes are 0 to 45 percent. Elevation is 1,100 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Elvedere silt loam in an area of Elvedere-Leahy silt loams complex, 0 to 15 percent

slopes, about 5 miles northwest of Elmer City; 200 feet north and 1,800 feet west of the southeast corner of sec. 25, T. 30 N., R. 30 E., W.M.:

E—0 to 6 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; weak fine subangular blocky structure; hard, firm, slightly sticky and slightly plastic; many very fine roots and common fine roots; common fine irregular pores; 5 percent rounded pebbles; neutral; abrupt wavy boundary.

Bt—6 to 10 inches; 60 percent pale brown (10YR 6/3) and 40 percent light gray (2.5Y 7/2) silty clay loam, brown (10YR 5/3) moist; moderate fine subangular blocky structure; hard, firm, sticky and plastic; common very fine and fine roots; common fine irregular pores; many distinct clay films on faces of peds; mildly alkaline; clear smooth boundary.

Bk1—10 to 15 inches; very pale brown (10YR 7/3) silty clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; hard, firm, sticky and plastic; common very fine and fine roots; common fine irregular pores; common fine lime filaments and soft masses; violently effervescent; moderately alkaline; clear smooth boundary.

Bk2—15 to 27 inches; light gray (2.5Y 7/2) silty clay loam, light brownish gray (2.5Y 6/2) moist; massive (varved); hard, firm, sticky and plastic; common very fine and fine roots; common fine irregular pores; few fine soft masses of lime between varves; violently effervescent; strongly alkaline; gradual smooth boundary.

Bk3—27 to 52 inches; white (2.5Y 8/2) silty clay loam, light brownish gray (2.5Y 6/2) moist; massive (varved); slightly hard, friable, sticky and plastic; few very fine and fine roots; few fine tubular pores; few fine soft masses of lime between varves; violently effervescent; strongly alkaline; gradual smooth boundary.

Bk4—52 to 60 inches; light gray (2.5Y 7/2) silty clay loam, light brownish gray (2.5Y 6/2) moist; massive (varved); slightly hard, friable, sticky and plastic; few very fine roots; few fine tubular pores; few fine soft masses of lime between varves; strongly effervescent; strongly alkaline.

Depth to secondary carbonates is 7 to 16 inches. The particle-size control section is 0 to 5 percent pebbles, 35 to 45 percent clay, and less than 15 percent fine sand or coarser.

The E horizon has hue of 10YR or 2.5Y and value of 6 or 7 dry and 4 or 5 moist. It is neutral or mildly alkaline. It is silt loam or stony silt loam with 0 to 5

percent stones, 0 to 5 percent cobbles, and 0 to 10 percent pebbles.

The Bt horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is silty clay loam or silty clay. It is mildly alkaline or moderately alkaline.

The Bk horizon has hue of 10YR or 2.5Y, value of 7 or 8 dry and 5 or 6 moist, and chroma of 2 or 3 dry and 2 to 4 moist. It is silty clay loam or silty clay. It is moderately alkaline or strongly alkaline.

## Emdent Series

The Emdent series consists of very deep, somewhat poorly drained and poorly drained soils in depressions on till plains and in backswamps of streams. These soils formed in alluvium derived from volcanic ash and loess. Slopes are 0 to 3 percent. Elevation is 1,200 to 2,600 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Emdent silt loam, 0 to 3 percent slopes, about 6 miles east of Nespelem; 1,400 feet north and 450 feet east of the southwest corner of sec. 19, T. 31 N., R. 32 E., W.M.:

Akzn1—0 to 6 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common very fine and fine roots; few fine tubular pores; strongly effervescent; very strongly alkaline; clear smooth boundary.

Akzn2—6 to 13 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; common fine roots; few fine tubular pores; slightly effervescent; very strongly alkaline; abrupt smooth boundary.

Akzn3—13 to 18 inches; grayish brown (10YR 5/2) silt loam, dark brown (10YR 3/3) moist; common very dark gray (10YR 3/1) organic stains on surface of peds; weak fine subangular blocky structure; hard, friable, slightly sticky and nonplastic; few very fine roots; few fine tubular pores; violently effervescent; very strongly alkaline; clear smooth boundary.

Bkzn—18 to 26 inches; light brownish gray (2.5Y 6/2) silt loam, olive brown (2.5Y 4/4) moist; weak medium platy structure parting to weak fine subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; few

fine tubular pores; violently effervescent; strongly alkaline; clear smooth boundary.

Bkg1—26 to 35 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; massive; slightly hard, friable, slightly sticky and nonplastic; strongly effervescent; strongly alkaline; clear smooth boundary.

Bkg2—35 to 48 inches; light gray (2.5Y 7/2) silt loam, light olive brown (2.5Y 5/4) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; violently effervescent; strongly alkaline; clear smooth boundary.

Bkg3—48 to 60 inches; light gray (5Y 7/1) silt loam, olive (5Y 5/3) moist; massive; hard, firm, slightly sticky and slightly plastic; slightly effervescent; moderately alkaline.

An apparent water table is present throughout the year. The soils are ponded in February through May.

The Akzn horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. It is strongly effervescent or violently effervescent. It is strongly alkaline or very strongly alkaline. The sodium adsorption ratio is 15 to 30.

The Bkzn horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 1 to 3 dry or moist. The horizon is silt loam, very fine sandy loam, or loam. It is strongly effervescent or violently effervescent. It is mildly alkaline to strongly alkaline. The sodium adsorption ratio is 5 to 30.

The Bkg horizon has hue of 2.5Y, 5Y, or 10YR, value of 6 to 8 dry and 3 to 5 moist, and chroma 1 to 3 dry or moist. The horizon is silt loam, very fine sandy loam, or loam with 0 to 5 percent pebbles. It is slightly effervescent or strongly effervescent. The horizon is mildly alkaline to strongly alkaline. The sodium adsorption ratio is 5 to 30.

## Ewall Series

The Ewall series consists of very deep, excessively drained soils on terraces with dunelike relief and on terrace escarpments. These soils formed in sandy glacial outwash and eolian sand. Slopes are 0 to 60 percent. Elevation is 1,300 to 3,000 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Ewall loamy fine sand, 10 to 25 percent slopes, about 3 miles south of Nespelem; 1,600 feet north and 700 feet west of the southeast corner of sec. 1, T. 30 N., R. 30 E., W.M.:

A—0 to 7 inches; brown (10YR 5/3) loamy fine sand, dark brown (10YR 3/3) moist; weak medium

subangular blocky structure; loose, nonsticky and nonplastic; common very fine and fine roots; few fine tubular pores; 5 percent pebbles; neutral; clear wavy boundary.

- AC—7 to 13 inches; brown (10YR 5/3) loamy fine sand, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine roots; few fine tubular pores; 5 percent pebbles; neutral; clear wavy boundary.
- C1—13 to 38 inches; pale brown (10YR 6/3) sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few fine roots; few fine tubular pores; 10 percent pebbles; neutral; gradual wavy boundary.
- C2—38 to 60 inches; pale brown (10YR 6/3) gravelly sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; 25 percent pebbles; neutral.

The particle-size control section is 0 to 5 percent clay and 0 to 25 percent rock fragments.

The A horizon has value of 4 to 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is loamy fine sand, coarse sand, or gravelly loamy sand with 0 to 35 percent pebbles.

The AC horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is loamy fine sand, loamy sand, or coarse sand with 0 to 15 percent pebbles. This horizon is absent in some pedons.

The C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 1 to 4 dry or moist. It is loamy sand, sand, or coarse sand with 0 to 25 percent pebbles and 0 to 5 percent cobbles.

## Farrell Series

The Farrell series consists of very deep, well drained soils on terraces and terrace escarpments. These soils formed in glaciofluvial material with a component of loess. Slopes are 0 to 25 percent. Elevation is 850 to 1,500 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Farrell fine sandy loam, 5 to 10 percent slopes, about 15 miles northeast of Bridgeport; 1,450 feet north and 150 feet east of the southwest corner of sec. 20, T. 30 N., R. 28 E., W.M.:

- A—0 to 10 inches; brown (10YR 5/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and

common fine roots; common fine tubular pores; 5 percent pebbles; mildly alkaline; clear wavy boundary.

- Bw—10 to 22 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common fine tubular pores; 5 percent pebbles; mildly alkaline; clear wavy boundary.

- Bk1—22 to 28 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 5/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common fine tubular pores; 5 percent pebbles; few fine filaments and soft masses of secondary carbonates; strongly effervescent; strongly alkaline; clear wavy boundary.

- Bk2—28 to 46 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; few fine tubular pores; 5 percent pebbles; common fine filaments and soft masses of secondary carbonates; slightly effervescent; strongly alkaline; gradual wavy boundary.

- Bk3—46 to 60 inches; light brownish gray (10YR 6/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, slightly sticky and nonplastic; few very fine and fine roots; few fine tubular pores; 5 percent pebbles; common fine filaments and soft masses of secondary lime; strongly effervescent; strongly alkaline.

The mollic epipedon is 7 to 15 inches thick. Depth to secondary carbonates is 20 to 40 inches. The particle-size control section is 0 to 10 percent rock fragments and 5 to 12 percent clay.

The A horizon has chroma of 2 or 3 dry or moist. It is fine sandy loam or very bouldery fine sandy loam with 0 to 5 percent pebbles. It is neutral or mildly alkaline.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is very fine sandy loam, fine sandy loam, or sandy loam with 0 to 5 percent pebbles. It is neutral or mildly alkaline.

The Bk1 horizon has hue of 10YR or 2.5Y and chroma of 3 or 4 dry or moist. It is very fine sandy loam, fine sandy loam, or sandy loam with 0 to 10 percent pebbles. It is moderately alkaline or strongly alkaline.

The Bk2 and Bk3 horizons have hue of 10YR or 2.5Y and chroma of 2 or 3 dry or moist. They are fine

sandy loam or sandy loam with 0 to 10 percent pebbles. They are moderately alkaline or strongly alkaline.

### Fivelakes Series

The Fivelakes series consists of very deep, well drained and moderately well drained soils on glacial outwash terraces and terrace escarpments. These soils formed in glacial outwash with a component of loess in the upper part. Slopes are 0 to 65 percent. Elevation is 1,200 to 2,700 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Fivelakes extremely bouldery loam, 0 to 30 percent slopes, about 9 miles southeast of Nespelem; 500 feet north and 1,500 feet west of the southeast corner of sec. 28, T. 30 N., R. 31 E., W.M.:

A1—0 to 4 inches; grayish brown (10YR 5/2) extremely bouldery loam, very dark grayish brown (10YR 3/2) moist, weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; common fine irregular pores; 35 percent boulders, 5 percent pebbles, 15 percent cobbles, and 10 percent stones; neutral; clear wavy boundary.

A2—4 to 12 inches; grayish brown (10YR 5/2) very bouldery loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and few fine roots; common fine irregular pores; 5 percent pebbles, 15 percent cobbles, 10 percent stones, and 15 percent boulders; neutral; clear wavy boundary.

Bw1—12 to 18 inches; light yellowish brown (10YR 6/4) very stony loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common fine irregular pores; 20 percent cobbles, 5 percent pebbles, 15 percent stones, and 5 percent boulders; neutral; clear irregular boundary.

Bw2—18 to 30 inches; light yellowish brown (10YR 6/4) very stony sandy loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common fine irregular pores; 20 percent pebbles, 10 percent cobbles, 15 percent stones, and 5 percent boulders; neutral; abrupt wavy boundary.

C—30 to 60 inches; multicolored extremely cobbly coarse sand; single grain; loose, nonsticky and nonplastic; 35 percent pebbles, 20 percent cobbles, and 5 percent stones; neutral.

The mollic epipedon is 9 to 15 inches thick. Depth to the C horizon is 20 to 36 inches. The particle-size control section is 35 to 60 percent rock fragments. The soils of the moist phase (detailed soil map unit 165) have an apparent water table in March and April.

The A1 horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is fine sandy loam, stony loam, extremely bouldery loam, or extremely bouldery sandy loam with 0 to 25 percent pebbles, 0 to 35 percent cobbles, and 0 to 45 percent stones and boulders.

The A2 horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is fine sandy loam, sandy loam, or loam with 0 to 25 percent pebbles, 0 to 25 percent cobbles, and 0 to 25 percent stones and boulders.

The Bw horizon has value of 5 or 6 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or loam with 5 to 30 percent pebbles, 10 to 25 percent cobbles, and 0 to 25 percent stones and boulders.

The C horizon is multicolored. It is loamy sand, sand, loamy coarse sand, or coarse sand with 30 to 70 percent pebbles, 5 to 45 percent cobbles, and 0 to 5 percent stones.

### Friedlander Series

The Friedlander series consists of very deep, well drained soils on backslopes, footslopes, and toeslopes of hills and mountains. These soils formed in residuum and some colluvium derived from granitic and metamorphic rock with a mantle of loess and volcanic ash. Slopes are 0 to 40 percent. Elevation is 2,400 to 4,000 feet. The average annual precipitation is 18 to 22 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Friedlander silt loam, 0 to 20 percent slopes, about 8 miles southeast of Keller; 1,000 feet south and 1,300 feet west of the northeast corner of sec. 17, T. 29 N., R. 34 E., W.M.:

Oi—3 inches to 0; needles, leaves, twigs, and cones.

A—0 to 3 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many

very fine, fine, and medium roots; common fine tubular pores; 2 percent fine pebbles; slightly acid; abrupt smooth boundary.

- Bw—3 to 8 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common very fine, fine, medium, and coarse roots; common fine irregular pores; 2 percent fine pebbles; slightly acid; abrupt smooth boundary.
- 2E—8 to 15 inches; very pale brown (10YR 7/3) loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots and common fine and medium roots; common fine irregular pores; 2 percent fine pebbles; slightly acid; clear smooth boundary.
- 2E/Bt—15 to 23 inches; 60 percent very pale brown (10YR 7/3) loam (E part), dark yellowish brown (10YR 4/4) moist, and 40 percent yellowish brown (10YR 5/4) silty clay loam (B part), dark yellowish brown (10YR 3/4) moist; moderate medium angular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine and medium roots and common fine roots; common fine irregular pores; many distinct clay films on face of peds and lining pores; 2 percent pebbles; medium acid; clear wavy boundary
- 2Bt/E—23 to 32 inches; 75 percent brown (7.5YR 5/4) silty clay loam (Bt part), dark brown (7.5YR 3/4) and brown (7.5YR 4/4) moist, and 25 percent light gray (10YR 7/2) loam (E part), brown (10YR 5/3) moist; strong coarse angular blocky structure; very hard, very firm, sticky and plastic; few very fine and common fine roots; common fine irregular pores; many distinct clay films on face of peds and lining pores; 2 percent pebbles; medium acid; clear wavy boundary.
- 2Bt1—32 to 52 inches; brown (7.5YR 5/4) silty clay loam, dark brown (7.5YR 3/4) moist; strong coarse prismatic and angular blocky structure; extremely hard, extremely firm, very sticky and plastic; few very fine and fine roots; few fine tubular pores; continuous distinct clay films on face of peds and lining pores; 5 percent pebbles; neutral; clear wavy boundary.
- 2Bt2—52 to 60 inches; brown (7.5YR 5/4) silty clay loam, dark brown (7.5YR 3/4) moist; moderate coarse angular blocky structure; extremely hard, extremely firm, sticky and plastic; few very fine and fine roots; few fine tubular pores; continuous distinct clay films on face of peds and lining pores; 5 percent pebbles; neutral.

The mantle of loess and volcanic ash is 7 to 14

inches thick. The particle-size control section is 35 to 45 percent clay and 2 to 15 percent rock fragments.

The A horizon has hue of 10YR or 7.5YR and chroma of 2 or 3 dry or moist. It is 0 to 5 percent pebbles. The horizon is slightly acid or neutral.

The Bw horizon has hue of 10YR or 7.5YR, value of 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is 0 to 5 percent pebbles. It is slightly acid or neutral.

The 2E horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is 0 to 10 percent pebbles.

The E part of the 2E/Bt horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. The Bt part has hue of 10YR or 7.5YR and value of 5 or 6 dry and 3 or 4 moist. The E part is loam or very fine sandy loam with 0 to 10 percent pebbles. It is medium acid or slightly acid.

The Bt part of the 2Bt/E horizon has hue of 7.5YR or 10YR and value of 5 or 6 dry and 3 or 4 moist. It is silty clay loam, clay loam, or loam. The E part has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is silt loam or loam with 0 to 10 percent pebbles.

The 2Bt horizon has hue of 5YR, 7.5YR, or 10YR, value of 4 to 6 dry and 3 or 4 moist, and chroma of 3 to 6 dry or moist. It is clay, silty clay loam, or clay loam with 5 to 10 percent pebbles. It is slightly acid or neutral.

## Garrison Series

The Garrison series consists of very deep, well drained soils on outwash terraces. These soils formed in glacial outwash with a component of loess and volcanic ash in the upper part. Slopes are 0 to 30 percent. Elevation is 1,600 to 2,800 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Garrison loam, 0 to 5 percent slopes, about 7 miles northeast of Nespelem; 700 feet west and 2,000 feet south of the northeast corner of sec. 19, T. 32 N., R. 31 E., W.M.:

Oi—1.5 inches to 0.5 inch; needles, twigs, and cones.

Oe—0.5 inch to 0; partially decomposed needles and twigs.

A—0 to 12 inches; dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 3/2) moist; moderate medium granular structure; soft, very friable, slightly sticky and nonplastic; many very fine, fine, and medium roots; common fine irregular pores; 5 percent pebbles; neutral; clear smooth boundary.

Bw1—12 to 18 inches; brown (10YR 5/3) gravelly

loam, dark brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine, fine, and medium roots; common fine irregular pores; 15 percent pebbles; neutral; clear wavy boundary.

Bw2—18 to 28 inches; yellowish brown (10YR 5/4) very gravelly sandy loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots; common fine tubular pores; 35 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

2C1—28 to 41 inches; pale brown (10YR 6/3) very gravelly coarse sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common fine irregular pores; 50 percent pebbles and 5 percent cobbles; neutral; gradual smooth boundary.

2C2—41 to 60 inches; multicolored extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine, fine, and medium roots; common fine irregular pores; 60 percent pebbles and 10 percent cobbles; neutral.

Depth to the 2C horizon is 24 to 36 inches. The particle-size control section is 35 to 70 percent rock fragments. The profile is neutral or slightly acid.

The A horizon has value of 4 or 5 dry and 2 or 3 moist. It is loam or gravelly loam with 0 to 30 percent pebbles.

The Bw horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loam or sandy loam with 20 to 40 percent pebbles and 0 to 10 percent cobbles.

The 2C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 6 moist, and chroma of 3 or 4 dry or moist. It is loamy sand or coarse sand with 50 to 75 percent pebbles, 5 to 30 percent cobbles, and 0 to 5 percent stones.

## Georgecreek Series

The Georgecreek series consists of deep, well drained soils on summits, shoulders, and backslopes of hills. These soils formed in residuum derived from granitic rock with a component of loess and volcanic ash. Slopes are 5 to 40 percent. Elevation is 1,800 to 3,400 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Georgecreek silt loam, 5 to 20

percent slopes, about 11 miles southeast of Nespelem; 1,800 feet west and 1,100 feet north of the southeast corner of sec. 1, T. 29 N., R. 31 E., W.M.:

Oi—2 inches to 0; needles, twigs, leaves, and cones.  
A1—0 to 6 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common fine irregular pores; neutral; clear wavy boundary.

A2—6 to 11 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common fine irregular pores; neutral; clear wavy boundary.

BA—11 to 19 inches; light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; hard, firm, sticky and plastic; few very fine, fine, and medium roots; few fine tubular pores; neutral; clear wavy boundary.

Bt1—19 to 35 inches; light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; hard, firm, sticky and plastic; few very fine and fine roots; common fine tubular pores; common faint clay films on faces of peds and in pores; neutral; clear wavy boundary.

Bt2—35 to 53 inches; light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; few very fine roots; few fine tubular pores; few thin clay films on faces of peds and in pores; mildly alkaline; gradual wavy boundary.

BC—53 to 58 inches; light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; 5 percent pebbles; slightly effervescent; mildly alkaline; abrupt wavy boundary.

Cr—58 to 68 inches; weathered granitic bedrock.

The mollic epipedon is 7 to 16 inches thick. The solum is 25 to 60 inches thick. Depth to weathered bedrock is 40 to 60 inches. The particle-size control section is 18 to 35 percent clay, 25 to 50 percent medium, coarse, and very coarse sand, and 0 to 25 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. It is silt

loam or loam with 0 to 15 percent pebbles. It is slightly acid or neutral.

The BA horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is silt loam or loam with 0 to 15 percent pebbles. It is slightly acid or neutral.

The Bt horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is loam, clay loam, or sandy clay loam with 0 to 25 percent pebbles. It is slightly acid to mildly alkaline.

The BC and C horizons have hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. They are loam or sandy loam with 5 to 30 percent pebbles and 0 to 2 percent cobbles. They are neutral or mildly alkaline. These horizons are absent in some pedons.

### Ginnis Series

The Ginnis series consists of moderately deep, well drained soils on footslopes, backslopes, and shoulders of hills. These soils formed in residuum and colluvium derived from granitic rock with a component of loess. Slopes are 5 to 65 percent. Elevation is 1,400 to 3,200 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Ginnis loam, 15 to 35 percent slopes, about 4 miles northeast of Coulee Dam; 2,000 feet south and 600 feet east of the northwest corner of sec. 26, T. 29 N., R. 31 E., W.M.:

- A—0 to 10 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; many very fine and common fine roots; many very fine continuous interstitial pores; 5 percent fine pebbles; neutral; clear wavy boundary.
- Bw1—10 to 22 inches; brown (10YR 5/3) gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine and very fine roots; common very fine interstitial pores and few very fine tubular pores; 15 percent pebbles; neutral; clear wavy boundary.
- Bw2—22 to 31 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure parting to weak fine subangular blocky; slightly hard, friable, slightly sticky and nonplastic; few very fine and fine roots; common fine interstitial pores; 20 percent pebbles; neutral; abrupt wavy boundary.

Cr—31 to 41 inches; weathered granitic bedrock.

The mollic epipedon is 8 to 14 inches thick. Depth to weathered bedrock is 20 to 40 inches. The particle-size control section is 10 to 35 percent rock fragments, but individual subhorizons are as much as 45 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is loam, cobbly loam, or stony sandy loam with 5 to 20 percent pebbles, 0 to 15 percent cobbles, and 0 to 5 percent stones.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. It is loam, sandy loam, or coarse sandy loam with 10 to 35 percent pebbles and 0 to 20 percent cobbles.

The C horizon, where present, has value of 6 or 7 dry and 4 or 5 moist. It is sandy loam or coarse sandy loam with 5 to 30 percent pebbles.

### Glenrose Series

The Glenrose series consists of very deep, well drained soils on foothills. These soils formed in glacial till with a mantle of loess and volcanic ash. Slopes are 8 to 30 percent. Elevation is 1,300 to 2,900 feet. The average annual precipitation is 17 to 20 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Glenrose silt loam, 8 to 15 percent slopes, about 17 miles south of Inchelium; 900 feet south and 1,450 feet east of the northwest corner of sec. 33, T. 30 N., R. 36 E., W.M.:

- Ap—0 to 5 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure parting to weak very fine subangular blocky; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; common fine irregular pores; 5 percent pebbles; slightly acid; clear smooth boundary.
- A—5 to 13 inches; grayish brown (10YR 5/2) silt loam, dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure parting to weak fine subangular blocky; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; common fine irregular pores; 5 percent pebbles; slightly acid; clear wavy boundary.
- BA—13 to 16 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very

fine roots; common fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

2E—16 to 27 inches; pale brown (10YR 6/3) loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; few fine tubular pores; 10 percent pebbles; slightly acid; abrupt irregular boundary.

2Bt1—27 to 39 inches; very pale brown (10YR 7/3) loam, yellowish brown (10YR 5/3) moist; moderate medium subangular blocky structure; hard, firm, sticky and slightly plastic; few very fine roots; few fine tubular pores; common thin clay films on faces of peds; 10 percent pebbles; slightly acid; clear wavy boundary.

2Bt2—39 to 60 inches; very pale brown (10YR 7/3) gravelly loam, brown (10YR 5/3) moist; moderate medium subangular blocky structure; hard, firm, sticky and plastic; common thin clay films on faces of peds; 15 percent pebbles; slightly acid.

The mollic epipedon is 10 to 20 inches thick. The particle-size control section is 5 to 20 percent rock fragments and 18 to 27 percent clay. The profile is slightly acid or neutral.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist.

The BA horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist.

The 2E horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is silt loam or loam with 5 to 20 percent pebbles.

The 2Bt horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma 2 to 6 dry or moist. It is loam or silt loam with 0 to 20 percent pebbles.

## Goddard Series

The Goddard series consists of very deep, well drained soils on terraces and terraces escarpments. These soils formed in glacial outwash with a mantle of volcanic ash. Slopes are 0 to 65 percent. Elevation is 2,000 to 3,900 feet. The average annual precipitation is 16 to 19 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Goddard silt loam, 0 to 20 percent slopes, about 21 miles northeast of Nespelem; 2,600 feet south and 500 feet east of the northwest corner of sec. 17, T. 34 N., R. 32 E., W.M.:

Oi—1 inch to 0; needles, leaves, and twigs.

A—0 to 3 inches; grayish brown (10YR 5/2) silt loam,

very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium and coarse roots; common fine tubular pores; 5 percent pebbles; neutral; clear wavy boundary.

Bw—3 to 10 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; common fine irregular pores; 10 percent pebbles; slightly acid; abrupt wavy boundary.

2BC—10 to 18 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; common fine irregular pores; 30 percent pebbles; neutral; clear wavy boundary.

2C1—18 to 30 inches; pale brown (10YR 6/3) very gravelly loamy sand, dark brown (10YR 3/3) moist; single grain; loose, nonsticky and nonplastic; few fine and medium roots; few fine tubular pores; 40 percent pebbles and 10 percent cobbles; neutral; gradual wavy boundary.

2C2—30 to 60 inches; multicolored very gravelly loamy coarse sand; single grain; loose, nonsticky and nonplastic; few fine roots; few fine tubular pores; 45 percent pebbles and 10 percent cobbles; neutral.

The mantle of volcanic ash is 7 to 14 inches thick. The particle-size control section is 35 to 60 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam or loam with 0 to 20 percent pebbles.

The 2BC horizon is sandy loam or coarse sandy loam with 0 to 10 percent cobbles and 15 to 30 percent pebbles.

The 2C horizon has value of 6 or 7 dry and 3 to 5 moist, and it has chroma of 2 to 4 dry or moist. It is loamy sand or coarse sand with 30 to 60 percent pebbles and 10 to 20 percent cobbles.

## Goldlake Series

The Goldlake series consists of soils that are deep to dense glacial till and are moderately well drained. These soils are in swales and draws of glaciated foothills. They formed in glacial till with a component of loess, volcanic ash, and slope alluvium in the upper part. Slopes are 0 to 8 percent. Elevation is 2,000 to

3,500 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Goldlake silt loam, 0 to 8 percent slopes, about 7 miles north of Nespelem; 1,200 feet east and 700 feet south of the northwest corner of sec. 19, T. 32 N., R. 31 E., W.M.:

Oi—3 inches to 0.5 inch; needles, twigs, leaves, and mosses.

Oe—0.5 inch to 0; partially decomposed litter and mosses.

A1—0 to 8 inches; dark grayish brown (10YR 4/2) silt loam, black (10YR 2/1) moist; strong medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, medium, and coarse roots; common fine irregular pores; 3 percent pebbles; neutral; clear wavy boundary.

A2—8 to 22 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium granular structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots, common coarse roots; common fine irregular pores; 3 percent pebbles; neutral; abrupt smooth boundary.

Bw1—22 to 29 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; few fine tubular pores; 15 percent pebbles, 5 percent cobbles, and 2 percent stones; neutral; clear smooth boundary.

Bw2—29 to 40 inches; very pale brown (10YR 7/3) gravelly sandy loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; few fine tubular pores; 20 percent pebbles, 10 percent cobbles, and 2 percent stones; neutral; clear smooth boundary.

2Cd—40 to 60 inches; very pale brown (10YR 7/3) dense glacial till that crushes to gravelly coarse sandy loam, brown (10YR 5/3) moist; few fine distinct brown (7.5YR 5/4) mottles, dark brown (7.5YR 3/4) moist; massive; hard, friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 20 percent pebbles, 10 percent cobbles, and 2 percent stones; neutral.

Depth to dense glacial till is 40 to 60 inches. The mollic epipedon is 20 to 28 inches thick. The particle-size control section is 8 to 15 percent clay and 10 to

25 percent rock fragments. The profile is neutral or slightly acid. An apparent water table is present in March through May.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam or loam in the upper part and loam or sandy loam in the lower part. The horizon is 10 to 30 percent pebbles, 0 to 10 percent cobbles, and 0 to 5 percent stones.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is loam, sandy loam, or coarse sandy loam with 15 to 40 percent pebbles, 5 to 20 percent cobbles, and 0 to 5 percent stones.

### Gooseflats Series

The Gooseflats series consists of soils that are deep to a duripan and very deep and are somewhat poorly drained and moderately well drained. These soils are in draws and valley flats that have swales and swells. They formed in alluvium derived from glacial outwash material. Slopes are 0 to 2 percent. Elevation is 800 to 2,400 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Gooseflats fine sandy loam, somewhat poorly drained, in an area of Gooseflats fine sandy loams complex, 0 to 2 percent slopes, about 20 miles west of Nespelem; 1,650 feet west and 1,900 feet north of the southeast corner of sec. 32, T. 31 N., R. 28 E., W.M.:

Akzn1—0 to 4 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; common fine irregular pores; violently effervescent; very strongly alkaline; gradual smooth boundary.

Akzn2—4 to 7 inches; grayish brown (10YR 5/2) fine sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common fine irregular pores; strongly effervescent; very strongly alkaline; clear smooth boundary.

Bkzn1—7 to 20 inches; light brownish gray (10YR 6/2) loamy fine sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine roots; common fine

tubular pores; violently effervescent; strongly alkaline; gradual smooth boundary.

Bkzn2—20 to 30 inches; light brownish gray (10YR 6/2) loamy fine sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; common fine irregular pores; violently effervescent; strongly alkaline; abrupt smooth boundary.

Bkgz—30 to 41 inches; light gray (2.5Y 7/2) fine sand, grayish brown (2.5Y 5/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; violently effervescent; strongly alkaline; abrupt smooth boundary.

Bkqzmz—41 to 48 inches; light gray (2.5Y 7/2) weakly lime- and silica-cemented duripan that crushes to fine sand, olive (5Y 5/3) moist; massive; common fine and medium distinct olive yellow (2.5Y 6/6) mottles; massive; extremely hard, extremely firm, nonsticky and nonplastic; strongly cemented discontinuous layers 0.25 to 0.50 inch thick; violently effervescent; strongly alkaline; clear smooth boundary.

Cg—48 to 60 inches; light gray (5Y 7/2) fine sand, olive (5Y 5/3) moist; massive; common fine and medium distinct olive yellow (2.5Y 6/6) mottles; massive; soft, very friable, nonsticky and nonplastic; strongly effervescent; very strongly alkaline.

Depth to the duripan is 40 to 60 inches. The particle-size control section is loamy fine sand or fine sand with 0 to 5 percent rock fragments. The sodium adsorption ratio is 15 to 35 throughout the profile. These soils are strongly saline in the upper 7 inches and moderately saline between depths of 7 and 60 inches. An apparent water table is present in January through May. The soils of the somewhat poorly drained phase are ponded in March and April.

The Akzn horizon has hue of 7.5YR, 10YR, or 2.5Y, value of 5 to 7 dry and 3 to 6 moist, and chroma of 1 to 3 dry or moist.

The Bkzn horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 1 to 4 dry or moist. It is loamy fine sand or fine sand.

The Bkgz horizon has hue of 2.5Y or 5Y, value of 6 to 8 dry and 5 to 7 moist, and chroma of 0 to 3 dry or moist.

The Bkqzmz horizon has hue of 2.5Y or 5Y, value of 6 to 8 dry and 5 or 6 moist, and chroma of 0 to 3 dry or moist. It is weakly cemented or strongly cemented. This horizon is absent in some pedons.

The Cg horizon has hue of 2.5Y or 5Y, value of 6 to 8 dry and 5 or 6 moist, and chroma of 0 to 3 dry or

moist. It is loamy fine sand or fine sand. This horizon is absent in some pedons.

## Growden Series

The Growden series consists of very deep, well drained soils on south-facing backslopes of mountains. These soils formed in residuum and colluvium derived from schist, quartzite, and granitic gneiss with a mantle of loess and volcanic ash. Slopes are 20 to 50 percent. Elevation is 5,500 to 6,500 feet. The average annual precipitation is 25 to 30 inches, the average annual air temperature is 39 to 41 degrees F, and the frost-free period is 80 to 100 days.

Typical pedon of Growden channery silt loam, 20 to 50 percent slopes, about 16 miles northwest of Inchelium; 300 feet west of the southeast corner of sec. 27, T. 34 N., R. 34 E., W.M.:

A1—0 to 4 inches; dark grayish brown (10YR 4/2) channery silt loam, very dark brown (10YR 2/2) moist; weak fine and medium granular structure; soft, friable, slightly sticky and slightly plastic; many very fine and fine roots and few medium and coarse roots; common fine irregular pores; 20 percent channers, 5 percent flagstones, and 1 percent stones; medium acid (NaF pH 11.0); clear wavy boundary.

A2—4 to 10 inches; brown (10YR 5/3) flaggy silt loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; many very fine and fine roots and few medium and coarse roots; common fine irregular pores; 15 percent channers, 10 percent flagstones, and 1 percent stones; medium acid (NaF pH 11.0); clear wavy boundary.

Bw1—10 to 16 inches; yellowish brown (10YR 5/4) very channery silt loam, brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium and coarse roots; common fine irregular pores; 30 percent channers and 15 percent flagstones; medium acid; clear wavy boundary.

Bw2—16 to 22 inches; light yellowish brown (10YR 6/4) very flaggy silt loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; common fine irregular pores; 30 percent channers and 20 percent flagstones; medium acid; clear wavy boundary,

C—22 to 60 inches; very pale brown (10YR 7/3)

extremely flaggy sandy loam, brown (10YR 5/3) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; 30 percent channers and 45 percent flagstones; medium acid.

The umbric epipedon is 8 to 18 inches thick. The solum is 20 to 40 inches thick. The particle-size control section is 8 to 16 percent clay and 35 to 80 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 30 percent channers and 0 to 15 percent flagstones.

The Bw horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam or loam with 25 to 45 percent channers and 5 to 25 percent flagstones. It is medium acid or slightly acid.

The C horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam or sandy loam with 25 to 45 percent channers and 15 to 45 percent flagstones. It is medium acid or slightly acid.

### Hadencreek Series

The Hadencreek series consists of very deep, moderately well drained soils on glacial lake terraces and basins. These soils formed in glacial lake sediment with a component of loess and volcanic ash. Slopes are 0 to 8 percent. Elevation is 1,700 to 3,600 feet. The average annual precipitation is 16 to 18 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 110 days.

Typical pedon of Hadencreek silt loam, 0 to 8 percent slopes, about 7 miles northeast of Disautel; 1,950 feet north and 1,750 feet west of the southeast corner of sec. 25, T. 34 N., R. 29 E., W.M.:

Ap—0 to 13 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and few fine roots; common very fine tubular pores; neutral; abrupt smooth boundary.

Bw1—13 to 18 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine roots; common very fine tubular pores; mildly alkaline; clear irregular boundary.

Bw2—18 to 32 inches; pale yellow (2.5Y 7/3) silt loam, light olive brown (2.5Y 5/3) moist; moderate fine angular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine roots; common very fine tubular pores; moderately alkaline; clear wavy boundary.

Bk1—32 to 40 inches; pale yellow (2.5Y 7/3) silty clay loam, light olive brown (2.5Y 5/3) moist; massive; hard, firm, sticky and plastic; few very fine roots; few very fine tubular pores; common fine secondary masses of lime in irregularly shaped seams; strongly effervescent; highly stratified; moderately alkaline; clear wavy boundary.

Bk2—40 to 60 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; massive; slightly hard, friable, sticky and plastic; few very fine tubular pores; common fine secondary masses of lime in irregularly shaped seams and filaments; slightly effervescent; highly stratified; mildly alkaline.

Depth to secondary carbonates is 20 to 36 inches. The particle-size control section is 18 to 27 percent clay and less than 15 percent fine sand or coarser. An apparent water table is present in January through May.

The Ap or A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 or 3 dry or moist. It is neutral or mildly alkaline.

The Bk horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is stratified very fine sandy loam to silty clay loam. It is mildly alkaline or moderately alkaline.

The C horizon, where present, has hue of 2.5Y, value of 6 to 8 dry and 4 to 6 moist, and chroma of 2 or 3 dry or moist. It is silt loam or silty clay loam and typically has thin strata of very fine sandy loam. It is mildly alkaline.

### Haley Series

The Haley series consists of very deep, well drained soils on outwash terraces and terrace escarpments. These soils formed in glacial outwash with a component of loess in the upper part. Slopes are 0 to 25 percent. Elevation is 1,500 to 2,600 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Haley fine sandy loam, 0 to 5

percent slopes, about 3 miles south of Nespelem; 2,000 feet north and 1,100 west of the southeast corner of sec. 1, T. 30 N., R. 30 E., W.M.:

A1—0 to 6 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; neutral; clear wavy boundary.

A2—6 to 12 inches; grayish brown (10YR 5/2) fine sandy loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; neutral; gradual wavy boundary.

Bw—12 to 24 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine roots; common fine irregular pores; neutral; clear wavy boundary.

BC—24 to 28 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common fine roots; few fine tubular pores; neutral; clear wavy boundary.

2C1—28 to 40 inches; brown (10YR 5/3) and pale brown (10YR 6/3) loamy sand, dark brown (10YR 3/3) and brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; few fine roots; few fine tubular pores; 5 percent pebbles; neutral; abrupt wavy boundary.

2C2—40 to 60 inches; multicolored sand; single grain; loose, nonsticky and nonplastic; 10 percent pebbles; neutral.

The mollic epipedon is 10 to 16 inches thick. Thickness of the solum and depth to the 2C horizon are 20 to 30 inches. The particle-size control section is 0 to 5 percent pebbles.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist.

The Bw and BC horizons have value of 4 to 6 dry and 3 to 5 moist, and they have chroma of 3 or 4 dry or moist. They are 0 to 5 percent pebbles.

The 2C horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is loamy fine sand, loamy sand, sand, or coarse sand that commonly becomes coarser as depth increases. The horizon is 0 to 15 percent pebbles. It is neutral or mildly alkaline.

## Hallcreek Series

The Hallcreek series consists of very deep, well drained soils on outwash terraces. These soils formed in glacial outwash with a mantle of volcanic ash and loess. Slopes are 0 to 10 percent. Elevation is 1,700 to 2,700 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Hallcreek loam, 0 to 10 percent slopes, about 7 miles west of Nespelem; 1,500 feet north and 800 feet west of the southeast corner of sec. 2, T. 31 N., R 29 E., W.M.:

Oi—1 inch to 0; needles, leaves, and twigs.

A—0 to 3 inches; brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; common fine tubular pores; 10 percent pebbles; neutral; clear wavy boundary.

Bw—3 to 11 inches; pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; common fine tubular pores; 10 percent pebbles; neutral; clear wavy boundary.

2BC—11 to 17 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, and coarse roots; common fine irregular pores; 20 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

2C—17 to 60 inches; light gray (10YR 7/2) extremely gravelly sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 50 percent pebbles and 20 percent cobbles; neutral.

The mantle of volcanic ash is 7 to 14 inches thick. Depth to the 2C horizon is 10 to 24 inches. The particle-size control section is 35 to 70 percent rock fragments.

The A horizon has chroma of 2 or 3 dry or moist. It is slightly acid or neutral.

The Bw horizon has chroma of 3 or 4 dry or moist. It is 5 to 15 percent pebbles. It is slightly acid or neutral.

The 2BC horizon has chroma of 3 or 4 dry or moist. It is sandy loam or coarse sandy loam with 20 to 40 percent pebbles and 5 to 10 percent cobbles. It is slightly acid or neutral.

The 2C horizon has value of 6 or 7 dry and 4 or 5 moist. It is sand or coarse sand with 35 to 60 percent pebbles, 20 to 30 percent cobbles, and 0 to 5 percent stones. It is medium acid to neutral.

## Haploxerolls

Haploxerolls consist of moderately deep to very deep, well drained and somewhat excessively drained soils on terrace escarpments. These soils formed in glacial outwash, glaciofluvial material, and glacial lake sediment. The parent material commonly has been mixed by colluvial action, and it is stratified in some areas. Slopes are 30 to 70 percent and mainly face north and east. Elevation is 1,200 to 2,600 feet. The average annual precipitation is 11 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Reference pedon of Haploxerolls, 30 to 70 percent slopes, about 11 miles southwest of Nespelem; 200 feet east and 2,600 feet south of the northwest corner of sec. 5, T. 30 N., R. 29 E., W.M.:

A1—0 to 3 inches; grayish brown (10YR 5/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; 20 percent rounded pebbles and 5 percent cobbles; neutral; clear wavy boundary.

A2—3 to 11 inches; brown (10YR 5/3) very gravelly sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; 35 percent rounded pebbles and 5 percent cobbles; neutral; clear wavy boundary.

AC—11 to 17 inches; pale brown (10YR 6/3) very gravelly loamy sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common fine irregular pores; 40 percent rounded pebbles and 5 percent cobbles; neutral; gradual wavy boundary.

C1—17 to 35 inches; light brownish gray (10YR 6/2) very gravelly sand, dark grayish brown (10YR 4/2) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 50 percent rounded pebbles and 2 percent cobbles; neutral; clear wavy boundary.

C2—35 to 60 inches; light gray (10YR 7/2) gravelly

sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 20 percent pebbles; mildly alkaline.

The mollic epipedon is 10 to 25 inches thick. Depth to bedrock is 20 to 80 inches. The particle-size control section is 5 to 30 percent clay and averages 10 to 60 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 10 to 50 percent pebbles, 0 to 15 percent cobbles, and 0 to 5 percent stones. It is neutral or mildly alkaline.

The C horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 or 3 dry or moist. It is loamy sand or sand with 10 to 50 percent pebbles, 0 to 20 percent cobbles, and 0 to 5 percent stones. It is neutral to moderately alkaline.

## Hartill Series

The Hartill series consists of moderately deep, well drained soils on backslopes and shoulders of mountains. These soils formed in residuum and colluvium derived from metamorphic rock with a mantle of volcanic ash. Slopes are 20 to 65 percent. Elevation is 2,300 to 4,800 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Hartill silt loam, dry, 20 to 40 percent slopes, about 15 miles southwest of Inchelium; 200 feet south and 1,400 feet west of the northeast corner of sec. 23, T. 31 N., R. 34 E., W.M.:

Oi—1 inch to 0; needles, twigs, and leaves.

A—0 to 6 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; 5 percent channers; slightly acid; clear wavy boundary.

Bw1—6 to 14 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; common fine irregular pores; 10 percent channers; slightly acid; abrupt wavy boundary.

2Bw2—14 to 30 inches; pale brown (10YR 6/3) very channery sandy loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, friable, slightly sticky and nonplastic; many very

fine and fine roots and common medium and coarse roots; common fine irregular pores; 40 percent channers and 15 percent flagstones; neutral; clear wavy boundary.

2C—30 to 39 inches; pale brown (10YR 6/3) extremely flaggy sandy loam, brown (10YR 5/3) moist; massive; soft, friable, slightly sticky and nonplastic; common very fine and fine roots and few medium roots; few fine tubular pores; 50 percent channers, 20 percent flagstones, and 5 percent stones; neutral; abrupt irregular boundary.

2R—39 to 43 inches; graywacke bedrock.

Depth to bedrock is 20 to 40 inches. The mantle of volcanic ash is 7 to 14 inches thick. The profile is slightly acid or neutral.

The A horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry and 2 to 4 moist. It is 5 to 15 percent channers.

The Bw1 horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 to 5 moist, and chroma of 3 or 4 dry and 2 to 4 moist. It is silt loam or loam with 5 to 15 percent channers.

The 2Bw2 horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is sandy loam or loam with 30 to 45 percent channers, 5 to 15 percent flagstones, and 0 to 5 percent stones.

The 2C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 5 or 6 moist, and chroma of 3 or 4 dry or moist. It is sandy loam or loam with 30 to 50 percent channers, 15 to 25 percent flagstones, and 0 to 5 percent stones.

## Hellgate Series

The Hellgate series consists of very deep, well drained soils on toeslopes of mountains and on fan terraces. These soils formed in colluvium, residuum, and valley fill derived from granitic rock with a minor component of loess and volcanic ash. Slopes are 3 to 20 percent. Elevation is 1,600 to 2,700 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Hellgate gravelly coarse sandy loam, 3 to 20 percent slopes, about 8 miles southwest of Keller; 800 feet south and 1,750 feet east of the northwest corner of sec. 1, T. 28 N., R. 32 E., W.M.:

Oi—3 inches to 0; needles, leaves, and twigs.

A—0 to 8 inches; grayish brown (10YR 5/2) gravelly

coarse sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, common fine, and few medium roots; common fine irregular pores; 25 percent fine pebbles; neutral; abrupt wavy boundary.

AB—8 to 12 inches; pale brown (10YR 6/3) gravelly coarse sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; common fine irregular pores; 20 percent fine pebbles; neutral; clear wavy boundary.

Bw—12 to 25 inches; very pale brown (10YR 7/3) gravelly coarse sandy loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots and few coarse roots; few fine tubular pores; 15 percent fine pebbles and 5 percent coarse pebbles; neutral; abrupt smooth boundary.

C1—25 to 36 inches; pale brown (10YR 6/3) very gravelly loamy coarse sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few fine and medium roots; few fine tubular pores; 25 percent fine pebbles, 15 percent coarse pebbles, and 5 percent cobbles; mildly alkaline; gradual wavy boundary.

C2—36 to 60 inches; multicolored very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; 30 percent fine pebbles and 10 percent coarse pebbles; neutral.

The mollic epipedon is 8 to 18 inches thick. Thickness of the solum is 22 to 36 inches. The particle-size control section is 5 to 12 percent clay and 15 to 35 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is gravelly loam or gravelly coarse sandy loam with 15 to 30 percent pebbles. It is slightly acid or neutral.

The AB horizon is absent in some pedons.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or coarse sandy loam with 10 to 35 percent pebbles and 0 to 5 percent cobbles. It is slightly acid or neutral.

The upper part of the C horizon has hue of 2.5Y or 10YR, value of 6 or 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist, and the lower part is multicolored. The horizon is coarse sandy loam, loamy coarse sand, or coarse sand with 25 to 50 percent pebbles and 0 to 5 percent cobbles. It is neutral or mildly alkaline.

## Henneway Series

The Henneway series consists of deep, well drained soils on toeslopes and footslopes of hills and mountains. These soils formed in residuum and colluvium derived from metasedimentary rock with a mantle of volcanic ash. Slopes are 0 to 40 percent. Elevation is 2,400 to 3,700 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature as 42 to 45 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Henneway silt loam, 20 to 40 percent slopes, about 10 miles northeast of Keller; 600 feet south and 950 feet west of the northeast corner of sec. 13, T. 31 N., R. 33 E., W.M.:

- Oi—3 inches to 0; twigs, needles, cones, and bark.
- A—0 to 3 inches; dark yellowish brown (10YR 4/4) silt loam, dark yellowish brown (10YR 3/4) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine, common fine and medium, and few coarse roots; common fine tubular pores; 5 percent channers; neutral; clear smooth boundary.
- Bw—3 to 10 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, and medium roots and few coarse roots; common fine tubular pores; 5 percent channers; neutral; clear wavy boundary.
- 2BE—10 to 15 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium roots; common fine irregular pores; 5 percent channers; neutral; clear smooth boundary.
- 2Bt/E—15 to 28 inches; 60 percent brown (10YR 5/3) silt loam (Bt part), dark brown (10YR 3/3) moist, and 40 percent pale brown (10YR 6/3) silt loam (E part), brown (10YR 4/3) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; few fine tubular pores; few faint clay films on faces of peds (B part); neutral; gradual smooth boundary.
- 2Bt1—28 to 41 inches; yellowish brown (10YR 5/4) silty clay loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; hard, firm, sticky and plastic; few very fine and fine roots; few fine tubular pores; common faint clay

films lining pores and on faces of peds; 10 percent channers; neutral; clear smooth boundary.

- 2Bt2—41 to 49 inches; light olive brown (2.5Y 5/4) channery silty clay loam, olive brown (2.5Y 4/4) moist; weak fine subangular blocky structure; hard, friable, slightly sticky and slightly plastic; few fine roots; few fine tubular pores; common faint clay films lining pores and on faces of peds; 15 percent channers; neutral; gradual smooth boundary.
- 2Bt3—49 to 51 inches; olive yellow (2.5Y 6/6) channery clay loam, light olive brown (2.5Y 5/6) moist; weak fine subangular blocky structure; hard, firm, sticky and plastic; few fine roots; few fine tubular pores; common faint clay films lining pores and on faces of peds; 30 percent channers; neutral; abrupt smooth boundary.
- 2BCt—51 to 59 inches; light olive brown (2.5Y 5/4) channery silt loam, olive brown (2.5Y 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; few fine roots; few fine tubular pores; few faint clay films lining pores; 30 percent channers; neutral; gradual smooth boundary.
- 2R—59 to 63 inches; phyllite bedrock.

Depth to bedrock is 40 to 60 inches. The mantle of volcanic ash is 7 to 14 inches thick. The particle-size control section is 18 to 35 percent clay and 5 to 35 percent hard channers and pebbles. It is neutral or slightly acid throughout.

The A horizon has value of 4 to 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is 0 to 10 percent channers.

The Bw horizon has value of 5 or 6 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is 0 to 10 percent channers.

The 2BE horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 1 to 3 dry or moist. It is 0 to 10 percent channers and 0 to 15 percent soft weathered channers.

The Bt part of the 2Bt/E horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry, and chroma of 2 or 3 dry or moist. The E part has hue of 10YR or 2.5Y, value of 5 or 6 dry, and chroma of 2 to 4 dry or moist. The horizon is silt loam or loam with 0 to 10 percent channers and 10 to 20 percent soft weathered channers.

The 2Bt horizon has hue of 10YR or 2.5Y, value of 4 to 6 dry and 3 to 5 moist, and chroma of 2 to 6 dry or moist. It is silt loam, silty clay loam, loam, or clay loam with 0 to 35 percent channers and 5 to 20 percent soft weathered channers.

The 2BCt horizon has hue of 2.5Y or 10YR, value of 5 or 6 dry and 4 or 5 moist, and chroma of 2 to 4 dry

or moist. It is silt loam or loam with 15 to 35 percent channers and 10 to 20 percent soft weathered channers.

## Heytou Series

The Heytou series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on backslopes of glaciated hills. They formed in glacial till derived from basalt with an admixture of loess. Slopes are 25 to 65 percent. Elevation is 1,200 to 2,000 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Heytou stony loam in an area of Heytou-Stubblefield stony loams complex, 25 to 65 percent slopes, about 4 miles northeast of Bridgeport; 2,600 feet east and 1,900 feet north of the southwest corner of sec. 32, T. 30 N., R. 26 E., W.M.:

- A1—0 to 4 inches; gray (10YR 5/1) stony loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine interstitial pores; 15 percent pebbles, 5 percent cobbles, and 3 percent stones; mildly alkaline; gradual wavy boundary.
- A2—4 to 16 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; few fine interstitial pores; 25 percent pebbles and 5 percent cobbles; mildly alkaline; clear wavy boundary.
- Bw—16 to 30 inches; grayish brown (10YR 5/2) very cobbly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; common fine and medium interstitial pores; 20 percent pebbles, 15 percent cobbles, and 5 percent stones; mildly alkaline; clear wavy boundary.
- 2Bkd1—30 to 40 inches; light brownish gray (10YR 6/2) dense glacial till that crushes to very cobbly loam, dark grayish brown (10YR 4/2) moist; massive; hard, friable, nonsticky and nonplastic; very few very fine and fine roots; common fine and medium interstitial pores; slightly effervescent; 20 percent pebbles, 25 percent cobbles, and 5 percent stones; moderately alkaline; gradual wavy boundary.
- 2Bkd2—40 to 60 inches; gray (10YR 6/1) dense glacial till that crushes to very gravelly loam, dark yellowish brown (10YR 4/2) moist; massive; hard, friable, nonsticky and nonplastic; common fine

and medium interstitial pores; slightly effervescent; 25 percent pebbles, 15 percent cobbles, and 5 percent stones; moderately alkaline.

Depth to dense glacial till is 20 to 40 inches. The mollic epipedon is 10 to 17 inches thick. Depth to secondary carbonates is 20 to 36 inches. The particle-size control section is 35 to 55 percent rock fragments.

The A horizon has value of 4 or 5 dry and chroma of 1 or 2 dry. It is 10 to 25 percent pebbles, 2 to 5 percent cobbles, and 0 to 5 percent stones. It is neutral or mildly alkaline.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry and 2 or 3 moist. It is sandy loam or loam with 25 to 45 percent pebbles, 10 to 20 percent cobbles, and 0 to 5 percent stones.

The 2Bkd horizon has hue of 10YR or 2.5Y, value of 3 or 4 moist, and chroma of 2 to 4 dry and 2 or 3 moist. It is sandy loam or loam with 0 to 5 percent stones, 15 to 25 percent cobbles, and 25 to 45 percent pebbles. It is mildly alkaline or moderately alkaline.

## Histosols

Histosols consist of very deep, very poorly drained soils in backswamps of flood plains and in depressions surrounding lakes and ponds. These soils formed in decomposed organic matter overlying alluvial material that commonly contains a large component of volcanic ash. Slopes are 0 to 1 percent. Elevation is 1,500 to 4,000 feet. The average annual precipitation is 10 to 25 inches, the average annual air temperature is 41 to 47 degrees F, and the frost-free period is 80 to 150 days.

Reference pedon of Histosols, ponded, about 6 miles northeast of Nespelem; 800 feet north and 800 feet west of the southeast corner of sec. 2, T. 31 N., R. 31 E., W.M.:

- Oe—0 to 4 inches; mucky peat that is black (10YR 2/1) moist and very dark gray (10YR 3/1) dry; about 35 percent fiber, 20 percent rubbed; moderate fine granular structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common fine vesicular pores; common fine irregular pores; slightly acid; clear smooth boundary.
- Oa—4 to 20 inches; muck that is black (10YR 2/1) moist and very dark gray (10YR 3/1) dry; about 20 percent fiber, 5 percent rubbed; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots;

common fine irregular pores; slightly acid; gradual smooth boundary.

2C—20 to 32 inches; silt loam that is very dark brown (10YR 2/2) moist and very dark grayish brown (10YR 3/2) dry; massive; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium roots; few fine tubular pores; neutral; clear smooth boundary.

2Cg—32 to 60 inches; silt loam that is gray (10YR 6/1) moist and light gray (10YR 7/1) dry; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; neutral.

An apparent water table is present throughout the year. These soils are ponded in November through August. The organic material is 16 to 60 inches thick or more. The control section is sapric, hemic, or fibric material and is 15 to 70 percent fiber, of which 5 to 50 percent is rubbed.

The O horizons have hue of 5YR, 7.5YR, or 10YR, value of 3 or 4 dry and 2 or 3 moist, and chroma of 0 to 2 dry or moist. They are medium acid or slightly acid.

The 2C and 2Cg horizons, where present, have hue of 10YR, 2.5Y, or 5Y, value of 3 to 5 dry and 2 to 5 moist, and chroma of 1 or 2 dry or moist. They are silt loam, fine sandy loam, sand, loam, or clay loam with 0 to 50 percent pebbles and 0 to 5 percent cobbles. The horizons are slightly acid or neutral.

## Hobohill Series

The Hobohill series consists of very deep, somewhat excessively drained soils on fan terraces, old alluvial fans, and terrace escarpments. These soils formed in glacial outwash and alluvium. Slopes are 3 to 70 percent. Elevation is 1,400 to 2,500 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Hobohill sandy loam, 40 to 70 percent slopes, about 5 miles southeast of Nespelem; 1,000 feet north and 1,000 feet west of the southeast corner of sec. 10, T. 30 N., R. 31 E., W.M.:

A1—0 to 3 inches; dark grayish brown (10YR 4/2) sandy loam, black (10YR 2/1) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; 10 percent pebbles; neutral; clear wavy boundary.

A2—3 to 18 inches; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common

very fine and fine roots; common fine irregular pores; 10 percent pebbles; neutral; clear smooth boundary.

C1—18 to 30 inches; pale brown (10YR 6/3) gravelly loamy sand, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 15 percent pebbles; neutral; gradual smooth boundary.

C2—30 to 60 inches; light gray (2.5Y 7/2) gravelly sand, grayish brown (2.5Y 5/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 25 percent pebbles; neutral.

The mollic epipedon is 10 to 20 inches thick. The particle-size control section is 10 to 30 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 moist. It is sandy loam or stony sandy loam. The upper part is 0 to 10 percent pebbles, 0 to 5 percent cobbles, and 0 to 5 percent stones, and the lower part is 10 to 25 percent pebbles.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 5 or 6 moist, and chroma of 2 or 3 dry or moist. The upper part is sand, loamy sand, or loamy coarse sand with 10 to 25 percent pebbles and 0 to 10 percent cobbles. The lower part is loamy coarse sand, coarse sand, or sand with 15 to 40 percent pebbles and 0 to 5 percent cobbles.

## Hodgson Series

The Hodgson series consists of very deep, moderately well drained soils on terraces and terrace escarpments. These soils formed in glacial lake sediment with a component of loess and volcanic ash. Some areas formed in landslide or mudflow deposits. Slopes are 0 to 50 percent. Elevation is 1,300 to 2,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 120 days.

Typical pedon of Hodgson silt loam, 0 to 5 percent slopes, about 2.5 miles southeast of Inchelium; 1,600 feet north and 20 feet east of the southwest corner of sec. 17, T. 32 N., R. 37 E., W.M.:

Oi—2 inches to 0; needles, twigs, and leaves.

A—0 to 3 inches; light brownish gray (2.5Y 6/2) silt loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots and common medium roots;

common fine irregular pores; slightly acid; clear wavy boundary.

B/E—3 to 7 inches; light brownish gray (2.5Y 6/2) silty clay loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; slightly hard, friable, sticky and plastic; common very fine roots and few medium and coarse roots; common fine irregular pores; neutral; clear wavy boundary.

Bt1—7 to 17 inches; light gray (2.5Y 7/2) silty clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; hard, firm, sticky and plastic; common very fine and fine roots; common fine irregular pores; few faint clay films on faces of peds and in pores; neutral; clear wavy boundary.

Bt2—17 to 28 inches; light gray (2.5Y 7/2) silty clay loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; hard, firm, sticky and plastic; few very fine and fine roots; common fine irregular pores; common distinct clay films on faces of peds and in pores; neutral; abrupt wavy boundary.

Bt3—28 to 47 inches; light gray (2.5Y 7/2) silty clay, grayish brown (2.5Y 5/2) moist; massive; hard, firm, sticky and plastic; few very fine and fine roots; common fine irregular pores; few distinct clay films on faces of varves and in pores; consolidated platy lake sediment; neutral; clear wavy boundary.

Bk—47 to 60 inches; light gray (2.5Y 7/2) silty clay, light brownish gray (2.5Y 6/2) moist; massive; hard, firm, sticky and plastic; few fine roots; common fine irregular pores; few very fine soft masses of lime; slightly effervescent; consolidated platy lake sediment; mildly alkaline.

The argillic horizon averages 35 to 45 percent clay. An apparent water table is present in January through May.

The A horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 or 3 dry or moist. It is slightly acid or neutral.

The B/E horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist.

The Bt horizon has hue of 10YR, 2.5Y, or 5Y, value of 6 to 8 dry and 3 to 6 moist, and chroma of 2 to 4 dry or moist. It is silty clay, silty clay loam, or clay loam. It is neutral or mildly alkaline.

The Bk horizon has hue of 10YR, 2.5Y or 5Y, value of 6 to 8 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is silty clay, silty clay loam, or silt loam. It is mildly alkaline or moderately alkaline.

## Hudnut Series

The Hudnut series consists of very deep, well drained soils on till plains, outwash terraces, and escarpments. These soils formed in granitic ablation till and glacial outwash. Slopes are 0 to 40 percent. Elevation is 1,800 to 2,700 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Hudnut gravelly sandy loam, 0 to 20 percent slopes, about 6 miles northeast of Nespelem; 1,700 feet south and 2,200 feet east of the northwest corner of sec. 4, T. 31 N., R. 30 E., W.M.:

Oi—1.5 inches to 0; pine needles, twigs, bark, and cones.

A—0 to 2 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few medium roots; common fine irregular pores; 15 percent pebbles; neutral; clear wavy boundary.

Bw—2 to 17 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, medium, and coarse roots; common fine irregular pores; 20 percent pebbles; neutral; clear wavy boundary.

C1—17 to 50 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and common fine and medium roots; few fine tubular pores; 20 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

C2—50 to 60 inches; pale brown (10YR 6/3) very gravelly loamy sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 30 percent pebbles and 10 percent cobbles; neutral.

The solum is 15 to 32 inches thick. The particle-size control section is 4 to 12 percent clay and 15 to 35 percent rock fragments. Depth to the C2 horizon is 40 to 60 inches or more. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 20 percent pebbles and 0 to 5 percent cobbles.

The Bw horizon is 15 to 25 percent pebbles and 0 to 10 percent cobbles.

The C1 horizon has value of 6 to 8 dry and 4 to 6

moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 25 percent pebbles and 0 to 10 percent cobbles.

The C2 horizon has value of 6 to 8 dry and 4 to 6 moist, and it has chroma of 2 or 3 dry or moist. It is loamy sand or sand with 15 to 40 percent pebbles and 0 to 25 percent cobbles. This horizon is absent in some pedons.

## Hunters Series

The Hunters series consists of very deep, well drained soils on terraces. These soils formed in glacial lake sediment with a component of loess and volcanic ash. Slopes are 0 to 65 percent. Elevation is 1,300 to 2,000 feet. The average annual precipitation is 15 to 19 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Hunters silt loam, 0 to 5 percent slopes, about 10 miles north of Inchelium; 1,100 feet south and 3,200 feet east of the northwest corner of sec. 14, T. 34 N., R. 36 E., W.M.:

Oi—1.5 inches to 0; needles, twigs, and cones.

A—0 to 10 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium roots; common fine irregular pores; slightly acid; clear smooth boundary.

Bw1—10 to 15 inches; light brownish gray (2.5Y 6/2) silt loam, olive brown (2.5Y 4/4) moist; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium roots; common fine irregular pores; neutral; clear smooth boundary.

Bw2—15 to 28 inches; light brownish gray (2.5Y 6/2) silt loam, olive brown (2.5Y 4/4) moist; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; few fine and medium roots; common fine irregular pores; neutral; clear wavy boundary.

Bk1—28 to 46 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few fine filaments of segregated lime; strongly effervescent; moderately alkaline; clear wavy boundary.

Bk2—46 to 60 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; common fine filaments of segregated lime; strongly effervescent; moderately alkaline.

The mollic epipedon is 10 to 20 inches thick. Depth to secondary carbonates is 20 to 34 inches. The particle-size control section is 18 to 27 percent clay.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is slightly acid or neutral.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is 0 to 5 percent pebbles. It is neutral or mildly alkaline.

The Bk horizon has hue of 2.5Y or 10YR, value of 6 to 8 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is 0 to 5 percent pebbles. It is mildly alkaline or moderately alkaline.

The C horizon, where present, has hue of 5Y, 2.5Y or 10YR, value of 6 to 8 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is 0 to 5 percent pebbles. It is mildly alkaline or moderately alkaline.

## Inchelium Series

The Inchelium series consists of very deep, moderately well drained soils on terraces adjacent to uplands. These soils formed in loess and glaciofluvial material over glacial lake sediment. Slopes are 0 to 10 percent. Elevation is 1,300 to 2,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Inchelium silt loam, 0 to 5 percent slopes, about 4 miles north of Inchelium; 2,350 feet south and 1,600 feet west of the northeast corner of sec. 13, T. 33 N., R. 36 E., W.M.:

A1—0 to 13 inches; very dark grayish brown (10YR 3/2) silt loam, black (10YR 2/1) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; neutral; diffuse smooth boundary.

A2—13 to 27 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common fine irregular pores; neutral; gradual smooth boundary.

AB—27 to 42 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine roots; common fine irregular pores; mildly alkaline; gradual smooth boundary.

Bw—42 to 51 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable,

slightly sticky and slightly plastic; few very fine roots; few fine tubular pores; mildly alkaline; abrupt smooth boundary.

2Bk—51 to 60 inches; light gray (2.5Y 7/2) silt loam, light brownish gray (2.5Y 6/2) moist; massive; hard, firm, slightly sticky and slightly plastic; common fine soft segregated lime in pores; strongly effervescent; moderately alkaline.

The mollic epipedon is 20 to 42 inches thick. Depth to the 2Bk horizon is 50 to 60 inches or more. The particle-size control section is 10 to 18 percent clay. An apparent water table is present in January through June.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist.

The AB horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam or very fine sandy loam.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 4 of 5 moist, and chroma of 2 or 3 dry or moist. It is silt loam or very fine sandy loam. It is neutral or mildly alkaline.

The 2Bk horizon has hue of 2.5Y or 5Y, value of 6 or 7 dry and 5 or 6 moist, and chroma of 2 or 3 moist or dry. It is silt loam or silty clay loam. It is slightly effervescent or strongly effervescent. It is mildly alkaline or moderately alkaline.

## Inkler Series

The Inkler series consists of very deep, well drained soils on backslopes, footslopes, and toeslopes of hills and mountains. These soils formed in glacial till and colluvium derived from volcanic and metamorphic rock with an admixture of volcanic ash and loess. Slopes are 5 to 65 percent. Elevation is 2,000 to 4,200 feet. The average annual precipitation is 16 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Inkler gravelly silt loam, dry, 40 to 65 percent slopes, about 22 miles northeast of Nespelem; 1,300 feet south and 2,600 feet west of the northeast corner of sec. 6, T. 34 N., R. 32 E., W.M.:

Oi—2 inches to 0; needles, twigs, and leaves.

A—0 to 3 inches; grayish brown (10YR 5/2) gravelly silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium and coarse roots; few very fine irregular pores; 15 percent pebbles; slightly acid; clear wavy boundary.

Bw1—3 to 9 inches; light brownish gray (10YR 6/2) gravelly silt loam, dark grayish brown (10YR 4/2)

moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few coarse roots; common very fine irregular pores; 15 percent pebbles; slightly acid; clear wavy boundary.

2Bw2—9 to 18 inches; pale brown (10YR 6/3) gravelly loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure, slightly hard, friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common very fine irregular pores; 25 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

2C1—18 to 31 inches; light brownish gray (2.5Y 6/2) very gravelly loam, dark grayish brown (2.5Y 4/2) moist; massive; slightly hard, very friable, slightly sticky and slightly plastic; few fine and medium roots; common very fine irregular pores; 40 percent pebbles and 15 percent cobbles; neutral; clear wavy boundary.

2C2—31 to 60 inches; light brownish gray (2.5Y 6/2) very gravelly sandy loam, dark grayish brown (2.5Y 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few fine and medium roots; few very fine irregular pores; 40 percent pebbles and 10 percent cobbles; neutral.

The mantle of volcanic ash is 7 to 14 inches thick, but there may be a component of volcanic ash in the lower part of the solum. The solum is 12 to 29 inches thick. The particle-size control section is 7 to 14 percent clay and 35 to 60 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 to 3 moist. It is 15 to 35 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is silt loam, loam, or sandy loam with 10 to 25 percent pebbles and 0 to 10 percent cobbles.

The 2Bw horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 20 to 40 percent pebbles, 0 to 20 percent cobbles, and 0 to 5 percent stones. This horizon is absent in some pedons.

The 2C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 20 to 45 percent pebbles, 5 to 30 percent cobbles, and 0 to 5 percent stones.

## Jimcreek Series

The Jimcreek series consists of very deep, somewhat poorly drained soils in depressions on

terraces and lake plains. These soils formed in glacial lake sediment and recent alluvium mixed with volcanic ash. Slopes are 0 to 5 percent. Elevation is 1,600 to 3,100 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Jimcreek silt loam, 0 to 5 percent slopes, about 3 miles southeast of Disautel; 1,400 feet north and 700 feet west of the southeast corner of sec. 28, T. 33 N., R. 29 E., W.M.:

Oi—1 inch to 0; leaves, needles, twigs, and branches.

A1—0 to 4 inches; dark gray (10YR 4/1) silt loam, black (10YR 2/1) moist; moderate fine granular structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots; common fine irregular pores; neutral; clear wavy boundary.

A2—4 to 19 inches; gray (10YR 5/1) silt loam, very dark gray (10YR 3/1) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine, fine, medium, and coarse roots; common fine irregular pores; neutral; clear wavy boundary.

2Btg1—19 to 36 inches; light gray (2.5Y 7/2) silty clay loam, grayish brown (2.5Y 5/2) moist; few fine faint light brownish gray (2.5Y 6/2) mottles; moderate medium angular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine and fine roots and few medium roots; few fine tubular pores; many faint clay films on faces of peds and lining pores; 2 percent fine pebbles; neutral; clear wavy boundary.

2Btg2—36 to 46 inches; light gray (2.5Y 7/2) silty clay loam, grayish brown (2.5Y 5/2) moist; common fine distinct light yellowish brown (2.5Y 6/4) mottles, light olive brown (2.5Y 5/4) moist; moderate medium angular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine and fine roots; few fine tubular pores; many distinct clay films on faces of peds and lining pores; 2 percent pebbles; neutral; clear wavy boundary.

2Btg3—46 to 60 inches; light gray (5Y 7/2) silty clay loam, grayish brown (2.5Y 5/2) moist; common medium prominent pale brown (10YR 6/3) mottles, brown (10YR 4/3) moist, and common medium distinct gray (5Y 6/1) mottles, dark gray (5Y 4/1) moist; moderate medium angular blocky structure; very hard, firm, sticky and plastic; many distinct clay films on faces of peds and lining pores; 3 percent pebbles; neutral.

The mollic epipedon is 16 to 20 inches thick. The particle-size control section is 25 to 35 percent clay, less than 15 percent fine sand or coarser, and 0 to 3 percent rock fragments. An apparent water table is present in December through July.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist.

The 2Btg1 and 2Btg2 horizons have hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. They are silt loam or silty clay loam.

The 2Btg3 horizon has hue of 2.5Y or 5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 1 to 3 dry or moist. It is silty clay loam or silty clay.

### Johntom Series

The Johntom series consists of shallow, well drained soils on ridges, shoulders, and upper backslopes of hills and mountains. These soils formed in colluvium and residuum derived from rhyodacite and quartz latite with a component of loess and volcanic ash. Slopes are 8 to 65 percent. Elevation is 1,600 to 3,500 feet. The average annual precipitation is 14 to 20 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Johntom stony loam in an area of Northstar-Johntom-Rock outcrop complex, 8 to 30 percent slopes, about 6 miles north of Nespelem; 1,700 feet east and 600 feet north of the southwest corner of sec. 19, T. 32 N., R. 31 E., W.M.:

A—0 to 4 inches; dark brown (10YR 4/3) stony loam, very dark brown (10YR 2/2) moist; moderate fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots; common fine irregular pores; 20 percent angular pebbles, 5 percent cobbles, and 5 percent stones; slightly acid; clear wavy boundary.

AC—4 to 11 inches; brown (10YR 5/3) very gravelly sandy loam, dark brown (10YR 3/3) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots; common fine irregular pores; 45 percent angular pebbles and 20 percent cobbles; slightly acid; clear wavy boundary.

C—11 to 16 inches; pale brown (10YR 6/3) extremely gravelly coarse sandy loam, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common fine irregular pores; 60 percent angular

pebbles and 10 percent cobbles; slightly acid; abrupt wavy boundary.

R—16 to 20 inches; rhyodacite bedrock.

Depth to bedrock is 10 to 20 inches. The particle-size control section is 5 to 15 percent clay and 45 to 70 percent rock fragments. It is neutral or slightly acid.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 35 percent pebbles, 5 to 20 percent cobbles, and 0 to 10 percent stones.

The AC horizon is loam or sandy loam with 30 to 55 percent pebbles and 5 to 20 percent cobbles.

The C horizon has chroma of 2 or 3 dry or moist. It is sandy loam or coarse sandy loam with 45 to 65 percent pebbles and 5 to 20 percent cobbles.

### Karamin Series

The Karamin series consists of very deep, well drained soils on terraces, terrace escarpments, and mountainsides. These soils formed in sandy glacial outwash. Slopes are 0 to 65 percent. Elevation is 2,700 to 4,500 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Karamin fine sandy loam, 0 to 20 percent slopes, about 5 miles southeast of Disautel; 600 feet west and 400 feet north of the southeast corner of sec. 34, T. 33 N., R. 29 E., W.M.:

Oi—2 inches to 1 inch; needles, leaves, and twigs.

Oe—1 inch to 0; partially decomposed forest litter.

A—0 to 6 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots; common fine irregular pores; slightly acid; clear wavy boundary.

Bw—6 to 18 inches; light yellowish brown (10YR 6/4) fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots; common fine tubular pores; slightly acid; clear wavy boundary.

C1—18 to 28 inches; light gray (10YR 7/2) loamy fine sand, grayish brown (10YR 5/2) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; common fine tubular pores; slightly acid; gradual smooth boundary.

C2—28 to 43 inches; light gray (10YR 7/2) loamy sand, grayish brown (10YR 5/2) moist; massive; soft, very friable, nonsticky and nonplastic; few fine and medium roots; common fine tubular pores; neutral; gradual smooth boundary.

C3—43 to 60 inches; light gray (2.5Y 7/2) loamy sand, grayish brown (2.5Y 5/2) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; neutral.

Thickness of the solum and depth to the C horizon are 14 to 23 inches. The particle-size control section is 1 to 5 percent clay and 0 to 10 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 5 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is fine sandy loam, sandy loam, or loam with 0 to 5 percent pebbles.

The C horizon has hue of 10YR or 2.5Y, value of 6 to 8 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loamy fine sand, loamy sand, fine sand, or sand with 0 to 10 percent pebbles and 0 to 5 percent cobbles.

### Kartar Series

The Kartar series consists of very deep, well drained soils on terraces and till plains. These soils formed in glacial outwash and reworked glacial till. Slopes are 0 to 10 percent. Elevation is 2,000 to 3,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Kartar sandy loam, warm, 0 to 10 percent slopes, about 6 miles northwest of Nespelem; 2,100 feet north and 1,000 feet east of the southwest corner of sec. 7, T. 31 N., R. 30 E., W.M.:

Oi—1 inch to 0; needles and twigs.

A—0 to 6 inches; pale brown (10YR 6/3) sandy loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; common fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

Bw—6 to 18 inches; pale brown (10YR 6/3) sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable,

nonsticky and nonplastic; few very fine and fine roots; common fine irregular pores; 5 percent pebbles; neutral; abrupt wavy boundary.

BC—18 to 22 inches; very pale brown (10YR 7/3) gravelly sandy loam, brown (10YR 4/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; few fine roots; common fine tubular pores; 15 percent pebbles; neutral; clear wavy boundary.

C1—22 to 42 inches; very pale brown (10YR 7/3) gravelly sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few fine roots; few fine tubular pores; 25 percent pebbles; neutral; gradual wavy boundary.

C2—42 to 60 inches; light gray (10YR 7/2) fine sand, grayish brown (2.5Y 5/2) moist; single grain; loose, nonsticky and nonplastic; few fine roots; few fine tubular pores; 5 percent pebbles; neutral.

Depth to the C horizon is 20 to 30 inches. The particle-size control section is 15 to 35 percent rock fragments.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is 5 to 10 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or fine sandy loam with 5 to 25 percent pebbles and 0 to 5 percent cobbles.

The BC horizon has value of 6 or 7 dry and 3 or 4 moist. It is sandy loam or fine sandy loam with 5 to 25 percent pebbles and 0 to 5 percent cobbles. This horizon is absent in some pedons.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 5 or 6 moist, and chroma of 2 or 3 moist or dry. It is loamy sand, sand, fine sand, or coarse sand with 5 to 30 percent pebbles and 0 to 15 percent cobbles.

## Kellerbutte Series

The Kellerbutte series consists of very deep, well drained soils on dominantly north-facing backslopes and footslopes of mountains. These soils formed in volcanic ash over colluvium derived from granitic rock and rhyodacite. Slopes are 20 to 65 percent. Elevation is 2,500 to 5,000 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Kellerbutte silt loam, 20 to 40 percent slopes, about 15 miles west of Inchelium; 1,800 feet north and 2,450 feet west of the southeast corner of sec. 33, T. 33 N., R. 34 E., W.M.:

Oi—1 inch to 0; needles, leaves, and twigs.

A—0 to 5 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine and medium granular structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots; common fine irregular pores; 10 percent angular pebbles and 2 percent cobbles; slightly acid; gradual wavy boundary.

Bw1—5 to 12 inches; pale brown (10YR 6/3) gravelly silt loam, dark yellowish brown (10YR 3/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; common fine irregular pores; 15 percent angular pebbles and 5 percent cobbles; slightly acid; clear wavy boundary.

Bw2—12 to 17 inches; light yellowish brown (10YR 6/4) gravelly silt loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots; few fine tubular pores; 15 percent angular pebbles and 5 percent cobbles; slightly acid; clear wavy boundary.

2C1—17 to 30 inches; light gray (10YR 7/2) very gravelly coarse sandy loam, brown (10YR 5/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 40 percent angular pebbles and 10 percent cobbles; slightly acid; clear wavy boundary.

2C2—30 to 60 inches; light gray (10YR 7/2) very gravelly coarse sandy loam, brown (10YR 5/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 45 percent angular pebbles and 5 percent cobbles; slightly acid.

Thickness of the mantle of volcanic ash and depth to the 2C horizon are 15 to 26 inches. The upper part of the particle-size control section is 5 to 25 percent angular rock fragments, and the lower part is 35 to 60 percent angular rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 15 percent pebbles.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 to 7 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is loam or silt loam with 5 to 25 percent pebbles and 0 to 10 percent cobbles.

The 2C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 6 moist, and chroma of 2 to 4 dry and 3 to 6 moist. It is loam, sandy loam, or coarse

sandy loam with 30 to 50 percent pebbles, 5 to 25 percent cobbles, and 0 to 10 percent stones.

### Kenotrail Series

The Kenotrail series consists of moderately deep, well drained soils on ridges and shoulders of hills and mountains. These soils formed in residuum derived from serpentine, greenstone, and talc with an admixture of volcanic ash and loess. Slopes are 20 to 40 percent. Elevation is 3,200 to 3,800 feet. The average annual precipitation is 18 to 22 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Kenotrail silt loam, 20 to 40 percent slopes, about 13 miles northeast of Keller; 950 feet north and 300 feet east of the southwest corner of sec. 25, T. 32 N., R. 33 E., W.M.:

Oi—2 inches to 0; needles, cones, bark, and twigs.

A—0 to 4 inches; brown (10YR 5/3) silt loam, dark brown (7.5YR 3/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; common fine irregular pores; 10 percent pebbles; neutral; clear smooth boundary.

BA—4 to 9 inches; light brown (7.5YR 6/4) silt loam, strong brown (7.5YR 4/6) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots and few medium roots; common fine irregular pores; 10 percent pebbles; slightly acid; clear wavy boundary.

Bt1—9 to 19 inches; reddish yellow (7.5YR 6/6) gravelly silty clay loam, strong brown (7.5YR 4/6) moist; moderate fine subangular blocky structure; hard, firm, sticky and plastic; few faint clay films on faces of peds and in pores; common very fine and fine roots and few medium roots; few fine tubular pores; 15 percent pebbles; neutral; clear smooth boundary.

Bt2—19 to 32 inches; reddish yellow (7.5YR 6/6) gravelly silty clay loam, strong brown (7.5YR 5/6) moist; moderate fine subangular blocky structure; hard, firm, sticky and plastic; few faint clay films on faces of peds and in pores; common fine and few very fine roots; few fine tubular pores; 30 percent pebbles and 20 percent soft, weathered, pebble-sized talc fragments; neutral; abrupt smooth boundary.

Cr—32 to 42 inches; weathered talc bedrock.

Depth to weathered bedrock is 20 to 40 inches. The

particle-size control section is 18 to 35 percent clay and 15 to 35 percent pebbles. The profile is slightly acid or neutral.

The A horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 to 5 moist, and chroma of 3 to 5 dry or moist. It is 5 to 15 percent pebbles.

The Bt horizon has hue of 7.5YR or 5YR, value of 6 or 7 dry and 4 or 5 moist, and chroma of 4 to 6 dry or moist. It is silty clay loam, loam, or clay loam with 15 to 35 percent pebbles and 15 to 30 percent soft, weathered, pebble-sized talc fragments.

### Kewach Series

The Kewach series consists of very deep, moderately well drained soils on terraces and terrace escarpments. These soils formed in glacial lake sediment with a thin mantle of volcanic ash and loess. Slopes are 0 to 50 percent. Elevation is 1,300 to 2,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 43 to 45 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Kewach silt loam, 0 to 5 percent slopes, about 10 miles east of Keller; 1,550 feet south and 1,000 feet west of the northeast corner of sec. 32, T. 30 N., R. 35 E., W.M.:

Oi—2 inches to 0; twigs and bark.

A—0 to 4 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 3/3) moist; moderate very fine and fine subangular blocky structure; soft, friable, slightly sticky and nonplastic; many very fine roots and common fine and medium roots; common fine tubular pores; neutral; clear smooth boundary.

E—4 to 10 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 4/3) moist; moderate fine angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots and few coarse roots; common fine tubular pores; neutral; abrupt wavy boundary.

B/E—10 to 16 inches; very pale brown (10YR 7/3) silt loam (B part), yellowish brown (10YR 5/4) moist, and light gray (10YR 7/2) silt loam (E part), pale brown (10YR 6/3) moist; moderate coarse angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine roots, common fine roots, and few medium roots; common fine irregular pores; neutral; clear wavy boundary.

Bt/E—16 to 29 inches; pale yellow (2.5Y 7/4) silt loam (B part), light gray (2.5Y 7/2) silt loam (E part), light olive brown (2.5Y 5/4) moist (B and E parts); moderate coarse angular blocky structure; hard,

friable, sticky and plastic; many very fine roots and few fine and medium roots; common fine irregular pores; few faint clay films on faces of peds; neutral; gradual wavy boundary.

Bt—29 to 36 inches; brownish yellow (10YR 6/6) silty clay loam, dark yellowish brown (10YR 4/4) moist; moderate thick platy structure; very hard, firm, sticky and plastic; common very fine and fine roots and few medium and coarse roots; common fine irregular pores; common faint clay films on faces of peds; neutral; abrupt wavy boundary.

Btk—36 to 42 inches; light yellowish brown (2.5Y 6/4) silty clay loam, light olive brown (2.5Y 5/4) moist; moderate coarse angular blocky structure; finely laminated; very hard, very firm, sticky and plastic; few fine roots; common fine irregular pores; many faint clay films on faces of peds; few very fine soft masses of lime; slightly effervescent; neutral; clear smooth boundary.

Bk—42 to 60 inches; light gray (5Y 7/2) silty clay loam, olive (5Y 5/4) moist; laminated; hard, friable, sticky and plastic; few fine roots; common fine irregular pores; few very fine soft masses of lime; slightly effervescent; mildly alkaline.

The argillic horizon is 35 to 45 percent clay. An apparent water table is present in December through June.

The A horizon has value 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is slightly acid or neutral.

The E horizon has value of 6 or 7 dry and chroma of 2 or 3 dry or moist. It is slightly acid or neutral. This horizon is absent in some pedons.

The B/E and Bt/E horizons have value of 6 or 7 dry and 4 to 6 moist, and they have chroma of 2 to 4 dry or moist. They are silt loam or silty clay loam. They are neutral or mildly alkaline.

The Bt and Btk horizons have hue of 10YR, 2.5Y, or 5Y, value of 6 to 8 dry and 3 to 6 moist, and chroma of 2 to 4 dry or moist. They are silty clay or silty clay loam. They are neutral or mildly alkaline.

The Bk horizon has hue of 10YR, 2.5Y, or 5Y, value of 6 to 8 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is silty clay loam, silty clay, or silt loam. It is mildly alkaline or moderately alkaline.

## Kiehl Series

The Kiehl series consist of very deep, well drained soils on outwash terraces, kame terraces, and terrace escarpments. These soils formed in glacial outwash with a mantle of volcanic ash and loess. Slopes are 0 to 65 percent. Elevation is 2,000 to 4,000 feet. The

average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 45 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Kiehl silt loam, 0 to 8 percent slopes, about 9 miles northwest of Inchelium; 1,750 feet north and 1,125 feet west of the southeast corner of sec. 19, T. 34 N., R. 36 E., W.M.:

Oi—1 inch to 0; needles, twigs, leaves, and cones.

A—0 to 2 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine granular structure; soft, friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common fine irregular pores; 5 percent pebbles; slightly acid (NaF pH 10.5); abrupt wavy boundary.

Bw—2 to 10 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; common fine irregular pores; 10 percent pebbles; slightly acid (NaF pH 10.5); abrupt wavy boundary.

2BC—10 to 21 inches; light yellowish brown (10YR 6/4) very gravelly sandy loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; common fine irregular pores; 40 percent pebbles; slightly acid; clear wavy boundary.

2C1—21 to 29 inches; brown (10YR 5/3) extremely gravelly loamy coarse sand, dark brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; common very fine and fine roots; few fine tubular pores; 50 percent pebbles, 10 percent cobbles, and 5 percent stones; neutral; gradual wavy boundary.

2C2—29 to 60 inches; multicolored extremely gravelly coarse sand; single grain; loose; nonsticky and nonplastic; few very fine and fine roots; 60 percent pebbles, 10 percent cobbles, and 5 percent stones; neutral.

The mantle of volcanic ash is 7 to 14 inches thick. It is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma 2 or 3 dry or moist. It is 5 to 15 percent pebbles. This horizon is absent in some pedons.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 to 7 dry and 3 to 5 moist, and chroma of 3 to 6 dry or moist. It is 5 to 15 percent pebbles.

The 2BC horizon has hue of 7.5YR or 10YR, value of 5 to 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry

or moist. It is 20 to 40 percent pebbles and 0 to 5 percent cobbles. This horizon is absent in some pedons.

The 2C horizon has hue of 2.5Y or 10YR, value of 5 to 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is loamy sand, coarse sand, loamy coarse sand, or coarse sand with 35 to 60 percent pebbles, 10 to 20 percent cobbles, and 0 to 5 percent stones.

## Koepke Series

The Koepke series consists of soils that are deep to dense glacial till and are well drained. These soils are on footslopes and backslopes of hills and mountains. They formed in glacial till with a mantle of volcanic ash and loess. Slopes are 15 to 30 percent. Elevation is 2,200 to 4,800 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Koepke loam, 15 to 30 percent slopes, about 8 miles northeast of Disautel; 1,500 feet north and 2,400 east of the southwest corner of sec. 11, T. 34 N., R. 29 E., W.M.:

Oi—1 inch to 0; needles, twigs, and cones.

A1—0 to 3 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common very fine irregular pores; 10 percent pebbles; neutral; clear wavy boundary.

A2—3 to 22 inches; dark brown (10YR 4/3) loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine, fine, and medium roots and common coarse roots; common very fine irregular pores; 10 percent pebbles; slightly acid; gradual wavy boundary.

2Bw—22 to 40 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots and few coarse roots; common very fine irregular pores; 25 percent pebbles and 5 percent cobbles; neutral; gradual wavy boundary.

2Cd—40 to 60 inches; yellowish brown (10YR 5/4) dense glacial till that crushes to very cobbly sandy loam, brown (10YR 4/4) moist; massive; hard, friable, slightly sticky and nonplastic; few very fine, fine, and medium roots; few very fine irregular

pores; 30 percent pebbles and 15 percent cobbles; neutral.

Depth to dense glacial till is 40 to 60 inches. The mollic epipedon is 20 to 30 inches thick. The upper part of the 2Bw horizon is part of the mollic epipedon in some pedons. Thickness of the solum is 30 to 45 inches. The lower part of the particle-size control section is 8 to 18 percent clay and 15 to 35 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles.

The 2Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry and 2 or 3 moist. It is sandy loam or loam with 15 to 30 percent pebbles and 0 to 5 percent cobbles.

The 2Cd horizon has value of 5 to 7 dry and 4 to 6 moist, and it has chroma of 3 or 4 dry and 2 or 3 moist. It is 25 to 50 percent pebbles and 5 to 25 percent cobbles.

## Lakesol Series

The Lakesol series consists of very deep, well drained soils on north-facing terrace escarpments. These soils formed in glacial lake sediment with a component of loess in the upper part. Slopes are 30 to 65 percent. Elevation is 1,400 to 2,200 feet. The average annual precipitation is 18 to 20 inches, the average annual air temperature is 43 to 45 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Lakesol silt loam, 30 to 65 percent north slopes, about 4 miles south of Inchelium; 800 feet south and 2,400 feet west of the northeast corner of sec. 31, T. 31 N., R. 37 E., W.M.:

Oi—1 inch to 0; needles, twigs, and leaves.

A1—0 to 2 inches; dark grayish brown (10YR 4/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak thin platy structure and weak fine granular; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots and few medium roots; common fine irregular pores; neutral; clear wavy boundary.

A2—2 to 10 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots and common medium roots; common fine irregular pores; neutral; clear wavy boundary.

Bw1—10 to 23 inches; pale brown (10YR 6/3) silt loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; many very fine roots

and common fine and medium roots; common fine irregular pores; less than 5 percent pebbles; neutral; gradual wavy boundary.

Bw2—23 to 37 inches; light yellowish brown (10YR 6/4) silt loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; hard, firm, slightly sticky and slightly plastic; many very fine roots, common fine and medium roots, and few coarse roots; common fine irregular pores; mildly alkaline; abrupt wavy boundary.

C—37 to 60 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; massive; slightly hard, friable, nonsticky and slightly plastic; few very fine roots; few fine tubular pores; slightly effervescent; mildly alkaline.

The mollic epipedon is 9 to 12 inches thick. The particle-size control section is 10 to 18 percent clay.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist.

The Bw horizon has value of 6 or 7 dry and chroma of 2 or 3 dry or moist. It is neutral or mildly alkaline.

The C horizon has hue of 2.5Y or 10YR, value of 6 or 7 dry and 5 or 6 moist, and chroma of 2 to 4 dry or moist. It is neutral or mildly alkaline.

## Leahy Series

The Leahy series consists of very deep, moderately well drained soils on undulating lake terraces. These soils formed in glacial lake sediment. Slopes are 0 to 15 percent. Elevation is 1,100 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Leahy silt loam in an area of Elvedere-Leahy silt loams complex, 0 to 15 percent slopes, about 5 miles northwest of Elmer City; 1,200 feet north and 1,900 feet east of the southwest corner of sec. 25, T. 30 N., R. 30 E., W.M.:

Ez—0 to 3 inches; light gray (2.5Y 7/2) silt loam, grayish brown (2.5Y 5/2) moist; moderate fine subangular blocky structure; slightly hard, friable, sticky and plastic; common very fine, fine, and medium roots; few fine tubular pores; violently effervescent; strongly alkaline; abrupt smooth boundary.

Btnz—3 to 10 inches; 70 percent brown (10YR 5/3) and 30 percent light gray (10YR 7/2) silty clay, 70 percent dark brown (10YR 3/3) and 30 percent brown (10YR 5/3) moist; weak coarse prismatic structure parting to moderate coarse subangular blocky; hard, friable, sticky and plastic; common very fine, fine, and medium roots; few fine tubular

pores; common distinct clay films on faces of peds; violently effervescent; very strongly alkaline; clear smooth boundary.

Bknz—10 to 16 inches; light gray (10YR 7/2) silty clay loam, brown (10YR 5/3) moist; moderate fine subangular blocky structure; hard, firm, sticky and plastic; common very fine, fine, and medium roots; few fine tubular pores; common fine soft masses and filaments of lime on faces of peds; violently effervescent; very strongly alkaline; abrupt smooth boundary.

Cknz1—16 to 28 inches; very pale brown (10YR 7/3) silty clay loam, brown (10YR 5/3) moist; massive (varved); hard, firm, sticky and plastic; few very fine, fine, and medium roots; few fine tubular pores; few soft masses of lime between varves; violently effervescent; very strongly alkaline; clear smooth boundary.

Cknz2—28 to 60 inches; very pale brown (10YR 7/3) silty clay loam, brown (10YR 5/3) moist; massive (varved); hard, firm, sticky and plastic; few very fine roots; few fine tubular pores; few soft masses of lime between varves; strongly effervescent; very strongly alkaline.

The natric horizon is 5 to 10 inches thick and 35 to 55 percent clay. The sodium adsorption ratio is 15 to 30 throughout the profile. An apparent water table is present in February through April. These soils are slightly saline in the upper 3 inches and moderately saline or strongly saline below a depth of 3 inches.

The Ez horizon has hue of 10YR or 2.5Y and value of 6 or 7 dry and 4 or 5 moist.

The Btnz horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 or 3 dry or moist. It is silty clay loam or silty clay.

The Bknz and Cknz horizons have hue of 10YR or 2.5Y, value of 6 to 8 dry and 5 or 6 moist, and chroma of 2 or 3 dry or moist. They are silty clay loam or silty clay.

## Lithic Xerorthents

Lithic Xerorthents consist of very shallow, well drained soils on summits, shoulders, and backslopes of glacially scoured hills and mountains. These soils formed in colluvium and residuum derived from rhyodacite and quartz latite with some glacial till and a component of volcanic ash and loess. Slopes are 8 to 70 percent. Elevation is 2,500 to 4,200 feet. The average annual precipitation is 15 to 20 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Reference pedon of Lithic Xerorthents in an area of Lithic Xerorthents-Baldknob-Rock outcrop complex,

8 to 40 percent slopes, about 20 miles northeast of Nespelem; 1,300 feet west and 1,100 feet north of the southeast corner of sec. 13, T. 34 N., R. 32 E., W.M.:

A—0 to 2 inches; yellowish brown (10YR 5/4) gravelly loam, dark brown (10YR 3/3) moist; weak fine granular structure; soft, very friable, slightly sticky and nonplastic; many very fine and few fine roots; common fine irregular pores; 20 percent pebbles; slightly acid; clear wavy boundary.

Bw—2 to 7 inches; yellowish brown (10YR 5/6) gravelly loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine roots; few fine tubular pores; 25 percent pebbles; neutral; abrupt wavy boundary.

R—7 to 11 inches; rhyodacite bedrock.

Depth to bedrock is 4 to 10 inches. The particle-size control section is 8 to 18 percent clay and 15 to 60 percent rock fragments. It is slightly acid or neutral.

The A horizon has hue of 7.5YR or 10YR, value of 4 or 5 dry, and chroma of 3 or 4 dry or moist. It is 15 to 40 percent pebbles, 0 to 20 percent cobbles, and 0 to 10 percent stones.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry, and chroma of 4 to 6 dry. It is 20 to 50 percent pebbles, 0 to 25 percent cobbles, and 0 to 15 percent stones.

## Logy Series

The Logy series consists of very deep, somewhat excessively drained soils on alluvial fans. These soils formed in recent alluvium. Slopes are 3 to 25 percent. Elevation is 800 to 1,600 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Logy very stony sandy loam, 3 to 25 percent slopes, about 5 miles southwest of Okanogan; 2,300 feet east and 1,500 feet south of the northwest corner of sec. 1, T. 32 N., R. 25 E., W.M.:

A—0 to 10 inches; grayish brown (10YR 5/2) very stony sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; many fine roots; few fine and very fine interstitial pores; 20 percent pebbles, 10 percent cobbles, and 5 percent stones; mildly alkaline; gradual wavy boundary.

Bw—10 to 24 inches; brown (10YR 5/3) very gravelly sandy loam, dark brown (10YR 3/3) moist; weak

medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; few fine interstitial pores; 50 percent pebbles and 5 percent cobbles; mildly alkaline; gradual wavy boundary.

C—24 to 60 inches; brown (10YR 5/3) very gravelly loamy sand, dark brown (10YR 3/3) moist; single grain; soft, very friable, nonsticky and nonplastic; few fine roots; few fine tubular pores; 30 percent pebbles and 15 percent cobbles; moderately alkaline.

The mollic epipedon is 7 to 12 inches thick. The particle-size control section is 35 to 60 percent rock fragments. Depth to the C horizon is 20 to 40 inches.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry. It is 5 to 15 percent stones, 10 to 20 percent cobbles, and 15 to 30 percent pebbles. It is neutral or mildly alkaline.

The Bw horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 1 to 3 dry and 2 or 3 moist. It is 5 to 15 percent cobbles and 45 to 60 percent pebbles. It is neutral or mildly alkaline.

The C horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is loamy sand or sand with 5 to 25 percent cobbles and 35 to 65 percent pebbles. It is mildly alkaline or moderately alkaline.

## Loony Series

The Loony series consists of soils that are moderately deep to dense glacial till and are moderately well drained. These soils are on till plains and toeslopes of mountains. They formed in volcanic ash over glacial till. Slopes are 0 to 15 percent. Elevation is 2,500 to 4,000 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Loony loam, 0 to 15 percent slopes, about 7 miles northeast of Disautel; 200 feet north and 1,300 feet east of the southwest corner of sec. 31, T. 34 N., R. 30 E., W.M.:

Oi—1 inch to 0; needles, twigs, and cones.

A—0 to 3 inches; light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots, common medium roots, and few coarse roots; common fine irregular pores; slightly acid; clear wavy boundary.

Bw1—3 to 8 inches; pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; weak fine subangular

blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots and few coarse roots; common fine tubular pores; slightly acid; gradual wavy boundary.

Bw2—8 to 17 inches; light yellowish brown (10YR 6/4) loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine roots and common fine, medium, and coarse roots; common fine irregular pores; slightly acid; gradual wavy boundary.

2CB—17 to 28 inches; light gray (10YR 7/2) cobbly sandy loam, grayish brown (10YR 5/2) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few very fine, fine, and coarse roots and common medium roots; few fine tubular pores; 10 percent pebbles and 10 percent cobbles; neutral; gradual wavy boundary.

2Cd1—28 to 43 inches; white (10YR 8/2) dense glacial till that crushes to sandy loam, yellowish brown (10YR 5/4) moist, massive; hard, firm, nonsticky and nonplastic; 5 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

2Cd2—43 to 50 inches; light gray (2.5Y 7/2) dense glacial till that crushes to loam, light brownish gray (2.5Y 6/2) moist; massive; very hard, very firm, slightly sticky and slightly plastic; 5 percent pebbles; neutral; clear wavy boundary.

2Cd3—50 to 60 inches; light gray (2.5Y 7/2) dense glacial till that crushes to loam, grayish brown (2.5Y 5/2) moist; massive; very hard, very firm, slightly sticky and slightly plastic; neutral.

The mantle of volcanic ash is 14 to 20 inches thick. Depth to dense glacial till is 20 to 40 inches. The particle-size control section is 5 to 25 percent rock fragments. An apparent water table is present in February through May.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is 0 to 10 percent pebbles.

The 2CB horizon is 5 to 15 percent cobbles and 10 to 25 percent pebbles.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 7 or 8 dry and 5 or 6 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with lenses of loamy sand or sand. It is 0 to 15 percent pebbles and 0 to 5 percent cobbles.

## Lostcreek Series

The Lostcreek series consists of very deep, moderately well drained soils on alluvial fans, terraces, and toeslopes of hills and mountains. These soils formed in alluvium and glacial till with a component of loess and volcanic ash. Slopes are 3 to 15 percent. Elevation is 2,000 to 3,500 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Lostcreek loam, 3 to 15 percent slopes, about 4.5 miles northwest of Nespelem; 600 feet north and 500 feet west of the southeast corner of sec. 8, T. 31 N., R. 30 E., W.M.:

Oi—0.5 inch to 0; needles, twigs, leaves, and bark.

A—0 to 11 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common fine irregular pores; 2 percent pebbles; slightly acid; clear wavy boundary.

Bw1—11 to 20 inches; light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and coarse roots and few medium roots; common fine irregular pores; 3 percent pebbles; neutral; clear wavy boundary.

Bw2—20 to 27 inches; light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine roots and few medium and coarse roots; few fine tubular pores; 5 percent pebbles; neutral; clear wavy boundary.

C1—27 to 42 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; common fine and medium roots and few coarse roots; few fine tubular pores; 10 percent pebbles; neutral; clear wavy boundary.

C2—42 to 60 inches; light gray (10YR 7/2) fine sandy loam, pale brown (10YR 6/3) moist; common fine distinct light yellowish brown (10YR 6/4) mottles, dark yellowish brown (10YR 4/4) moist; massive; slightly hard, friable, nonsticky and nonplastic; few fine and coarse roots; few fine tubular pores; 10 percent pebbles; neutral.

The mollic epipedon is 10 to 20 inches thick. Thickness of the solum is 20 to 35 inches. The particle-size control section is 7 to 15 percent clay and 5 to 25 percent rock fragments. The profile is slightly acid or neutral. An apparent water table is present in February through June.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. It is 0 to 15 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is loam, sandy loam, or fine sandy loam with 0 to 20 percent pebbles and 0 to 2 percent cobbles.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is loam, sandy loam, or fine sandy loam with 10 to 25 percent pebbles and 0 to 5 percent cobbles.

### Louiecreek Series

The Louiecreek series consists of very deep, well drained soils on backslopes, footslopes, and toeslopes of hills and mountains. These soils formed in colluvium derived from rhyodacite and quartz latite with a component of loess and volcanic ash. Slopes are 3 to 65 percent. Elevation is 1,600 to 3,800 feet. The average annual precipitation is 15 to 20 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Louiecreek gravelly loam in an area of Northstar-Louiecreek-Rock outcrop complex, 40 to 65 percent slopes, about 12 miles north of Nespelem; 800 feet north and 250 feet west of the southeast corner of sec. 29, T. 33 N., R. 31 E., W.M.:

Oi—1 inch to 0; needles, twigs, and leaves.

A—0 to 13 inches; dark brown (10YR 4/3) gravelly loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and few medium roots; common fine irregular pores; 15 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

Bw1—13 to 20 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, friable, slightly sticky and nonplastic; many very fine roots and common fine and medium roots; common fine irregular pores; 25 percent pebbles and 5 percent cobbles; slightly acid; clear wavy boundary.

Bw2—20 to 32 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 4/3) moist;

weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine roots, common fine and medium roots, and few coarse roots; few fine tubular pores; 35 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

C—32 to 60 inches; very pale brown (10YR 7/3) very gravelly sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots and few coarse roots; few fine tubular pores; 40 percent pebbles, 10 percent cobbles, and 5 percent stones; neutral.

The mollic epipedon is 7 to 15 inches thick. The particle-size control section is 35 to 50 percent rock fragments and 8 to 15 percent clay. The profile is neutral or slightly acid.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 30 percent pebbles and 0 to 5 percent cobbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. Chroma is 4 in areas where value is 3 when moist. The horizon is loam or sandy loam with 25 to 55 percent pebbles, 5 to 35 percent cobbles, and 0 to 5 percent stones.

The C horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam or sandy loam with 40 to 60 percent pebbles, 10 to 40 percent cobbles, and 0 to 5 percent stones.

### Louploup Series

The Louploup series consists of soils that are deep to dense glacial till and are well drained. These soils are on till plains and on footslopes and toeslopes of mountains. They formed in a mantle of volcanic ash over glacial till. Slopes are 0 to 40 percent. Elevation is 2,000 to 4,500 feet. The average annual precipitation is 17 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Louploup silt loam, 0 to 20 percent slopes, about 4.5 miles southeast of Disautel; 400 feet east and 1,500 feet north of the southwest corner of sec. 34, T. 33 N., R. 29 E., W.M.:

Oi—3 inches to 1 inch; needles, leaves, and twigs.

Oe—1 inch to 0; partially decomposed forest litter.

A—0 to 6 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots;

common fine irregular pores; slightly acid; clear wavy boundary.

Bw—6 to 22 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak medium and coarse subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine, medium, and coarse roots; common fine irregular pores; 5 percent pebbles; slightly acid; clear wavy boundary.

2CB—22 to 46 inches; light gray (10YR 7/2) sandy loam, brown (10YR 5/3) moist; massive; hard, friable, nonsticky and nonplastic; common fine and medium roots; common fine irregular pores; 10 percent pebbles; neutral; gradual wavy boundary.

2Cd—46 to 60 inches; light gray (2.5Y 7/2) dense glacial till that crushes to gravelly sandy loam, grayish brown (2.5Y 5/2) moist; massive; hard, friable, nonsticky and nonplastic; 15 percent pebbles; neutral.

Depth to dense glacial till is 40 to 60 inches. The mantle of volcanic ash is 15 to 28 inches thick. The upper part of the particle-size control section is 0 to 10 percent rock fragments, and the lower part is 4 to 10 percent clay and 10 to 35 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has value of 6 or 7 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam, fine sandy loam, or silt loam with 0 to 15 percent pebbles.

The 2CB horizon, where present, has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is fine sandy loam, sandy loam, or coarse sandy loam with 5 to 25 percent pebbles and 0 to 5 percent cobbles.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 5 to 8 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is sandy loam, coarse sandy loam, or loamy sand with 15 to 35 percent pebbles, 0 to 10 percent cobbles, and 0 to 5 percent stones.

## Lynxcreek Series

The Lynxcreek series consists of very deep, moderately well drained soils on terraces in narrow mountain valleys. These soils formed in glacial lake sediment with a mantle of volcanic ash. Slopes are 20 to 40 percent. Elevation is 3,300 to 4,200 feet. The average annual precipitation is 20 to 30 inches, the

average annual air temperature is 39 to 41 degrees F, and the frost-free period is 80 to 100 days.

Typical pedon of Lynxcreek silt loam, 20 to 40 percent slopes, about 16 miles northwest of Inchelium; 2,000 feet east and 1,000 feet south of the northwest corner of sec. 2, T. 33 N., R. 34 E., W.M.:

Oi—3 inches to 0; needles, leaves, and twigs.

A—0 to 9 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium granular structure; soft, friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium and coarse roots; few fine tubular pores; slightly acid; abrupt smooth boundary.

2E—9 to 10 inches; very pale brown (10YR 7/3) silt loam, brown (10YR 5/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium and coarse roots; few fine tubular pores; neutral; clear broken boundary.

2Bt1—10 to 16 inches; light gray (10YR 7/2) silty clay loam, brown (10YR 5/3) moist; moderate fine and medium subangular blocky structure; hard, firm, sticky and plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; few faint clay films on faces of peds and in pores; 5 percent pebbles and cobbles; neutral; clear wavy boundary.

2Bt2—16 to 28 inches; very pale brown (10YR 7/3) silty clay loam, pale brown (10YR 6/3) moist; moderate fine and medium subangular blocky structure; hard, firm, sticky and plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; few faint clay films on faces of peds and in pores; 10 percent pebbles and cobbles; neutral; clear wavy boundary.

2Bt3—28 to 36 inches; light gray (10YR 7/2) silty clay loam, brown (10YR 5/3) moist; moderate fine and medium subangular blocky structure; hard, firm, sticky and plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; few faint clay films on faces of peds and in pores; neutral; clear wavy boundary.

2C—36 to 60 inches; light gray (10YR 7/2) silty clay loam, brown (10YR 5/3) moist; laminated; hard, firm, sticky and plastic; matted roots between laminations; neutral.

The mantle of volcanic ash is 7 to 14 inches thick. The particle-size control section is 5 to 15 percent rock fragments and 18 to 35 percent clay. The profile is slightly acid or neutral. An apparent water table is present in February through May.

The A horizon has hue of 7.5YR or 10YR, value of 5 to 7 dry and 3 to 5 moist, and chroma of 3 to 6 dry or moist. It is 0 to 5 percent pebbles.

The 2Bt horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 5 or 6 moist, and chroma of 2 or 3 dry and 3 or 4 moist. It is silt loam or silty clay loam with 0 to 10 percent pebbles and 0 to 5 percent cobbles. Distinct or prominent mottles are present in some pedons.

The 2C horizon has hue of 10YR or 2.5Y, value of 7 or 8 dry and 5 or 6 moist, and chroma of 2 or 3 dry and 3 or 4 moist. It is silty clay loam, loam, or silt loam with 0 to 15 percent pebbles and 0 to 5 percent cobbles.

### Malott Series

The Malott series consists of soils that are deep to a duripan and are well drained (fig. 21). These soils are on till plains and hills. They formed in glacial till with a mantle of loess. Slopes are 0 to 70 percent. Elevation is 800 to 2,000 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Malott very fine sandy loam, 0 to 5 percent slopes, about 3.5 miles south of Okanogan; 1,575 feet west and 1,500 feet south of the northeast corner of sec. 6, T. 32 N., R. 26 E., W.M.:

- A1—0 to 4 inches; grayish brown (10YR 5/2) very fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; slightly hard, friable, nonsticky and slightly plastic; many very fine and fine roots; common fine irregular and tubular pores; neutral; gradual smooth boundary.
- A2—4 to 12 inches; brown (10YR 5/3) very fine sandy loam, dark brown (10YR 3/3) moist; weak medium granular structure; slightly hard, friable, nonsticky and slightly plastic; many very fine and fine roots; common fine irregular and tubular pores; neutral; clear smooth boundary.
- Bw1—12 to 24 inches; yellowish brown (10YR 5/4) very fine sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine roots; common fine irregular and tubular pores; mildly alkaline; gradual smooth boundary.
- Bw2—24 to 36 inches; yellowish brown (10YR 5/4) very fine sandy loam, dark yellowish brown (10YR 3/4) moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and slightly plastic; common very fine and fine roots;

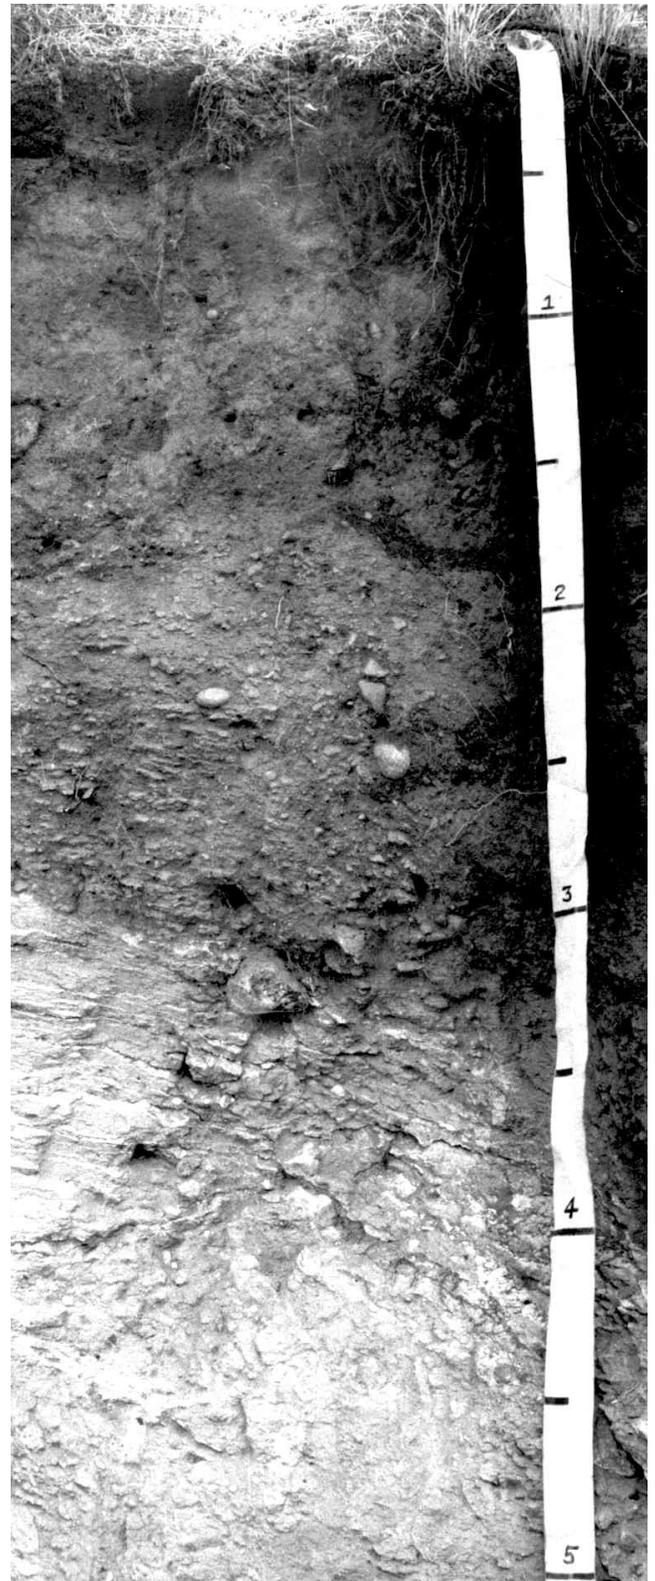

Figure 21.—Typical pedon of a Malott soil that has a continuous lime- and silica-cemented duripan below a depth of 40 inches. (Numbers on tape represent feet.)

common fine irregular and tubular pores; mildly alkaline; clear wavy boundary.

2Bk—36 to 49 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 4/3) moist; massive; slightly hard, friable, nonsticky and slightly plastic; few very fine and fine roots; few very fine and fine irregular pores; 25 percent pebbles and 5 percent cobbles; strongly effervescent; moderately alkaline; abrupt wavy boundary.

2Bkqm—49 to 60 inches; white (10YR 8/2) weakly lime- and silica-cemented duripan that crushes to gravelly sandy loam, light brownish gray (10YR 6/2) moist; massive; hard, firm, nonsticky and slightly plastic; few very fine and fine irregular pores; 20 percent pebbles and 5 percent cobbles; violently effervescent; strongly alkaline.

Depth to the duripan is 40 to 60 inches. The mollic epipedon is 10 to 15 inches thick. Depth to secondary carbonates is 23 to 43 inches. The particle-size control section is 5 to 30 percent rock fragments.

The A horizon has value of 4 or 5 dry and chroma of 1 to 3 dry and 2 or 3 moist. It is very fine sandy loam or stony very fine sandy loam with 0 to 10 percent pebbles, 0 to 5 percent cobbles, and 0 to 5 percent stones. It is neutral or mildly alkaline.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry and 2 to 4 moist. It is very fine sandy loam, fine sandy loam, or loam with 0 to 20 percent pebbles and 0 to 10 percent cobbles.

The 2Bk horizon has value of 6 or 7 dry and 4 to 6 moist, and it has chroma of 1 to 3 dry or moist. It is loam or sandy loam with 10 to 25 percent pebbles, 5 to 20 percent cobbles, and 0 to 5 percent stones. It is mildly alkaline or moderately alkaline.

The 2Bkqm horizon has value of 6 to 8 dry and 5 or 6 moist, and it has chroma of 1 to 3 dry and 2 or 3 moist. It is moderately alkaline or strongly alkaline.

## Manley Series

The Manley series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on toeslopes, footslopes, and backslopes of mountains. They formed in glacial till with a mantle of volcanic ash. Slopes are 5 to 65 percent. Elevation is 3,000 to 6,000 feet. The average annual precipitation is 20 to 30 inches, the average annual air temperature is 38 to 41 degrees F, and the frost-free period is 80 to 100 days.

Typical pedon of Manley silt loam, dry, 5 to 20 percent slopes, about 17 miles north of Nespelem; 700 feet north and 2,200 feet west of the southeast corner of sec. 30, T. 34 N., R. 31 E., W.M.:

Oi—3 inches to 1 inch; needles, twigs, leaves, and bark.

Oe—1 inch to 0; decomposed organic matter.

A—0 to 1 inch; pale brown (10YR 6/3) silt loam, dark yellowish brown (10YR 3/4) moist; moderate medium granular structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; many very fine irregular pores; medium acid (NaF pH 10.5); abrupt smooth boundary.

Bw1—1 inch to 12 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots; common very fine tubular pores; 5 percent pebbles; slightly acid (NaF pH 10.5); clear wavy boundary.

Bw2—12 to 17 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common very fine tubular pores; 10 percent pebbles; slightly acid (NaF pH 10.5); abrupt wavy boundary.

2BC—17 to 27 inches; light gray (10YR 7/2) very gravelly sandy loam, yellowish brown (10YR 5/4) moist; common medium very pale brown (10YR 7/4) patches of volcanic ash, yellowish brown (10YR 5/6) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; many very fine irregular pores; 40 percent pebbles and 5 percent cobbles; medium acid (NaF pH 9.9); clear wavy boundary.

2CB—27 to 38 inches; very pale brown (10YR 7/3) extremely gravelly coarse sandy loam, pale brown (10YR 6/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine and fine roots; many very fine irregular pores; 60 percent pebbles and 5 percent cobbles; medium acid; clear smooth boundary.

2Cd—38 to 60 inches; light gray (2.5Y 7/2) dense glacial till that crushes to very gravelly loamy coarse sand, light brownish gray (2.5Y 5/2) moist; massive; very hard, firm, nonsticky and nonplastic; 50 percent pebbles and 5 percent cobbles.

Depth to dense glacial till is 20 to 40 inches. The mantle of volcanic ash is 14 to 22 inches thick. The lower part of the particle-size control section is 35 to 60 percent rock fragments. It is medium acid to neutral.

The A horizon has value of 6 to 8 dry and 3 to 6 moist, and it has chroma of 2 to 4 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has hue of 10YR or 7.5YR, value of 5 to 7 dry and 3 or 4 dry or moist, and chroma of 3 to 6 dry or moist. It is loam, silt loam, or fine sandy loam with 0 to 20 percent pebbles and 0 to 5 percent cobbles.

The 2BC and 2CB horizons have hue of 10YR or 2.5Y, value of 5 to 7 dry and 5 or 6 moist, and chroma of 2 to 4 dry or moist. They are sandy loam or coarse sandy loam with 30 to 60 percent pebbles, 5 to 25 percent cobbles, and 0 to 5 percent stones. The 2BC horizon has volcanic ash in pores and root channels. These horizons are absent in some pedons.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is coarse sandy loam, loamy sand, or loamy coarse sand with 20 to 60 percent pebbles, 5 to 25 percent cobbles, and 0 to 5 percent stones.

## Martella Series

The Martella series consists of very deep, moderately well drained soils on terraces and terrace escarpments. These soils formed in glacial lake sediment with a mantle of volcanic ash and loess. Slopes are 0 to 30 percent. Elevation is 2,000 to 3,600 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Martella silt loam, 0 to 8 percent slopes, about 8 miles southwest of Inchelium; 1,050 feet north and 500 feet west of the southeast corner of sec. 25, T. 32 N., R. 35 E., W.M.:

Oi—1 inch to 0; needles and twigs.

A—0 to 3 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine granular structure; soft, friable, nonsticky and nonplastic; many very fine and fine roots and common medium and coarse roots; common fine irregular pores; slightly acid (NaF pH 10.6); clear smooth boundary.

Bw—3 to 12 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine granular structure; soft, friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; common fine irregular pores; neutral (NaF pH 10.1); abrupt wavy boundary.

2E—12 to 15 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic;

common very fine and fine roots and few medium roots; common fine irregular pores; neutral; clear wavy boundary.

2BE—15 to 23 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and plastic; common very fine and fine roots and few medium roots; few fine tubular pores; few thin clay films lining pores; neutral; gradual wavy boundary.

2Bt1—23 to 33 inches; brown and pale brown (10YR 5/3 and 6/3) silt loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and plastic; common very fine and fine roots; few fine tubular pores; common distinct clay films lining pores and on faces of peds; neutral; gradual wavy boundary.

2Bt2—33 to 46 inches; pale brown (10YR 6/3) silt loam, dark grayish brown (2.5Y 4/2) moist; moderate medium subangular blocky structure; slightly hard, friable, sticky and plastic; common very fine and fine roots; few fine tubular pores; common distinct clay films lining pores and on faces of peds; neutral; clear wavy boundary.

2BCt—46 to 53 inches; pale olive (5Y 6/3) silt loam, olive (5Y 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, friable, sticky and plastic; few very fine and fine roots; few fine tubular pores; few distinct clay films lining pores; neutral; abrupt wavy boundary.

2C—53 to 60 inches; pale olive (5Y 6/3) silty clay loam, olive (5Y 4/3) moist; massive; slightly hard, friable, sticky and plastic; few very fine and fine roots; few fine tubular pores; neutral.

The mantle of volcanic ash is 7 to 14 inches thick. The argillic horizon has 18 to 35 percent clay, less than 15 percent fine sand or coarser, and 0 to 5 percent rock fragments. An apparent water table is present in December through June.

The A horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. A thin layer of Mt. St. Helens "T" or "W" volcanic ash is present in some pedons. This horizon has chroma of 1 or 2 dry or moist.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is silt loam, loam, or very fine sandy loam. It is slightly acid or neutral. This horizon is absent in some pedons.

The 2E and 2BE horizons have hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. They are silt loam, loam, or very fine sandy loam. They are slightly acid or neutral. These horizons are absent in some pedons.

The 2Bt horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 6 moist, and chroma of 2 to 4 dry or moist. It is very fine sandy loam, silt loam, or silty clay loam. It is slightly acid to mildly alkaline.

The 2BCt horizon has hue of 10YR, 2.5Y, or 5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is stratified very fine sandy loam to silty clay loam. It is neutral or mildly alkaline. This horizon is absent in some pedons.

The 2C horizon has hue of 10YR, 2.5Y, or 5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is stratified very fine sandy loam to silty clay loam. It is neutral or mildly alkaline.

## Medisaprists

Medisaprists consist of very deep, very poorly drained soils in backswamps of flood plains and in depressions on till plains, ground moraines, and terraces. These soils formed in decomposed organic material that in places overlies alluvium, glacial outwash, or glacial lake sediment. Elevation is 1,700 to 2,800 feet. Slopes are 0 to 2 percent. The average annual precipitation is 12 to 18 inches, the average annual air temperature is 45 to 49 degrees F, and the frost-free period is 100 to 150 days.

Reference pedon of Medisaprists, 0 to 2 percent slopes, about 4.5 miles northeast of Elmer City; 1,800 feet south and 900 feet east of the northwest corner of sec. 33, T. 30 N., R. 31 E., W.M.:

- Oi—2 inches to 0; leaves, grasses, and twigs.
- Oa1—0 to 10 inches; dark gray (10YR 4/1) muck, black (10YR 2/1) moist; weak medium granular structure; slightly hard, very friable, slightly sticky and nonplastic; 20 percent fiber, 10 percent rubbed; many very fine and fine roots and common medium roots; common fine irregular pores; slightly acid; clear wavy boundary.
- Oa2—10 to 36 inches; dark gray (10YR 4/1) muck, black (10YR 2/1) moist; massive; slightly hard, very friable, slightly sticky and nonplastic; 15 percent fiber, 5 percent rubbed; common very fine, fine, and medium roots; common fine irregular pores; neutral; gradual wavy boundary.
- Oa3—36 to 60 inches; gray (10YR 5/1) muck, very dark gray (10YR 3/1) moist; massive; slightly hard, very friable, slightly sticky and nonplastic; 10 percent fiber, less than 5 percent rubbed; few very fine and fine roots; few fine tubular pores; neutral.

Depth to mineral soil material is 16 to 60 inches or more. The profile is slightly acid or neutral. An apparent water table is present throughout the year.

Occasional periods of flooding occur in February through April.

The Oa horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist.

A and C mineral horizons are present in some pedons. They are silt loam to coarse sand with 0 to 60 percent rock fragments.

## Merkel Series

The Merkel series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on summits, toeslopes, footslopes, and backslopes of hills and mountains. They formed in granitic glacial till with loess and volcanic ash in the upper part. Slopes are 5 to 65 percent. Elevation is 2,600 to 5,200 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Merkel sandy loam, 40 to 65 percent slopes, about 15 miles northeast of Disautel; 400 feet north and 1,100 feet west of the southeast corner of sec. 6, T. 34 N., R. 31 E., W.M.:

- Oi—1 inch to 0; needles, twigs, and bark.
- A—0 to 6 inches; brown (10YR 5/3) sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; common fine irregular pores; 10 percent pebbles; medium acid (NaF pH 9.8); clear wavy boundary.
- Bw1—6 to 12 inches; yellowish brown (10YR 5/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; common fine irregular pores; 20 percent pebbles; medium acid (NaF pH 10.1); gradual wavy boundary.
- Bw2—12 to 29 inches; yellowish brown (10YR 5/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots; common fine irregular pores; 25 percent pebbles, 5 percent cobbles, and 2 percent stones; medium acid (NaF pH 10.1); clear wavy boundary.
- 2BC—29 to 35 inches; light yellowish brown (10YR 6/4) very gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; few fine tubular pores;

40 percent pebbles, 5 percent cobbles, and 5 percent stones; neutral; clear wavy boundary.  
 2Cd—35 to 60 inches; pale brown (10YR 6/3) dense glacial till that crushes to very gravelly coarse sandy loam, brown (10YR 5/3) moist; massive; hard, friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 35 percent pebbles, 15 percent cobbles, and 5 percent stones; slightly acid.

Depth to dense glacial till is 20 to 40 inches. Thickness of the mantle of volcanic ash is 7 to 30 inches. The particle-size control section is 35 to 60 percent subangular rock fragments. The profile is medium acid to neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is sandy loam or bouldery fine sandy loam with 10 to 20 percent pebbles, 0 to 5 percent cobbles, and 0 to 5 percent stones and boulders.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is fine sandy loam or sandy loam with 10 to 25 percent pebbles, 0 to 10 percent cobbles, and 0 to 5 percent stones.

The 2Cd horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is sandy loam, loamy coarse sand, or coarse sandy loam with 20 to 40 percent pebbles, 15 to 25 percent cobbles, and 0 to 5 percent stones.

## Mineral Series

The Mineral series consists of moderately deep, well drained soils on ridges, shoulders, and backslopes of mountains. These soils formed in colluvium and glacial till derived from granitic rock with loess and volcanic ash in the upper part. Slopes are 5 to 65 percent. Elevation is 2,000 to 5,300 feet. The average annual precipitation is 17 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 110 days.

Typical pedon of Mineral stony loam in an area of Mineral-Rock outcrop complex, 20 to 40 percent slopes, about 5 miles northeast of Disautel; 550 feet north and 100 feet west of the southeast corner of sec. 34, T. 34 N., R. 29 E., W.M.:

Oi—1 inch to 0; needles, twigs, bark, and leaves.  
 A—0 to 6 inches; grayish brown (10YR 5/2) stony loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and few medium roots; common fine irregular pores; common very fine

irregular pores; 20 percent pebbles and 5 percent cobbles and stones; neutral; clear wavy boundary.

Bw—6 to 12 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; few fine tubular pores; common very fine irregular pores; 30 percent pebbles and 10 percent cobbles; neutral; gradual wavy boundary.

C—12 to 23 inches; very pale brown (10YR 7/3) very stony sandy loam, brown (10YR 5/3) moist; massive; hard, friable, slightly sticky and nonplastic; common very fine and fine roots and few medium roots; few fine tubular pores; common very fine irregular pores; 30 percent pebbles, 10 percent cobbles, and 10 percent stones; neutral; abrupt wavy boundary.

R—23 to 33 inches; granitic bedrock.

Depth to bedrock is 20 to 40 inches. The particle-size control section is 7 to 12 percent clay and 40 to 65 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 35 percent pebbles, 2 to 5 percent cobbles, and 2 to 5 percent stones. It is medium acid to neutral.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam, sandy loam, or coarse sandy loam with 20 to 45 percent pebbles, 0 to 30 percent cobbles, and 0 to 5 percent stones. It is medium acid to neutral.

The C horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is sandy loam or loam with 15 to 35 percent pebbles, 10 to 20 percent cobbles, and 0 to 15 percent stones. It is slightly acid or neutral. This horizon is absent in some pedons.

## Mitchellpoint Series

The Mitchellpoint series consists of very deep, well drained soils on outwash terraces. These soils formed in glaciofluvial deposits over glacial outwash with a mantle of volcanic ash and loess. Slopes are 0 to 5 percent. Elevation is 1,800 to 2,100 feet. The average annual precipitation is 17 to 19 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Mitchellpoint silt loam, 0 to 5 percent slopes, about 16 miles east of Keller; 1,750 feet north and 300 feet east of the southwest corner of sec. 30, T. 30 N., R. 36 E., W.M.:

- Oi—3 inches to 0; needles, grass, and twigs.
- A—0 to 7 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; many very fine roots and common fine and medium roots; common fine irregular pores; slightly acid; abrupt smooth boundary.
- Bw—7 to 14 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine roots and common fine and medium roots; few fine tubular pores; slightly acid; clear smooth boundary.
- 2B/E—14 to 20 inches; light yellowish brown (10YR 6/4) silt loam (B part), dark yellowish brown (10YR 4/4) moist, and very pale brown (10YR 7/4) silt loam (E part), yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; few fine tubular pores; slightly acid; clear wavy boundary.
- 2Bt—20 to 26 inches; very pale brown (10YR 7/3) cobbly silt loam, yellowish brown (10YR 5/4) moist; moderate medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium roots; few fine tubular pores; common faint dark yellowish brown (10YR 4/4, moist) clay films on faces of peds and lining pores; 5 percent pebbles and 10 percent cobbles; slightly acid; clear smooth boundary.
- 3C1—26 to 36 inches; multicolored very cobbly loamy coarse sand; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; few fine tubular pores; 30 percent pebbles, 15 percent cobbles, and 5 percent stones; neutral; clear smooth boundary.
- 3C2—36 to 60 inches; multicolored very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 55 percent pebbles; neutral.

The mantle of volcanic ash is 14 to 20 inches thick. The solum is 23 to 35 inches thick. The solum and the upper part of the particle-size control section are 18 to 27 percent clay, and the substratum and lower part of the particle-size control section are 35 to 60 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4

moist, and it has chroma of 3 or 4 dry or moist. It is 0 to 10 percent pebbles.

The 2B/E horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam, loam, or silt loam with 0 to 20 percent pebbles and 0 to 5 percent cobbles.

A 2E/B horizon is present in some pedons.

The 2Bt horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam or loam with 5 to 15 percent pebbles and 0 to 15 percent cobbles.

The 3C horizon is multicolored, stratified loamy coarse sand and coarse sand with 30 to 55 percent pebbles, 5 to 20 percent cobbles, and 0 to 5 percent stones.

## Monse Series

The Monse series consists of very deep, moderately well drained soils on stream terraces. These soils formed in alluvium overlying glacial lake sediment. Slopes are 0 to 8 percent. Elevation is 750 to 1,400 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Monse silt loam, 0 to 8 percent slopes, about 3 miles north of the town of Monse; 350 feet west and 600 feet south of the northeast corner of sec. 22, T. 31 N., R. 25 E., W.M.:

- A1—0 to 7 inches, grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and few fine roots; common very fine interstitial pores; mildly alkaline; clear smooth boundary.
- A2—7 to 14 inches; grayish brown (10YR 5/2) silt loam, dark brown (10YR 3/3) moist; moderate fine and medium granular structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; common fine irregular pores; common very fine interstitial pores; mildly alkaline; clear wavy boundary.
- Bw1—14 to 19 inches; light brownish gray (10YR 6/2) silt loam, dark yellowish brown (10YR 4/4) moist; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine interstitial pores and few very fine tubular pores; mildly alkaline; clear wavy boundary.
- Bw2—19 to 29 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; few medium faint mottles that are brown

(10YR 4/3) when moist; moderate fine and medium subangular blocky structure; hard, friable, sticky and plastic; few very fine roots; common very fine and fine interstitial and tubular pores; mildly alkaline; clear smooth boundary.

2Bw3—29 to 34 inches; light gray (10YR 7/2) silty clay loam, grayish brown (10YR 5/2) moist; common medium distinct mottles that are dark yellowish brown (10YR 4/4) when moist; moderate fine and medium subangular blocky structure; hard, friable, sticky and plastic; few very fine roots; common very fine and fine interstitial and tubular pores; mildly alkaline; clear smooth boundary.

2Bw4—34 to 40 inches; light brownish gray (10YR 6/2) silty clay loam, dark grayish brown (10YR 4/2) moist; common medium faint mottles that are grayish brown (10YR 5/2) when moist; moderate fine and medium subangular blocky structure; hard, friable, sticky and plastic; common very fine and fine interstitial and tubular pores; mildly alkaline; abrupt smooth boundary.

2BCK1—40 to 45 inches; light gray (10YR 7/2) silt loam, dark grayish brown (10YR 4/2) moist; common medium prominent mottles that are dark yellowish brown (10YR 4/6) when moist; weak fine and medium subangular blocky structure; hard, friable, sticky and plastic; common very fine and fine interstitial and tubular pores; few very fine soft masses of lime; strongly effervescent; moderately alkaline; clear smooth boundary.

2BCK2—45 to 60 inches; very pale brown (10YR 7/3) silty clay loam, brown (10YR 5/3) moist; common medium distinct mottles that are dark yellowish brown (10YR 4/6) when moist; massive; hard, firm, sticky and plastic; common very fine and fine interstitial and tubular pores; few very fine soft masses of lime; strongly effervescent; moderately alkaline.

The mollic epipedon is 10 to 15 inches thick. Depth to mottles is 15 to 30 inches. The particle-size control section is 20 to 30 percent clay. An apparent water table is present in December through July.

The A horizon has chroma of 2 or 3 moist. It is neutral or mildly alkaline.

The Bw horizon has value of 4 or 5 moist and chroma of 2 or 3 dry and 2 to 4 moist. It is silt loam or silty clay loam. It is mildly alkaline or moderately alkaline.

The 2Bw horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam or silty clay loam. It is mildly alkaline or moderately alkaline. This horizon is absent in some pedons.

The 2BCK horizon has hue of 10YR or 2.5Y, value

of 6 or 7 dry and 4 to 6 moist, and chroma of 1 to 3 dry and 2 to 4 moist. It is silt loam or silty clay loam. It is moderately alkaline or strongly alkaline.

## Morical Series

The Morical series consists of moderately deep, well drained soils on summits, shoulders, and backslopes of foothills. These soils formed in residuum and colluvium derived from granitic rock with loess and volcanic ash. Slopes are 8 to 60 percent. Elevation is 2,400 to 3,200 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Morical silt loam, 8 to 30 percent slopes, about 12 miles northeast of Coulee Dam; 800 feet south and 1,300 feet east of the northwest corner of sec. 2, T. 29 N., R. 32 E., W.M.:

A1—0 to 6 inches; brown (10YR 4/3) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, friable, slightly sticky and slightly plastic; many very fine and fine roots; common very fine tubular pores; neutral; clear wavy boundary.

A2—6 to 13 inches; brown (10YR 4/3) silt loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; neutral; clear wavy boundary.

Bt1—13 to 18 inches; yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; common very fine and fine roots; common very fine and fine tubular pores; common faint clay films on faces of peds and lining pores; 5 percent fine pebbles; neutral; clear wavy boundary.

Bt2—18 to 22 inches; yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, firm, sticky and plastic; common very fine and fine roots; common very fine and fine tubular pores; many faint clay films on faces of peds and lining pores; 10 percent fine pebbles; neutral; abrupt wavy boundary.

Cr—22 to 32 inches; weathered granitic bedrock.

Depth to weathered bedrock is 20 to 40 inches. The mollic epipedon is 10 to 18 inches thick. The particle-size control section is 5 to 25 percent pebbles and 18 to 27 percent clay.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist.

The Bt horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam or loam with 5 to 25 percent pebbles. It is neutral or mildly alkaline.

### Moscow Series

The Moscow series consists of moderately deep, well drained soils on shoulders, backslopes, and footslopes of mountains. These soils formed in colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess. Slopes are 20 to 65 percent. Elevation is 3,000 to 4,500 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Moscow silt loam, dry, 40 to 65 percent slopes, about 14 miles southwest of Inchelium; 50 feet south and 2,280 feet east of the northwest corner of sec. 26, T. 32 N., R. 34 E., W.M.:

- Oi—2 inches to 0; needles, twigs, mosses, and cones.
- A—0 to 3 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine irregular pores; 5 percent pebbles; slightly acid; abrupt wavy boundary.
- Bw—3 to 11 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common fine irregular pores; 5 percent pebbles; slightly acid; abrupt wavy boundary.
- 2BC—11 to 23 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; soft, friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common fine irregular pores; 20 percent pebbles; neutral; clear wavy boundary.
- 2C—23 to 34 inches; very pale brown (10YR 7/3) gravelly sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, friable, nonsticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 30 percent pebbles; neutral; gradual wavy boundary.
- 2Cr—34 to 44 inches; weathered granitic bedrock.

Depth to weathered bedrock is 20 to 40 inches. The mantle of volcanic ash is 7 to 14 inches thick. The

particle-size control section is 10 to 30 percent rock fragments. It is medium acid to neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is 0 to 10 percent pebbles. This horizon is absent in some pedons.

The Bw horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is loam or silt loam with 0 to 15 percent pebbles.

The 2BC horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 to 5 dry or moist. It is coarse sandy loam or sandy loam with 15 to 30 percent rock fragments.

The 2C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is sandy loam or coarse sandy loam with 15 to 30 percent rock fragments.

### Moses Series

The Moses series consists of moderately deep, well drained soils on footslopes, backslopes, and summits of mountains. These soils formed in residuum and colluvium derived from granitic rock with a mantle of volcanic ash. Slopes are 0 to 70 percent. Elevation is 3,500 to 6,800 feet. The average annual precipitation is 25 to 35 inches, the average annual air temperature is 37 to 41 degrees F, and the frost-free period is 70 to 100 days.

Typical pedon of Moses silt loam, 0 to 30 percent slopes, about 15 miles west of Inchelium; 1,000 feet north and 500 feet east of the southwest corner of sec. 15, T. 32 N., R. 34 E., W.M.:

- Oi—4 inches to 0; needles, twigs, and grasses.
- A—0 to 1 inch; light gray (10YR 7/2) silt loam, brown (10YR 5/3) moist; weak very fine granular structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common fine irregular pores; medium acid; abrupt wavy boundary.
- Bw1—1 inch to 6 inches; yellowish brown (10YR 5/6) silt loam, dark yellowish brown (10YR 4/6) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common fine irregular pores; medium acid (NaF pH 10.7); clear wavy boundary.
- Bw2—6 to 13 inches; brownish yellow (10YR 6/6) silt loam, yellowish brown (10YR 5/6) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very

fine, fine, medium, and coarse roots; few fine tubular pores; medium acid (NaF pH 10.8); abrupt wavy boundary.

2Bw3—13 to 20 inches; light yellowish brown (10YR 6/4) very gravelly coarse sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; 50 percent pebbles; medium acid; abrupt wavy boundary.

2C—20 to 34 inches; very pale brown (10YR 7/4) very gravelly coarse sandy loam, yellowish brown (10YR 5/4) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; 50 percent pebbles and 5 percent cobbles; strongly acid; clear wavy boundary.

2Cr—34 to 44 inches; weathered granitic bedrock.

The mantle of volcanic ash is 7 to 14 inches thick. Depth to weathered bedrock is 20 to 40 inches. The particle-size control section is 35 to 60 percent rock fragments. A thin A horizon of Mt. St. Helens "T" ash is immediately below the organic layer in some pedons.

The A horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam or extremely bouldery silt loam with 0 to 10 percent pebbles, 0 to 25 percent cobbles, and 0 to 25 percent stones and boulders. It is medium acid to neutral.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 to 5 moist, and chroma of 3 to 6 dry or moist. It is 0 to 10 percent pebbles. It is medium acid to neutral.

The 2Bw horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is coarse sandy loam or sandy loam with 25 to 55 percent pebbles, 0 to 20 percent cobbles, and 5 to 15 percent stones. It is medium acid to neutral.

The 2C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 or 3 dry or moist. It is sandy loam or coarse sandy loam with 25 to 50 percent pebbles, 5 to 30 percent cobbles, and 0 to 5 percent stones. It is strongly acid to neutral.

## Narcisse Series

The Narcisse series consists of very deep, moderately well drained soils on flood plains and low stream terraces. These soils formed in alluvium of mixed mineralogy. Slopes are 0 to 3 percent. Elevation is 1,700 to 2,400 feet. The average annual precipitation is 12 to 18 inches, the average annual air

temperature is 45 to 49 degrees F, and the frost-free period is 100 to 150 days.

Typical pedon of Narcisse silt loam, dry, 0 to 3 percent slopes; 1,500 feet east and 1,900 feet north of the southwest corner of sec. 23, T. 29 N., R. 31 E., W.M.:

Ap—0 to 6 inches; very dark gray (10YR 3/1) silt loam, black (10YR 2/1) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; common fine irregular pores; slightly acid; gradual smooth boundary.

A1—6 to 10 inches; dark gray (10YR 4/1) silt loam, black (10YR 2/1) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common fine irregular pores; neutral; clear smooth boundary.

A2—10 to 21 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; hard, friable, sticky and plastic; few very fine and fine roots; neutral; clear smooth boundary.

Bw—21 to 31 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; hard, firm, sticky and plastic; few very fine and fine roots; common fine irregular pores; neutral; abrupt smooth boundary.

C1—31 to 35 inches; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; few fine tubular pores; 10 percent pebbles; neutral; clear smooth boundary.

C2—35 to 46 inches; light brownish gray (10YR 6/2) sandy loam, dark grayish brown (10YR 4/2) dry; common fine distinct mottles that are brown (7.5YR 4/4) when moist; massive; slightly hard, friable, slightly sticky and nonplastic; few very fine roots; few fine tubular pores; 10 percent pebbles; neutral; clear smooth boundary.

C3—46 to 60 inches; pale brown (10YR 6/3) gravelly loamy coarse sand, brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 25 percent pebbles; neutral.

The mollic epipedon is 20 to 30 inches thick. The particle-size control section is 0 to 15 percent pebbles. It is slightly acid or neutral. An apparent water table is present in February through April. Occasional, brief periods of flooding occur in February through April.

The A horizon has value of 3 to 5 dry and 1 to 3

moist, and it has chroma of 1 or 2 dry or moist.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist. It is silt loam, loam, or fine sandy loam.

The C horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. The upper part to a depth of 40 inches is silt loam, loam, or sandy loam, and the lower part is stratified silt loam, loam, sandy loam, and loamy sand with 0 to 30 percent pebbles and 0 to 10 percent cobbles.

## Nespelem Series

The Nespelem series consists of soils that are moderately deep to a duripan and are well drained. These soils are on terraces and terrace escarpments. They formed in glacial lake sediment with a mantle of loess. Slopes are 0 to 30 percent. Elevation is 1,200 to 2,600 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Nespelem silt loam, 0 to 5 percent slopes, about 9 miles west of Nespelem; 1,850 feet south and 1,600 east of the northwest corner of sec. 22, T. 29 N., R. 31 E., W.M.:

A1—0 to 7 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; many very fine and fine roots; common fine irregular pores; neutral; clear smooth boundary.

A2—7 to 12 inches; grayish brown (10YR 5/2) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common very fine and fine roots; common fine irregular pores; neutral; clear smooth boundary.

Bw—12 to 22 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common fine roots; few fine tubular pores; neutral; abrupt smooth boundary.

2Bkqm—22 to 24 inches; light brownish gray (10YR 6/2) weakly lime- and silica-cemented duripan, grayish brown (10YR 5/2) moist; massive; very hard, very firm, slightly sticky and slightly plastic; few fine roots at top of duripan; few filaments and soft masses of secondary lime; slightly effervescent; strongly alkaline; clear smooth boundary.

2Bk1—24 to 32 inches; light gray (2.5Y 7/2) silt loam, light brownish gray (2.5Y 6/2) moist; massive with fine varves; slightly hard, friable, slightly sticky and

slightly plastic; few filaments and soft masses of secondary lime; slightly effervescent; strongly alkaline; clear smooth boundary.

2Bk2—32 to 43 inches; light gray (2.5Y 7/2) silt loam, light brownish gray (2.5Y 6/2) moist; massive with fine varves; hard, firm, slightly sticky and slightly plastic; few filaments and soft masses of secondary lime; strongly effervescent; strongly alkaline; clear smooth boundary.

2Bk3—43 to 60 inches; light gray (2.5Y 7/2) silt loam, light brownish gray (2.5Y 6/2) moist; massive with fine varves; hard, firm, sticky and slightly plastic; few filaments and soft masses of secondary lime; slightly effervescent; strongly alkaline.

Depth to the duripan is 20 to 40 inches. The mollic epipedon is 10 to 20 inches thick. Depth to secondary lime accumulation is 16 to 36 inches. The particle-size control section is 10 to 18 percent clay and less than 15 percent material that is coarser than very fine sand.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. The lower part is silt loam or very fine sandy loam. The horizon is slightly acid or neutral.

The Bw horizon has hue of 10YR or 2.5YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is silt loam or very fine sandy loam. It is neutral or mildly alkaline.

The 2Bkqm horizon has hue of 10YR or 2.5YR, value of 6 or 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is moderately alkaline or strongly alkaline.

The 2Bk horizon has hue of 10YR, 2.5Y, or 5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 1 to 4 dry or moist. It is stratified very fine sandy loam to silty clay loam. It is moderately alkaline or strongly alkaline.

## Neuske Series

The Neuske series consists of soils that are deep to dense glacial till and are well drained. These soils are on ground moraines and on footslopes and backslopes of mountains. The soils formed in glacial till mixed with volcanic ash and loess. Slopes are 0 to 40 percent. Elevation is 1,800 to 3,300 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Neuske silt loam, 0 to 20 percent slopes, about 4 miles southeast of Disautel; 350 feet south and 50 feet east of the northwest corner of sec. 33, T. 33 N., R. 29 E., W.M.:

Oi—1 inch to 0; needles, twigs, and grass.

- A—0 to 5 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and few medium roots; few very fine interstitial pores; neutral; clear wavy boundary.
- AE—5 to 24 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; few very fine interstitial pores; 5 percent pebbles; neutral; clear irregular boundary.
- E—24 to 30 inches; light gray (2.5Y 7/2) loam, grayish brown (2.5Y 5/2) moist; weak medium subangular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine interstitial pores; 5 percent pebbles; neutral; clear wavy boundary.
- Bt/E—30 to 39 inches; light brownish gray (2.5Y 6/2) loam (B part), dark grayish brown (2.5Y 4/2) moist, and light gray (2.5Y 7/2) loam (E part), grayish brown (2.5Y 5/2) moist; moderate medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine tubular pores; few faint clay films on faces of peds and lining pores; 5 percent pebbles; neutral; clear wavy boundary.
- 2Bt—39 to 50 inches; pale brown (10YR 6/3) and light gray (2.5Y 7/2) clay loam, brown (10YR 4/3) and grayish brown (2.5Y 5/2) moist; moderate medium angular blocky structure; very hard, firm, sticky and plastic; few very fine and fine roots; common very fine tubular pores; common distinct clay films on faces of peds and in pores; 5 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.
- 2BCtd—50 to 60 inches; light gray (2.5Y 7/2) dense glacial till that crushes to cobbly loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; few very fine roots; few very fine interstitial pores; few faint clay films on faces of peds; 5 percent pebbles and 5 percent cobbles; neutral.

Depth to dense glacial till is 40 to 60 inches. The particle-size control section is 27 to 35 percent clay and 5 to 25 rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles. It is slightly acid or neutral.

The AE and E horizons and the E part of the Bt/E

horizon are 5 to 15 percent pebbles. They are slightly acid or neutral.

The 2Bt horizon and the Bt part of the Bt/E horizon have hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. They are loam, sandy clay loam, or clay loam with 5 to 25 percent pebbles and 0 to 15 percent cobbles. They are slightly acid to mildly alkaline.

The 2BCtd horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is loam, sandy clay loam, or clay loam with 5 to 15 percent pebbles, 5 to 25 percent cobbles, and 0 to 5 percent stones. It is neutral or mildly alkaline.

## Nevine Series

The Nevine series consists of soils that are moderately deep to dense glacial till and are well drained (fig. 22). These soils are on toeslopes, footslopes, and backslopes of hills and mountains. They formed in a mantle of volcanic ash over glacial till. Slopes are 5 to 65 percent. Elevation is 2,000 to 4,500 feet. The average annual precipitation is 16 to 24 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Nevine silt loams association, 5 to 20 percent slopes, about 12 miles north of Nespelem; 1,500 feet north and 1,600 feet east of the southwest corner of sec. 24, T. 33 N., R. 30 E., W.M.:

- Oi—2 inches to 0; needles, twigs, and cones.
- A—0 to 1 inch; 60 percent pale brown (10YR 6/3) and 40 percent light gray (10YR 7/2) silt loam, brown (10YR 5/3) moist; moderate fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; common fine irregular pores; neutral; abrupt smooth boundary.
- Bw1—1 inch to 4 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; weakly smeary; many very fine and fine roots and common medium roots; common fine irregular pores; 2 percent pebbles; slightly acid; clear smooth boundary.
- Bw2—4 to 9 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; weakly smeary; many very fine and fine roots and common medium and coarse roots; few fine tubular pores;

2 percent pebbles; slightly acid; abrupt wavy boundary.

Bw3—9 to 18 inches; light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; weakly smeary; many very fine and fine roots; few fine tubular pores; 10 percent pebbles; slightly acid; abrupt wavy boundary.

2BC—18 to 28 inches; light yellowish brown (10YR 6/4) very gravelly sandy loam, brown (10YR 4/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; common very fine and few fine roots; few fine tubular pores; 45 percent pebbles and 5 percent cobbles; medium acid; gradual wavy boundary.

2Cd1—28 to 41 inches; white (10YR 8/2) dense glacial till that crushes to very gravelly sandy loam, brown (10YR 5/3) moist; massive; hard, friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 35 percent pebbles and 2 percent cobbles; medium acid; diffuse smooth boundary.

2Cd2—41 to 60 inches; white (10YR 8/2) dense glacial till that crushes to very gravelly loamy sand, pale brown (10YR 6/3) moist; massive; slightly hard, friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 40 percent pebbles and 5 percent cobbles; medium acid.

Depth to dense glacial till is 20 to 40 inches. The mantle of volcanic ash is 14 to 25 inches thick.

The A horizon has value of 4 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles and 0 to 5 percent cobbles. It is slightly acid or neutral.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam or loam with 0 to 20 percent pebbles and 0 to 5 percent cobbles. It is slightly acid or neutral.

The 2BC horizon has value of 4 or 5 moist and chroma of 3 or 4 dry or moist. It is loam or sandy loam with 30 to 45 percent pebbles, 0 to 20 percent cobbles, and 0 to 5 percent stones. It is medium acid to neutral.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. The upper part is sandy loam or coarse sandy loam and is very gravelly or very cobbly, and the lower part is sandy loam or loamy sand with 30 to 45 percent pebbles, 5 to 20 percent cobbles, and 0 to 15 percent stones. The horizon is medium acid to neutral.

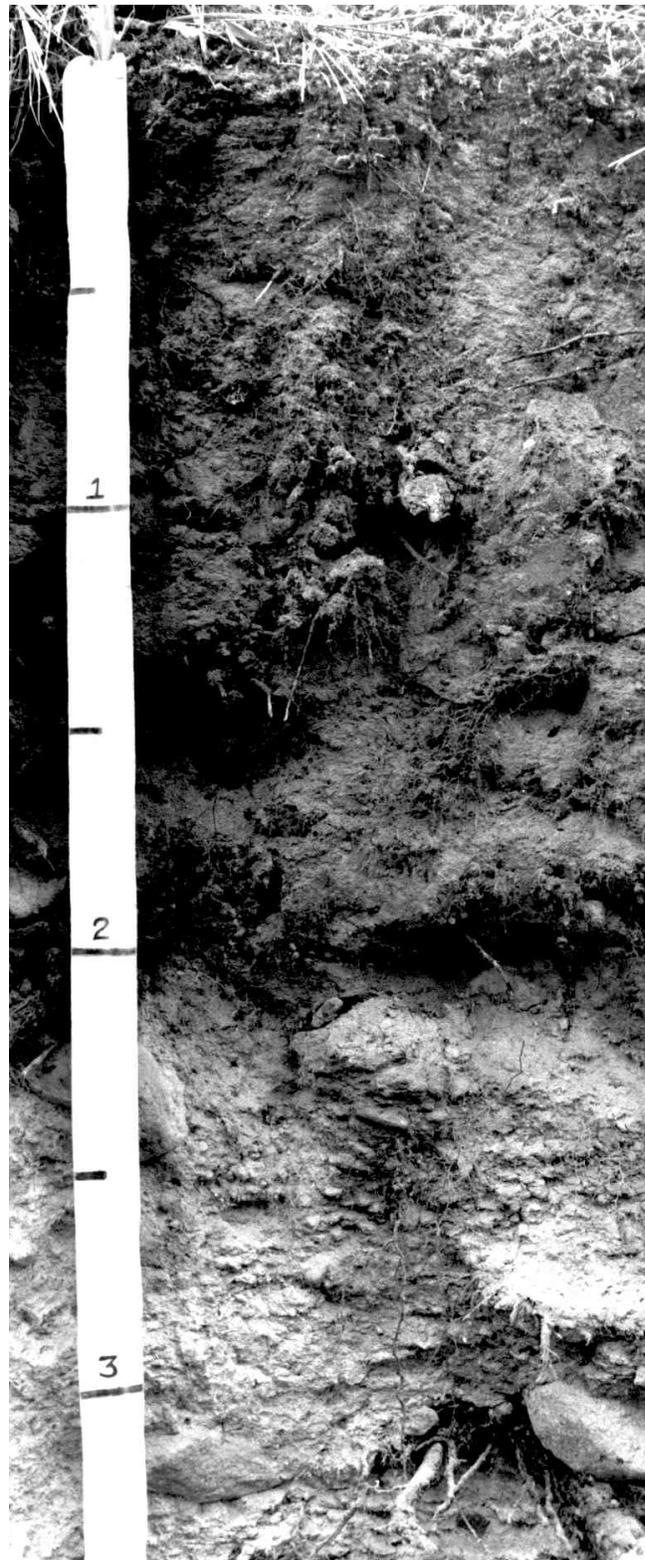

Figure 22.—Typical pedon of a Nevine soil that has a mantle of ash about 25 inches thick over loamy-skeletal glacial till to a depth of about 40 inches. Dense material is at a depth of about 40 inches. (Numbers on tape represent feet.)

## Newbell Series

The Newbell series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on toeslopes, footslopes, and backslopes of mountains. They formed in glacial till with a mantle of volcanic ash and loess. Slopes are 5 to 65 percent. Elevation is 2,400 to 4,500 feet. The average annual precipitation is 19 to 24 inches, the average annual air temperature is 43 to 45 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Newbell silt loam, dry, 5 to 20 percent slopes, about 11 miles northwest of Inchelium; 200 feet north and 50 feet west of the southeast corner of sec. 29, T. 33 N., R. 35 E., W.M.:

Oi—1.5 inches to 0; needles, leaves, and twigs.

A—0 to 1 inch; dark brown (10YR 4/3) silt loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium and coarse roots; common fine tubular pores; 10 percent pebbles; neutral; clear smooth boundary.

Bw1—1 inch to 5 inches; light yellowish brown (10YR 6/4) silt loam, dark brown (7.5YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common fine tubular pores; 10 percent pebbles; neutral; gradual wavy boundary.

Bw2—5 to 11 inches; light yellowish brown (10YR 6/4) silt loam, yellowish brown (10YR 5/6) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common fine tubular pores; 10 percent pebbles; slightly acid; gradual wavy boundary.

2Bw3—11 to 21 inches; very pale brown (10YR 7/3) very gravelly loam, yellowish brown (10YR 5/4) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; 35 percent pebbles and 5 percent cobbles; slightly acid; clear smooth boundary.

2Cd1—21 to 45 inches; very pale brown (10YR 7/3) dense glacial till that crushes to very gravelly loam, pale brown (10YR 6/3) moist; massive; hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; few fine tubular pores; 40 percent pebbles and 5 percent cobbles; slightly acid; gradual wavy boundary.

2Cd2—45 to 60 inches; very pale brown (10YR 7/3) dense glacial till that crushes to very gravelly loam, pale brown (10YR 6/3) moist; massive; hard, friable, slightly sticky and slightly plastic; very few fine roots; few fine tubular pores; 45 percent pebbles and 5 percent cobbles; slightly acid.

Depth to dense glacial till is 20 to 40 inches. The mantle of volcanic ash is 10 to 18 inches thick. The particle-size control section is 35 to 60 percent rock fragments. It is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 or 6 dry and 3 to 5 moist, and chroma of 4 to 6 dry or moist. It is 0 to 10 percent pebbles.

The 2Bw horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is loam or sandy loam with 30 to 50 percent pebbles and 5 to 15 percent cobbles. This horizon is absent in some pedons.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 35 to 60 percent pebbles and 5 to 20 percent cobbles.

## Northstar Series

The Northstar series consists of moderately deep, well drained soils on ridges, shoulders, and backslopes of hills and mountains. These soils formed in colluvium and residuum derived from rhyodacite and quartz latite with a component of loess and volcanic ash. Slopes are 5 to 65 percent. Elevation is 1,600 to 3,800 feet. The average annual precipitation is 15 to 20 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Northstar gravelly loam in an area of Northstar-Johntom-Rock outcrop complex, 30 to 65 percent slopes, about 6 miles north of Nespelem; 1,050 feet west and 2,600 feet north of the southeast corner of sec. 29, T. 32 N., R. 31 E., W.M.:

Oi—1.5 inches to 0.5 inch; ponderosa pine needles, twigs, and cones.

Oe—0.5 inch to 0; partially decomposed needles, leaves, and twigs.

A1—0 to 2 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine, fine, and medium roots and few coarse roots; common fine tubular pores; 30 percent

angular pebbles; medium acid; clear smooth boundary.

A2—2 to 11 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common fine tubular pores; 35 percent angular pebbles and 5 percent cobbles; slightly acid; clear wavy boundary.

Bw—11 to 18 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common fine irregular pores; 45 percent angular pebbles and 10 percent cobbles; slightly acid; gradual wavy boundary.

C—18 to 27 inches; pale brown (10YR 6/3) extremely cobbly loam, brown (10YR 4/3) dry; massive; slightly hard, very friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; few fine tubular pores; 40 percent angular pebbles, and 25 percent cobbles; slightly acid; gradual wavy boundary.

R—27 to 31 inches; rhyodacite bedrock.

Depth to bedrock is 20 to 40 inches. The particle-size control section is 10 to 18 percent clay and 35 to 70 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is gravelly loam or very gravelly loam with 15 to 35 percent pebbles and 0 to 5 percent cobbles. It is medium acid or slightly acid.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is 35 to 65 percent pebbles and 5 to 30 percent cobbles. It is slightly acid or neutral.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is loam or sandy loam with 35 to 65 percent pebbles, 5 to 30 percent cobbles, and 0 to 5 percent stones. It is slightly acid or neutral. This horizon is absent in some pedons.

## Ohscow Series

The Ohscow series consists of very deep, well drained soils on footslopes and backslopes of mountains. These soils formed in colluvium and residuum derived from granitic rock with a mantle of volcanic ash and loess. Slopes are 20 to 65 percent. Elevation is 2,200 to 5,000 feet. The average annual

precipitation is 20 to 25 inches, the average annual air temperature is 41 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Ohscow silt loam, 20 to 40 percent slopes, about 20 miles west of Inchelium; 500 feet south and 100 feet west of the northeast corner of sec. 16, T. 33 N., R. 34 E., W.M.:

Oi—1 inch to 0; needles, twigs, and leaves.

A—0 to 4 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; moderate fine granular structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; many very fine irregular pores; 45 percent pebbles; slightly acid; clear wavy boundary.

Bw1—4 to 11 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common fine irregular pores; 10 percent pebbles; slightly acid; abrupt wavy boundary.

2Bw2—11 to 27 inches; light gray (10YR 7/2) very gravelly sandy loam, brown (10YR 5/3) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; many very fine irregular pores; 25 percent pebbles and 10 percent cobbles; slightly acid; gradual wavy boundary.

2C1—27 to 46 inches; light gray (10YR 7/2) very cobbly sandy loam, brown (10YR 5/3) moist; massive; loose, nonsticky and nonplastic; few fine, medium, and coarse roots; few fine tubular pores; 30 percent pebbles, 20 percent cobbles, and 2 percent stones; slightly acid; gradual wavy boundary.

2C2—46 to 60 inches; light gray (10YR 7/2) very cobbly loamy sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few fine and medium roots; few fine tubular pores; 30 percent pebbles, 20 percent cobbles, and 5 percent stones; slightly acid.

The mantle of volcanic ash is 7 to 14 inches thick. The particle-size control section is 35 to 70 percent rock fragments. It is neutral or slightly acid.

The A horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 to 6 dry or moist. It is loam or silt loam with 10 to 25 percent pebbles and 0 to 5 percent cobbles.

The 2Bw horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is 20 to 45 percent pebbles and 0 to 20 percent cobbles.

The 2C1 horizon has value of 6 or 7 dry and 5 or 6 moist, and it has chroma of 2 or 3 dry and 3 or 4 moist. It is 10 to 45 percent pebbles, 15 to 30 percent cobbles, and 0 to 5 percent stones.

The 2C2 horizon has value of 6 or 7 dry and 5 or 6 moist, and it has chroma of 2 or 3 dry and 3 or 4 moist. It is loamy sand or sandy loam with 30 to 45 percent pebbles, 15 to 30 percent cobbles, and 0 to 5 percent stones.

## Okanogan Series

The Okanogan series consists of very deep, well drained soils on flood plains and low stream terraces. These soils formed in alluvium of mixed mineralogy. Slopes are 0 to 5 percent. Elevation is 780 to 900 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Okanogan loam, 0 to 5 percent slopes, about 1 mile southwest of Malott; 1,000 feet south and 300 feet west of the northeast corner of sec. 17, T. 32 N., R. 25 E., W.M.:

- A1—0 to 14 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic, many fine, medium, and coarse roots; many fine irregular pores; neutral; gradual wavy boundary.
- A2—14 to 24 inches; grayish brown (10YR 5/2) very fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and few medium roots; common fine irregular pores and few fine tubular pores; mildly alkaline; gradual wavy boundary.
- AC—24 to 42 inches; brown (10YR 5/3) very fine sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and few medium roots; few fine irregular and tubular pores; slightly effervescent; mildly alkaline; gradual wavy boundary.
- C1—42 to 48 inches; pale brown (10YR 6/3) fine sandy loam, dark yellowish brown (10YR 4/3) moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; few fine irregular and tubular pores; slightly effervescent; mildly alkaline; clear wavy boundary.
- C2—48 to 51 inches; pale brown (10YR 6/3) fine

sand, dark yellowish brown (10YR 3/4) moist; single grain; loose, nonsticky and nonplastic; few fine roots; few fine irregular and tubular pores; slightly effervescent; mildly alkaline; abrupt wavy boundary.

- C3—51 to 60 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; few fine irregular and tubular pores; slightly effervescent; moderately alkaline.

The particle-size control section is 0 to 10 percent pebbles. The mollic epipedon is 20 to 35 inches thick. The content of organic carbon decreases irregularly as depth increases. Occasional periods of flooding occur in January through April.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is neutral or mildly alkaline.

The AC horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry. It is loam, silt loam, or very fine sandy loam. It is neutral or mildly alkaline. This horizon is absent in some pedons.

The C horizon has value of 5 or 6 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry and 2 to 4 moist. It is stratified sand to silt loam. In some pedons the lower part has lenses of loamy fine sand or fine sand 1 to 3 inches thick. The horizon is mildly alkaline or moderately alkaline.

## Olical Series

The Olical series consists of deep, well drained soils on mounds in areas of patterned ground on basalt plateaus. These soils formed in loess mixed with material weathered from basalt. Slopes are 0 to 30 percent. Elevation is 2,300 to 2,700 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Olical silt loam in an area of Bakeoven-Olical complex, 0 to 30 percent slopes, about 2 miles east of Coulee Dam; 1,200 feet north and 1,600 feet east of the southwest corner of sec. 33, T. 29 N., R. 33 E., W.M.:

- A1—0 to 2 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/3) moist; weak very fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine roots; many very fine irregular pores; 3 percent pebbles; neutral; abrupt smooth boundary.
- A2—2 to 15 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak medium

subangular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; common very fine roots; many very fine irregular pores; 3 percent pebbles; neutral; clear smooth boundary.

Bw—15 to 23 inches; light yellowish brown (10YR 6/4) silt loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; common very fine and fine roots; common very fine tubular pores; 5 percent pebbles; strongly effervescent; strongly alkaline; clear smooth boundary.

Bk1—23 to 38 inches; light yellowish brown (10YR 6/4) gravelly silt loam, yellowish brown (10YR 5/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common fine and medium roots; common very fine tubular pores; 20 percent pebbles; common fine filaments of secondary lime; violently effervescent; strongly alkaline; clear smooth boundary.

Bk2—38 to 51 inches; light yellowish brown (10YR 6/4) gravelly loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, slightly sticky and nonplastic; few fine roots; few fine tubular pores; 30 percent pebbles; common fine filaments of secondary lime; violently effervescent; strongly alkaline; abrupt smooth boundary.

R—51 to 55 inches; basalt bedrock.

Depth to bedrock is 40 to 60 inches. Depth to secondary carbonates is 20 to 40 inches. The mollic epipedon is 10 to 18 inches thick. The particle-size control section is 10 to 18 percent clay and 5 to 20 percent rock fragments.

The A horizon has chroma of 2 or 3 dry or moist.

The Bw horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam, loam, or very fine sandy loam with 0 to 15 percent rock fragments. It is moderately alkaline or strongly alkaline.

The Bk horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is silt loam or loam. The upper part is 10 to 30 percent pebbles and 0 to 5 percent cobbles, and the lower part is 20 to 40 percent pebbles and 0 to 20 percent cobbles.

The Olical soils in this survey area are a taxadjunct to the Olical series because the particle-size control section is coarse-loamy and that of the series is coarse-silty. This difference, however, does not significantly affect use and management.

## Omak Series

The Omak series consists of soils that are moderately deep to a duripan and are moderately well drained. These soils are on terraces. They formed in intermixed glacial lake sediment and glacial till with a component of loess and volcanic ash. Slopes are 0 to 8 percent. Elevation is 2,100 to 3,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Omak silt loam, 0 to 8 percent slopes, about 11 miles east of Omak; 1,100 feet north and 1,500 feet west of the southeast corner of sec. 21, T. 33 N., R. 28 E., W.M.:

Oi—2 inches to 0; ponderosa pine needles, twigs, and cones.

A1—0 to 5 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak very fine subangular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; common very fine and fine roots; many very fine irregular pores; neutral; clear smooth boundary.

A2—5 to 10 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common fine and few medium roots; many very fine irregular pores; neutral; clear smooth boundary.

E—10 to 15 inches; pale brown (10YR 6/3) silt loam, brown (10YR 5/3) moist; weak fine subangular blocky structure; hard, firm, slightly sticky and slightly plastic; common fine and medium roots and few coarse roots; common very fine tubular pores; 2 percent pebbles; neutral; abrupt smooth boundary.

Bt/E—15 to 26 inches; 60 percent light brownish gray (2.5Y 6/2) silt loam (B part), olive brown (2.5Y 4/4) moist, and 40 percent light gray (2.5Y 6/2) silt loam (E part), light brownish gray (2.5Y 6/2) moist; moderate fine angular blocky structure; hard, firm, slightly sticky and slightly plastic; few fine roots; common fine irregular pores; few faint clay films on faces of peds (B part); neutral; abrupt smooth boundary.

Bt—26 to 38 inches; light yellowish brown (2.5Y 6/4) silty clay loam, olive brown (2.5Y 4/4) moist; moderate fine angular blocky structure; hard, firm, sticky and plastic; few fine roots; few fine tubular pores; common distinct clay films on faces of peds; neutral; clear smooth boundary.

Bqm—38 to 45 inches; light yellowish brown (2.5Y 6/4) strongly silica-cemented duripan, olive brown

(2.5Y 4/4) moist; massive; very hard, very firm, slightly sticky and nonplastic; mat of very fine roots at top of duripan; 5 percent pebbles; moderately alkaline; abrupt wavy boundary.

Bkqm—45 to 60 inches; light gray (2.5Y 7/2), indurated, silica-cemented duripan, olive brown (2.5Y 4/4) moist; massive; 5 percent pebbles; weakly effervescent; few masses of segregated lime; strongly alkaline.

The mollic epipedon is 7 to 14 inches thick. Depth to the strongly cemented duripan is 20 to 40 inches, and depth to the indurated duripan is 40 to 60 inches. The particle-size control section is 35 to 45 percent clay. A perched water table is present in February through April.

The A horizon has value of 4 or 5 dry and chroma of 1 to 3 dry or moist. It is 0 to 10 percent pebbles. It is slightly acid or neutral.

The E horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loam or silt loam with 0 to 10 percent pebbles. It is slightly acid or neutral.

The Bt part of the Bt/E horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. The E part has hue of 10YR or 2.5Y, value of 6 to 8 dry and 5 or 6 moist, and chroma of 1 to 3 dry or moist. It is 0 to 10 percent pebbles. It is slightly acid or neutral.

The Bt horizon has hue of 2.5Y or 10YR, value of 5 to 7 dry and 4 to 7 moist, and chroma of 2 to 4 dry or moist. It is clay loam, silty clay loam, or silty clay with 0 to 10 percent pebbles and 0 to 5 percent cobbles.

The Bqm horizon has hue of 2.5Y or 10YR, value of 5 to 7 dry and 4 to 7 moist, and chroma of 2 to 4 dry or moist. It is mildly alkaline or moderately alkaline.

The Bkqm horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is moderately alkaline or strongly alkaline.

## Owhi Series

The Owhi series consists of very deep, well drained soils on terraces and terrace escarpments. These soils formed in glacial outwash with a component of loess in the upper part. Slopes are 0 to 30 percent. Elevation is 1,200 to 2,700 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Owhi loam, 0 to 8 percent slopes, about 6 miles northeast of Nespelem; 1,200 feet north and 600 feet west of the southeast corner of sec. 1, T. 31 N., R. 31 E., W.M.:

A1—0 to 7 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; many very fine and fine roots; many very fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

A2—7 to 12 inches; brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine and fine roots; many very fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

Bw—12 to 20 inches; light yellowish brown (10YR 6/4) gravelly loam, dark yellowish brown (10YR 4/4) moist; moderate medium and fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common very fine roots; common fine irregular pores; 15 percent pebbles; neutral; clear wavy boundary.

BC—20 to 26 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; few fine tubular pores; 40 percent pebbles and 2 percent cobbles; neutral; abrupt smooth boundary.

C—26 to 60 inches; multicolored extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few fine roots; few fine tubular pores; 70 percent pebbles; neutral.

The mollic epipedon is 9 to 14 inches thick. The particle-size control section is 35 to 50 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is loam, stony loam, or fine sandy loam with 0 to 15 percent pebbles and 0 to 5 percent stones. It is slightly acid or neutral.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loam or sandy loam with 10 to 30 percent pebbles and 0 to 10 percent cobbles. It is slightly acid or neutral.

The BC horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loamy sand, sandy loam, or fine sandy loam with 10 to 40 percent pebbles and 0 to 5 percent cobbles. It is slightly acid or neutral.

The C horizon is multicolored. It is loamy sand or coarse sand with 40 to 70 percent pebbles and 0 to 5 percent cobbles. It is neutral or mildly alkaline.

## Oxerine Series

The Oxerine series consists of moderately deep, well drained soils on footslopes, backslopes, shoulders, and ridges of hills and mountains. These soils formed in residuum and colluvium derived from metamorphic and sedimentary rock with a mantle of volcanic ash. Slopes are 5 to 65 percent. Elevation is 2,000 to 5,700 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 45 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Oxerine silt loam, 5 to 20 percent slopes, about 10 miles northwest of Inchelium; 1,000 feet north and 500 feet east of the southwest corner of sec. 25, T. 34 N., R. 35 E., W.M.:

- Oi—1 inch to 0; needles, twigs, and leaves.
- A—0 to 5 inches; brown (10YR 5/3) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; many very fine irregular pores; 10 percent pebbles; slightly acid (NaF pH 10.1); clear wavy boundary.
- Bw1—5 to 11 inches; brown (10YR 5/3) channery silt loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; common fine irregular pores; 25 percent channers; slightly acid (NaF pH 10.1); gradual wavy boundary.
- 2Bw2—11 to 20 inches; light yellowish brown (10YR 6/4) very channery loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, friable, nonsticky and slightly plastic; many very fine and fine roots; common fine irregular pores; 35 percent channers and 5 percent flagstones; neutral; abrupt wavy boundary.
- 2C—20 to 28 inches; light yellowish brown (10YR 6/4) very channery loam, yellowish brown (10YR 5/4) moist; massive; soft, friable, nonsticky and slightly plastic; few very fine roots; few fine tubular pores; 45 percent channers, 15 percent soft channer-sized fragments, and 15 percent flagstones; neutral; abrupt irregular boundary.
- 2R—28 inches; phyllite bedrock.

Depth to bedrock is 20 to 40 inches. The mantle of volcanic ash is 9 to 14 inches thick.

The A horizon has value of 4 or 5 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is 5 to 15 percent channers and pebbles. The horizon is slightly acid or neutral.

The Bw and 2Bw horizons have hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 to 5 moist, and

chroma of 3 or 4 dry or moist. They are silt loam or loam with 0 to 35 percent channers, 0 to 20 percent pebbles, 0 to 5 percent flagstones, and 0 to 5 percent cobbles. They are slightly acid or neutral.

The 2C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 6 moist, and chroma of 1 to 4 dry or moist. It is sandy loam or loam with 0 to 50 percent channers, 15 to 45 percent pebbles, 10 to 40 percent flagstones, 0 to 20 percent cobbles, and 0 to 5 percent stones. It is dominantly slightly acid or neutral, but it is mildly alkaline or moderately alkaline in the soils of the limestone substratum phase (detailed soil map unit 384).

## Parmenter Series

The Parmenter series consists of very deep, well drained soils on kames, kame terraces, and outwash terraces. These soils formed in glacial outwash with a mantle of volcanic ash. Slopes are 0 to 40 percent. Elevation is 1,900 to 3,500 feet. The average annual precipitation is 15 to 22 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Parmenter silt loam, 0 to 8 percent slopes, about 22 miles northeast of Nespelem; 100 feet south and 300 feet east of the northwest corner of sec. 24, T. 34 N., R. 32 E., W.M.:

- Oi—0.5 inch to 0; needles, twigs, bark, and cones.
- A—0 to 4 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and common medium roots; few very fine irregular pores; 10 percent pebbles and 3 percent cobbles; neutral; clear wavy boundary.
- Bw—4 to 16 inches; pale brown (10YR 6/3) stony silt loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and common medium and coarse roots; few very fine irregular pores; 10 percent pebbles, 5 percent cobbles, and 2 percent stones; neutral; abrupt wavy boundary.
- 2C1—16 to 31 inches; pale brown (10YR 6/3) very stony loamy sand, brown (10YR 4/3) moist; massive; loose, nonsticky and nonplastic; common very fine, fine, and medium roots; 25 percent pebbles, 20 percent cobbles, and 10 percent stones; neutral; clear wavy boundary.
- 2C2—31 to 60 inches; multicolored extremely cobbly coarse sand; single grain; loose, nonsticky and nonplastic; coarsely stratified; 35 percent pebbles,

20 percent cobbles, and 10 percent stones; neutral.

The mantle of volcanic ash is 14 to 28 inches thick. The profile is slightly acid or neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is silt loam or bouldery silt loam with 0 to 10 percent pebbles, 0 to 10 percent cobbles, and 0 to 5 percent stones and boulders.

The Bw horizon has chroma of 3 or 4 dry or moist. It is 0 to 15 percent pebbles, 5 to 15 percent cobbles, and 0 to 5 percent stones and boulders.

The upper part of the 2C horizon has value of 6 or 7 dry and chroma of 2 or 3 dry or moist, and the lower part is multicolored. The horizon typically is stratified loamy fine sand, loamy sand, sand, loamy coarse sand, or coarse sand with 25 to 60 percent pebbles, 20 to 25 percent cobbles, and 5 to 25 percent stones and boulders.

## Peshastin Series

The Peshastin series consists of very deep, well drained soils on moraines and terraces. These soils formed in glacial outwash and ablation glacial till with a component of loess. Slopes are 0 to 60 percent. Elevation is 900 to 2,400 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Peshastin stony fine sandy loam, 0 to 10 percent slopes, about 7 miles northeast of Bridgeport; 300 feet south and 1,800 feet east of the northwest corner of sec. 35, T. 30 N., R. 26 E., W.M.:

A—0 to 10 inches; grayish brown (10YR 5/2) stony fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium granular structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots; common fine and medium interstitial pores; 5 percent pebbles, 5 percent cobbles, and 5 percent stones and boulders; mildly alkaline; gradual wavy boundary.

Bw—10 to 21 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, friable, nonsticky and nonplastic; few fine and medium roots; common fine and medium interstitial pores; 5 percent pebbles and 5 percent cobbles; mildly alkaline; clear wavy boundary.

Bk—21 to 60 inches; light yellowish brown (10YR 6/4) very gravelly sandy loam, dark brown (10YR 4/3) moist; massive; soft, friable, nonsticky and nonplastic; few fine roots; few fine tubular pores;

40 percent pebbles, 10 percent cobbles, and 5 percent stones; accumulation of secondary carbonates on underside of rock fragments; strongly effervescent; moderately alkaline.

Depth to secondary carbonates is 15 to 27 inches. The mollic epipedon is 7 to 16 inches thick.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is stony fine sandy loam or extremely bouldery loam with 5 to 25 percent stones and boulders, 5 to 25 percent cobbles, and 5 to 25 percent pebbles. It is neutral or mildly alkaline.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loam, fine sandy loam, or sandy loam with 5 to 15 percent pebbles, 5 to 15 percent cobbles, and 0 to 5 percent stones. It is neutral or mildly alkaline.

The Bk horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is 30 to 60 percent pebbles, 10 to 25 percent cobbles, and 0 to 5 percent stones. It is mildly alkaline to strongly alkaline.

## Phoebe Series

The Phoebe series consists of very deep, well drained soils on terraces, terrace escarpments, and backslopes of hills. These soils formed in glacial till and outwash with a component of volcanic ash and loess. Slopes are 0 to 65 percent. Elevation is 1,300 to 2,500 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Phoebe fine sandy loam, 40 to 65 percent slopes, about 6 miles northeast of Omak; 790 feet south and 1,450 feet east of the northwest corner of sec. 10, T. 34 N., R. 27 E., W.M.:

A1—0 to 3 inches; dark grayish brown (10YR 4/2) fine sandy loam, black (10YR 2/1) moist; weak thin platy structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; many very fine irregular pores; neutral; clear smooth boundary.

A2—3 to 11 inches; grayish brown (10YR 5/2) fine sandy loam, very dark brown (10YR 2/2) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and fine roots; many very fine irregular pores; neutral; clear smooth boundary.

Bw1—11 to 30 inches; brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; few

very fine, fine, medium, and coarse roots; many very fine irregular pores; neutral; clear smooth boundary.

Bw2—30 to 47 inches; pale brown (10YR 6/3) sandy loam, dark brown (10YR 4/3) moist; weak fine and medium subangular blocky structure; slightly hard, very friable, nonsticky and slightly plastic; few very fine, fine, and medium roots; many very fine irregular pores; neutral; clear wavy boundary.

C—47 to 60 inches; pale brown (10YR 6/3) loamy sand, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; neutral.

The mollic epipedon is 20 to 32 inches thick. Depth to the C horizon is 30 to 60 inches or more. The particle-size control section averages 0 to 10 percent rock fragments and 5 to 15 percent clay. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is fine sandy loam or sandy loam with 0 to 10 percent pebbles.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loamy sand or sand with 0 to 15 percent pebbles.

## Picard Series

The Picard series consists of very deep, well drained soils on terraces and terrace escarpments. These soils formed in glacioluvial material with a component of loess. Slopes are 0 to 30 percent. Elevation is 1,200 to 2,700 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Picard very fine sandy loam, 0 to 8 percent slopes, about 2 miles east of Nespelem; 2,000 feet south and 2,150 feet west of the northeast corner of sec. 20, T. 31 N., R. 31 E., W.M.:

A1—0 to 5 inches; grayish brown (10YR 5/2) very fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots and common medium roots; many very fine tubular pores; neutral; clear smooth boundary.

A2—5 to 16 inches; brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; weak medium

subangular blocky structure parting to weak fine subangular blocky; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots and few medium roots; common very fine tubular pores; neutral; clear smooth boundary.

Bw1—16 to 27 inches; light yellowish brown (10YR 6/4) fine sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very few roots, common fine roots, and few medium roots, common very fine tubular pores; neutral; clear smooth boundary.

Bw2—27 to 40 inches; light yellowish brown (10YR 6/4) fine sandy loam, olive brown (2.5Y 4/4) moist; weak medium subangular blocky structure parting to weak fine subangular blocky; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine tubular pores; neutral; gradual smooth boundary.

C1—40 to 51 inches; light yellowish brown (10YR 6/4) fine sandy loam, olive brown (2.5Y 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; few very fine tubular pores; neutral; gradual smooth boundary.

C2—51 to 60 inches; light yellowish brown (2.5Y 6/4) loamy fine sand, light olive brown (2.5Y 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few very fine tubular pores; neutral.

The mollic epipedon is 10 to 18 inches thick. The solum is 25 to 45 inches thick. The particle-size control section is 5 to 15 percent clay and 0 to 10 percent pebbles.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 5 percent pebbles. It is slightly acid or neutral.

The Bw horizon has hue of 10YR or 2.5Y moist, value of 5 or 6 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is very fine sandy loam, fine sandy loam, or loam with 0 to 10 percent pebbles. It is slightly acid or neutral.

The C horizon has hue of 10YR or 2.5Y, value of 6 to 8 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. The upper part is very fine sandy loam, fine sandy loam, or sandy loam, and the lower part is very fine sandy loam or loamy fine sand. The horizon is 0 to 20 percent pebbles. It is neutral or mildly alkaline.

## Pogue Series

The Pogue series consists of very deep, somewhat excessively drained soils on terraces and terrace

escarpments. These soils formed in glacial outwash with a component of loess in the upper part. Slopes are 0 to 65 percent. Elevation is 800 to 2,000 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Pogue fine sandy loam, 0 to 5 percent slopes, about 2 miles northeast of Elmer City; 900 feet south and 580 feet east of the northeast corner of sec. 16, T. 29 N., R. 31 E., W.M.:

- A1—0 to 2 inches; brown (10YR 5/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; moderate medium platy structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; many very fine tubular pores; neutral; clear smooth boundary.
- A2—2 to 8 inches; brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; moderate thick platy structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common very fine and fine tubular pores; neutral; clear smooth boundary.
- Bw—8 to 14 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine and fine roots and few medium roots; common very fine tubular pores; 5 percent pebbles; neutral; clear wavy boundary.
- BC—14 to 22 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; common very fine tubular pores; 25 percent pebbles; mildly alkaline; abrupt wavy boundary.
- 2C1—22 to 29 inches; light brownish gray (2.5Y 6/2) very gravelly loamy coarse sand, dark brownish gray (2.5Y 5/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; 45 percent pebbles and 10 percent cobbles; mildly alkaline; clear wavy boundary.
- 2C2—29 to 60 inches; multicolored very gravelly sand; single grain; loose, nonsticky and nonplastic; few very fine roots; 55 percent pebbles and 10 percent cobbles; moderately alkaline.

The mollic epipedon is 7 to 16 inches thick. Depth to the 2C horizon is 20 to 30 inches. The upper part of the particle-size control section is 35 to 70 percent rock fragments.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is fine sandy loam, gravelly fine

sandy loam, or stony fine sandy loam with 0 to 30 percent pebbles, 0 to 15 percent cobbles, and 0 to 5 percent stones. It is neutral or mildly alkaline.

The Bw horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is fine sandy loam, sandy loam, or loam with 5 to 30 percent pebbles and 0 to 10 percent cobbles. It is neutral or mildly alkaline.

The BC horizon is absent in some pedons.

The upper part of the 2C horizon has hue of 10YR or 2.5Y, and the lower part is multicolored. The horizon is coarse sand, loamy coarse sand, sand, or loamy sand with 30 to 55 percent pebbles and 5 to 30 percent cobbles. It is neutral to moderately alkaline.

## Poween Series

The Poween series consists of very deep, moderately well drained soils on stream terraces and alluvial fans. These soils formed in calcareous alluvium of mixed mineralogy. Slopes are 0 to 5 percent. Elevation is 1,600 to 2,600 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Poween loam, 0 to 5 percent slopes, about 6 miles southeast of Nespelem; 1,800 feet south and 600 feet east of the northwest corner of sec. 12, T. 30 N., R. 31 E., W.M.:

- A1—0 to 12 inches; very dark gray (10YR 3/1) loam, black (10YR 2/1) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots; many very fine irregular pores; 5 percent pebbles; moderately alkaline; gradual wavy boundary.
- A2—12 to 30 inches; dark grayish brown (10YR 4/2) sandy loam, very dark gray (10YR 3/1) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots; many very fine irregular pores; 10 percent pebbles; violently effervescent; strongly alkaline; clear wavy boundary.
- AC—30 to 44 inches; grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common fine roots; many very fine irregular pores; 10 percent pebbles; violently effervescent; strongly alkaline; clear wavy boundary.
- C—44 to 60 inches; light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, slightly sticky and nonplastic; few fine roots; few fine tubular pores;

10 percent pebbles; violently effervescent; moderately alkaline.

The mollic epipedon is 20 to 50 inches thick. The particle-size control section is 5 to 18 percent clay and 0 to 15 percent pebbles. It is moderately alkaline or strongly alkaline. An apparent water table is present in February through May.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. The lower part is loam, silt loam, or sandy loam with 0 to 10 percent pebbles.

The AC horizon has value of 5 or 6 dry and chroma of 2 or 3 dry or moist. It is sandy loam, fine sandy loam, or loam with 0 to 10 percent pebbles.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 1 to 3 dry or moist. It is stratified loamy fine sand to silt loam with 0 to 15 percent pebbles. Mottles are below a depth of 40 inches in some pedons.

## Quincy Series

The Quincy series consists of very deep, excessively drained soils on outwash terraces, dunes, and alluvial fans. These soils formed in eolian sand and glacial outwash sand. Slopes are 0 to 60 percent. Elevation is 800 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Quincy loamy fine sand, 0 to 10 percent slopes, about 6 miles east of Coulee Dam; 3,200 feet south and 200 feet east of the northwest corner of sec. 31, T. 29 N., R. 32 E., W.M.:

- A—0 to 5 inches; grayish brown (10YR 5/2) loamy fine sand, very dark grayish brown (10YR 3/2) moist; single grain; loose, nonsticky and nonplastic; many very fine and common fine roots; mildly alkaline; clear smooth boundary.
- C1—5 to 28 inches; brown (10YR 5/3) loamy fine sand, dark brown (10YR 3/3) moist; single grain; loose, nonsticky and nonplastic common very fine and few fine roots; moderately alkaline; gradual smooth boundary.
- C2—28 to 44 inches; pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; strongly effervescent; moderately alkaline; clear smooth boundary.
- C3—44 to 52 inches; light brownish gray (10YR 6/2) loamy sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; violently effervescent; few soft masses of

secondary lime; moderately alkaline; clear smooth boundary.

- C4—52 to 60 inches; multicolored coarse sand; single grain; loose, nonsticky and nonplastic; few very fine roots; slightly effervescent; moderately alkaline.

The particle-size control section is 0 to 5 percent clay and less than 75 percent very coarse, coarse, and medium sand. The organic matter content in the surface layer is less than 1 percent when mixed.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is sand, loamy sand, fine sand, or loamy fine sand. It is neutral or mildly alkaline. This horizon is absent in some pedons.

The C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is dominantly sand, fine sand, loamy fine sand, or loamy sand, but it is coarse sand below a depth of 40 inches in some pedons. The horizon is dominantly 0 to 5 percent pebbles, but in detailed soil map unit 363 some parts of this horizon are 15 to 25 percent pebbles and 0 to 5 percent cobbles. The C horizon is neutral to moderately alkaline.

## Raisio Series

The Raisio series consists of moderately deep, well drained soils on ridges, shoulders, and backslopes of hills and mountains. These soils formed in colluvium and residuum derived from metamorphic rock with an admixture of volcanic ash and loess. Slopes are 8 to 65 percent. Elevation is 1,900 to 4,700 feet. The average annual precipitation is 15 to 22 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Raisio channery loam, dry, 40 to 65 percent slopes, about 23 miles northeast of Nespelem; 900 feet west and 2,600 feet north of the southeast corner of sec. 1, T. 34 N., R. 31 E., W.M.:

- Oi—1 inch to 0; needles, twigs, bark, and cones.
- A1—0 to 5 inches; grayish brown (10YR 5/2) channery loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; many very fine irregular pores; 25 percent channers; neutral; clear smooth boundary.
- A2—5 to 12 inches; grayish brown (10YR 5/2) very channery loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common fine and few medium

roots; many very fine irregular pores; 40 percent channers; neutral; clear wavy boundary.

Bw—12 to 28 inches; grayish brown (2.5Y 5/2) very channery loam, dark grayish brown (2.5Y 4/2) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few very fine and common fine roots; few fine tubular pores; 50 percent channers; slightly acid; abrupt wavy boundary.

R—28 to 32 inches; phyllite bedrock.

Depth to bedrock is 20 to 40 inches. The profile is neutral or slightly acid.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. The upper part is 15 to 25 percent channers and 0 to 5 percent flagstones, and the lower part is loam or sandy loam with 20 to 50 percent channers and 0 to 25 percent flagstones.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 20 to 50 percent channers and 0 to 25 percent flagstones.

The C horizon, where present, has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry and 2 to 4 moist. It is loam or sandy loam with 35 to 80 percent rock fragments, including 20 to 50 percent channers and 5 to 40 percent flagstones.

The Raisio soils in this survey area are a taxadjunct to the Raisio series because they are classified as Ultic Haploxerolls and the series is classified as Entic Ultic Haploxerolls. This difference, however, does not significantly affect use and management.

## Ralsen Series

The Ralsen series consists of very deep, poorly drained soils on flood plains and low stream terraces. These soils formed in alluvium of mixed mineralogy. Slopes are 0 to 3 percent. Elevation is 1,700 to 2,600 feet. The average annual precipitation is 14 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Ralsen silt loam, 0 to 3 percent slopes, about 8 miles north of Nespelem; 300 feet north and 1,800 feet east of the southwest corner of sec. 17, T. 32 N., R. 31 E., W.M.:

Ap—0 to 6 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; strong medium and coarse granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine irregular

pores; 2 percent rounded pebbles; neutral; clear smooth boundary.

A—6 to 11 inches; dark grayish brown (10YR 4/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine irregular pores; 2 percent rounded pebbles; neutral; clear smooth boundary.

Cg1—11 to 20 inches; light gray (10YR 7/2) sandy loam, dark grayish brown (10YR 4/2) moist; few fine prominent mottles that are yellowish red (5YR 5/6) when moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; common very fine tubular pores; 5 percent rounded pebbles; neutral; abrupt smooth boundary.

Cg2—20 to 26 inches; light gray (10YR 7/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; common fine prominent mottles that are yellowish red (5YR 5/6) when moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; common very fine tubular pores; neutral; clear smooth boundary.

Cg3—26 to 42 inches; white (10YR 8/1) fine sandy loam, light gray (10YR 7/2) moist; common medium prominent mottles that are strong brown (7.5YR 5/6) when moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; neutral; abrupt smooth boundary.

2C—42 to 60 inches; brown (10YR 5/4) gravelly coarse sandy loam, dark brown (10YR 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 20 percent rounded pebbles; neutral.

These soils are saturated in winter and spring. The particle-size control section is 0 to 15 percent pebbles by weighted average. The mollic epipedon is 10 to 20 inches thick. The profile is slightly acid or neutral. An apparent water table is present in December through August. Occasional periods of flooding occur in March through May.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist. It is 0 to 5 percent pebbles.

The Cg horizon has value of 5 to 8 dry and 4 to 7 moist, and it has chroma of 1 or 2 dry or moist. It is stratified silt loam to sandy loam with 0 to 10 percent pebbles.

The 2C horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is stratified fine sandy loam to sand with 0 to 25 percent pebbles.

## Ratlake Series

The Ratlake series consists of soils that are shallow to a duripan and are poorly drained. These soils are in closed depressions on valley flats. They formed in glacial lake sediment with some additions of recent alluvium. Slopes are 0 to 2 percent. Elevation is 1,100 to 1,350 feet. The average annual precipitation is 9 to 11 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Ratlake silty clay loam, 0 to 2 percent slopes, about 16 miles west of Nespelem; 850 feet south and 250 feet west of the northeast corner of sec. 5, T. 30 N., R. 28 E., W.M.:

Bgkzn1—0 to 2 inches; light gray (10YR 7/1) silty clay loam, gray (10YR 6/1) moist; massive; very hard, very firm, very sticky and very plastic; common very fine and fine roots; few fine tubular pores; common masses of lime; violently effervescent; very strongly alkaline; clear wavy boundary.

Bgkzn2—2 to 18 inches; gray (10YR 6/1) silty clay loam, gray (10YR 5/1) moist; massive; very hard, very firm, very sticky and very plastic; few very fine and fine roots; few fine tubular pores; common masses of lime; violently effervescent; very strongly alkaline; clear wavy boundary.

Bkqm—18 to 22 inches; light gray (10YR 7/1), lime- and silica-cemented, indurated duripan that crushes to loam, gray (10YR 6/1) moist; massive; extremely hard, extremely firm, slightly sticky and slightly plastic when crushed; violently effervescent; very strongly alkaline.

Depth to the duripan is 10 to 20 inches. The particle-size control section is 22 to 35 percent clay. A perched water table is present in January through July. These soils are ponded in March through May.

The Bgkzn horizon has hue of 10YR or 2.5Y and value of 6 or 7 dry and 4 to 6 moist. It is silt loam or silty clay loam with 0 to 10 percent hard durinodes.

The Bkqm horizon has hue of 10YR or 2.5Y and value of 7 or 8 dry and 5 or 6 moist.

## Reardan Series

The Reardan series consists of very deep, well drained soils on plateaus and broad summits of hills. These soils formed in loess. Slopes are 0 to 15 percent. Elevation is 2,500 to 2,800 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Reardan silt loam, 0 to 8 percent

slopes, about 6 miles northeast of North Keller Ferry Landing; 1,200 feet east and 100 feet north of the southwest corner of sec. 31, T. 29 N., R. 34 E., W.M.:

Oi—1 inch to 0; needles and twigs.

A1—0 to 4 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine tubular pores; neutral; clear smooth boundary.

A2—4 to 11 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; many very fine irregular pores; neutral; clear smooth boundary.

E—11 to 22 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; moderate medium angular blocky structure; hard, friable, slightly sticky and slightly plastic; few very fine, fine, medium, and coarse roots; many very fine irregular pores; neutral; clear smooth boundary.

Bt/E—22 to 38 inches; 60 percent brown (7.5YR 5/4) silty clay brown (B part), dark yellowish brown (10YR 3/4) moist, and 40 percent pale brown (10YR 6/3) silt loam (E part), brown (10YR 4/3) moist; moderate medium angular blocky structure parting to fine angular blocky; very hard, firm, sticky and plastic; few very fine, fine, and medium roots; many very fine irregular pores; many faint clay films on faces of peds and lining pores; neutral; gradual smooth boundary.

Bt—38 to 51 inches; brown (7.5YR 5/4) silty clay, dark brown (7.5YR 4/4) moist; moderate medium angular blocky structure; very hard, firm, sticky and plastic; few very fine and fine roots; many very fine irregular pores; many faint clay films on faces of peds and lining pores; neutral; gradual smooth boundary.

Btk—51 to 60 inches; light brown (7.5YR 6/4) silty clay loam, brown (7.5YR 5/4) moist; weak medium angular blocky structure; hard, firm, sticky and plastic; few very fine and fine roots; many very fine irregular pores; common faint clay films on faces of peds and lining pores; few fine soft masses of secondary carbonates; slightly effervescent; mildly alkaline.

The mollic epipedon is 10 to 15 inches thick. Depth to secondary carbonates is 45 to 60 inches or more. The particle-size control section is 35 to 45 percent clay.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is slightly acid or neutral.

The E horizon is silt loam or silty clay loam.

The Bt part of the Bt/E horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 4 to 6 dry or moist. The E part has chroma of 3 or 4 dry or moist.

The Bt horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 4 or 5 moist, and chroma of 4 to 6 dry or moist. It is silty clay loam, clay, or silty clay. It is neutral or moderately alkaline.

The Btk horizon has color similar to that of the Bt horizon. The Btk horizon is silt loam or silty clay loam. It is mildly alkaline or moderately alkaline.

The Reardon soils in this survey area are a taxadjunct to the Reardon series because they are classified as Typic Argixerolls and the series is classified as Calcic Argixerolls. This difference, however, does not significantly affect use and management.

## Rebecca Series

The Rebecca series consists of very deep, well drained soils on alluvial fans. These soils formed in alluvium of mixed mineralogy. Slopes are 0 to 15 percent. Elevation is 1,200 to 2,600 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Rebecca gravelly sandy loam, 3 to 15 percent slopes, about 4 miles northeast of Coulee Dam; 1,800 feet east and 1,200 feet south of the northwest corner of sec. 27, T. 29 N., R. 31 E., W.M.:

- A1—0 to 9 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure parting to weak fine granular; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine irregular pores; 20 percent pebbles; neutral; clear smooth boundary.
- A2—9 to 15 inches; grayish brown (10YR 5/2) gravelly sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; common very fine and fine roots; many very fine irregular pores; 30 percent pebbles; neutral; clear smooth boundary.
- Bw1—15 to 29 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 5/3) moist; weak fine

subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine and fine roots; few fine tubular pores; 20 percent pebbles; neutral; clear smooth boundary.

Bw2—29 to 45 inches; light yellowish brown (10YR 6/4) gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and nonplastic; common very fine and fine roots; few fine tubular pores; 20 percent pebbles; neutral; clear wavy boundary.

C—45 to 60 inches; light yellowish brown (10YR 6/4) gravelly coarse sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 30 percent pebbles; neutral.

The mollic epipedon is 12 to 18 inches thick. The particle-size control section is 15 to 35 percent rock fragments and 5 to 15 percent clay.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is gravelly sandy loam or fine sandy loam with 0 to 30 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or fine sandy loam with 15 to 35 percent pebbles. It is neutral or mildly alkaline.

The C horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam, fine sandy loam, or coarse sandy loam with 15 to 35 percent pebbles. It is neutral or mildly alkaline.

## Renha Series

The Renha series consists of moderately deep, well drained soils on benches, shoulders, and footslopes of hills and mountains. These soils formed in residuum and colluvium derived from limestone, marble, and dolomite with a mantle of volcanic ash and loess. Slopes are 5 to 40 percent. Elevation is 2,300 to 3,800 feet. The average annual precipitation is 20 to 22 inches, the average annual air temperature is 42 to 45 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Renha silt loam in an area of Renha, warm-Oxerine silt loams complex, 20 to 40 percent slopes, about 12 miles northeast of Keller; 1,450 feet south and 2,150 feet west of the northeast corner of sec. 5, T. 31 N., R. 34 E., W.M.:

- Oi—1 inch to 0; needles, leaves, grass, and twigs.
- A—0 to 2 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak

fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; many very fine irregular pores; 2 percent pebbles; neutral; abrupt wavy boundary.

- Bw—2 to 7 inches; pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; weak fine granular and subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; common very fine tubular pores; 3 percent pebbles; neutral; abrupt wavy boundary.
- 2E/Bt—7 to 11 inches; very pale brown (10YR 7/3) silt loam (E part), brown (10YR 5/3) moist; light yellowish brown (10YR 6/4) silty clay loam (B part), brown (7.5YR 4/4) moist; moderate medium angular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine and fine roots and few medium roots; common very fine tubular pores; common faint clay films on faces of peds; 2 percent pebbles; slightly acid; abrupt smooth boundary.
- 2Bt1—11 to 22 inches; reddish brown (5YR 4/3) clay, dark reddish brown (5YR 3/3) dry; strong coarse prismatic structure parting to strong medium angular blocky; extremely hard, very firm, sticky and very plastic; few very fine and fine roots; few fine tubular pores; continuous distinct clay films on faces of peds; 5 percent pebbles; neutral; clear wavy boundary.
- 2Bt2—22 to 28 inches; reddish brown (5YR 4/3) and reddish yellow (7.5YR 6/6) gravelly clay loam, dark reddish brown (5YR 3/3 and 5YR 3/2) and strong brown (7.5YR 4/6) moist; strong medium and coarse angular blocky structure; extremely hard, very firm, very sticky and plastic; few very fine, fine, and coarse roots; few fine tubular pores; many distinct clay films on faces of peds; 15 percent hard pebbles and 5 percent soft pebbles; mildly alkaline; clear wavy boundary.
- 2R—28 to 32 inches; limestone bedrock.

The mantle of volcanic ash is 7 to 14 inches thick. Depth to bedrock is 20 to 40 inches. The particle-size control section is 35 to 50 percent clay and 0 to 20 percent rock fragments.

The A horizon has value of 2 or 3 moist. It is 0 to 10 percent pebbles.

The Bw horizon has hue of 7.5YR or 10YR, value of 5 to 7 dry and 3 to 5 moist, and chroma of 3 or 4 dry or moist. It is 0 to 15 percent pebbles and 0 to 10 percent cobbles. It is slightly acid or neutral.

The E part of the 2E/Bt horizon has value of 6 or 7 dry and 3 or 4 moist. Color of the Bt part is similar to that of the 2Bt horizon. The Bt part is clay

loam with 2 to 15 percent pebbles and 0 to 10 percent cobbles.

The 2Bt horizon has hue of 5YR, 7.5YR, or 10YR, value of 3 to 6 dry and 3 to 5 moist, and chroma of 3 to 6 dry and 2 to 6 moist. It is clay or clay loam with 5 to 15 percent pebbles and 0 to 5 percent cobbles. It is neutral or mildly alkaline.

## Republic Series

The Republic series consists of very deep, well drained soils on alluvial fans and on toeslopes, footslopes, and backslopes of hills and mountains. These soils formed in alluvium and glacial till with a component of loess and volcanic ash. Slopes are 3 to 65 percent. Elevation is 1,700 to 3,500 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Republic loam, 30 to 65 percent slopes, about 3 miles northwest of Nespelem; 800 feet north and 1,000 feet east of the southwest corner of sec. 11, T. 31 N., R. 30 E., W.M.:

- Oi—1 inch to 0; needles, twigs, bark, cones, and leaves.
- A1—0 to 5 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots and few medium roots; common very fine and fine interstitial pores; 10 percent pebbles; neutral; clear wavy boundary.
- A2—5 to 11 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots and common medium and coarse roots; common very fine and fine interstitial pores; 20 percent pebbles; neutral; clear wavy boundary.
- Bw—11 to 16 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, medium, and coarse roots; common very fine and few fine interstitial pores; 20 percent pebbles; neutral; clear wavy boundary.
- C1—16 to 38 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; massive; soft, very friable, slightly sticky and nonplastic; common very fine, fine, medium, and coarse roots; common very fine and few fine interstitial pores; 25 percent pebbles; neutral; clear wavy boundary.

C2—38 to 60 inches; very pale brown (10YR 7/3) very gravelly sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, slightly sticky and nonplastic; common very fine, fine, and medium roots; common very fine and fine interstitial pores; 35 percent pebbles and 5 percent cobbles; neutral.

The mollic epipedon is 12 to 20 inches thick. The particle-size control section is 5 to 35 percent rock fragments. It is slightly acid or neutral.

The A1 horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. It is 5 to 15 percent pebbles.

The A2 horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam, loam, or sandy loam with 5 to 25 percent pebbles.

The Bw horizon has value of 4 to 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loam, sandy loam, or silt loam with 5 to 20 percent pebbles and 0 to 5 percent cobbles and stones.

The C1 horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is loam, sandy loam, or silt loam with 15 to 30 percent pebbles and 0 to 5 percent cobbles and stones.

The C2 horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 20 to 45 percent pebbles and 0 to 5 percent cobbles.

## Resner Series

The Resner series consists of very deep, well drained soils on outwash terraces, terrace escarpments, and toeslopes and footslopes of mountains. These soils formed in a mantle of volcanic ash over glacial outwash and ablation till derived from granitic rock. Slopes are 0 to 40 percent. Elevation is 3,500 to 5,200 feet. The average annual precipitation is 20 to 30 inches, the average annual air temperature is 39 to 41 degrees F, and the frost-free period is 80 to 100 days.

Typical pedon of Resner loam, 0 to 20 percent slopes, about 17 miles north of Nespelem; 1,200 feet west and 1,000 feet south of the northeast corner of sec. 31, T. 34 N., R. 31 E., W.M.:

Oi—1.5 inches to 0.5 inch; needles, leaves, and twigs.

Oe—0.5 inch to 0; partially decomposed litter.

A—0 to 5 inches; yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 3/4) moist; weak fine and medium subangular blocky structure; soft,

very friable, nonsticky and nonplastic; many very fine, fine, medium, and coarse roots; many very fine irregular pores; slightly acid; clear wavy boundary.

Bw—5 to 17 inches; light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium and coarse roots; common very fine tubular pores; 2 percent pebbles; neutral; abrupt smooth boundary.

2C1—17 to 34 inches; white (10YR 8/2) very gravelly loamy sand, pale brown (10YR 6/3) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; common very fine tubular pores; 40 percent pebbles and 5 percent cobbles; neutral; gradual smooth boundary.

2C2—34 to 60 inches; white (10YR 8/2) extremely gravelly loamy sand, pale brown (10YR 6/3) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 50 percent pebbles and 10 percent cobbles; neutral.

The mantle of volcanic ash is 14 to 25 inches thick. It is slightly acid or neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is 0 to 5 percent pebbles. Some pedons have a discontinuous 2-inch-thick surface layer of Mt. St. Helens "T" ash. It has value of 6 or 7 dry and 4 or 5 moist and chroma of 1 to 3 dry and 2 or 3 moist.

The Bw horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 to 6 dry or moist. It is loam or silt loam with 0 to 15 percent pebbles.

The 2C horizon has hue of 10YR or 2.5Y, value of 7 or 8 dry and 5 or 6 moist, and chroma of 2 or 3 dry or moist. It is loamy sand, sand, or coarse sand with 40 to 65 percent pebbles, 0 to 30 percent cobbles, and 0 to 2 percent stones.

## Ret Series

The Ret series consists of very deep, somewhat poorly drained soils on flood plains and low stream terraces. These soils formed in recent alluvium of mixed mineralogy. Slopes are 0 to 3 percent. Elevation is 1,600 to 3,800 feet. The average annual precipitation is 15 to 20 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Ret silt loam, 0 to 3 percent slopes, about 8 miles northeast of Disautel; 1,500 feet

north and 1,500 feet west of the southeast corner of sec. 19, T. 34 N., R. 30 E., W.M.:

- A1—0 to 8 inches; very dark gray (10YR 3/1) silt loam, black (10YR 2/1) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; many very fine irregular pores; mildly alkaline; clear wavy boundary.
- A2—8 to 16 inches; very dark grayish brown (10YR 3/2) loam, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; many very fine irregular pores; 2 percent rounded pebbles; mildly alkaline; gradual wavy boundary.
- A3—16 to 22 inches; dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; common very fine tubular pores; 2 percent rounded pebbles; neutral; clear wavy boundary.
- Bw—22 to 30 inches; pale brown (10YR 6/3) sandy loam, brown (10YR 9/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; common very fine tubular pores; 5 percent rounded pebbles; neutral; clear wavy boundary.
- C1—30 to 36 inches; pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; common fine faint mottles that are dark yellowish brown (10YR 4/4) when moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 10 percent rounded pebbles; neutral; clear wavy boundary.
- C2—36 to 60 inches; very pale brown (10YR 7/3) loamy sand, brown (10YR 5/3) moist; common medium distinct mottles that are yellowish brown (10YR 5/6) when moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 10 percent rounded pebbles; neutral.

The mollic epipedon is 20 to 34 inches thick. Depth to the sandy substratum is 25 to 60 inches or more. The particle-size control section is 6 to 17 percent clay and 3 to 15 percent rock fragments. The profile is mildly alkaline or neutral. An apparent water table is present in December through July. Occasional periods of flooding occur in February through May.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist. The lower part is silt loam, fine sandy loam, or loam with 0 to 10 percent pebbles.

The AC horizon, where present, has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam, fine sandy loam, or loam with 0 to 15 percent pebbles.

The Bw horizon is stratified silt loam to sandy loam with 0 to 15 percent pebbles. This horizon is absent in some pedons.

The C horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. It is stratified silt loam to gravelly coarse sand with 0 to 20 percent pebbles.

## Roosevelt Series

The Roosevelt series consists of moderately deep, well drained soils on ridges, shoulders, and backslopes of hills. These soils formed in residuum and colluvium derived from granitic rock with a component of loess. Slopes are 5 to 65 percent. Elevation is 1,300 to 2,400 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Roosevelt gravelly loam in an area of Roosevelt-Soaplake-Rock outcrop complex, 5 to 30 percent slopes, about 1 mile southeast of Coulee Dam; 2,100 feet south and 1,600 feet east of the northwest corner of sec. 5, T. 28 N., R. 31 E., W.M.:

- A1—0 to 3 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; few very fine interstitial pores; 20 percent pebbles; neutral; clear wavy boundary.
- A2—3 to 14 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, friable, nonsticky and nonplastic; common very fine roots and few fine and medium roots; few very fine interstitial pores; 15 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.
- Bw—14 to 28 inches; pale brown (10YR 6/3) gravelly sandy loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; soft, friable, nonsticky and nonplastic; few very fine and fine roots; few very fine interstitial pores; 15 percent pebbles and 5 percent cobbles; neutral; gradual irregular boundary.
- R—28 to 32 inches; granitic bedrock.

The mollic epipedon is 9 to 16 inches thick. Depth to bedrock is 20 to 40 inches. The particle-size control

section is 5 to 30 percent rock fragments. It is neutral or mildly alkaline.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is 15 to 30 percent pebbles and 0 to 5 percent cobbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or fine sandy loam with 10 to 30 percent pebbles and 0 to 10 percent cobbles.

A thin Cr horizon is directly above the bedrock in some pedons.

## Rufus Series

The Rufus series consists of shallow, well drained soils on shoulders, backslopes, and ridges of hills and mountains. These soils formed in residuum and colluvium derived from metamorphic rock with an admixture of volcanic ash and loess. Slopes are 8 to 65 percent. Elevation is 1,900 to 4,700 feet. The average annual precipitation is 15 to 22 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Rufus channery loam in an area of Raisio, dry-Rufus-Rock outcrop complex, 30 to 65 percent slopes, about 10 miles north of Nespelem; 1,800 feet north and 550 east of the southwest corner of sec. 31, T. 33 N., R. 31 E., W.M.:

A1—0 to 5 inches; brown (10YR 4/3) channery loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots and few medium roots; common very fine tubular pores; 25 percent channers and 5 percent flagstones; neutral; clear wavy boundary.

A2—5 to 15 inches; brown (10YR 4/3) very channery loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots and few medium roots; common very fine tubular pores; 35 percent channers and 10 percent flagstones; neutral; abrupt wavy boundary.

R—15 to 19 inches; schist bedrock.

Depth to bedrock is 10 to 20 inches. The particle-size control section is 35 to 75 percent rock fragments and 8 to 15 percent clay. It is slightly acid or neutral.

The A1 horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 35 percent channers and 0 to 5 percent flagstones.

The A2 horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is loam or sandy loam with 35 to 50 percent channers and 5 to 20 percent flagstones.

The Bw horizon, where present, has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam or sandy loam with 35 to 50 percent channers and 5 to 20 percent flagstones.

## Sacheen Series

The Sacheen series consists of very deep, somewhat excessively drained soils on terraces, kames, and terrace escarpments. These soils formed in sandy glacial outwash. Slopes are 0 to 70 percent. Elevation is 1,700 to 4,600 feet. The average annual precipitation is 16 to 20 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Sacheen loamy fine sand, dry, 0 to 20 percent slopes, about 5 miles northwest of Nespelem; 1,900 feet south and 2,000 feet west of the northeast corner of sec. 35, T. 32 N., R. 30 E., W.M.:

Oi—1.5 inches to 0; needles, twigs, leaves, and bark.

A—0 to 4 inches; dark grayish brown (10YR 4/2) loamy fine sand, very dark gray (10YR 3/1) moist; single grain; loose, nonsticky and nonplastic; common very fine and fine roots; many very fine irregular pores; 5 percent pebbles; slightly acid; clear wavy boundary.

C1—4 to 20 inches; pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; common very fine and fine roots and few coarse roots; common very fine tubular pores; 5 percent pebbles; slightly acid; gradual wavy boundary.

C2—20 to 60 inches; light gray (10YR 7/2) gravelly sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few fine, medium, and coarse roots; common very fine tubular pores; 15 percent pebbles; neutral.

The particle-size control section is 3 to 8 percent clay and 5 to 25 percent pebbles. It is neutral or slightly acid.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist. It is loamy fine sand or loamy sand with 0 to 10 percent pebbles.

An AC horizon is present in some pedons.

The C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is sand, loamy sand, or loamy fine sand with 5 to 25 percent pebbles.

## Sanpoil Series

The Sanpoil series consists of very deep, poorly drained and very poorly drained soils on flood plains and low stream terraces. These soils formed in recent alluvium of mixed mineralogy. Slopes are 0 to 2 percent. Elevation is 1,600 to 3,800 feet. The average annual precipitation is 15 to 20 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Sanpoil silt loam, 0 to 2 percent slopes, about 22 miles northeast of Nespelem; 2,100 feet north and 1,100 feet west of the southeast corner of sec. 14, T. 34 N., R. 32 E., W.M.:

Ap—0 to 12 inches; dark grayish brown (10YR 4/2) silt loam, very dark gray (10YR 3/1) moist; common fine distinct mottles that are dark yellowish brown (10YR 4/4) when moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and fine roots; common very fine and fine irregular pores; neutral; clear wavy boundary.

A—12 to 28 inches; dark grayish brown (10YR 4/2) loam, very dark gray (10YR 3/1) moist; common fine faint mottles that are dark yellowish brown (10YR 4/4) when moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; common very fine and fine irregular pores; 5 percent fine pebbles; neutral; abrupt wavy boundary.

AC—28 to 31 inches; brown (10YR 5/3) sandy loam, dark brown (10YR 3/3) moist; many fine distinct mottles that are dark yellowish brown (10YR 4/4) when moist; massive; soft, very friable, nonsticky and nonplastic; common very fine roots; common very fine and fine irregular pores; 5 percent fine pebbles; neutral; abrupt wavy boundary.

Ab—31 to 41 inches; grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; common fine faint mottles that are dark brown (10YR 3/3) when moist; weak medium subangular blocky structure; slightly hard, friable, nonsticky and nonplastic; few very fine roots; common very fine and fine irregular pores; 5 percent fine pebbles; neutral; abrupt wavy boundary.

2C—41 to 60 inches; multicolored very gravelly sand; single grain; loose, nonsticky and nonplastic; 40 percent pebbles and 10 percent cobbles; neutral.

These soils are saturated in the moisture control section from winter to late in spring. The mollic

epipedon is 24 to 37 inches thick. The particle-size control section is 5 to 18 percent clay and 0 to 15 percent rock fragments. A seasonal high water table is 6 inches above the surface to a depth of 18 inches below the surface in February through June.

Occasional, brief periods of flooding occur in March through June. The profile is slightly acid or neutral.

The Ap and A horizons have value of 4 or 5 dry and 2 or 3 moist, and they have chroma of 1 or 2 dry or moist. The A horizon is silt loam or loam with 0 to 15 percent pebbles.

The AC horizon has hue of 10YR, 2.5Y, or 5Y, value of 4 to 6 dry and 2 or 3 moist, and chroma of 1 to 3 dry or moist. It is stratified silt loam to sandy loam with 0 to 20 percent pebbles. This horizon is absent in some pedons.

The Ab horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist. It is stratified silt loam to sandy loam with 0 to 20 percent pebbles.

The 2C horizon is multicolored. It is stratified sandy loam to sand with 5 to 50 percent pebbles and 0 to 10 percent cobbles. This horizon is absent in some pedons.

## Scala Series

The Scala series consists of very deep, well drained soils on terraces. These soils formed in sandy glacial outwash mixed with volcanic ash and loess. Slopes are 0 to 5 percent. Elevation is 1,400 to 2,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Scala very fine sandy loam, 0 to 5 percent slopes, about 6 miles northwest of Inchelium; 1,850 feet west and 500 feet south of the northeast corner of sec. 13, T. 33 N., R. 36 E., W.M.:

Oi—1 inch to 0; needles, leaves, and twigs.

A—0 to 6 inches; grayish brown (10YR 5/2) very fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine tubular pores; neutral; clear smooth boundary.

AB—6 to 13 inches; pale brown (10YR 6/3) very fine sandy loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few coarse roots; common very fine tubular pores; neutral; gradual smooth boundary.

Bw1—13 to 28 inches; pale brown (10YR 6/3) very

fine sandy loam, dark yellowish brown (10YR 4/4) moist; few fine faint (7.5YR 4/6) stains; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few coarse roots; few fine tubular pores; neutral; gradual smooth boundary.

Bw2—28 to 60 inches; light brownish gray (2.5Y 6/2) very fine sandy loam, olive brown (2.5Y 4/4) moist; many fine faint (7.5YR 4/4) stains; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few coarse roots; few fine tubular pores; neutral.

The particle-size control section is 5 to 10 percent clay. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 or 2 moist.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is very fine sandy loam or fine sandy loam.

## Sclome Series

The Sclome series consists of very deep, poorly drained soils on valley flats. These soils formed in alluvium overlying volcanic ash and valley fill. Slopes are 0 to 3 percent. Elevation is 2,400 to 2,700 feet. The average annual precipitation is 18 to 20 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Sclome silty clay loam, 0 to 3 percent slopes, about 6.5 miles east of Keller; 700 feet south and 1,400 feet west of the northeast corner of sec. 29, T. 30 N., R. 34 E., W.M.:

Ap—0 to 13 inches; very dark gray (10YR 3/1) silty clay loam, black (N 2/0) moist; strong fine and medium subangular blocky structure parting to strong fine granular; hard, firm, sticky and plastic; many very fine, common fine, and few medium roots; common very fine tubular pores; slightly acid; abrupt smooth boundary.

2Bw—13 to 18 inches; grayish brown (10YR 5/2) and pale brown (10YR 6/3) silt loam, very dark grayish brown (10YR 3/2) and brown (10YR 4/3) moist; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; pressure faces on faces of pedis and in root channels; neutral; clear wavy boundary.

3BAgb—18 to 28 inches; grayish brown (2.5Y 5/2) and light brownish gray (2.5Y 6/2) clay loam, very dark grayish brown (2.5Y 3/2) and dark grayish brown

(2.5Y 4/2) moist; moderate medium angular blocky structure; hard, firm, sticky and plastic; few very fine and fine roots; many very fine irregular pores; pressure faces on faces of pedis and in root channels; neutral; clear wavy boundary.

3Bgb—28 to 50 inches; light brownish gray (2.5Y 6/2) and light gray (2.5Y 7/2) sandy loam, grayish brown (2.5Y 5/2) moist; common medium distinct mottles that are light olive brown (2.5Y 5/4) when moist and common medium prominent mottles that are dark yellowish brown (10YR 4/4) when moist; weak medium angular blocky structure; slightly hard, firm, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; neutral; clear wavy boundary.

3Cg—50 to 60 inches; light gray (2.5Y 7/2) and (5Y 7/2) silty clay loam, dark grayish brown (2.5Y 4/2) and olive (5Y 5/3) moist; many medium distinct mottles that are yellowish brown (10YR 5/4) and dark yellowish brown (10YR 4/4) when moist and common fine distinct mottles that are dark brown (7.5Y 3/4) when moist; massive; hard, firm, sticky and plastic; neutral.

The mollic epipedon is 10 to 24 inches thick. The particle-size control section is 22 to 35 percent clay and 0 to 5 percent fine pebbles. The profile is slightly acid or neutral. An apparent water table is present in February through June. Occasional periods of flooding occur in March through May.

The Ap or A horizon has hue of 10YR, or it is neutral. The horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 0 to 3 dry or moist. In some areas this horizon is overlain by a thin C horizon of recent alluvium 1 to 3 inches thick or by an Oa horizon 1 to 4 inches thick.

The 2Bw horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry, and chroma of 2 to 4 dry or moist.

The 3BAgb horizon has value of 5 or 6 dry and 3 or 4 moist. It is clay loam or silty clay loam.

The 3Bgb horizon has value of 4 or 5 moist. It is stratified sandy loam to silty clay loam.

The 3Cg horizon has hue of 2.5Y or 5Y, value of 5 to 7 dry and 3 or 4 moist, and chroma of 1 to 3 dry or moist. It is stratified loamy sand to silty clay loam with 0 to 10 percent fine pebbles.

## Scoap Series

The Scoap series consists of very deep, well drained soils on toeslopes, footslopes, and backslopes of hills and mountains and on alluvial fans. These soils formed in colluvium, glacial till, and slope alluvium derived from volcanic and metamorphic rock with a

component of volcanic ash and loess. Slopes are 5 to 65 percent. Elevation is 1,600 to 4,800 feet. The average annual precipitation is 18 to 22 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Scoap gravelly loam, 20 to 40 percent slopes, about 12 miles north of Nespelem; 1,900 feet north and 120 feet east of the southwest corner of sec. 27, T. 33 N., R. 31 E., W.M.:

Oi—1 inch to 0; needles, twigs, and cones.

A—0 to 14 inches; dark brown (10YR 4/3) gravelly loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and common medium roots; few fine tubular pores; 20 percent pebbles; neutral; clear irregular boundary.

Bw1—14 to 22 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and common medium roots; few fine tubular pores; 30 percent pebbles; neutral; clear irregular boundary.

Bw2—22 to 36 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, friable, slightly sticky and slightly plastic; common very fine roots and few fine and medium roots; few fine tubular pores; 40 percent pebbles; neutral; clear wavy boundary.

C—36 to 60 inches; very pale brown (10YR 7/3) very gravelly sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, slightly sticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 40 percent pebbles and 5 percent cobbles; neutral.

The mollic epipedon is 20 to 30 inches thick. The particle-size control section is 8 to 12 percent clay and 35 to 50 percent rock fragments. It is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 to 3 dry or moist. It is gravelly loam or silt loam with 5 to 30 percent pebbles.

The Bw horizon has value of 4 to 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loam, silt loam, or sandy loam with 20 to 40 percent pebbles and 0 to 30 percent cobbles.

The C horizon has value of 6 or 7 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam or sandy loam with 20 to 45 percent pebbles, 5 to 30 percent cobbles, and 0 to 15 percent stones. This horizon is absent in some pedons.

## Scrabblers Series

The Scrabblers series consists of very deep, well drained soils on terraces, terrace escarpments, and toeslopes, footslopes, and backslopes of hills and mountains. These soils formed in sandy glacial outwash with a mantle of volcanic ash. Slopes are 0 to 40 percent. Elevation is 2,600 to 4,600 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 41 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Scrabblers silt loam, dry, 0 to 20 percent slopes, about 13 miles northwest of Inchelium; 1,500 feet south and 2,300 feet west of the northeast corner of sec. 14, T. 34 N., R. 35 E., W.M.:

Oi—2 inches to 0; needles, leaves, and twigs.

A—0 to 3 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium roots; many very fine irregular pores; slightly acid (NaF pH 10.0); clear smooth boundary.

Bw—3 to 11 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and medium roots and few coarse roots; many very fine irregular pores; 5 percent pebbles; slightly acid (NaF pH 10.0); clear wavy boundary.

2C1—11 to 24 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and medium roots; common very fine tubular pores; 20 percent pebbles and 5 percent cobbles; neutral; gradual wavy boundary.

2C2—24 to 37 inches; pale brown (10YR 6/3) gravelly loamy coarse sand, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; common very fine tubular pores; 20 percent pebbles and 10 percent cobbles; neutral; clear smooth boundary.

2C3—37 to 60 inches; brown (10YR 5/3) gravelly coarse sand, dark brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; few fine roots; few fine tubular pores; 20 percent pebbles; neutral.

The mantle of volcanic ash is 7 to 14 inches thick. The particle-size control section is 1 to 6 percent clay and 5 to 35 percent rock fragments. It is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 to 4

moist, and it has chroma of 2 to 4 dry or moist. It is 0 to 10 percent pebbles. It is loam or silt loam.

The Bw horizon has value of 5 or 6 dry and 3 to 5 moist, and it has chroma of 3 or 4 moist. It is silt loam, loam, or sandy loam with 5 to 15 percent pebbles and 0 to 5 percent cobbles.

The 2C1 horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 to 4 dry or moist. It is sandy loam or loamy sand with 10 to 30 percent pebbles and 0 to 10 percent cobbles.

The 2C2 and 2C3 horizons have hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. They are loamy sand, loamy coarse sand, coarse sand, or sand with 10 to 30 percent pebbles and 0 to 10 percent cobbles.

### Sitdown Series

The Sitdown series consists of very deep, well drained soils on backslopes of mountains and terrace escarpments. These soils formed in glacial outwash with a mantle of volcanic ash. Slopes are 40 to 70 percent. Elevation is 2,800 to 4,600 feet. The average annual precipitation is 20 to 25 inches, the average annual air temperature is 39 to 41 degrees F, and the frost-free period is 80 to 100 days.

Typical pedon of Sitdown gravelly loam, 40 to 70 percent slopes, about 16 miles north of Nespelem; 1,200 feet south and 2,200 feet east of the northwest corner of sec. 2, T. 33 N., R. 31 E., W.M.:

Oi—2.5 to 2.0 inches; needles, twigs, and cones.

Oe—2 inches to 0; moderately decomposed forest litter.

A—0 to 4 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots and few coarse roots; many very fine irregular pores; 20 percent rounded pebbles; slightly acid; clear wavy boundary.

Bw—4 to 13 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 9/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots and few coarse roots; common very fine tubular pores; 20 percent rounded pebbles; slightly acid; abrupt wavy boundary.

2C1—13 to 29 inches; pale brown (10YR 6/3) very gravelly loamy sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; common very fine and fine roots and few medium roots; few fine tubular pores; 35 percent rounded

pebbles and 15 percent cobbles; neutral; clear wavy boundary.

2C2—29 to 60 inches; light brownish gray (10YR 6/2) very gravelly sand, dark grayish brown (10YR 4/2) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 35 percent rounded pebbles and 15 percent cobbles; neutral.

The mantle of volcanic ash is 10 to 14 inches thick. The particle-size control section is 35 to 60 percent rock fragments. It is neutral or slightly acid.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is 15 to 30 percent pebbles and 0 to 5 percent cobbles.

The Bw horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is 15 to 30 percent pebbles and 0 to 5 percent cobbles.

The 2C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 to 6 moist, and chroma of 1 to 3 dry or moist. It is loamy sand or sand with 20 to 40 percent pebbles, 10 to 20 percent cobbles, and 0 to 5 percent stones.

### Skaha Series

The Skaha series consists of very deep, excessively drained soils on terraces and terrace escarpments. These soils formed in glacial outwash. Slopes are 0 to 65 percent. Elevation is 800 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Skaha loamy sand, 0 to 10 percent slopes, about 2.5 miles southwest of Malott; 1,150 feet south and 1,650 feet east of the northwest corner of sec. 29, T. 32 N., R. 25 E., W.M.:

A—0 to 7 inches; pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; many very fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

C1—7 to 19 inches; light yellowish brown (10YR 6/4) gravelly loamy sand, brown (10YR 4/3) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine roots and few fine and medium roots; common very fine tubular pores; 15 percent pebbles; neutral; clear wavy boundary.

C2—19 to 35 inches; pale brown (10YR 6/3) very gravelly coarse sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; few

very fine roots; common very fine tubular pores; 50 percent pebbles and 10 percent cobbles; neutral; clear smooth boundary.

C3—35 to 60 inches; multicolored extremely gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 55 percent pebbles and 10 percent cobbles; neutral.

The particle-size control section is 40 to 75 percent rock fragments. It is neutral or mildly alkaline.

The A horizon has value of 4 to 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is loamy sand, gravelly loamy sand, extremely gravelly loamy sand, or very stony sandy loam with 0 to 50 percent pebbles, 0 to 20 percent cobbles, and 0 to 15 percent stones.

The upper part of the C horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 1 to 4 dry or moist. The lower part is multicolored. The horizon is loamy sand, loamy coarse sand, sand, or coarse sand. The upper part is 15 to 50 percent pebbles, 0 to 10 percent cobbles, and 0 to 5 percent stones, and the lower part is 30 to 60 percent pebbles, 0 to 35 percent cobbles, and 0 to 5 percent stones.

### Skanid Series

The Skanid series consists of shallow, well drained soils on ridges, summits, shoulders, and backslopes of hills and mountains (fig. 23). These soils formed in colluvium and residuum derived from granitic rock with a minor component of loess and volcanic ash. Slopes are 5 to 65 percent. Elevation is 1,700 to 4,200 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Skanid gravelly sandy loam, warm, 20 to 40 percent slopes, about 5 miles northeast of Elmer City; 2,300 feet west and 100 feet north of the southeast corner of sec. 12, T. 29 N., R. 31 E., W.M.:

Oi—2.5 inches to 1.0 inch; needles, twigs, and cones.

Oe—1 inch to 0; moderately decomposed forest litter.

A1—0 to 5 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, very dark gray (10YR 3/1) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many fine and medium roots and common coarse roots; many very fine irregular pores; 20 percent fine pebbles; slightly acid; clear smooth boundary.

A2—5 to 11 inches; brown (10YR 5/3) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist;

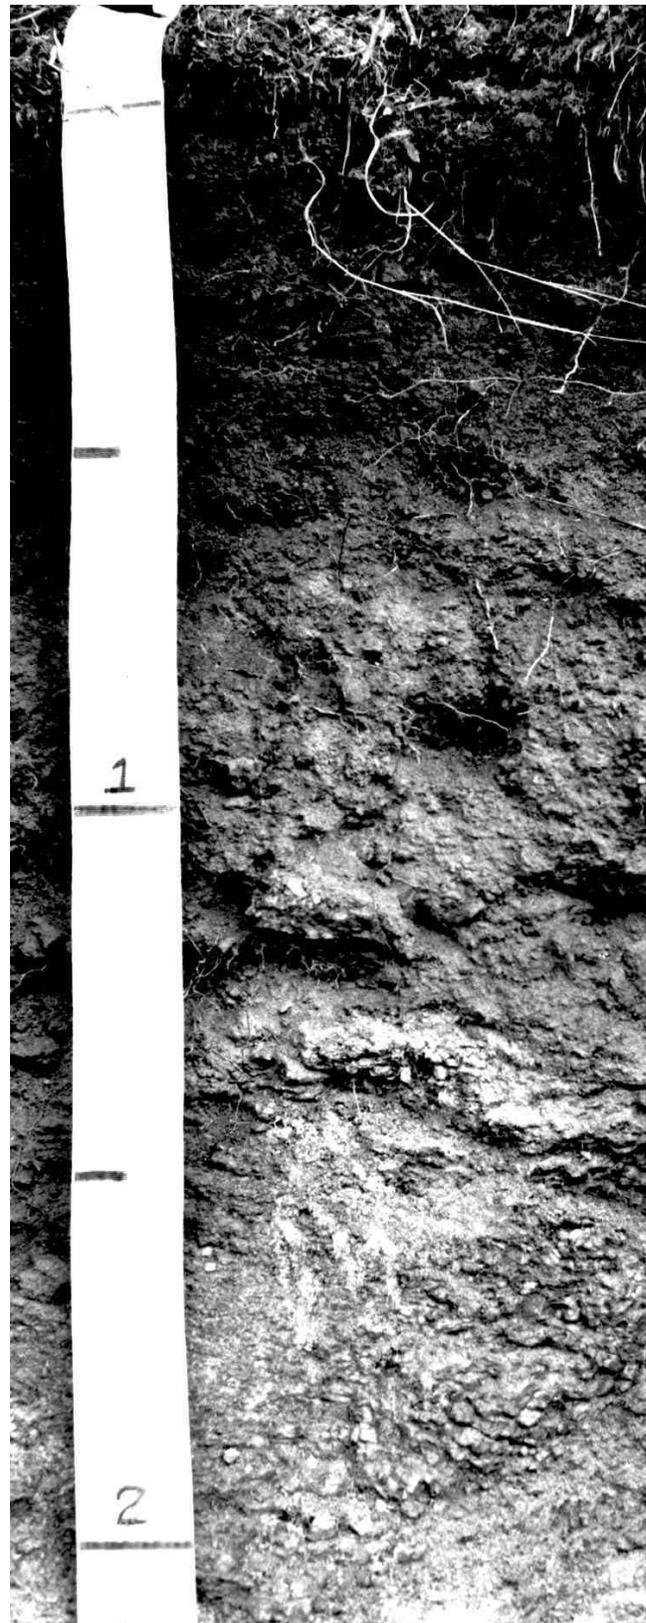

Figure 23.—Typical pedon of a Skanid soil that has weathered granitic bedrock at a depth of about 16 inches. (Numbers on tape represent feet.)

weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine, medium, and coarse roots; many very fine irregular pores; 20 percent fine pebbles; slightly acid; clear smooth boundary.

C—11 to 18 inches; brown (10YR 5/3) very gravelly coarse sandy loam, dark brown (10YR 4/3) dry; massive; slightly hard, friable, nonsticky and nonplastic; common fine and medium roots; common very fine tubular pores; 40 percent pebbles and 5 percent cobbles; slightly acid; clear wavy boundary.

Cr—18 to 28 inches; weathered quartz monzonite bedrock.

Depth to weathered bedrock is 10 to 20 inches. The particle-size control section is 35 to 50 percent rock fragments and 5 to 8 percent clay.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 to 3 moist. It is 15 to 30 percent pebbles and 0 to 5 percent cobbles. It is medium acid to neutral.

The Bw horizon, where present, has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or coarse sandy loam with 20 to 50 percent pebbles and 0 to 5 percent cobbles.

The C horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is sandy loam or coarse sandy loam with 30 to 55 percent pebbles and 0 to 5 percent cobbles.

## Soaplake Series

The Soaplake series consists of shallow, well drained soils on ridges, shoulders, and backslopes of hills. These soils formed in residuum and colluvium derived from granitic rock with a component of loess. Slopes are 5 to 65 percent. Elevation is 1,300 to 2,400 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Soaplake loam in an area of Roosevelt-Soaplake-Rock outcrop complex, 5 to 30 percent slopes, about 2 miles east of Coulee Dam; 2,000 feet south and 1,700 feet east of the northwest corner of sec. 4, T. 28 N., R. 31 E., W.M.:

A—0 to 10 inches; dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; few fine tubular pores; 2 percent pebbles; neutral; clear smooth boundary.

Bw1—10 to 14 inches; yellowish brown (10YR 5/4)

loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic, common very fine and fine roots; common fine and very fine tubular pores; 5 percent pebbles; neutral; clear smooth boundary.

Bw2—14 to 17 inches; light yellowish brown (10YR 6/4) loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 10 percent pebbles; neutral; abrupt smooth boundary.

R—17 to 21 inches; granitic bedrock.

Depth to bedrock is 10 to 20 inches. The particle-size control section is 5 to 15 percent clay and 5 to 20 percent rock fragments. It is neutral or mildly alkaline.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles and 0 to 5 percent cobbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is loam, fine sandy loam, or sandy loam with 5 to 25 percent pebbles and 0 to 5 percent cobbles.

## Spens Series

The Spens series consists of very deep, somewhat excessively drained soils on terrace escarpments and kames. These soils formed in glacial outwash. Slopes are 20 to 65 percent. Elevation is 1,300 to 4,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Spens very stony loamy sand, dry, 40 to 65 percent slopes, about 11 miles northwest of Nespelem; 1,100 feet south and 800 feet west of the northeast corner of sec. 5, T. 31 N., R. 29 E., W.M.:

Oi—1.5 inches to 0; needles, branches, twigs, and cones.

A—0 to 3 inches; grayish brown (10YR 5/2) very stony loamy sand, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; many very fine irregular pores; 20 percent pebbles, 5 percent cobbles, and 12 percent stones; neutral; clear wavy boundary.

AC—3 to 15 inches; light brownish gray (10YR 6/2) gravelly loamy sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine, fine, and

coarse roots and many medium roots; common very fine tubular pores; 25 percent pebbles; neutral; clear wavy boundary.

C—15 to 60 inches; multicolored very cobbly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; 25 percent pebbles and 20 percent cobbles; neutral.

The particle-size control section is 40 to 60 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 20 to 30 percent pebbles, 0 to 5 percent cobbles, and 5 to 15 percent stones and boulders.

The AC horizon has hue of 10YR or 2.5Y. This horizon is absent in some pedons.

The C horizon is multicolored. It is loamy sand or coarse sand with 20 to 50 percent pebbles and 15 to 30 percent cobbles.

## Spokane Series

The Spokane series consists of moderately deep, well drained soils on summits, ridges, shoulders, backslopes, footslopes, and toeslopes of hills and mountains. These soils formed in residuum and colluvium derived from granitic rock with a component of loess and volcanic ash. Slopes are 5 to 65 percent. Elevation is 1,800 to 4,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Spokane loam, warm, in an area of Spokane, warm-Skanid, warm complex, 5 to 20 percent slopes, about 5 miles east of Elmer City; 300 feet east and 700 feet south of the northwest corner of sec. 19, T. 29 N., R. 32 E., W.M.:

Oi—0.5 inch to 0; needles, leaves, twigs, and cones.

A1—0 to 4 inches; dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 2/2) moist; strong fine and medium granular structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine irregular pores; 5 percent fine pebbles; slightly acid; clear wavy boundary.

A2—4 to 9 inches; dark brown (10YR 4/3) loam, very dark grayish brown (10YR 3/2) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium and coarse roots; common very fine tubular pores;

5 percent pebbles; slightly acid; gradual wavy boundary.

AB—9 to 12 inches; brown (10YR 5/3) sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; slightly hard, very friable, nonsticky and nonplastic; few very fine, fine, and medium roots; common very fine tubular pores; 5 percent fine pebbles; slightly acid; clear wavy boundary.

Bw—12 to 22 inches; yellowish brown (10YR 5/4) sandy loam, dark yellowish brown (10YR 3/4) moist; moderate medium subangular blocky structure; hard, friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; few fine tubular pores; 10 percent fine pebbles; slightly acid; clear wavy boundary.

BC—22 to 30 inches; yellowish brown (10YR 5/4) gravelly coarse sandy loam, brown (10YR 4/3) moist; weak coarse subangular blocky structure; hard, very friable, nonsticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 15 percent fine pebbles; slightly acid; clear smooth boundary.

C—30 to 33 inches; very pale brown (10YR 7/3) gravelly loamy coarse sand, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 30 percent fine pebbles; slightly acid; clear smooth boundary.

Cr—33 to 43 inches; weathered granitic bedrock.

Depth to weathered bedrock is 20 to 40 inches. The particle-size control section is 15 to 35 percent rock fragments. The mollic epipedon is 7 to 16 inches thick. The profile is neutral or slightly acid.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 5 to 10 percent pebbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is loam, sandy loam, or coarse sandy loam with 10 to 30 percent pebbles and 0 to 10 percent cobbles.

The C horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is coarse sandy loam or loamy coarse sand with 5 to 30 percent pebbles.

## Springdale Series

The Springdale series consists of very deep, somewhat excessively drained soils on terraces and terrace escarpments. These soils formed in glacial outwash with a component of loess and volcanic ash. Slopes are 0 to 65 percent. Elevation is 1,400 to 3,500

feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Springdale gravelly sandy loam, 0 to 15 percent slopes, about 16 miles northeast of Nespelem; 750 feet south and 1,250 feet west of the northeast corner of sec. 26, T. 33 N., R. 32 E., W.M.:

Oe—1 inch to 0; moderately decomposed organic matter.

A—0 to 4 inches; grayish brown (10YR 5/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, friable, nonsticky and nonplastic; many fine and medium roots; many very fine irregular pores; 20 percent pebbles and 5 percent cobbles; neutral; clear smooth boundary.

Bw—4 to 11 inches; pale brown (10YR 6/3) gravelly sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, friable, nonsticky and nonplastic; many fine, medium, and coarse roots; common very fine tubular pores; 25 percent pebbles and 5 percent cobbles; neutral; clear smooth boundary.

C1—11 to 17 inches; very pale brown (10YR 7/3) gravelly sand, dark yellowish brown (10YR 4/4) moist; single grain; loose, nonsticky and nonplastic; many fine, medium, and coarse roots; few fine tubular pores; 25 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

C2—17 to 60 inches; multicolored extremely gravelly sand; single grain; loose, nonsticky and nonplastic; common fine and medium roots; few fine tubular pores; 50 percent pebbles and 15 percent cobbles; neutral.

Depth to the sandy substratum is 10 to 19 inches. The particle-size control section is 35 to 60 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 to 6 dry and 2 to 4 moist, and it has chroma of 2 or 3 dry or moist. It is 20 to 35 percent pebbles and 0 to 5 percent cobbles.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry and 2 to 4 moist. It is coarse sandy loam or sandy loam with 20 to 45 percent pebbles and 0 to 10 percent cobbles.

The C1 horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loamy sand, loamy coarse sand, or sand with 20 to 50 percent pebbles and 0 to 15 percent cobbles.

The upper part of the C2 horizon has hue of 10YR

or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. The lower part is multicolored. The horizon is loamy coarse sand, sand, or coarse sand with 30 to 50 percent pebbles and 5 to 30 percent cobbles.

## Stapaloo Series

The Stapaloo series consists of very deep, well drained soils on terraces and on footslopes and toeslopes of hills and mountains. These soils formed in glaciofluvial deposits and glacial till with a minor component of loess and volcanic ash. Slopes are 0 to 40 percent. Elevation is 1,900 to 4,800 feet. The average annual precipitation is 16 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the average frost-free period is 90 to 120 days.

Typical pedon of Stapaloo fine sandy loam, 0 to 20 percent slopes, about 8 miles northeast of Disautel; 1,000 feet north and 2,100 feet east of the southwest corner of sec 18, T. 34 N., R. 30 E., W.M.:

Oi—1 inch to 0; needles, leaves, and bark.

A—0 to 7 inches; light brownish gray (10YR 6/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, medium, and coarse roots; many very fine irregular pores; slightly acid; gradual wavy boundary.

Bw—7 to 22 inches; light gray (10YR 7/2) fine sandy loam, grayish brown (10YR 5/2) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine and fine roots and common medium and coarse roots; common very fine tubular pores; slightly acid; gradual wavy boundary.

C1—22 to 31 inches; light gray (2.5Y 7/2) fine sandy loam, brown (10YR 5/3) moist; massive; slightly hard, friable, slightly sticky and nonplastic; few very fine and fine roots and common medium and coarse roots; common very fine tubular pores; slightly acid; gradual wavy boundary.

C2—31 to 60 inches; white (10YR 8/2) very fine sandy loam, grayish brown (10YR 5/2) moist; massive; slightly hard, friable, slightly sticky and nonplastic; few very fine and fine roots and common medium and coarse roots; few fine tubular pores; few distinct irregular wavy  $\frac{1}{8}$ - to  $\frac{1}{4}$ -inch-thick bands of very fine sandy loam that is brown (10YR 4/3) moist; slightly acid.

The particle-size control section is 2 to 8 percent clay and 0 to 25 percent pebbles. The profile is slightly acid or neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent rock fragments.

The Bw horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 or 3 dry or moist. It is fine sandy loam or sandy loam with 0 to 10 percent rock fragments

The C horizon has hue of 10YR or 2.5Y, value of 6 to 8 dry and 4 or 5 moist, and chroma of 2 to 9 dry or moist. The upper part of the C horizon to a depth of about 30 inches is fine sandy loam or sandy loam with 0 to 25 percent pebbles, and the lower part is very fine sandy loam, fine sandy loam, or loamy fine sand with 0 to 30 percent pebbles.

### Stepstone Series

The Stepstone series consists of very deep, well drained soils on toeslopes, footslopes, and backslopes of mountains. These soils formed in a mantle of volcanic ash over glacial till derived from granitic rock. Slopes are 5 to 65 percent. Elevation is 2,500 to 5,000 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the average frost-free period is 90 to 120 days.

Typical pedon of Stepstone loam, 5 to 20 percent slopes, about 17 miles north of Nespelem; 1,700 feet east and 1,600 feet south of the northwest corner of sec. 33, T. 34 N., R. 31 E., W.M.:

Oi—0.75 to 0.25 inch; needles, leaves, and twigs.

Oe—0.25 inch to 0; moderately decomposed needles, leaves, and twigs.

A—0 to 0.5 inch; light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common fine and medium roots; many very fine irregular pores; 2 percent pebbles; neutral; abrupt smooth boundary.

Bw1—0.5 inch to 6 inches; yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 3/4) moist; moderate very fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; many fine, medium, and coarse roots; common very fine tubular pores; 5 percent pebbles, 5 percent cobbles, and 2 percent stones; neutral; clear smooth boundary.

Bw2—6 to 18 inches; light yellowish brown (10YR 6/4) loam, dark brown (7.5YR 4/4) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common fine, medium, and coarse roots;

common very fine tubular pores; 10 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

BC—18 to 22 inches; very pale brown (10YR 7/4) gravelly sandy loam, yellowish brown (10YR 5/4) moist; weak very fine subangular blocky structure; soft, friable, nonsticky and nonplastic; common fine and medium roots; few fine tubular pores; 20 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

2C1—22 to 34 inches; light gray (10YR 7/2) very stony loamy sand, brown (10YR 5/3) dry; massive; slightly hard, friable, nonsticky and nonplastic; few fine and medium roots; few fine tubular pores; 20 percent pebbles, 15 percent cobbles, and 15 percent stones; neutral; gradual wavy boundary.

2C2—34 to 60 inches; white (10YR 8/2) extremely stony loamy sand, grayish brown (10YR 5/2) moist; massive; slightly hard, friable, nonsticky and nonplastic; few fine and medium roots; few fine tubular pores; 20 percent pebbles, 20 percent cobbles, and 20 percent stones; neutral.

The mantle of volcanic ash is 14 to 30 inches thick. The particle-size control section is 35 to 60 percent rock fragments. The profile is neutral or slightly acid.

The A horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry or moist. It is loam or bouldery loam with 0 to 5 percent stones and boulders, 0 to 5 percent cobbles, and 0 to 10 percent pebbles.

The Bw horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is loam or silt loam with 0 to 10 percent pebbles and 0 to 5 percent cobbles.

The BC horizon has value of 6 or 7 dry and 4 or 5 moist. It is sandy loam or loam with 15 to 30 percent pebbles and 5 to 15 percent cobbles.

The 2C horizon has hue of 10YR or 2.5Y, value of 6 to 8 dry and 5 or 6 moist, and chroma of 2 or 3 dry or moist. It is 20 to 55 percent pebbles, 5 to 20 percent cobbles, and 5 to 25 percent stones.

### Stevens Series

The Stevens series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on summits, backslopes, footslopes, and toeslopes of hills. They formed in glacial till with a component of loess and volcanic ash. Slopes are 0 to 65 percent. Elevation is 1,600 to 3,000 feet. The average annual precipitation

is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Stevens silt loam, 0 to 8 percent slopes, about 10 miles northeast of Inchelium; 800 feet west and 800 feet south of the northeast corner of sec. 30, T. 34 N., R. 36 E., W.M.:

Ap—0 to 9 inches; dark grayish brown (10YR 4/2) silt loam, black (10YR 2/1) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine irregular pores; 2 percent pebbles; neutral; clear wavy boundary.

A—9 to 22 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; many very fine irregular pores; 5 percent pebbles; neutral; clear wavy boundary.

Bw—22 to 30 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; 10 percent pebbles; neutral; clear smooth boundary.

2BC—30 to 38 inches; light brownish gray (10YR 6/2) gravelly loam, dark grayish brown (10YR 4/2) moist; weak fine subangular blocky structure; soft, friable, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; 20 percent pebbles; neutral; clear wavy boundary.

2Cd—38 to 60 inches; light brownish gray (2.5Y 6/2) dense glacial till that crushes to gravelly sandy loam, dark grayish brown (2.5Y 4/2) moist; massive; hard, friable, sticky and nonplastic; few very fine roots; few fine tubular pores; 25 percent pebbles and 5 percent cobbles; neutral.

Depth to dense glacial till is 20 to 40 inches. The mollic epipedon is 20 to 30 inches thick. The particle-size control section is 5 to 30 percent rock fragments.

The Ap and A horizons have value of 3 or 4 dry and 2 or 3 moist, and they have chroma of 1 to 3 dry or moist. They are silt loam or gravelly silt loam with 0 to 30 percent pebbles.

The Bw and 2BC horizons have value of 5 or 6 dry and 3 to 5 moist, and they have chroma of 3 or 4 dry or moist. They are silt loam or loam with 10 to 30 percent pebbles.

The 2Cd horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 15 to 35 percent pebbles. It is neutral or mildly alkaline.

## Strat Series

The Strat series consists of very deep, well drained soils on outwash terraces. These soils formed in glacial outwash with a component of loess in the upper part. Slopes are 0 to 10 percent. Elevation is 1,000 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Strat gravelly fine sandy loam, 0 to 10 percent slopes, about 9 miles south of Keller; 50 feet south and 2,500 feet east of the northwest corner of sec. 8, T. 28 N., R. 33 E., W.M.:

A—0 to 11 inches; brown (10YR 5/3) gravelly fine sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine interstitial pores; 25 percent pebbles; neutral; clear wavy boundary.

AB—11 to 17 inches; yellowish brown (10YR 5/4) very gravelly fine sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine interstitial pores; 35 percent pebbles and 5 percent cobbles; mildly alkaline; abrupt smooth boundary.

Bw—17 to 24 inches; yellowish brown (10YR 5/4) very gravelly fine sandy loam, dark brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine and common fine roots; few fine interstitial pores; 50 percent pebbles and 5 percent cobbles; mildly alkaline; clear smooth boundary.

2Bk1—24 to 31 inches; light brownish gray (2.5Y 6/2) extremely gravelly loamy sand, dark grayish brown (2.5Y 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few medium tubular pores; coatings of secondary lime on underside of rock fragments; violently effervescent; 45 percent pebbles and 20 percent cobbles; mildly alkaline; clear wavy boundary.

2Bk2—31 to 39 inches; light brownish gray (2.5Y 6/2) extremely gravelly sand, dark grayish brown (2.5Y 4/2) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine

tubular pores; secondary lime coatings on underside of rock fragments; violently effervescent; 40 percent pebbles, 20 percent cobbles, and 5 percent stones; mildly alkaline; abrupt smooth boundary.

2Bk3—39 to 60 inches; multicolored extremely cobbly coarse sand; single grain; loose, nonsticky and nonplastic; coatings of secondary lime on undersides of rock fragments; violently effervescent; 35 percent pebbles, 25 percent cobbles, and 15 percent stones; moderately alkaline.

Depth to secondary carbonates is 18 to 36 inches. The particle-size control section is 40 to 70 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 35 percent pebbles and 0 to 5 percent cobbles. It is neutral or mildly alkaline.

The Bw horizon has value of 3 or 4 moist and chroma of 3 or 4 dry or moist. It is fine sandy loam or loam with 25 to 50 percent pebbles and 5 to 20 percent cobbles. It is neutral or mildly alkaline.

The upper part of the 2Bk horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. The lower part is multicolored. The horizon is sand, coarse sand, or loamy sand with 35 to 60 percent pebbles, 5 to 25 percent cobbles, and 0 to 15 percent stones. It is mildly alkaline or moderately alkaline.

## Stubblefield Series

The Stubblefield series consists of soils that are moderately deep to a duripan. These soils are underlain by dense glacial till and are well drained. They are on ground moraines and glaciated hills. They formed in glacial till derived from basalt with a component of loess. Slopes are 3 to 65 percent. Elevation is 1,200 to 2,000 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Stubblefield stony loam, 3 to 25 percent slopes, about 16 miles northeast of Bridgeport; 900 feet north and 500 feet west of the southeast corner of sec. 18, T. 30 N., R. 28 E., W.M.:

A—0 to 9 inches; grayish brown (10YR 5/2) stony loam, very dark grayish brown (10YR 3/2) moist;

weak fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine roots and common fine roots; few fine irregular pores; 10 percent pebbles and 5 percent stones; neutral; clear wavy boundary.

Bw—9 to 24 inches; pale brown (10YR 6/3) very gravelly loam, dark brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; few fine interstitial pores; 30 percent pebbles, 10 percent cobbles, and 5 percent stones; neutral; abrupt smooth boundary.

Bkqm—24 to 28 inches; light brownish gray (2.5Y 6/2) strongly lime- and silica-cemented duripan, dark grayish brown (2.5Y 4/2) moist; massive; very hard, very firm, nonsticky and nonplastic; few very fine roots matted on top of duripan; common masses of lime in voids; 25 percent pebbles, 15 percent cobbles, and 10 percent stones; slightly effervescent; strongly alkaline; clear wavy boundary.

2Bkd—28 to 60 inches; light brownish gray (2.5Y 6/2) dense glacial till that crushes to very cobbly sandy loam, dark brownish gray (2.5Y 4/2) moist; massive; hard, firm, nonsticky and nonplastic; few very fine interstitial and tubular pores; 30 percent cobbles, 10 percent pebbles, and 5 percent stones; few fine filaments and soft masses of calcium carbonate, disseminated carbonates in matrix, and few fine distinct coatings of carbonates on rock fragments; strongly effervescent; moderately alkaline (pH 8.0).

Depth to the duripan is 20 to 40 inches. The mollic epipedon is 8 to 12 inches thick.

The A horizon has chroma of 2 or 3 dry or moist. It is 2 to 5 percent stones, 2 to 5 percent cobbles, and 10 to 15 percent pebbles. It is neutral or mildly alkaline.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 or 3 dry or moist. It is loam or sandy loam with 25 to 50 percent pebbles, 5 to 15 percent cobbles, and 0 to 10 percent stones. It is neutral or mildly alkaline.

The Bkqm horizon has hue of 10YR or 2.5Y, value of 5 to 7 moist, and chroma of 1 or 2 dry or moist.

The 2Bkd horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 4 to 6 moist, and chroma of 1 or 2 dry or moist. It is sandy loam or fine sandy loam with 10 to 40 percent pebbles, 5 to 35 percent cobbles, and 0 to 10 percent stones. It is mildly alkaline to strongly alkaline.

## Swakane Series

The Swakane series consists of shallow, well drained soils on ridges, shoulders, and backslopes of glacially scoured hills and mountains. These soils formed in residuum and colluvium derived from granitic rock with a component of loess and volcanic ash. Slopes are 3 to 70 percent. Elevation is 1,500 to 3,000 feet. The average annual precipitation is 12 to 16 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Swakane cobbly loam, 25 to 65 percent slopes, about 6 miles southeast of Nespelem; 1,000 feet north and 100 feet west of the southeast corner of sec. 1, T. 30 N., R. 31 E., W.M.:

- A1—0 to 6 inches; grayish brown (10YR 5/2) cobbly loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common fine tubular pores; 15 percent pebbles and 10 percent cobbles; slightly acid; clear wavy boundary.
- A2—6 to 11 inches; grayish brown (10YR 5/2) very gravelly loam, very dark grayish brown (10YR 3/2) moist; massive; soft, very friable, nonsticky and nonplastic; common fine roots; common fine tubular and interstitial pores; 40 percent pebbles and 15 percent cobbles; neutral; clear wavy boundary.
- C—11 to 14 inches; brown (10YR 5/3) extremely gravelly sandy loam, dark brown (10YR 3/3) moist; massive; soft, very friable, slightly sticky and slightly plastic; few fine roots; common fine tubular and irregular pores; 45 percent pebbles and 15 percent cobbles; neutral; gradual wavy boundary.
- R—14 to 18 inches; granitic bedrock.

Depth to bedrock is 10 to 20 inches. The particle-size control section is 35 to 70 percent rock fragments and 7 to 18 percent clay.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. The upper part is very stony loam or cobbly loam with 15 to 40 percent pebbles, 10 to 15 percent cobbles, and 0 to 15 percent stones and boulders. The lower part is loam, sandy loam, or coarse sandy loam with 0 to 5 percent stones, 5 to 20 percent cobbles, and 35 to 55 percent pebbles. The horizon is slightly acid or neutral.

The C horizon has hue of 10YR or 2.5Y, value of 4 to 6 dry and 3 to 5 moist, and chroma of 3 or 4 dry or

moist. It is loam or sandy loam with 35 to 60 percent pebbles, 5 to 20 percent cobbles, and 0 to 5 percent stones. It is neutral or mildly alkaline. This horizon is absent in some pedons.

## Swipkin Series

The Swipkin series consists of very deep, well drained soils on lake plains and terraces. These soils formed in glacial lake sediment with a component of loess and volcanic ash. Slopes are 0 to 10 percent. Elevation is 1,450 to 2,800 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Swipkin silt loam, 0 to 5 percent slopes, about 1.5 miles west of Disautel; 1,800 feet east and 850 feet north of the southwest corner of sec. 14, T. 33 N., R. 28 E., W.M.:

- O—2 inches to 0; needles, twigs, and cones.
- A1—0 to 7 inches; dark grayish brown (10YR 4/2) silt loam, very dark brown (10YR 2/2) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; neutral; clear smooth boundary.
- A2—7 to 16 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium roots; common very fine tubular pores; neutral; gradual smooth boundary.
- Bw—16 to 21 inches; light yellowish brown (10YR 6/4) silt loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; common very fine tubular pores; 2 percent pebbles; neutral; clear smooth boundary.
- C1—21 to 44 inches; light brownish gray (2.5Y 6/2) silt loam, dark grayish brown (2.5Y 4/2) moist; massive; hard, friable, slightly sticky and slightly plastic; few very fine roots; common very fine tubular pores; 2 percent pebbles; neutral; gradual smooth boundary.
- C2—44 to 60 inches; light brownish gray (2.5Y 6/2) silt loam, dark grayish brown (2.5Y 4/2) moist; massive (varved); hard, friable, slightly sticky and slightly plastic; few very fine roots between varve planes; few fine tubular pores; 2 percent pebbles; mildly alkaline.

The mollic epipedon is 7 to 17 inches thick. The particle-size control section is 10 to 18 percent clay and less than 15 percent material that is coarser than very fine sand.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 3 or 4 dry or moist. It is slightly acid or neutral.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. The horizon is silt loam or very fine sandy loam with 0 to 10 percent pebbles.

The C horizon has hue of 10YR or 2.5Y, value of 6 to 8 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is silt loam or very fine sandy loam with 0 to 10 percent pebbles. It is neutral to moderately alkaline. The C horizon has secondary carbonates below a depth of 44 inches in some pedons.

### Thout Series

The Thout series consists of moderately deep, well drained soils on summits, shoulders, and backslopes of hills and mountains. These soils formed in residuum and colluvium derived from rhyodacite and quartz latite with some glacial till and a minor component of volcanic ash and loess. Slopes are 5 to 65 percent. Elevation is 2,200 to 4,200 feet. The average annual precipitation is 15 to 20 inches, the average annual air temperature is 42 to 46 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Thout gravelly loam in an area of Thout, dry-Rock outcrop complex, 20 to 40 percent slopes, about 20 miles northeast of Nespelem; 1,800 feet west and 1,400 feet south of the northeast corner of sec. 27, T. 34 N., R. 32 E., W.M.:

Oi—1 inch to 0; needles, twigs, and leaves.

A—0 to 4 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and slightly plastic; many very fine and fine roots; common very fine irregular pores; 20 percent pebbles; neutral; clear wavy boundary.

Bw1—4 to 18 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and slightly plastic; common very fine and fine roots and few medium and coarse roots; common very fine irregular pores; 40 percent pebbles and 10 percent cobbles; neutral; clear wavy boundary.

Bw2—18 to 26 inches; pale brown (10YR 6/3) very gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, friable,

nonsticky and slightly plastic; few very fine roots; few very fine irregular pores; 45 percent pebbles and 10 percent cobbles; neutral; abrupt wavy boundary.

R—26 to 30 inches; rhyodacite bedrock.

Depth to bedrock is 20 to 40 inches. The particle-size control section is 35 to 60 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 25 percent pebbles and 0 to 5 percent cobbles.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 3 or 4 dry or moist. It is loam or sandy loam with 20 to 45 percent pebbles, 0 to 15 percent cobbles, and 0 to 5 percent stones.

### Timentwa Series

The Timentwa series consists of soils that are deep to a duripan and are well drained. These soils are on glacial till plains and moraines on basalt plateaus. They formed in glacial till derived mainly from basalt with a mantle of loess and volcanic ash. Slopes are 0 to 65 percent. Elevation is 2,200 to 2,900 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Timentwa loam, 0 to 8 percent slopes, about 5 miles east of Monse; 300 feet east and 300 feet north of the southwest corner of sec. 33, T. 31 N., R. 26 E., W.M.:

A1—0 to 2 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; moderate medium granular structure; soft, very friable, nonsticky and nonplastic; many very fine and few fine roots; common very fine irregular pores; 5 percent pebbles; slightly acid; abrupt smooth boundary.

A2—2 to 7 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; moderate medium granular structure; slightly hard, friable, nonsticky and nonplastic; many very fine and few fine roots; common very fine irregular pores; 5 percent pebbles; neutral; gradual wavy boundary.

A3—7 to 18 inches; grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine roots; common very fine irregular pores and few very fine tubular

pores; 5 percent pebbles; neutral; gradual wavy boundary.

- Bw1**—18 to 28 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine roots; few very fine irregular and tubular pores; 15 percent pebbles; neutral; clear wavy boundary.
- 2Bw2**—28 to 41 inches; pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; moderate fine and medium subangular blocky structure; hard, firm, slightly sticky and slightly plastic; common very fine roots; few very fine irregular and vesicular pores; 15 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.
- 2Bk1**—41 to 50 inches; light brownish gray (2.5Y 6/2) cobbly sandy loam, dark grayish brown (2.5Y 4/2) moist; massive; slightly hard, friable, nonsticky and slightly plastic; common very fine roots; few very fine irregular and vesicular pores; 10 percent pebbles, 10 percent cobbles, and 5 percent stones; strongly effervescent with common fine irregularly shaped soft masses of secondary lime; strongly alkaline; clear wavy boundary.
- 2Bk2**—50 to 56 inches; pale brown (10YR 6/3) cobbly sandy loam, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few very fine irregular pores; 10 percent cobbles and 10 percent pebbles; strongly effervescent with common fine irregularly shaped soft masses of secondary lime; strongly alkaline; abrupt wavy boundary.
- 2Bkqm**—56 to 60 inches; light brownish gray (2.5Y 6/2) weakly lime- and silica-cemented duripan that crushes to gravelly sandy loam, dark grayish brown (2.5Y 4/2) moist; massive; extremely hard, firm, nonsticky and nonplastic; few very fine irregular pores; 15 percent pebbles, 5 percent cobbles, and 5 percent stones; violently effervescent with common fine irregularly shaped masses of secondary lime in seams; strongly alkaline.

The mollic epipedon is 20 to 30 inches thick. Depth to secondary carbonates is 24 to 43 inches. The particle-size control section is 10 to 35 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is loam or very bouldery loam with 5 to 10 percent pebbles, 0 to 15 percent cobbles, and 0 to 15 percent stones and boulders. It is slightly acid to mildly alkaline.

The Bw and 2Bw horizons have hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. They are loam or very fine sandy loam with 5 to 25 percent pebbles and 0 to 10 percent cobbles. They are neutral or mildly alkaline.

The 2Bk horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry and 2 or 3 moist. It is loam, fine sandy loam, or sandy loam with 10 to 40 percent pebbles, 5 to 25 percent cobbles, and 0 to 5 percent stones. It is mildly alkaline to strongly alkaline.

The 2Bkqm horizon has hue of 7.5YR, 10YR, or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is 10 to 30 percent pebbles, 5 to 20 percent cobbles, and 0 to 10 percent stones. It is moderately alkaline or strongly alkaline.

## Togo Series

The Togo series consists of very deep, well drained soils on ridges, backslopes, footslopes, and toeslopes of mountains. These soils formed in a mantle of volcanic ash over residuum and colluvium derived from granitic rock. Slopes are 5 to 65 percent. Elevation is 4,000 to 6,000 feet. The average annual precipitation is 20 to 30 inches, the average annual air temperature is 39 to 42 degrees F, and the frost-free period is 80 to 110 days.

Typical pedon of Togo silt loam, 20 to 40 percent slopes, about 18 miles northwest of Inchelium; 1,000 feet south and 1,600 feet east of the northwest corner of sec. 32, T. 34 N., R. 34 E., W.M.:

- Oi**—2 inches to 0; needles, leaves, and twigs.
- A**—0 to 4 inches; yellowish brown (10YR 5/4) silt loam, dark brown (7.5YR 3/4) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common very fine tubular pores; 5 percent pebbles and 2 percent cobbles; slightly acid (NaF pH 11.0); clear wavy boundary.
- Bw**—4 to 15 inches; yellowish brown (10YR 5/4) silt loam, dark brown (7.5YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common very fine tubular pores; 5 percent pebbles and 2 percent cobbles; slightly acid (NaF pH 11.0); clear wavy boundary.
- 2BC**—15 to 28 inches; light yellowish brown (10YR 6/4) very cobbly sandy loam, dark yellowish brown (10YR 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; few fine and medium

roots; few fine tubular pores; 15 percent pebbles, 20 percent cobbles, and 5 percent stones; medium acid; gradual wavy boundary.

2C—28 to 60 inches; light yellowish brown (10YR 6/4) very cobbly sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; few fine tubular pores; 20 percent pebbles, 30 percent cobbles, and 5 percent stones; medium acid.

The mantle of volcanic ash is 14 to 20 inches thick.

The A horizon has hue of 10YR or 7.5YR and value of 6 or 7 dry and 4 or 5 moist. It is silt loam or very stony silt loam with 0 to 25 percent pebbles, 0 to 15 percent cobbles, and 0 to 15 percent stones. It is slightly acid or neutral.

The Bw horizon has hue of 10YR or 7.5YR, value of 5 or 6 dry and 4 or 5 moist, and chroma of 3 or 4 dry or moist. It is silt loam or loam with 0 to 20 percent pebbles, 0 to 20 percent cobbles, and 0 to 5 percent stones. It is slightly acid or neutral.

The 2BC horizon has value of 6 or 7 dry and 4 to 6 moist, and it has chroma of 2 to 4 dry or moist. It is 15 to 35 percent pebbles, 10 to 25 percent cobbles, and 0 to 5 percent stones. It is slightly acid or medium acid.

The 2C horizon has hue of 10YR or 2.5Y, value of 6 to 8 dry and 4 to 6 moist, and chroma of 2 to 4 dry or moist. It is 20 to 60 percent pebbles, 15 to 35 percent cobbles, and 0 to 5 percent stones. It is slightly acid or medium acid.

## Torboy Series

The Torboy series consists of very deep, well drained soils on terraces and on toeslopes, footslopes, and backslopes of mountains. These soils formed in glacial outwash with a component of loess and volcanic ash in the upper part. Slopes are 0 to 40 percent. Elevation is 2,800 to 4,500 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Torboy fine sandy loam, 0 to 20 percent slopes, about 21 miles north of Nespelem; 1,500 feet north and 1,500 feet west of the southeast corner of sec. 3, T. 34 N., R. 30 E., W.M.:

Oi—1 inch to 0; needles, leaves, twigs, bark, and cones.

A—0 to 4 inches; pale brown (10YR 6/3) fine sandy loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and

fine roots; many very fine irregular pores; slightly acid; abrupt smooth boundary.

Bw—4 to 16 inches; pale brown (10YR 6/3) fine sandy loam, brown (10YR 4/3) moist; moderate medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine, fine, and coarse roots and few medium roots; many very fine irregular pores; slightly acid; clear wavy boundary.

2CB—16 to 20 inches; light gray (10YR 7/2) gravelly loamy sand, brown (10YR 5/3) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few fine roots; few fine tubular pores; 25 percent pebbles and 5 percent cobbles; neutral; gradual wavy boundary.

2C1—20 to 33 inches; very pale brown (10YR 7/3) gravelly sand, brown (10YR 5/3) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 25 percent pebbles; neutral; gradual wavy boundary.

2C2—33 to 60 inches; light gray (10YR 7/1) gravelly fine sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 20 percent pebbles; neutral.

Depth to the sandy substratum is 16 to 24 inches. The particle-size control section is 2 to 8 percent clay and 15 to 35 percent rock fragments. It is slightly acid or neutral.

The A horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 2 to 4 dry or moist. It is 0 to 10 percent pebbles.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 to 4 dry or moist. It is fine sandy loam or sandy loam with 0 to 20 percent pebbles and 0 to 5 percent cobbles.

The 2CB and 2C horizons have hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 1 to 4 dry or moist. They are loamy sand, fine sand, or sand with 15 to 40 percent pebbles and 0 to 15 percent cobbles.

## Torrifluventic Haploxerolls

Torrifluventic Haploxerolls consist of very deep, excessively drained soils on stream terraces. These soils formed in alluvium. Slopes are 0 to 3 percent. Elevation is 800 to 2,000 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Reference pedon of Torrifluventic Haploxerolls, 0 to 3 percent slopes, about 14 miles southeast of

Okanogan; 1,575 feet south and 1,450 feet west of the northeast corner of sec. 29, T. 32 N., R. 28 E., W.M.:

- A—0 to 11 inches; gray (10YR 5/1) loamy coarse sand, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; common very fine tubular pores; violently effervescent; moderately alkaline; abrupt wavy boundary.
- C1—11 to 17 inches; brown (10YR 5/3) coarse sand, dark brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; common very fine and few fine roots; common very fine tubular pores; 2 percent pebbles; strongly effervescent; moderately alkaline; abrupt smooth boundary.
- C2—17 to 26 inches; pale brown (10YR 6/3) coarse sand, yellowish brown (10YR 5/4) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; common very fine tubular pores; 2 percent pebbles; slightly effervescent; moderately alkaline; abrupt wavy boundary.
- C3—26 to 29 inches; light brownish gray (10YR 6/2) coarse sandy loam, dark grayish brown (10YR 4/2) moist; massive; soft, friable, nonsticky and nonplastic; few very fine roots; common very fine tubular pores; few very fine and fine tubular pores; slightly effervescent; moderately alkaline; abrupt smooth boundary.
- C4—29 to 45 inches; multicolored and very pale brown (10YR 7/3) stratified coarse sand and loamy fine sand, light yellowish brown (10YR 6/4) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; slightly effervescent in the loamy fine sand; mildly alkaline; abrupt wavy boundary.
- C5—45 to 58 inches; light brownish gray (10YR 6/2) silt loam, grayish brown (10YR 5/2) with strata of very dark grayish brown (10YR 3/2) moist; massive; slightly hard, friable, slightly sticky and slightly plastic; few very fine roots; few fine tubular pores; strongly effervescent; moderately alkaline; abrupt wavy boundary.
- C6—58 to 60 inches; light brownish gray (10YR 6/2) coarse sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky and nonplastic; slightly effervescent; moderately alkaline.

The mollic epipedon is 10 to 18 inches thick. The particle-size control section is 2 to 10 percent clay and 0 to 65 percent rock fragments. The profile is neutral to moderately alkaline. Occasional periods of flooding occur in February through May.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist.

The C horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 or 3 dry and 2 to 4 moist. It is stratified with silt loam to coarse sand. It is 0 to 45 percent pebbles, 0 to 25 percent cobbles, and 0 to 5 percent stones.

## Torriorthents

Torriorthents consist of very deep, well drained soils on highly dissected, eroded backslopes of glaciated hills. These soils formed in glacial till mixed with a small amount of loess in the upper part. Slopes are 25 to 70 percent. Elevation is 1,000 to 2,000 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Reference pedon of Torriorthents in an area of Malott-Torriorthents complex, 25 to 70 percent slopes, about 7 miles northeast of Bridgeport; 50 feet south and 1,600 feet east of the northwest corner of sec. 26, T. 30 N., R. 26 E., W.M.:

- A—0 to 6 inches; light gray (10YR 7/2) stony loam, grayish brown (10YR 5/2) moist; weak fine granular structure; soft, friable, nonsticky and nonplastic; common fine and medium roots; common fine tubular and interstitial pores; 15 percent pebbles, 5 percent cobbles, and 5 percent stones; slightly effervescent; mildly alkaline; gradual wavy boundary.
- Ck—6 to 60 inches; light gray (10YR 7/2) very cobbly fine sandy loam, light brownish gray (10YR 6/2) moist; massive; hard, firm, nonsticky and nonplastic; few fine and medium roots; few fine and medium tubular and interstitial pores; common masses of carbonates; strongly effervescent; 25 percent pebbles, 10 percent cobbles, and 5 percent stones; moderately alkaline.

The particle-size control section is 25 to 50 percent rock fragments.

The A horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 or 3 dry or moist. It is mildly alkaline or moderately alkaline. This horizon is absent in some pedons.

The Ck horizon has value of 6 or 7 dry and 5 or 6 moist, and it has chroma of 1 or 2 dry and 2 or 3 moist. It is fine sandy loam, sandy loam, or loam with 20 to 45 percent pebbles and 5 to 20 percent cobbles and stones. It is moderately alkaline or strongly alkaline. Some pedons are as much as 35 percent weakly cemented durinodes.

## Tunkcreek Series

The Tunkcreek series consists of very deep, well drained soils on terraces and on toeslopes and footslopes of mountains. These soils formed in sandy glacial outwash with a mantle of volcanic ash and loess. Slopes are 5 to 40 percent. Elevation is 3,500 to 4,600 feet. The average annual precipitation is 22 to 28 inches, the average annual air temperature is 39 to 41 degrees F, and the frost-free period is 80 to 100 days.

Typical pedon of Tunkcreek fine sandy loam, 20 to 40 percent slopes, about 11 miles northeast of Omak; 100 feet east and 2,350 feet north of the southwest corner of sec. 10, T. 34 N., R. 28 E., W M.:

- Oe—1.5 inches to 0; moderately decomposed needles, twigs, and mosses.
- C—0 to 0.75 inch; light gray (10YR 7/1) very fine sandy loam, grayish brown (10YR 5/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots; few fine tubular pores; neutral; abrupt wavy boundary.
- Bw1—0.75 inch to 7 inches; light yellowish brown (10YR 6/4) fine sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots and few coarse roots; few fine tubular pores; 2 percent pebbles; slightly acid; clear wavy boundary.
- Bw2—7 to 16 inches; light yellowish brown (10YR 6/4) fine sandy loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots and few coarse roots; few fine tubular pores; 5 percent pebbles; slightly acid; clear wavy boundary.
- 2C1—16 to 31 inches; light gray (10YR 7/2) loamy sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky and nonplastic; few fine and medium roots; few fine tubular pores; 10 percent pebbles; slightly acid; gradual wavy boundary.
- 2C2—31 to 60 inches; light gray (10YR 7/1) gravelly coarse sand, grayish brown (10YR 5/2) moist; coarse sand grains are multicolored; single grain; loose, nonsticky and nonplastic; few fine and medium roots; few fine tubular pores; 20 percent pebbles; neutral.

The mantle of volcanic ash is 14 to 20 inches thick. The particle-size control section is 0 to 20 percent rock fragments.

The C horizon is absent in some pedons.

The Bw horizon has value of 4 or 5 moist and chroma of 2 to 4 dry or moist. It is 0 to 10 percent pebbles. It is slightly acid or medium acid.

The 2C horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 1 to 3 dry and 2 or 3 moist. It is loamy sand, sand, or coarse sand with 0 to 25 percent pebbles and 0 to 5 percent cobbles. It is slightly acid or neutral.

## Tyee Series

The Tyee series consists of soils that are shallow to bedrock and are well drained. These soils are on summits, shoulders, and backslopes of hills. They formed in residuum and colluvium derived from granitic rock with a component of loess. Slopes are 5 to 65 percent. Elevation is 2,000 to 3,200 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days

Typical pedon of Tyee gravelly loam, 5 to 30 percent slopes, about 4 miles northeast of Elmer City; 2,100 feet south and 1,600 feet east of the northwest corner of sec. 11, T. 29 N., R. 31 E., W.M.:

- A1—0 to 5 inches; dark grayish brown (10YR 4/2) gravelly loam, black (10YR 2/1) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine irregular pores; 15 percent pebbles; slightly acid; gradual wavy boundary.
- A2—5 to 11 inches; brown (10YR 5/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine irregular pores; 15 percent pebbles; slightly acid; clear smooth boundary.
- Bw—11 to 17 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, friable, slightly sticky and slightly plastic; common very fine and fine roots; few fine tubular pores; 20 percent pebbles; neutral; clear smooth boundary.
- Cr—17 to 27 inches; weathered granitic bedrock.

Depth to weathered bedrock is 10 to 20 inches. The particle-size control section is 15 to 35 percent rock fragments. The profile is slightly acid or neutral.

The A horizon has chroma of 2 or 3 dry and 1 to 3 moist. It is 15 to 25 percent pebbles and 0 to 5 percent cobbles.

The Bw horizon has value of 5 or 6 dry and 3 or 4

moist, and it has chroma of 3 or 4 dry or moist. It is loam, sandy loam, or coarse sandy loam with 10 to 35 percent pebbles and 0 to 5 percent cobbles.

### Typic Haplaquolls

Typic Haplaquolls consist of very deep, poorly drained soils on low terraces and flood plains. These soils formed in alluvium and glacial outwash. Slopes are 0 to 2 percent. Elevation is 740 to 800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Reference pedon of Typic Haplaquolls, 0 to 2 percent slopes, about 1,300 feet north of the southeast corner of sec. 17, T. 30 N., R. 25 E., W.M.:

- A—0 to 8 inches; brown (10YR 5/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many fine roots; common fine tubular and interstitial pores; mildly alkaline; gradual wavy boundary.
- Bw—8 to 24 inches; light brownish gray (2.5Y 6/2) fine sandy loam, dark grayish brown (2.5Y 4/2) moist; few fine faint mottles that are gray (10YR 5/1) when moist; weak moderate subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; many fine tubular pores; mildly alkaline; gradual wavy boundary.
- C1—24 to 32 inches; light brownish gray (10YR 6/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; few fine faint mottles that are gray (10YR 5/1) when moist; massive; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; common fine tubular and vesicular pores; 5 percent pebbles; mildly alkaline; gradual wavy boundary.
- C2—32 to 60 inches; light brownish gray (10YR 6/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few fine and very fine roots; common fine tubular and vesicular pores; 5 percent pebbles; mildly alkaline.

The mollic epipedon is 8 to 20 inches thick. The particle-size control section averages 5 to 12 percent clay and 0 to 50 percent rock fragments. An apparent water table is present in December through August. Occasional periods of flooding occur in January through June.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is fine sandy loam, sandy loam, or loamy sand with 0 to 10 percent pebbles

and 0 to 5 percent cobbles. The horizon is neutral or mildly alkaline. It is slightly effervescent in some pedons.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 4 or 5 moist, and chroma of 1 or 2 dry or moist. Mottles have value of 4 to 6 and chroma of 1 to 4 moist. The horizon is fine sandy loam, coarse sandy loam, or loamy sand with 0 to 50 percent pebbles and 0 to 5 percent cobbles. It is slightly effervescent to strongly effervescent in some pedons. It is mildly alkaline or moderately alkaline. This horizon is absent in some pedons.

The C horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 1 or 2 dry or moist. Mottles in the upper part have value of 4 or 5 and chroma of 1 to 4 moist. The horizon is fine sandy loam, very fine sandy loam, or sand with 0 to 60 percent pebbles and 0 to 10 percent cobbles. It is slightly effervescent or strongly effervescent in some pedons. It is mildly alkaline or moderately alkaline.

### Typic Xerochrepts

Typic Xerochrepts consist of very deep, well drained soils on unstable terrace escarpments and hummocky metastable slopes associated with landslides. These soils formed in glacial outwash, glaciofluvial material, glacial lake sediment, and mixed material derived from landslides. Slopes are 5 to 50 percent. Elevation is 1,300 to 1,900 feet. The average annual precipitation is 15 to 17 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Reference pedon of Typic Xerochrepts in an area of Typic Xerorthents-Typic Xerochrepts, 5 to 50 percent slopes, about 3 miles south of Keller; 600 feet south and 500 feet east of the northwest corner of sec. 4, T. 29 N., R. 33 E., W.M.:

- A—0 to 7 inches; grayish brown (10YR 5/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine roots and common fine and medium roots; many very fine irregular pores; 30 percent rounded pebbles; neutral; abrupt wavy boundary.
- Bw—7 to 22 inches; light brownish gray (2.5Y 6/2) very gravelly coarse sandy loam, dark grayish brown (2.5Y 5/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and nonplastic; many very fine roots and common fine and medium roots; many very fine irregular pores; 35 percent rounded pebbles,

10 percent cobbles, and 5 percent stones; neutral; clear wavy boundary.

Bk1—22 to 31 inches; light gray (2.5Y 7/2) very gravelly loam, grayish brown (2.5Y 5/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine tubular pores; 30 percent rounded pebbles and 5 percent cobbles; strongly effervescent; mildly alkaline; abrupt wavy boundary.

2Bk2—31 to 60 inches; light brownish gray (2.5Y 6/2) silt loam, dark grayish brown (2.5Y 4/2) moist; massive (varved); slightly hard, friable, slightly sticky and slightly plastic; common very fine roots and few fine, medium, and coarse roots; common very fine tubular pores; strongly effervescent; mildly alkaline.

The particle-size control section is 15 to 30 percent clay and 5 to 45 percent rock fragments.

The A horizon has hue of 10YR or 2.5Y, value of 4 or 5 dry and 2 or 3 moist, and chroma of 2 or 3 dry or moist. It is 5 to 30 percent pebbles and 0 to 15 percent cobbles.

The Bw horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is silty clay loam, loam, or coarse sandy loam with 15 to 40 percent pebbles, 0 to 10 percent cobbles, and 0 to 5 percent stones.

The Bk horizon has value of 6 or 7 dry and 4 or 5 moist. It is silt loam, loam, or sandy loam with 5 to 35 percent pebbles and 0 to 5 percent cobbles. This horizon is absent in some pedons.

The 2Bk horizon has hue of 2.5Y or 5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is fine sandy loam, silt loam, or silty clay loam with 0 to 10 percent pebbles. This horizon is absent in some pedons.

## Typic Xerorthents

Typic Xerorthents consist of very deep, well drained and somewhat excessively drained soils on unstable terrace escarpments and slopes associated with recent landslides. These soils formed in glacial outwash, glaciofluvial material, glacial lake sediment, and mixed material derived from landslides and debris flows. Slopes are 5 to 50 percent. Elevation is 1,300 to 2,600 feet. The average annual precipitation is 12 to 17 inches, the average annual air temperature is 45 to 49 degrees F, and the frost-free period is 100 to 150 days.

Reference pedon of Typic Xerorthents in an area

of Typic Xerorthents-Typic Xerochrepts complex, 5 to 50 percent slopes, about 4 miles south of Keller; 500 feet south and 1,350 feet east of the northwest corner of sec. 9, T. 29 N., R. 33 E., W.M.:

A—0 to 5 inches; dark grayish brown (10YR 4/2) loam, very dark brown (10YR 2/2) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots and common medium roots; many very fine irregular pores; 5 percent rounded pebbles; mildly alkaline; abrupt smooth boundary.

Bw—5 to 9 inches; grayish brown (2.5Y 5/2) loam, very dark grayish brown (2.5Y 3/2) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine, fine, medium, and coarse roots; common very fine tubular pores; 10 percent rounded pebbles; mildly alkaline; clear smooth boundary.

Bk1—9 to 25 inches; light gray (2.5Y 7/2) gravelly sandy loam, grayish brown (2.5Y 5/2) moist; massive; slightly hard, friable, slightly sticky and nonplastic; common very fine roots and few fine and medium roots; common very fine tubular pores; common masses of lime; slightly effervescent; 15 percent rounded pebbles and 5 percent cobbles; moderately alkaline; clear wavy boundary.

Bk2—25 to 49 inches; pale yellow (2.5Y 7/4) sandy loam, grayish brown (2.5Y 5/2) moist; massive; slightly hard, very friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; common masses of lime; strongly effervescent; 10 percent rounded pebbles; moderately alkaline; clear smooth boundary.

2Bk3—49 to 60 inches; light gray (2.5Y 7/2) and white (2.5Y 8/2) silty clay loam, light brownish gray (2.5Y 6/2) moist; stains or mottles that are very dark grayish brown (2.5Y 3/2) when moist; massive (varved); firm, sticky and plastic; few fine roots; few fine tubular pores; common masses of lime; strongly effervescent; 5 percent rounded pebbles; mildly alkaline.

The particle-size control section is 5 to 27 percent clay and 0 to 45 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is silt loam or loam with 0 to 25 percent pebbles, 0 to 10 percent cobbles, and 0 to 5 percent stones. It is neutral or mildly alkaline.

The Bw horizon has hue of 10YR or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 or 3 dry

or moist. It is loam or sandy loam with 5 to 25 percent pebbles and 0 to 10 percent cobbles. It is neutral or mildly alkaline.

The Bk and 2Bk horizons have value of 5 to 8 dry and 3 to 4 moist, and they have chroma of 2 to 4 dry or moist. They are silty clay loam, sandy loam, or silt loam with 0 to 15 percent cobbles. They are mildly alkaline or moderately alkaline.

## Ultic Haploxerolls

Ultic Haploxerolls consist of very deep, well drained and somewhat excessively drained soils on terrace escarpments. These soils formed in glacial outwash, glaciofluvial material, and glacial lake sediment. The parent material commonly is mixed by colluvial action, and it is stratified in some areas. Slopes are 40 to 70 percent and are mainly north- and east-facing. Elevation is 1,400 to 2,800 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Reference pedon of Ultic Haploxerolls, 40 to 70 percent slopes, about 3 miles southeast of Keller; 1,100 feet west and 300 feet south of the northeast corner of sec. 4, T. 29 N., R. 33 E., W.M.:

Oi—2 inches to 0.5 inch; needles, twigs, leaves, and cones.

Oe—0.5 inch to 0; moderately decomposed organic matter.

A1—0 to 6 inches; grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; many very fine irregular pores; 20 percent rounded pebbles; slightly acid; clear wavy boundary.

A2—6 to 13 inches; brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine, fine, and medium roots; common very fine tubular pores; 25 percent rounded pebbles; neutral; gradual wavy boundary.

Bw—13 to 28 inches; pale brown (10YR 6/3) gravelly sandy loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium and coarse roots; common very fine tubular pores; 25 percent rounded pebbles and 2 percent cobbles, neutral; gradual wavy boundary.

C1—28 to 42 inches; light brownish gray (10YR 6/2)

gravelly sandy loam, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic, few very fine, fine, and medium roots; common very fine tubular pores; 30 percent rounded pebbles; neutral; clear wavy boundary.

C2—42 to 60 inches; light brownish gray (10YR 6/2) gravelly loamy sand, dark grayish brown (10YR 4/2) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 20 percent rounded pebbles; neutral.

The mollic epipedon is 7 to 18 inches thick. The particle-size control section is 5 to 30 percent clay and 10 to 60 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 15 to 25 pebbles and 0 to 5 percent cobbles. It is slightly acid or neutral.

The Bw horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is clay loam, fine sandy loam, or sandy loam with 5 to 30 percent pebbles and 0 to 15 percent cobbles. It is neutral or mildly alkaline. This horizon is absent in some pedons.

The C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is sandy loam, loamy sand, or sand with 5 to 50 percent pebbles and 0 to 20 percent cobbles. Stratification is common. The horizon is neutral to moderately alkaline.

## Uncas Series

The Uncas series consists of very deep, very poorly drained soils in backswamps and valley flats. These soils formed in alluvium derived dominantly from volcanic ash overlain by decomposed organic material. Slopes are 0 to 2 percent. Elevation is 1,900 to 2,600 feet. The average annual precipitation is 18 to 22 inches, the average annual air temperature is 42 to 45 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Uncas muck, 0 to 2 percent slopes, about 11 miles east of Keller; 1,950 feet north and 1,900 feet west of the southeast corner of sec. 28, T. 30 N., R. 35 E., W.M.:

Oa—0 to 7 inches; dark gray (10YR 4/1) muck, black (10YR 2/1) moist; about 15 percent fiber, less than 5 percent rubbed; moderate fine and medium granular structure; slightly hard, very friable, nonsticky and nonplastic; many very fine and fine roots; many very fine irregular pores; neutral; clear smooth boundary.

A—7 to 11 inches; gray (10YR 5/1) silt loam, very dark brown (10YR 2/2) moist; moderate fine angular blocky structure; slightly hard, friable, nonsticky and slightly plastic; many very fine and fine roots; many very fine irregular pores; neutral; abrupt smooth boundary

ACg—11 to 21 inches; light gray (10YR 7/1) silt loam, dark grayish brown (10YR 4/2) moist; moderate fine angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine and fine roots; neutral; abrupt smooth boundary.

Cg1—21 to 48 inches; white (10YR 8/1) silt loam, olive gray (5Y 5/2) moist; common medium distinct mottles that are yellowish brown (10YR 5/6) when moist; massive; soft, very friable, slightly sticky and slightly plastic; few fine roots; common very fine tubular pores; neutral; clear smooth boundary.

Cg2—48 to 52 inches; white (10YR 8/1) very fine sandy loam, light brownish gray (10YR 6/2) moist; common medium distinct mottles that are yellowish brown (10YR 5/6) when moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; common very fine tubular pores; neutral; abrupt smooth boundary.

Cg3—52 to 60 inches; light gray (5Y 7/2) silt loam, olive (5Y 4/3) moist; common medium distinct mottles that are light olive brown (2.5Y 5/6) when moist; massive; slightly hard, friable, slightly sticky and nonplastic; neutral.

An apparent water table is present in December through August. Frequent periods of flooding occur in March through May. The organic surface layer is 5 to 10 inches thick.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 1 or 2 dry or moist.

The ACg horizon has value of 5 to 7 dry and 4 to 6 moist, and it has chroma of 1 or 2 dry or moist.

The Cg horizon has hue of 10YR, 2.5Y, or 5Y, and it has value of 7 or 8 dry and 4 to 7 moist. It is silty clay loam, silt loam, or very fine sandy loam.

## Vanbrunt Series

The Vanbrunt series consists of moderately deep, well drained soils on summits, ridges, shoulders, footslopes, and backslopes of hills and mountains. These soils formed in colluvium, residuum, and glacial till derived from granitic rock with a component of loess and volcanic ash. Slopes are 5 to 65 percent. Elevation is 1,800 to 4,400 feet. The average annual precipitation is 14 to 20 inches, the average annual air

temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Vanbrunt very stony sandy loam in an area of Vanbrunt-Rock outcrop complex, 20 to 40 percent slopes, about 4 miles northwest of Nespelem; 2,050 feet south and 550 feet west of the northeast corner of sec. 16, T. 31 N., R. 30 E., W.M.:

Oi—2.0 inches to 0.25 inch; needles, twigs, leaves, and cones.

Oe—0.25 inch to 0; moderately decomposed needles, twigs, and leaves.

A1—0 to 3 inches; brown (10YR 5/3) very stony sandy loam, very dark grayish brown (10YR 3/2) moist; moderate fine granular structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and common medium and coarse roots; few fine tubular pores; 25 percent pebbles, 5 percent cobbles, and 5 percent stones; medium acid; clear smooth boundary.

A2—3 to 10 inches; brown (10YR 5/3) very gravelly sandy loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky and slightly plastic; many very fine and fine roots and common medium and coarse roots; few fine tubular pores; 30 percent pebbles and 10 percent cobbles; medium acid; clear wavy boundary.

Bw—10 to 19 inches; light yellowish brown (10YR 6/4) extremely cobbly sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine and medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; few very fine, fine, medium, and coarse roots; few fine tubular pores; 35 percent pebbles and 25 percent cobbles; medium acid; clear wavy boundary.

C—19 to 25 inches; very pale brown (10YR 7/3) very cobbly sandy loam, yellowish brown (10YR 5/4) dry; massive; soft, very friable, slightly sticky and slightly plastic; few very fine, fine, and medium roots; few fine tubular pores; 35 percent pebbles and 20 percent cobbles; slightly acid; abrupt wavy boundary.

R—25 to 29 inches; granitic bedrock.

Depth to bedrock is 20 to 40 inches. The particle-size control section is 3 to 8 percent clay and 35 to 70 percent rock fragments. The profile is medium acid or slightly acid.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 10 to 30 percent pebbles, 5 to 15 percent cobbles, and 5 to 15 percent stones and boulders.

The Bw horizon has value of 6 or 7 dry and 4 or 5

moist. It is 20 to 40 percent pebbles, 15 to 40 percent cobbles, and 0 to 10 percent stones.

The C horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 or 3 dry or moist. It is 20 to 50 percent pebbles, 15 to 25 percent cobbles, and 0 to 10 percent stones.

## Wannacott Series

The Wannacott series consists of soils that are moderately deep to dense glacial till and are well drained. These soils are on undulating till plains. They formed in intermixed glacial lake sediment and glacial till with loess in the upper part. Slopes are 0 to 15 percent. Elevation is 2,200 to 2,700 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Wannacott silt loam, 0 to 8 percent slopes, about 8 miles west of Disautel; 900 feet south and 600 feet west of the northeast corner of sec. 17, T. 33 N., R. 28 E., W.M.:

A—0 to 10 inches; grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots; many very fine irregular pores; 3 percent pebbles; neutral; clear smooth boundary.

BA—10 to 15 inches; light yellowish brown (10YR 6/4) silt loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; many very fine and common fine roots; common very fine tubular pores; 3 percent pebbles; neutral; clear smooth boundary.

Bt—15 to 22 inches; light brownish gray (2.5Y 6/2) silt loam, olive brown (2.5Y 4/4) moist; weak fine subangular blocky structure; hard, firm, sticky and plastic; few faint clay films in pores and on faces of peds; common very fine and fine roots; common very fine tubular pores; 3 percent pebbles; moderately alkaline; abrupt smooth boundary.

Btk—22 to 29 inches; light yellowish brown (2.5Y 6/4) silty clay loam, olive brown (2.5Y 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, sticky and plastic; common distinct clay films on faces of peds and in pores; few fine roots; few fine tubular pores; 5 percent pebbles; common accumulations of soft powdery secondary lime in cracks and seams; strongly

effervescent; strongly alkaline; abrupt smooth boundary.

2C—29 to 35 inches; light yellowish gray (2.5Y 6/2) gravelly sandy loam, olive brown (2.5Y 4/4) moist; massive; hard, friable, slightly sticky and slightly plastic; few fine roots; few fine tubular pores; thin dense lake sediment; slightly effervescent; 20 percent pebbles; strongly alkaline; clear smooth boundary.

2Cd—35 to 60 inches; light gray (2.5Y 7/2) dense glacial till that crushes to gravelly sandy loam, dark grayish brown (2.5Y 4/2) moist; massive; hard, friable, nonsticky and nonplastic; thin dense lake sediment; 25 percent pebbles; strongly alkaline.

Depth to dense glacial till is 20 to 40 inches. The mollic epipedon is 7 to 14 inches thick. The solum is 21 to 35 inches thick. The particle-size control section is 18 to 35 percent clay and less than 15 percent fine sand or coarser material.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is 0 to 10 percent pebbles. It is neutral or mildly alkaline.

The BA horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is 0 to 10 percent pebbles. It is neutral or mildly alkaline. This horizon is absent in some pedons.

The Bt horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is silt loam or silty clay loam with 0 to 10 percent pebbles. It is mildly alkaline to strongly alkaline.

The Btk horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 to 4 dry or moist. It is silt loam or silty clay loam with 0 to 10 percent pebbles. It is mildly alkaline to strongly alkaline.

The 2Cd horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. The upper part is 15 to 35 percent pebbles, and the lower part is 15 to 50 percent pebbles. The horizon is mildly alkaline to strongly alkaline.

## Wapal Series

The Wapal series consists of very deep, somewhat excessively drained soils on terraces and terrace escarpments. These soils formed in glacial outwash with a minor component of volcanic ash and loess. Slopes are 0 to 65 percent. Elevation is 1,600 to 3,500 feet. The average annual precipitation is 16 to 24 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Wapal gravelly sandy loam, 30 to 65 percent slopes, about 23 miles northeast of Nespelem; 1,000 feet south and 175 feet west of the northeast corner of sec. 10, T. 34 N., R. 32 E., W.M.:

- Oi—1.5 inches to 0; needles, twigs, and leaves.  
 A—0 to 5 inches; dark grayish brown (10YR 4/2) gravelly sandy loam, very dark gray (10YR 3/1) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and very fine roots; common very fine tubular pores; 15 percent pebbles; medium acid; clear wavy boundary.  
 Bw—5 to 11 inches; yellowish brown (10YR 5/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; common very fine tubular pores; 15 percent pebbles; medium acid; abrupt wavy boundary.  
 C—11 to 60 inches; multicolored very gravelly coarse sand; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 40 percent pebbles and 10 percent cobbles; slightly acid.

Depth to the C horizon is 10 to 20 inches. The particle-size control section is 35 to 70 percent rock fragments.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is gravelly or cobbly sandy loam with 5 to 30 percent pebbles, 0 to 25 percent cobbles, and 0 to 5 percent stones. It is medium acid to neutral.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is sandy loam or coarse sandy loam with 15 to 35 percent pebbles, 0 to 50 percent cobbles, and 0 to 5 percent stones. It is medium acid to neutral.

The C horizon commonly is multicolored. The horizon is loamy sand, sand, or coarse sand with 30 to 70 percent pebbles, 5 to 35 percent cobbles, and 0 to 5 percent stones. It is slightly acid or neutral.

## Wells creek Series

The Wells creek series consists of very deep, well drained soils on fans and on toeslopes, footslopes, and backslopes of hills and mountains. These soils formed in colluvium derived from metasedimentary rock with a small component of loess and volcanic ash. Slopes are 5 to 65 percent. Elevation is 2,000 to 3,200 feet. The average annual precipitation

is 18 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Wells creek very channery loam, 40 to 65 percent slopes, about 14 miles southwest of Inchelium; 1,900 feet south and 1,950 feet east of the northwest corner of sec. 3, T. 20 N., R. 35 E., W.M.:

- Oi—4 inches to 1 inch; needles, twigs, cones, and mosses.  
 Oe—1 inch to 0; moderately decomposed organic matter.  
 A1—0 to 6 inches; dark grayish brown (10YR 4/2) very channery loam, very dark brown (10YR 2/2) moist; weak fine granular structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots; common very fine tubular pores; 35 percent hard channers and 15 percent soft channers; slightly acid; clear smooth boundary.  
 A2—6 to 14 inches; brown (10YR 5/3) very channery loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine, fine, and medium roots; common very fine tubular pores; 40 percent hard channers, 20 percent soft channers, and 5 percent cobbles; neutral; abrupt wavy boundary.  
 Bw1—14 to 26 inches; yellowish brown (10YR 5/4) extremely cobbly silt loam, dark yellowish brown (10YR 3/4) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and common medium and coarse roots; common very fine tubular pores; 30 percent hard channers, 20 percent soft channers, 25 percent cobbles, and 10 percent stones; neutral; gradual wavy boundary.  
 Bw2—26 to 42 inches; light yellowish brown (10YR 6/4) extremely channery loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; common very fine, fine, medium, and coarse roots; common very fine tubular pores; 55 percent hard channers, 10 percent soft channers, and 20 percent cobbles; slightly acid; gradual wavy boundary.  
 C—42 to 60 inches; light yellowish brown (10YR 6/4) extremely channery loam, olive brown (2.5Y 4/4) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and few fine roots; few fine tubular pores; 55 percent hard channers, 15 percent soft channers, and 20 percent cobbles; slightly acid.

The mollic epipedon is 10 to 20 inches thick. The particle-size control section is 18 to 30 percent clay. It is slightly acid or neutral.

The A1 horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 to 3 moist. It is channery or very channery loam.

The A2 horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is loam or silt loam with 15 to 40 percent hard channers, 0 to 20 percent soft channers, 0 to 10 percent pebbles, and 0 to 5 percent cobbles.

The Bw horizon has hue of 10YR or 7.5YR, value of 4 to 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is loam, silt loam, or clay loam with 20 to 30 percent hard channers, 0 to 25 percent soft channers, 0 to 20 percent pebbles, 0 to 10 percent flagstones, 0 to 30 percent cobbles, and 0 to 10 percent stones.

The C horizon has hue of 10YR or 2.5Y, value of 4 to 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is loam or clay loam with 30 to 60 percent hard channers, 5 to 25 percent soft channers, 0 to 20 percent pebbles, 5 to 25 percent cobbles, 5 to 15 percent flagstones, and 0 to 10 percent stones.

## Whitestone Series

The Whitestone series consists of very deep, well drained soils on shoulders, backslopes, footslopes, and toeslopes of hills and mountains. These soils formed in colluvium and glacial till derived from granitic rock with a small component of loess and volcanic ash. Slopes are 5 to 65 percent. Elevation is 1,700 to 3,700 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Whitestone gravelly sandy loam, 20 to 40 percent slopes, about 4 miles northwest of Nespelem; 1,150 feet north and 250 feet east of the southwest corner of sec. 16, T. 31 N., R. 30 E., W.M.:

Oi—1 inch to 0; needles, twigs, leaves, and cones.

A1—0 to 8 inches; grayish brown (10YR 5/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and nonplastic; many very fine and fine roots and few medium roots; common very fine irregular pores; 20 percent pebbles, 5 percent cobbles, and 1 percent stones; neutral; clear wavy boundary.

A2—8 to 16 inches; brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots and few medium roots; common very fine

irregular pores; 25 percent pebbles and 5 percent cobbles; neutral; clear wavy boundary.

Bw—16 to 32 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 5/3) moist; weak medium subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots and few medium roots; common very fine irregular pores; 35 percent pebbles and 5 percent cobbles; slightly acid; clear wavy boundary.

C—32 to 60 inches; pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; few very fine irregular pores; 35 percent pebbles and 5 percent cobbles; slightly acid.

The mollic epipedon is 10 to 18 inches thick. The solum is 20 to 35 inches thick. The particle-size control section is 3 to 8 percent clay and 35 to 60 percent angular granitic rock fragments. The profile is slightly acid or neutral.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry or moist. It is loam, gravelly sandy loam, or very stony sandy loam with 5 to 25 percent pebbles, 0 to 15 percent cobbles, and 0 to 15 percent stones and boulders.

The Bw horizon has value of 5 or 6 dry and 4 or 5 moist, and it has chroma of 3 or 4 dry or moist. It is 20 to 40 percent pebbles, 0 to 25 percent cobbles, and 0 to 5 percent stones.

The C horizon has value of 6 or 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is sandy loam or loamy sand with 25 to 50 percent pebbles, 5 to 30 percent cobbles, and 0 to 5 percent stones.

## Wilmont Series

The Wilmont series consists of very deep, well drained soils on toe slopes, footslopes, and backslopes of hills and mountains. These soils formed in residuum and colluvium derived from metasedimentary rock with a mantle of volcanic ash. Slopes are 20 to 65 percent. Elevation is 2,200 to 3,300 feet. The average annual precipitation is 18 to 25 inches, the average annual air temperature is 41 to 44 degrees F, and the frost-free period is 90 to 120 days.

Typical pedon of Wilmont silt loam, 40 to 65 percent slopes, about 16 miles southwest of Inchelium; 550 feet east and 1,975 feet north of the southwest corner of sec. 14, T. 31 N., R. 34 E., W.M.:

Oi—2 inches to 0; needles and twigs.

- A—0 to 5 inches; brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine and fine roots and few medium and coarse roots; common very fine tubular pores; 10 percent channers; neutral (NaF pH 10.1); clear wavy boundary.
- Bw1—5 to 12 inches; yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; many very fine roots, common fine and medium roots, and few coarse roots; common very fine tubular pores; 10 percent channers; neutral (NaF pH 9.8); abrupt wavy boundary.
- 2Bw2—12 to 17 inches; light yellowish brown (10YR 6/4) very channery sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and fine roots and few medium and coarse roots; common very fine tubular pores; 40 percent channers and 5 percent flagstones; neutral; gradual wavy boundary.
- 2Bw3—17 to 27 inches; light yellowish brown (10YR 6/4) very channery sandy loam, dark yellowish brown (10YR 4/4) moist; weak fine subangular blocky structure; soft, very friable, slightly sticky and slightly plastic; common very fine and few fine roots; few fine tubular pores; 40 percent channers, 5 percent pebbles, and 10 percent flagstones; neutral; clear wavy boundary.
- 2C1—27 to 47 inches; brown (10YR 5/3) extremely channery loamy sand, dark brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; few very fine, fine, and medium roots; few fine tubular pores; 55 percent channers, 5 percent pebbles, 10 percent flagstones, and 2 percent stones; neutral; clear wavy boundary.
- 2C2—47 to 60 inches; dark grayish brown (10YR 4/2) extremely channery sand, very dark grayish brown (10YR 3/2) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 50 percent channers, 10 percent pebbles, 20 percent flagstones, and 2 percent stones; neutral.

The mantle of volcanic ash is 7 to 14 inches thick. The solum is 20 to 30 inches thick. The particle-size control section is 35 to 70 percent rock fragments and 7 to 15 percent clay.

The A horizon has value of 4 or 5 dry and chroma of 2 or 3 dry or moist. It is 0 to 10 percent channers.

The Bw horizon has value of 5 or 6 dry and 3 or 4 moist, and it has chroma of 3 or 4 dry or moist. It is silt

loam or loam with 5 to 35 percent channers and 0 to 10 percent cobbles and flagstones.

The 2Bw horizon has hue of 10YR or 2.5Y, value of 5 to 7 dry and 3 to 5 moist, and chroma of 2 to 4 dry or moist. It is loam or sandy loam with 20 to 45 percent channers, 0 to 20 percent pebbles, 0 to 10 percent flagstones, 0 to 15 percent cobbles, and 0 to 15 percent soft rock fragments.

The 2C1 horizon has hue of 7.5YR, 10YR, or 2.5Y, value of 5 or 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is loam, sandy loam, or loamy sand with 30 to 55 percent channers, 0 to 20 percent pebbles, 0 to 10 percent flagstones, 0 to 10 percent cobbles, 0 to 5 percent stones, and 0 to 15 percent soft rock fragments.

The 2C2 horizon has hue of 7.5YR, 10YR, or 2.5Y, value of 4 to 6 dry and 3 or 4 moist, and chroma of 2 to 4 dry or moist. It is sandy loam, loamy sand, or sand with 30 to 60 percent channers, 0 to 20 percent pebbles, 0 to 20 percent flagstones, 0 to 10 percent cobbles, 0 to 5 percent stones, and 0 to 15 percent soft rock fragments.

## Winchester Series

The Winchester series consists of very deep, excessively drained soils on outwash terraces, terrace escarpments, and dunes. These soils formed in glacial outwash sand that has been reworked by wind in some areas. Slopes are 0 to 60 percent. Elevation is 900 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Typical pedon of Winchester loamy coarse sand, 0 to 10 percent slopes, about 11 miles south of Keller; 2,300 feet north and 300 feet east of the southwest corner of sec. 18, T. 28 N., R. 33 E., W.M.:

- A—0 to 9 inches; grayish brown (10YR 5/2) loamy coarse sand, very dark grayish brown (10YR 3/2) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; common very fine tubular pores; 5 percent fine pebbles; neutral; abrupt smooth boundary.
- AC—9 to 15 inches; brown (10YR 5/3) sand, dark brown (10YR 3/3) moist; single grain; loose, nonsticky and nonplastic; common very fine and fine roots; few fine tubular pores; 5 percent fine pebbles; mildly alkaline; clear smooth boundary.
- C1—15 to 29 inches; yellowish brown (10YR 5/4) sand, dark yellowish brown (10YR 3/4) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores;

5 percent fine pebbles; neutral; abrupt smooth boundary.

C2—29 to 48 inches; pale brown (10YR 6/3) sand, yellowish brown (10YR 5/4) moist; single grain; loose, nonsticky and nonplastic; 5 percent fine pebbles; mildly alkaline; abrupt smooth boundary.

C3—48 to 60 inches; multicolored sand; single grain; loose, nonsticky and nonplastic; neutral.

The particle-size control section is about 75 percent very coarse, coarse, and medium sand, 0 to 5 percent clay, and 0 to 10 percent pebbles. The surface layer is less than 1 percent organic matter. Depth to secondary carbonates is 30 to 60 inches or more.

The A and AC horizons have chroma of 2 or 3 dry or moist. Soil structure is absent in some pedons. These horizons are slightly acid or neutral. They are absent in some pedons.

The C horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 2 to 4 dry or moist. It is sand or coarse sand. It is neutral or mildly alkaline.

### Winthrop Series

The Winthrop series consists of very deep, somewhat excessively drained soils on alluvial fans and terraces. These soils formed in mixed alluvium and glacial outwash. Slopes are 0 to 20 percent. Elevation is 1,300 to 2,700 feet. The average annual precipitation is 14 to 16 inches, the average annual air temperature is 45 to 47 degrees F, and the frost-free period is 100 to 130 days.

Typical pedon of Winthrop stony sandy loam, 0 to 20 percent slopes, about 7 miles northeast of Nespelem; 1,300 feet south and 950 feet east of the northwest corner of sec. 7, T. 31 N., R. 32 E., W.M.:

A—0 to 10 inches; very dark grayish brown (10YR 3/2) stony sandy loam, black (10YR 2/1) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and fine roots; common very fine tubular pores; 25 percent pebbles and 5 percent stones; neutral; clear smooth boundary.

2C1—10 to 21 inches; light brownish gray (10YR 6/2) extremely gravelly sand, dark grayish brown (10YR 4/2) moist; single grain; loose, nonsticky and nonplastic; common very fine and few fine roots; few fine tubular pores; 50 percent pebbles, 10 percent cobbles, and 2 percent stones; neutral; gradual smooth boundary.

2C2—21 to 60 inches; light brownish gray (10YR 6/2) extremely gravelly coarse sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky and nonplastic; few very fine roots; few fine

tubular pores; 60 percent pebbles, 5 percent cobbles, and 1 percent stones; neutral.

The mollic epipedon is 8 to 15 inches thick. The particle-size control section is 35 to 70 percent rock fragments.

The A horizon has value of 3 to 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 or 2 moist. It is 15 to 35 percent pebbles and 5 to 10 percent cobbles and stones. It is neutral or slightly acid.

The 2C horizon has hue of 10YR or 2.5Y, value of 6 or 7 dry and 4 or 5 moist, and chroma of 2 or 3 dry or moist. It is sand or coarse sand with 35 to 60 percent pebbles, 0 to 20 percent cobbles, and 0 to 5 percent stones.

### Wynhoff Series

The Wynhoff series consists of moderately deep, well drained soils on shoulders, backslopes, and footslopes of hills and mountains. These soils formed in colluvium and residuum derived from granitic rock, rhyodacite porphyry, and soft metasedimentary rock, with an admixture of loess. Slopes are 8 to 65 percent. Elevation is 1,400 to 3,400 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days.

Typical pedon of Wynhoff stony loam, 30 to 65 percent slopes, about 8 miles southeast of Keller; 1,600 feet north and 350 feet west of the southeast corner of sec. 34, T. 29 N., R. 33 E., W.M.:

A1—0 to 7 inches; brown (10YR 5/3) stony loam, dark brown (10YR 3/3) moist; moderate fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; many very fine and common fine roots; many very fine irregular pores; 20 percent pebbles, 5 percent cobbles, and 2 percent stones; neutral; gradual wavy boundary.

A2—7 to 12 inches; yellowish brown (10YR 5/4) gravelly loam, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine roots; 25 percent pebbles and 5 percent cobbles, neutral; clear wavy boundary.

Bw1—12 to 19 inches; light yellowish brown (10YR 6/4) very gravelly loam, brown (10YR 4/3) moist; weak fine subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; 35 percent pebbles, 5 percent cobbles, and 2 percent stones; neutral; clear wavy boundary.

Bw2—19 to 28 inches; light yellowish brown (10YR

6/4) very gravelly loam, brown (10YR 4/3) moist; weak medium subangular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; common very fine roots; many very fine irregular pores; 40 percent pebbles, 10 percent cobbles, and 2 percent stones; neutral; clear smooth boundary.

C—28 to 34 inches; light yellowish brown (10YR 6/4) extremely gravelly coarse sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky and nonplastic; few very fine roots; few fine tubular pores; 50 percent pebbles, 10 percent cobbles, and 5 percent stones; neutral; clear wavy boundary.

R—34 to 38 inches; rhyodacite bedrock.

The mollic epipedon is 10 to 18 inches thick. Depth to bedrock is 20 to 40 inches. The particle-size control section is 8 to 15 percent clay and 40 to 70 percent rock fragments. The profile is neutral or mildly alkaline.

The A horizon has value of 4 to 6 dry and 2 or 3 moist, and it has chroma of 2 to 4 dry and 2 or 3 moist. The lower part of the horizon is loam or sandy loam. The horizon is 20 to 30 percent pebbles and 5 to 10 percent cobbles and stones.

The Bw horizon has value of 5 to 7 dry and 3 to 5 moist, and it has chroma of 3 or 4 dry or moist. It is loam, fine sandy loam, or sandy loam with 30 to 60 percent pebbles, 5 to 25 percent cobbles, and 0 to 5 percent stones.

The C horizon has value of 6 or 7 dry and 4 to 6 moist, and it has chroma of 3 or 4 dry or moist. It is loam, sandy loam, or coarse sandy loam with 35 to 60 percent pebbles, 5 to 25 percent cobbles, and 0 to 5 percent stones.

## Xeric Torriorthents

Xeric Torriorthents consist of very deep, well drained to excessively drained soils on terraces and terrace escarpments. These soils formed in glacial outwash, glaciofluvial material, and glacial lake sediment. The parent material commonly is mixed by colluvial action and is stratified. Slopes are 0 to 65 percent. Elevation is 800 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, and the frost-free period is 140 to 180 days.

Reference pedon of Xeric Torriorthents, escarpments, 30 to 65 percent slopes, about 5 miles northwest of Elmer City; 1,800 feet south and 1,700 feet west of the northeast corner of sec. 35, T. 30 N., R. 30 E., W.M.:

A—0 to 8 inches; brown (10YR 5/3) extremely cobbly loamy sand, dark brown (10YR 3/3) moist; weak fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common very fine and fine roots; many very fine irregular pores; 35 percent rounded pebbles, 30 percent cobbles, and 5 percent stones; neutral; gradual wavy boundary.

C1—8 to 33 inches; pale brown (10YR 6/3) cobbly loamy sand, brown (10YR 4/3) moist; single grain; loose, nonsticky and nonplastic; few very fine and fine roots; few fine tubular pores; 10 percent rounded pebbles and 10 percent cobbles; neutral; abrupt wavy boundary.

2C2—33 to 45 inches; very pale brown (10YR 7/3) silty clay loam, brown (10YR 5/3) moist; moderate medium subangular blocky structure; slightly hard, friable, sticky and plastic; few fine roots; few fine tubular pores; 10 percent rounded pebbles; mildly alkaline; abrupt wavy boundary.

3C3—45 to 60 inches; light gray (10YR 7/2) sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky and nonplastic; 5 percent rounded pebbles; violently effervescent; mildly alkaline.

The particle-size control section is 2 to 15 percent clay and 15 to 60 percent rock fragments. The profile is neutral or mildly alkaline.

The A horizon has chroma of 2 or 3 dry or moist. It is extremely cobbly loamy sand or gravelly fine sandy loam with 15 to 40 percent pebbles, 0 to 30 percent cobbles, and 0 to 5 percent stones. This horizon is absent in some pedons.

The C horizon has value of 6 or 7 dry and 4 to 6 moist, and it has chroma of 2 or 3 dry or moist. It is silty clay loam to coarse sand with 5 to 40 percent pebbles and 0 to 30 percent cobbles. Stratification is common.

## Xerochrepts

Xerochrepts consist of very deep, well drained soils on backslopes of mountains. These soils formed in colluvium derived from rhyodacite, metasedimentary rock, and granitic rock. In some areas the upper part has an admixture of volcanic ash. Slopes are 40 to 90 percent. Elevation is 1,800 to 4,000 feet. The average annual precipitation is 17 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

Reference pedon of Xerochrepts in an area of Xerochrepts-Rubble land-Rock outcrop complex,

40 to 90 percent slopes, about 22 miles northeast of Nespelem; 2,100 feet west and 900 feet south of the northeast corner of sec. 16, T. 34 N., R. 32 E., W.M.:

Oi—1.5 inches to 0; needles, leaves, and twigs.

A—0 to 3 inches; brown (10YR 5/3) very cobbly loam, dark brown (10YR 3/3) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots; many very fine irregular pores; 20 percent angular pebbles and 30 percent cobbles; neutral; clear wavy boundary.

Bw1—3 to 7 inches; pale brown (10YR 6/3) extremely cobbly loam, brown (10YR 4/3) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; common fine and medium roots and few coarse roots; few fine tubular pores; 20 percent angular pebbles and 40 percent cobbles; neutral; gradual wavy boundary.

Bw2—7 to 24 inches; very pale brown (10YR 7/3) extremely cobbly loam, brown (10YR 5/3) moist; weak very fine subangular blocky structure; soft, very friable, nonsticky and nonplastic; few fine and medium roots; few fine tubular pores; 15 percent

angular pebbles and 60 percent cobbles; neutral; gradual wavy boundary.

C—24 to 60 inches; very pale brown (10YR 7/3) extremely cobbly sandy loam, brown (10YR 5/3) moist; massive; soft, very friable, nonsticky and nonplastic; few fine roots; few fine tubular pores; 15 percent angular pebbles and 75 percent cobbles; neutral.

Volcanic ash that has bulk density of 0.75 to 0.95 grams per cubic centimeter is in some pedons to a depth of 7 to 14 inches. The particle-size control section is 3 to 15 percent clay and 35 to 90 percent rock fragments. The profile is neutral to medium acid.

The A horizon has value of 4 or 5 dry and 2 or 3 moist, and it has chroma of 2 or 3 dry and 1 to 3 moist. It is loam or silt loam with 25 to 45 percent pebbles, 15 to 30 percent cobbles, and 0 to 5 percent stones.

The Bw horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 3 to 6 dry or moist. It is loam or sandy loam with 15 to 75 percent pebbles, 5 to 65 percent cobbles, and 0 to 5 percent stones.

The C horizon has value of 5 to 7 dry and 4 or 5 moist, and it has chroma of 2 to 4 dry or moist. It is loam or sandy loam with 15 to 80 percent pebbles, 20 to 80 percent cobbles, and 0 to 5 percent stones.

# Formation of the Soils

---

Soils are a collection of three-dimensional natural bodies that contain living matter and support or are capable of supporting plants. The properties and characteristics of a soil are determined by soil-forming processes that result from (1) the physical and mineralogical characteristics of the parent material; (2) the climate under which the soil has formed or accumulated; (3) the living organisms, both plant and animals, including man; (4) the topography or relief; and (5) the length of time over which the processes of soil formation have occurred. In this section the soil-forming factors are discussed separately; however, these factors function interdependently.

Many soil-forming processes act together to form a soil profile. These processes include additions to the soil surface, transformations within the soil, vertical transfers (up and down), and removals (Birkeland, 1974). Additions include organic matter from plants and animals, ions from rainwater, and particles carried and deposited by wind and water. Transformations include organic compound formation during organic matter decomposition as well as weathering of rocks and primary minerals to form secondary minerals and other products. Vertical transfers mainly consist of translocation of clay, soluble salts, organic compounds, and ions from one part of the soil to another by water moving through the soil. Removals consist of the leaching of soluble salts and other substances in solution out of the soil profile.

## Parent Material

Parent material is the unconsolidated mineral or organic material from which soils develop. Soil properties and characteristics are strongly influenced by the nature of the parent material, especially in the younger soils.

Soils in this survey area have formed in many kinds of parent material, including residuum and colluvium derived from metamorphic, sedimentary, granitic, and volcanic rock; glacial deposits including glacial till, glacial outwash, eolian sand, and glaciolacustrine sediment; volcanic ash; loess; alluvium; and organic material.

### *Residuum and colluvium derived from bedrock.—*

The oldest rocks of the survey area are the late Paleozoic metamorphic and sedimentary rock known collectively as the Covada Group (Pardee, 1918). These rocks are concentrated in the eastern and north-central parts of the survey area and consist mainly of phyllite, schist, quartzite, slate, graywacke, shale, and limestone. Soils that formed in material derived from these rocks are in the loamy-skeletal family, and the rock fragments commonly consist of flattened channers and flagstones because of the platy, interbedded nature of the bedrock. Depth to bedrock is 10 to 60 inches or more. Depth is strongly influenced by the topographic position. The Raisio, Rufus, Oxerine, and Wilmont series are examples of soils that formed in this material.

The next oldest and most extensive rocks of the survey area are the Mesozoic and Tertiary granitic rocks of the Colville Batholith. The dominant rocks are quartz monzonite, granite, granodiorite, quartz diorite, diorite, and granitic gneiss. These granitic rocks occur in a complex, intricate pattern, but they behave similarly in terms of soil formation. In nonglaciated areas, the bedrock commonly is highly weathered and the soils are 10 to 60 inches deep to a paralithic contact. The soils in these areas are mainly in the coarse-loamy or loamy-skeletal family, and the rock fragments are dominantly fine gravel. Soils of the Centralpeak, Dinkelman, Moses, Skanid, and Spokane series are examples. In glaciated areas, the granitic bedrock has been scoured and abraded by glacial ice that has removed the weathered material, exposing hard, relatively unweathered rock. The soils in these areas are dominantly 10 to 40 inches deep, are in the loamy-skeletal family, and have gravel-sized to boulder-sized rock fragments. Soils of the Buhrig, Mineral, Vanbrunt, and Swakane series are examples.

Volcanic rock and related rocks of the early Tertiary comprise an extensive area in the central part of the survey area. These rocks are divided into three formations: (1) the O'Brien Creek Formation, composed mainly of tuff and breccia; (2) the Sanpoil Volcanics, composed largely of flows and some interbedded tuff; and (3) Scatter Creek rhyodacite,

consisting of dikes and other small intrusive bodies (Staatz, 1964). These formations consist dominantly of rhyodacite, andesite, and quartz latite. Soils that formed in material weathered from these rocks are 4 to 60 inches deep or more. Depth is highly dependent on the topographic position. These soils are mainly in the loamy-skeletal family, and they are associated with areas of Rock outcrop and Rubble land. Soils of the Baldknob, Thout, Johntom, Inkler, Northstar, and Louiecreek series are examples. Flows of late Tertiary Columbia River Basalt formed the Okanogan Plateau, known locally as Timentwa Flats, in the southwestern part of the survey area (Baker and Nummendal, 1978). Other small plateau remnants of this basalt are in the south-central part of the survey area, generally in proximity with the Columbia River. These flows make up the youngest rocks in the survey area. Most soils in the survey area formed in material weathered from this basalt and have a component of loess. Depth to bedrock is 4 to 60 inches or more, depending on the topographic position. Soils of the Anders, Badge, and Bakeoven series are examples.

*Glacial deposits.*—During the Pleistocene, approximately 75 percent of the survey area was covered by glacial ice of the Cordilleran Ice Sheet (Richmond and others, 1965). The ice sheet in the survey area was made up of three main lobes. These were (1) the Okanogan Lobe, which covered the western half of the survey area, except for the upper elevations of the Moses and Armstrong Mountains; (2) the Sanpoil Lobe, which was confined within the valley walls of the Sanpoil River Valley, in the central part of the survey area, and ended just north of the confluence with the Columbia River (the exact terminus is in dispute); and (3) the Columbia River Lobe, which covered the extreme eastern part of the survey area.

The glaciation resulted in deposits of glacial till of varying thickness covering much of the survey area. Glacial till is unsorted, nonstratified material deposited directly by and underneath a glacier. It consists of a heterogeneous mixture of sand, silt, clay, and rock fragments. The mineralogy of the till commonly is similar to that of the local bedrock; for example, glacial till in an area with granitic bedrock is composed mainly of material of granitic origin, with only a small component of erratic material from other sources. Soils in this survey area that formed in glacial till are mainly in the coarse-loamy and loamy-skeletal families. The substrata generally are compacted and have high bulk density because of the weight of the glacial ice. The Apex, Conconully, Donavan, Manley, and Nevine series are examples of soils that formed in

glacial till and have a component or mantle of volcanic ash and loess.

Glacial outwash from melting glaciers has formed terraces, kames, and eskers consisting mainly of sorted and stratified sand, gravel, and cobbles. Some terraces are mainly composed of nongravelly coarse-loamy material, called glaciofluvial deposits in this survey. Outwash deposits are most extensive along the Columbia, Okanogan, and Sanpoil Rivers, but they also occur along many of the secondary streams. Many of the soils that formed in this material also have a mantle of volcanic ash and loess. The Hallcreek, Kiehl, Pogue, Skaha, and Wapal series are examples of soils that formed in sandy-skeletal glacial outwash. The Bisbee, Ewall, and Quincy series are examples of soils that formed in nongravelly, sandy glacial outwash that has been reworked by wind. The Cashmere, Phoebe, Picard, Scala, and Stapaloo series are examples of soils that formed in coarse-loamy glaciofluvial deposits.

Glaciolacustrine sediment is extensive along the Columbia River and its tributaries, from the vicinity of Barnaby Creek downstream to the confluence with the Nespelem River and along the Sanpoil River from its confluence with the Columbia River to the vicinity of Bridge Creek. Other less extensive deposits are along the Okanogan River and in the Disautel and Moses Meadows areas. Glaciolacustrine sediment consists of stratified silt, clay, and sand deposited in glacial lakes. This sediment commonly is interbedded or laminated with varves. A major glacial lake was formed when the Okanogan Ice Lobe periodically blocked the Columbia River in the vicinity of Grand Coulee Dam, forming Lake Columbia (Richmond and others, 1965). Other smaller glacial lakes were formed throughout the survey area by similar processes. Soils that formed in this sediment are dominantly in the coarse-silty, fine-silty, or fine families and have a mantle of volcanic ash and loess. The Cedonia, Elvedere, Hodgson, Kewach, Martella, and Nespelem series are examples of soils that formed in glaciolacustrine sediment.

*Volcanic ash.*—Two major volcanic eruptions in the Cascade Mountains deposited volcanic ash over most of the survey area. These were the eruptions of Glacier Peak in the North Cascades about 12,000 years ago and of Mount Mazama (Crater Lake) in the Southern Oregon Cascades about 7,500 years ago (Fryxell, 1965). Physical characteristics of the volcanic ash include low bulk density (less than 0.85 grams per cubic centimeter), a dominance of silt and very fine sand-sized particles, weak structural development, and relatively high available water capacity (greater than 0.18 inch per inch). Chemical properties include a

high ratio of 15-bar water content and cation exchange capacity to measured clay, and pH value in sodium fluoride of more than 9.4.

The volcanic ash commonly occurs as a discrete mantle on north-facing soils at an elevation of about 2,000 feet or more, and it overlies a wide variety of parent material. The Nevine, Manley, Moses, and Resner series are examples of soils that formed in this material. On south-facing soils and on north-facing soils at an elevation of less than about 2,000 feet, the volcanic ash commonly occurs as a component of the surface horizons and it may be mixed with loess or the underlying parent material. Soils of the Conconully, Donavan, Merkel, and Spokane series are examples. Thick alluvial deposits of volcanic ash are in wet depressions. Soils of the Emdent, Bossburg, and Uncas series formed in these deposits.

*Loess.*—Many of the soils in the survey area have a mantle of loess that commonly is mixed with volcanic ash. The Broadax and Reardan series are examples of soils that formed entirely in loess that is believed to be of at least two different geologic ages, the older of which is identified by a strongly developed argillic horizon. The origin of the loess is complex, but it is believed to be from glaciolacustrine sediment in the vicinity and from redeposited loess from the Columbia Plateau to the south.

*Alluvium and organic material.*—The major streams in the survey area and many of the secondary streams have formed flood plains and stream terraces composed of recent alluvium. The character of the alluvium is dependent on the velocity and volume of the floodwaters and on the soils and geology of adjacent upland areas. Soils that formed in alluvium commonly are stratified because the velocity of the floodwater varies during formation. Many of the soils have textures that become coarser as depth increases, which reflects a gradual reduction of stream gradients over geologic time. Most of the alluvial soils in the survey area are in the coarse-loamy family. The Cubcreek, Narcisse, Okanogan, Poween, Ralsen, Ret, and Sanpoil series are examples.

Alluvial fans are common in the drier areas of the survey area. These fans form in areas where a stream with relatively steep gradient emerges from a narrow valley onto a nearly level or gently sloping plain or terrace. The Beverly, Cashmont, Logy, Rebecca, and Winthrop series are examples of soils that formed on alluvial fans.

Organic soils are in back swamps of flood plains and in wet depressions on outwash terraces, till plains, ground moraines, and other glacial landforms. The

parent material consists of organic matter from water-tolerant plants in various stages of decomposition. Organic soils commonly have thin strata of alluvium or overlies alluvium that commonly is high in content of volcanic ash. Borosapristis, Medisapristis, and Histosols are examples of organic soils in the survey area. The Bossburg and Uncas series are examples of soils that have a thin organic surface layer over volcanic ash.

## Climate

Precipitation and temperature are the primary climatic factors that affect soil development. Precipitation influences the amount of moisture entering the soil, which affects the physical, chemical, and biological processes of soil formation, including the weathering of minerals, organic matter production and decomposition, elevation of colloids, leaching of ions, and rate of erosion. Soil moisture and temperature also influence the rate at which these soil-forming processes occur. The higher the soil temperature and moisture content, the higher the rate of these processes.

The climate in the survey area is strongly influenced by the rainshadow created by the Cascade Mountains to the west. The average annual precipitation is 9 to 35 inches, increasing progressively from west to east and from south to north. Most of the precipitation occurs from late in fall through spring, with only occasional thunderstorms occurring in summer and early in fall. The average annual air temperature is 37 to 51 degrees F, and the frost-free period is 70 to 180 days. Precipitation increases and the temperature and frost-free period decrease as elevation increases.

For purposes of soil classification, five broad climatic zones are recognized in the project area. These zones are defined in the following paragraphs.

*Zone 1.*—This driest zone includes soils that have an aridic moisture regime bordering on xeric and a mesic temperature regime. Elevation is 800 to 1,800 feet. The average annual precipitation is 9 to 12 inches, the average annual air temperature is 49 to 51 degrees F, the frost-free period is 140 to 180 days. The dominant plant community is bunchgrass-shrub steppe.

Most of the soils in this zone have received sufficient organic matter to form a thin mollic epipedon. The subsoil has been weathered and altered to form a weakly developed cambic horizon. In the well drained soils, carbonates generally have been leached to a depth of more than 20 inches. The Cashmere, Farrell,

Pogue, and Ellisforde series are examples of soils in this zone. The Quincy and Skaha series are examples of soils in this zone that are sandy throughout and have not developed diagnostic horizons.

*Zone 2.*—This zone includes soils that have a xeric moisture regime and a mesic temperature regime. Elevation is 1,200 to 3,000 feet. The average annual precipitation is 12 to 15 inches, the average annual air temperature is 47 to 49 degrees F, and the frost-free period is 110 to 150 days. The dominant plant community is bunchgrass-shrub steppe with occasional, widely spaced coniferous trees.

The soils in this zone have a well-developed mollic epipedon that generally is darker and thicker than that in the soils of zone 1. Carbonates have been leached to a depth of more than 30 inches, except in soils that have restricted permeability. Most of the soils have a well-developed cambic horizon. The Conconully, Owhi, Haley, Ginnis, and Timentwa series are examples. The Achimin and Morical series are examples of soils that have formed an argillic horizon and are in older, mostly nonglaciaded landscape positions.

*Zone 3.*—This zone includes forested soils that have a xeric moisture regime and a mesic temperature regime. Elevation is 1,400 to 3,000 feet. The average annual precipitation is 15 to 18 inches, the average annual air temperature is 45 to 48 degrees F, and the frost-free period is 100 to 130 days. These soils have a mollic epipedon that is intermediate in development between that of the soils in zones 1 and 2. The Hudnut and Scala series are examples of soils that have an ochric epipedon. Carbonates have been leached to a depth of more than 60 inches, except in some soils that have restricted permeability. The Cedonia, Donovan, Garrison, Phoebe, Spokane, and Stevens series are examples of soils that have a well-developed cambic horizon. The Bernhill, Georgecreek, Hodgson, and Reardan series are examples of nonglaciaded soils that have developed an argillic horizon and are in stable landscape positions.

*Zone 4.*—This zone is colder than zone 3. It includes forested soils that have a xeric moisture regime and a frigid temperature regime. Elevation is 2,000 to 5,000 feet. The average annual precipitation is 15 to 25 inches, the average annual air temperature is 42 to 44 degrees F, and the frost-free period is 90 to 120 days.

In soils such as those of the Aits, Centralpeak, Elbowlake, Merkel, Nevine, and Oxerine series, the content of organic carbon is 1 to 4 percent but the soil color does not meet the requirements for a mollic epipedon. Soils in this zone that have a mollic

epipedon commonly are on southerly aspects, are the warmest in this zone, or have restricted drainage. The Dinkelman, Mineral, Republic, and Ret series are examples of soils that have a well-developed cambic horizon. The Brusher, Henneway, Kewach, Martella, Neuske, and Renha series are examples of soils that have developed an argillic horizon and are in stable landscape positions.

*Zone 5.*—This coldest zone includes forested soils that have a xeric moisture regime bordering on udic and a cryic temperature regime. Elevation is 3,500 to 6,700 feet. The average annual precipitation is 20 to 35 inches, the average annual temperature is 37 to 41 degrees F, and the frost-free period is 70 to 100 days. The content of organic carbon in the soils in this zone is 1 to 4 percent, but the soil color does not meet the requirements for a mollic epipedon. The Buhrig, Manley, Moses, Resner, and Togo series are examples of soils that have a strongly developed cambic horizon. The Lynxcreek series is an example of soils that have an argillic horizon and are in cold areas.

## Living Organisms

Vegetation, micro-organisms, and higher animals, including man, influence the rate and characteristics of certain chemical and physical processes of soil development. Vegetation is the most important biotic factor in soil formation, because it represents the main source of organic matter. The O and A horizons in forested soils develop as a result of the accumulation and decomposition of organic matter. Organic matter promotes structural development and stability, which is important to air and water movement. The available water capacity and cation exchange capacity increase with additions of organic matter. Plants cycle nutrients through the soils, and they provide cover that reduces runoff and erosion. Plant roots improve aeration and permeability by increasing soil porosity.

Soil micro-organisms contribute to the decomposition of organic matter. Nitrogen mineralization and atmospheric nitrogen fixation, by micro-organisms alone or with legumes, provide nutrients for plant growth. Micro-organisms also are active in the transformation of phosphorous, sulfur, iron, and other elements in the soil.

Earthworms, rodents, insects, and other burrowing animals influence organic matter accumulation and decomposition. They also improve soil aeration and permeability. They mix the soil, which tends to accelerate the soil-forming processes and alterations.

When the soil moisture content is high, cultivation can cause puddling of fine-textured soils, and when

the soil is dry, cultivation produces hard clods that are difficult to break. Excessive cultivation, even when the soil moisture content is optimum, can compact the soil and thus destroy natural aggregation and reduce aeration and porosity. Conversion of forested soils to pastureland or hayland results in the darkening and thickening of the A horizon, especially in irrigated areas. Additions of organic matter, fertilizer, and other soil amendments changes many chemical and physical soil properties, such as the pH value, base saturation, and soil tilth. Cultivation of sloping soils, some logging practices, and other forms of soil disturbance that expose the mineral surface can accelerate runoff and erosion.

The vegetation in the survey area can be divided into the same five broad zones described in this section under the heading "Climate." The effects of vegetation on soil formation are difficult to separate from those of climate, because the two factors are highly interdependent. See the sections "Forest Overstory Vegetation, Management, and Productivity," "Forest Understory Vegetation, Management, and Productivity," and "Rangeland" for more detailed information on the vegetation in the survey area.

The rangeland soils in the 9- to 12-inch precipitation zone have minimal mollic epipedon development because the plant cover is relatively sparse and thus additions of organic matter are small. Soils of the Malott and Pogue series are examples.

The rangeland soils in the 12- to 15-inch precipitation zone have a thicker, darker colored mollic epipedon with greater structural development because the plant community is more productive and higher quantities of organic matter are added to the soil. Soils of the Conconully, Ginnis, and Timentwa series are examples.

The forested soils in this survey area have a thinner A horizon, and the organic matter content in these soils decreases more rapidly as depth increases than it does in the rangeland soils. These differences are partly a result of the way in which the organic matter enters the soils. On forested soils, most of the organic matter received is in the form of litter on the soil surface. On the rangeland soils, most of the organic matter is received from decomposing roots of grasses and other herbaceous plants.

Base saturation and pH value of the forested soils generally are lower than those in the rangeland soils. This is partly because of the higher precipitation and rate of leaching in the forested areas, but other factors related directly to the forest vegetation also contribute to these differences. Organic acids produced from the decomposition of forest litter increase soil acidity, and some decomposition products of forest litter act as

chelating agents of iron and aluminum compounds, which increase the solubility of these compounds and result in lower base saturation and pH value.

## Topography

The configuration of the land surface, or topography, affects soil formation in a number of ways. Aspect affects the amount of solar radiation received at a given site, which influences soil temperature and evapotranspiration. It also affects the deposition and accumulation of eolian material such as loess. Soils on north- and east-facing slopes receive less solar radiation; therefore, they are cooler and more moist than those on south- and west-facing slopes. Soils on north-facing slopes commonly have a more dense plant cover than those on south-facing slopes, which results in a higher organic matter content and provides more protection from soil erosion.

Topographic position can also influence soil depth. In the mountains, the soils on ridges and shoulders are shallow to moderately deep to bedrock. Soils of the Swakane and Vanbrunt series are examples. Water erosion and colluvial action, such as soil creep and landslides, remove soil and geologic material from ridges, shoulders, and backslopes and deposit it in downslope positions. The Whitestone series is an example of very deep soils in areas where soil material has accumulated on footslopes and toeslopes.

Soils on steep slopes have minimal profile development because the rate of removal of soil material by water erosion and mass movement is nearly as high as or higher than the rate of soil development. The Skaha and Spens series are examples of weakly developed soils. On stable, nearly level to gently sloping uplands, soils commonly become well developed over time. The rate of erosion is much slower than the rate of soil formation. The Georgecreek and Reardan series are examples of soils that have developed an argillic horizon.

Topographic position can also affect the soil moisture regime. Most upland soils are well drained, but the soils on flood plains and low stream terraces commonly exhibit restricted drainage as evidenced by a seasonal high water table and the presence of mottles. The Coxlake and Ret series are examples of somewhat poorly drained soils. The Ralsen and Sanpoil are examples of poorly drained soils.

In the drier, glaciated areas of the survey area are closed depressions that do not have sufficient outlets for the removal of surface water. The Emdent and Gooseflats series are examples of soils in these depressions. These soils have a seasonal high water

table and a high concentration of salts and exchangeable sodium.

## Time

Weathering of rocks and minerals and the development of soil horizons are dependent on time. The degree of soil development changes over time. Soil horizons require less than one hundred years to many thousands of years to develop.

Soil horizon development in this survey area is most pronounced in stable landscape positions in nonglaciaded areas. The Achimin and Friedlander series are examples of soils that have had sufficient time to form a strongly developed argillic horizon that has clay films.

Most of the soils that formed in glacial deposits have had time to develop a cambic horizon. The Cedonia, Conconully, Donavan, and Republic series are examples of soils that have a cambic horizon. The Bernhill, Hodgson, Martella, and Neuske series are examples of glacial soils that have parent material that is high in content of clay and that have formed an argillic horizon.

The hardness of the bedrock and the characteristics of the rock fragments in soil also are dependent on time. The Mineral series, which is mainly in glaciaded areas, is an example of soils that are underlain by hard granitic rock. Glacial scouring

has removed weathered material, exposing fresh rock and interrupting the weathering processes. As a result, the rock fragments in the Mineral soils are gravel, cobbles, and stones. The Centralpeak series, in contrast, is an example of soils that are underlain by highly weathered granitic rock. This rock has not been subject to the scouring and scraping action of glaciers; therefore, it has weathered for a longer period of time and the rock fragments are fine gravel.

The accumulation of organic matter that forms a mollic epipedon occurs in a relatively short period of time under certain conditions. The Okanogan and Poween series are examples of soils that formed in recent alluvium and have a well developed mollic epipedon, but they do not have diagnostic subsurface horizons. Occasional or rare periods of flooding have deposited recent alluvium on these soils, periodically interrupting the soil-forming processes.

Aquic Xerofluvents are examples of soils on flood plains that are subject to occasional periods of flooding. These soils have not had sufficient time to form genetic horizons. Each flood episode deposits a new layer of alluvium on the soil surface so that the soil-forming processes must begin anew. On very steep slopes, the rate of erosion and mass movement is nearly as high or higher than the rate of soil formation. The Skaha series and Xeric Torriorthents are examples of soils on very steep terrace escarpments.

# Glossary

---

**ABC soil.** A soil having an A, a B, and a C horizon.

**Ablation till.** Loose, permeable till deposited during the final downwasting of glacial ice. Lenses of crudely sorted sand and gravel are common.

**AC soil.** A soil having only an A and a C horizon. Commonly, such soil formed in recent alluvium or on steep, rocky slopes.

**Aeration, soil.** The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.

**Aggregate, soil.** Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.

**Alkali (sodic) soil.** A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

**Alluvial fan.** The fanlike deposit of a stream where it issues from a gorge upon a plain or of a tributary stream near or at its junction with its main stream.

**Alluvium.** Material, such as sand, silt, or clay, deposited on land by streams.

**Andesite.** A fine-grained volcanic rock consisting mainly of plagioclase feldspar with small amounts of pyroxene, hornblende, or biotite. It is dark colored, mainly shades of gray or green.

**Animal unit month (AUM).** The amount of forage required by one mature cow of approximately 1,000 pounds weight, with or without a calf, for 1 month.

**Annual cropping.** Seeding and harvesting successive winter and/or spring crops in the same field each year.

**Aquic conditions.** Current soil wetness characterized by saturation, reduction, and mottling.

**Argillic horizon.** A subsoil horizon characterized by an accumulation of illuvial clay.

**Aridic (soil taxonomy).** A soil moisture regime that has no moisture available for plants for more than half the cumulative time that the soil temperature at a depth of 20 inches is above 41 degrees F and that

has no period as long as 90 consecutive days when moisture is available for plants while the soil temperature is above 41 degrees.

**Ashy (soil taxonomy).** Soils in which 60 percent or more of the entire soil, by weight, is volcanic ash, cinders, and pumice; less than 30 percent, by volume, is 2 millimeters in diameter or larger.

**Aspect.** The direction in which a slope faces.

**Association, soil.** A group of soils or miscellaneous areas geographically associated in a characteristic repeating pattern and defined and delineated as a single map unit.

**Available water capacity (available moisture capacity).** The capacity of soils to hold water available for use by most plants. It is commonly defined as the difference between the amount of soil water at field moisture capacity and the amount at wilting point. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:

Very low .....	0 to 2
Low .....	2 to 3.75
Moderate .....	3.75 to 5
Moderately high .....	5 to 7.5
High .....	7.5 to 10
Very high .....	more than 10

**Backslope.** The position that forms the steepest and generally linear, middle portion of a hillslope. In profile, backslopes are commonly bounded by a convex shoulder above and a concave footslope below.

**Backswamp.** The extensive marshy, depressed area of a flood plain between the natural levee of a stream and the valley side or terrace.

**Badland.** Steep or very steep, commonly nonstony, barren land dissected by many intermittent drainage channels. Badland is most common in semiarid and arid regions where streams are entrenched in soft geologic material. Local relief generally ranges from 25 to 500 feet. Runoff potential is very high, and geologic erosion is active.

**Basal area.** The area of a cross section of a tree,

generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

- Basal till.** Compact glacial till deposited beneath the ice.
- Basalt.** Fine-grained volcanic rock consisting mainly of plagioclase and pyroxene, but commonly also containing olivine. It is black to dark gray.
- Base course.** The layer or layers of specified or selected material of designed thickness placed on a road subbase or subgrade for various purposes such as to distribute a load, provide drainage, or minimize frost action.
- Base saturation.** The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, and K), expressed as a percentage of the total cation-exchange capacity.
- Base slope.** A geomorphic component of hills consisting of the concave to linear (perpendicular to the contour) slope that, regardless of the lateral shape, forms an apron or wedge at the bottom of a hillside dominated by colluvium and slope-wash sediments (for example, slope alluvium).
- Batholith.** A huge, domed mass of intrusive igneous rock such as granite.
- Bedding system.** A drainage system made by plowing, grading, or otherwise shaping the surface of a flat field. It consists of a series of low ridges separated by shallow, parallel dead furrows.
- Bedrock.** The solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface.
- Bedrock-controlled topography.** A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.
- Biomass.** The total amount of living material in a particular habitat or area; an expression of the total weight of a given population of organisms.
- Blowout.** A shallow depression from which all or most of the soil material has been removed by the wind. A blowout has a flat or irregular floor formed by a resistant layer or by an accumulation of pebbles or cobbles. In some blowouts the water table is exposed.
- Bottom land.** The normal flood plain of a stream, subject to flooding.
- Boulders.** Rock fragments larger than 2 feet (60 centimeters) in diameter.
- Breaks.** The steep and very steep broken land at the border of an upland summit that is dissected by ravines.

**Breast height.** An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.

**Breccia, volcanic.** A more or less indurated rock consisting mainly of coarse angular volcanic ejecta in a matrix of fine tuff.

**Brush management.** Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.

**Bulk density.** The mass of soil per unit bulk volume. Moist bulk density refers to the oven-dry weight of a given volume of soil with a moisture content at or near field moisture capacity.

**Cable yarding.** A method of moving felled trees to a nearby central area for transport to a processing facility. Most cable yarding systems involve use of a drum, a pole, and wire cables in an arrangement similar to that of a rod and reel used for fishing. To reduce friction and soil disturbance, felled trees generally are reeled in while one end is lifted or the entire log is suspended.

**Calcareous soil.** A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.

**Cambic horizon** (soil taxonomy). A mineral soil horizon that is loamy very fine sand or finer textured and has soil structure rather than rock structure. The cambic horizon contains some weatherable minerals, and it is characterized by alterations or removals as indicated by mottling or gleying, stronger chroma or redder hue than in underlying horizons, or removal of carbonates.

**Canopy.** The leafy crown of trees or shrubs. (See Crown.)

**Canyon.** A long, deep, narrow, very steep sided valley with high, precipitous walls in an area of high local relief.

**Capillary water.** Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.

**Carbonates.** Chemical compounds containing the carbonate ion  $\text{CO}_3$  in combination with bases such as calcium, magnesium, potassium, and sodium.

**Cation.** An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.

**Cation-exchange capacity.** The total amount of

exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.

- Channery soil material.** Soil material that has, by volume, 15 to 35 percent thin, flat fragments of sandstone, shale, slate, limestone, or schist as much as 6 inches (15 centimeters) along the longest axis. A single piece is called a channer.
- Chemical treatment.** Control of unwanted vegetation through the use of chemicals.
- Chiseling.** Tillage with an implement having one or more soil-penetrating points that are less than 16 inches long and that shatter or loosen hard, compacted layers to a depth below normal plow depth.
- Chroma.** The relative purity, strength, or saturation of color (see Munsell notation).
- Clay.** As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.
- Clay film.** A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.
- Clayey** (soil taxonomy). A particle-size class in which the fine-earth fraction is 35 percent clay or more and rock fragment content is less than 35 percent by volume.
- Climax forest stage.** The culminating succession stage. Overstory vegetation is dominated by trees that are climax for the site. Vertical depth of the understory and overstory canopies is at a maximum. Seedlings to maximum-size mature trees are present in varying amounts, resulting in an uneven-aged stand.
- Climax plant community.** See Historic climax plant community.
- Climax tree.** The most competitive tree capable of growing on a particular site. In this survey area, the most competitive coniferous tree normally is the most shade-tolerant species and can reproduce in closed stand conditions.
- Coarse-loamy** (soil taxonomy). A loamy particle-size class that is at least 15 percent fine sand or coarser, including fragments as much as 3 inches in diameter, and is less than 18 percent clay in the fine-earth fraction.
- Coarse-silty** (soil taxonomy). A loamy particle-size class that is less than 15 percent fine sand or coarser, including fragments as much as 3 inches

in diameter, and is less than 18 percent clay in the fine-earth fraction.

- Coarse textured soil.** Sand or loamy sand.
- Cobble (or cobblestone).** A rounded or partly rounded fragment of rock 3 to 10 inches (7.6 to 25 centimeters) in diameter.
- Cobby soil material.** Material that has 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (7.6 to 25 centimeters) in diameter. Very cobby soil material has 35 to 60 percent of these rock fragments, and extremely cobby soil material has more than 60 percent.
- COLE (coefficient of linear extensibility).** See Linear extensibility.
- Colluvium.** Soil material or rock fragments, or both, moved by creep, slide, or local wash and deposited at the base of steep slopes.
- Compaction.** The increase in soil bulk density as a result of applied loads or pressure. Compaction reduces porosity, water infiltration, and root penetration.
- Complex slope.** Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.
- Concentrated flow erosion.** An erosion process whereby water accumulates in narrow channels and removes the soil material to considerable depths.
- Concretions.** Cemented bodies with crude internal symmetry organized around a point, a line, or a plane. They typically take the form of concentric layers visible to the naked eye. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up concretions. If formed in place, concretions of iron oxide or manganese oxide are generally considered a type of redoximorphic concentration.
- Coniferous.** Pertaining to plants of the Coniferales order of the Gymnospermae subdivision. Coniferous plants have cone fruit and are commonly, but not always, evergreen. Examples include ponderosa pine, Douglas-fir, and western larch.
- Conservation cropping system.** Growing crops in combination with needed cultural and management practices. In a good conservation cropping system, the soil-improving crops and practices more than offset the effects of the soil-depleting crops and practices. Cropping systems are needed on all tilled soils. Soil-improving practices in a conservation cropping system include the use of rotations that contain grasses

and legumes and the return of crop residue to the soil. Other practices include the use of green manure crops of grasses and legumes, proper tillage, adequate fertilization, and weed and pest control.

**Conservation tillage.** A tillage system that retains residue on the soil surface after seeding to protect the soil from erosion. It includes no-till farming, strip tillage, minimum tillage, chemical fallow, stubble mulching, and other forms of noninversion tillage.

**Consistence, soil.** Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the "Soil Survey Manual."

**Contour stripcropping.** Growing crops in strips that follow the contour. Strips of grass or close-growing crops are alternated with strips of clean-tilled crops or summer fallow.

**Control section.** The part of the soil on which classification is based. The thickness varies among different kinds of soil, but for many it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.

**Cordilleras ice sheet.** The glacial ice sheet that covered much of the northern half of North America, from the eastern face of the Rocky Mountains to the Pacific Ocean, during the Pleistocene.

**Corrosion.** Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.

**Cover crop.** A close-growing crop grown primarily to improve and protect the soil between periods of regular crop production, or a crop grown between trees and vines in orchards and vineyards.

**Cropping system.** Growing crops according to a planned system of rotation and management practices.

**Crop residue management.** Returning crop residue to the soil, which helps to maintain soil structure, organic matter content, and fertility and helps to control erosion.

**Cross-slope farming.** Deliberately conducting farming operations on sloping farmland in such a way that tillage is across the general slope.

**Crown.** The upper part of a tree or shrub, including the living branches and their foliage.

**Cryic** (soil taxonomy). A soil temperature regime in

which the mean annual soil temperature at a depth of 20 inches ranges from 33 to 46 degrees F. The mean summer soil temperature is less than 47 degrees for soils that have an O horizon.

**Cuesta.** A hill or ridge that has a gentle slope on one side and a steep slope on the other; specifically, an asymmetric, homoclinal ridge capped by resistant rock layers of slight or moderate dip.

**Culmination of the mean annual increment (CMAI).**

The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase. The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.

**Cutbanks cave** (in tables). The walls of excavations tend to cave in or slough.

**Cutoff blanket.** A layer of impermeable material placed between a road subgrade and subbase. It is used to restrict the movement of water into the subgrade thereby reducing the risk of damage from frost action.

**Decreasers.** The most heavily grazed climax range plants. Because they are the most palatable, they are the first to be destroyed by overgrazing.

**Deferred grazing.** Postponing grazing or resting grazing land for a prescribed period.

**Delta.** A body of alluvium having a surface that is nearly flat and fan shaped; deposited at or near the mouth of a river or stream where it enters a body of relatively quiet water, generally a sea or lake.

**Dense layer (dense material)** (in tables). A very firm, massive layer that has a bulk density of more than 1.7 grams per cubic centimeter. Such a layer affects the ease of digging and can affect filling and compacting.

**Depth, soil.** Generally, the thickness of the soil over bedrock. Very deep soils are more than 60 inches deep over bedrock; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.

**Desert pavement.** On a desert surface, a layer of gravel or larger fragments that was emplaced by upward movement of the underlying sediments or that remains after finer particles have been removed by running water or the wind.

**Deciduous.** Pertaining to plants that lose their leaves in fall.

- Diorite.** A coarse-grained igneous rock consisting mainly of plagioclase but with smaller amounts of hornblende, biotite, and pyroxene. Quartz is absent or sparse. (See Quartz diorite.)
- Dip slope.** A slope of the land surface, roughly determined by and approximately conforming to the dip of the underlying bedrock.
- Displacement.** The horizontal movement of soil caused by scraping or machine gouging. It commonly occurs when using a blade for disposal of forest slash and for site preparation. Use of tractors can also result in displacement.
- Diversion (or diversion terrace).** A ridge of earth, generally a terrace, built to protect downslope areas by diverting runoff from its natural course.
- Divided-slope farming.** A form of field stripcropping in which crops are grown in a systematic arrangement of two strips, or bands, across the slope to reduce the hazard of water erosion. One strip is in a close-growing crop that provides protection from erosion, and the other strip is in a crop that provides less protection from erosion. This practice is used where slopes are not long enough to permit a full stripcropping pattern to be used.
- Dolomite.** A sedimentary rock consisting mainly of the mineral dolomite, which is a carbonate of calcium magnesium.
- Drainage class (natural).** Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized—*excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained*. These classes are defined in the “Soil Survey Manual.”
- Drainage, surface.** Runoff, or surface flow of water, from an area.
- Draw.** A small stream valley that generally is more open and has broader bottom land than a ravine or gulch.
- Drop structure.** A structure used to stabilize the head of a gully. It essentially reduces the flow gradient thereby reducing water velocity and erosion.
- Drumlin.** A low, smooth, elongated oval hill, mound, or ridge of compact glacial till. The longer axis is parallel to the path of the glacier and commonly has a blunt nose pointing in the direction from which the ice approached.
- Duff.** A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.
- Duripan (soil taxonomy).** A mineral soil horizon that is cemented by silica to the point that air-dry fragments will not slake in water or hydrochloric acid. A duripan may also have accessory cement such as calcium carbonate and iron oxide.
- Ecological site.** An area where climate, soil, and relief are sufficiently uniform to produce a distinct climax plant community. An ecological site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other ecological sites in kind and/or proportion of species or in total production.
- Eluviation.** The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.
- Eolian soil material.** Earthy parent material accumulated through wind action; commonly refers to sandy material in dunes or to loess in blankets on the surface.
- Ephemeral stream.** A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no long-continued supply from melting snow or other source, and its channel is above the water table at all times.
- Erosion.** The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep.  
*Erosion (geologic).* Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.  
*Erosion (accelerated).* Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.
- Erosion hazard, water.** The susceptibility of a soil to erosion by moving water. The erosion hazard classes for cropland are based on a bare surface without roots, and the classes for forestland and rangeland are based on a bare surface with common roots in the surface layer (clearcut areas or areas where a broadcast burn or range fire has

occurred). The classes and estimated soil loss, expressed as tons per acre per year, are:

Slight .....	less than 5
Moderate .....	5 to 20
Severe .....	20 to 50
Very severe .....	more than 50

**Erosion hazard, wind.** The susceptibility of a soil to erosion by wind. The classes are based on a bare surface. The classes and corresponding wind erodibility groups are:

None .....	8
Slight .....	5, 6, 7
Moderate .....	4, 4L
Severe .....	2, 3
Very severe .....	1

**Erratic** (geology). Refers to a rock fragment transported by glacial ice or floating ice that is different from the bedrock in the area in which it is deposited.

**Escarpment.** A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. Synonym: scarp.

**Esker.** A narrow, winding ridge of stratified gravelly and sandy drift deposited by a stream flowing in a tunnel beneath a glacier.

**Extrusive rock.** Igneous rock derived from deep-seated molten matter (magma) emplaced on the earth's surface.

**Fallow.** Cropland left idle in order to restore productivity through accumulation of moisture. Summer fallow is common in regions of limited rainfall where cereal grain is grown. The soil is tilled for at least one growing season for weed control and decomposition of plant residue.

**Fan terrace.** A relict alluvial fan, no longer a site of active deposition, incised by younger and lower alluvial surfaces.

**Fertility, soil.** The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.

**Fibric soil material (peat).** The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.

**Field border.** A strip of perennial vegetation established at the edge of a field by planting or by

converting it from trees to herbaceous vegetation and shrubs.

**Field moisture capacity.** The moisture content of a soil, expressed as a percentage of the oven-dry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity*, *normal moisture capacity*, or *capillary capacity*.

**Field strips.** Systematic arrangement of alternating strips of crops across the general slope to reduce water erosion. A strip of grass or a close-growing crop is alternated with a clean-tilled crop or fallow.

**Fill slope.** A sloping surface consisting of excavated soil material from a road cut. It commonly is on the downhill side of the road.

**Fine** (soil taxonomy). A clayey particle-size class that is 35 to 59 percent clay in the fine-earth fraction.

**Fine-loamy** (soil taxonomy). A loamy particle-size class that is at least 15 percent fine sand or coarser, including fragments as much as 3 inches in diameter, and is 18 to 34 percent clay in the fine-earth fraction.

**Fine-silty** (soil taxonomy). A loamy particle-size class that is less than 15 percent fine sand or coarser, including fragments as much as 3 inches in diameter, and is 18 to 34 percent clay in the fine-earth fraction.

**Fine textured soil.** Sandy clay, silty clay, or clay.

**First bottom.** The normal flood plain of a stream, subject to frequent or occasional flooding.

**Flaggy soil material.** Material that has, by volume, 15 to 35 percent flagstones. Very flaggy soil material has 35 to 60 percent flagstones, and extremely flaggy soil material has more than 60 percent flagstones.

**Flagstone.** A thin fragment of sandstone, limestone, slate, shale, or (rarely) schist 6 to 15 inches (15 to 38 centimeters) long.

**Flood plain.** A nearly level alluvial plain that borders a stream and is subject to flooding unless protected artificially.

**Fluvial.** Of or pertaining to rivers; produced by river action, as a fluvial plain.

**Foliated.** Refers to metamorphic rock that exhibits parallel structure or layering.

**Foothill.** A steeply sloping upland that has relief of as much as 1,000 feet (300 meters) and fringes a mountain range or high-plateau escarpment.

**Footslope.** The position that forms the inner, gently inclined surface at the base of a hillslope. In profile, footslopes are commonly concave. A footslope is a transition zone between upslope sites of erosion and transport (shoulders and

backslopes) and downslope sites of deposition (toeslopes).

**Forb.** Any herbaceous plant not a grass or a sedge.

**Frigid** (soil taxonomy). A soil temperature regime in which the mean annual soil temperature at a depth of 20 inches ranges from 33 to 46 degrees F. The mean summer soil temperature is more than 47 degrees for soils that have an O horizon. The difference between the mean winter soil temperature and the mean summer soil temperature is more than 9 degrees.

**Genesis, soil.** The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.

**Glacial drift.** Pulverized and other rock material transported by glacial ice and then deposited. Also, the sorted and unsorted material deposited by streams flowing from glaciers.

**Glacial outwash.** Gravel, sand, and silt, commonly stratified, deposited by glacial meltwater.

**Glacial till.** Unsorted, nonstratified glacial drift consisting of clay, silt, sand, and boulders transported and deposited by glacial ice.

**Glaciofluvial deposits.** Material moved by glaciers and subsequently sorted and deposited by streams flowing from the melting ice. The deposits are stratified and occur as kames, eskers, deltas, and outwash plains.

**Glaciolacustrine deposits.** Material ranging from fine clay to sand derived from glaciers and deposited in glacial lakes mainly by glacial meltwater. Many deposits are interbedded or laminated.

**Gleyed soil.** Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.

**Granite.** A coarse-grained igneous rock consisting mainly of quartz and feldspar, with more orthoclase than plagioclase (See Granodiorite.)

**Granitic.** Term generally applied to granite or granitelike rock. It is used when referring to granite, granodiorite, quartz monzonite, quartz diorite, diorite, and granitic gneiss.

**Granitic gneiss.** A crystalline, banded metamorphic rock of granitic composition.

**Granodiorite.** A coarse-grained igneous rock consisting mainly of quartz and feldspar, with more plagioclase than orthoclase. (See Granite.)

**Grassed waterway.** A natural or constructed waterway, typically broad and shallow, seeded to grass as protection against erosion. Conducts surface water away from cropland.

**Gravel.** Rounded or angular fragments of rock as much as 3 inches (2 millimeters to 7.6

centimeters) in diameter. An individual piece is a pebble.

**Gravelly soil material.** Material that has 15 to 35 percent, by volume, rounded or angular rock fragments, not prominently flattened, as much as 3 inches (7.6 centimeters) in diameter.

**Graywacke.** An indurated sedimentary rock that consists mainly of sand-sized grains but contains fragments of feldspar, quartz, and ferromagnesian minerals.

**Green manure crop** (agronomy). A soil-improving crop grown to be plowed under in an early stage of maturity or soon after maturity.

**Group selection system.** Uneven-aged silvicultural system in which small groups of trees are periodically removed from a large area so that age and size classes of the reproduction are mixed.

**Gully.** A miniature valley with steep sides cut by running water and through which water ordinarily runs only after rainfall. The distinction between a gully and a rill is one of depth. A gully generally is an obstacle to farm machinery and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.

**Habitat type.** All land capable of producing a similar climax plant community.

**Hard bedrock.** Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.

**Hardpan.** A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.

**Hard to reclaim** (in tables). Reclamation is difficult after the removal of soil for construction and other uses. Revegetation and erosion control are extremely difficult.

**Head slope.** A geomorphic component of hills consisting of a laterally concave area of a hillside, especially at the head of a drainageway. The overland waterflow is converging.

**Hemic soil material (mucky peat).** Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.

**Herb** (herbaceous plant). Any flowering plant except those that develop persistent woody bases and stems above ground.

**Herbaceous stage.** A forest successional stage in which the understory vegetation in a stand is dominantly grasses, grasslike plants, and forbs under full or nearly full sunlight. The canopy cover

generally is less than 15 percent, and it has little or no effect on the understory vegetation.

**High-residue crops.** Such crops as small grain and corn used for grain. If properly managed, residue from these crops can be used to control erosion until the next crop in the rotation is established. These crops return large amounts of organic matter to the soil.

**Hill.** A natural elevation of the land surface, rising as much as 1,000 feet above surrounding lowlands, commonly of limited summit area and having a well defined outline; hillsides generally have slopes of more than 15 percent. The distinction between a hill and a mountain is arbitrary and is dependent on local usage.

**Histic epipedon** (soil taxonomy). A thin, organic soil horizon that is saturated with water at some time during the year unless it is artificially drained. This horizon is at or near the surface of a mineral soil.

**Historic climax plant community.** The plant community that was best adapted to the unique combination of factors associated with the ecological site. It was in a natural dynamic equilibrium with the historic biotic, abiotic, and climatic factors on its ecological site in North America at the time of European immigration and settlement.

**Horizon, soil.** A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. An explanation of the subdivisions is given in the "Soil Survey Manual." The major horizons of mineral soil are as follows:

*O horizon.*—An organic layer of fresh and decaying plant residue.

*A horizon.*—The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.

*E horizon.*—The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.

*B horizon.*—The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or

browner colors than those in the A horizon; or (4) a combination of these.

*C horizon.*—The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

*Cr horizon.*—Soft, consolidated bedrock beneath the soil.

*R layer.*—Consolidated bedrock beneath the soil. The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.

**Hue.** One of the three properties of color. The property by which colors of the spectrum are distinguished from one another. Hues range from red through yellow, green, blue, and violet.

**Humus.** The well decomposed, more or less stable part of the organic matter in mineral soils.

**Hydrologic soil groups.** Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

**Igneous rock.** Rock formed by solidification from a molten or partially molten state. Major varieties include plutonic and volcanic rock. Examples are andesite, basalt, and granite.

**Illuviation.** The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

**Increasers.** Species in the climax vegetation that increase in amount as the more desirable plants are reduced by close grazing. Increasers commonly are the shorter plants and the less palatable to livestock.

**Indurated.** Refers to having a hard, brittle consistency as a result of particles being held together by cementing substances such as silica, calcium carbonate, and iron. An indurated layer can be broken by a sharp blow of a hammer.

**Infiltration.** The downward entry of water into the immediate surface of soil or other material, as

contrasted with percolation, which is movement of water through soil layers or material.

**Infiltration rate.** The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

**Intake rate.** The average rate of water entering the soil under irrigation. Most soils have a fast initial rate; the rate decreases with application time. Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

Less than 0.26 .....	slow
0.26 to 0.40 .....	moderately slow
0.40 to 0.60 .....	moderately fast
More than 0.60 .....	fast

**Interfluve.** An elevated area between two drainageways that sheds water to those drainageways.

**Irrigation.** Application of water to soils to assist in production of crops. Methods of irrigation are:  
*Corrugation.*—Water is applied to small, closely spaced furrows or ditches in fields of close-growing crops or in orchards so that it flows in only one direction.

*Drip (or trickle).*—Water is applied slowly and under low pressure to the surface of the soil or into the soil through such applicators as emitters, porous tubing, or perforated pipe.

*Furrow.*—Water is applied in small ditches made by cultivation implements. Furrows are used for tree and row crops.

*Sprinkler.*—Water is sprayed over the soil surface through pipes or nozzles from a pressure system.

**Kame.** An irregular, short ridge or hill of stratified glacial drift.

**Kame terrace.** A ridge consisting of stratified sand and gravel deposited by a meltwater stream flowing between a melting glacier and a higher valley wall or lateral moraine.

**K<sub>sat</sub>.** Saturated hydraulic conductivity. (See Permeability.)

**Lacustrine deposit.** Material deposited in lake water and exposed when the water level is lowered or the elevation of the land is raised.

**Landslide.** The rapid downhill movement of a mass of soil and loose rock, generally when wet or saturated. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.

**Large stones** (in tables). Rock fragments 3 inches

(7.6 centimeters) or more across. Large stones adversely affect the specified use of the soil.

**Leaching.** The removal of soluble material from soil or other material by percolating water.

**Levee.** An embankment constructed alongside a river or creek to prevent flooding of adjacent land during periods of high water.

**Limestone.** Sedimentary rock consisting mainly of calcium carbonate (CaCO<sub>3</sub>).

**Linear extensibility.** Refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. Linear extensibility is used to determine the shrink-swell potential of soils. It is an expression of the volume change between the water content of the clod at 1/3- or 1/10-bar tension (33kPa or 10kPa tension) and oven dryness. Volume change is influenced by the amount and type of clay minerals in the soil. The volume change is the percent change for the whole soil. If it is expressed as a fraction, the resulting value is COLE, coefficient of linear extensibility.

**Liquid limit.** The moisture content at which the soil passes from a plastic to a liquid state.

**Lithic contact** (soil taxonomy). A boundary between soil and underlying material that consists of unweathered bedrock that is too hard to dig with a spade.

**Loam.** Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

**Loamy** (soil taxonomy). A particle-size class in which the fine-earth fraction is loamy very fine sand, fine sand, or finer, the content of clay is less than 35 percent, and rock fragments make up less than 35 percent by volume.

**Loamy-skeletal** (soil taxonomy). A particle-size class in which rock fragments 2 millimeters in diameter or larger make up 35 percent or more by volume. The fine-earth fraction is loamy.

**Loess.** Fine grained material, dominantly of silt-sized particles, deposited by wind.

**Low-residue crops.** Such crops as corn used for silage, peas, beans, and potatoes. Residue from these crops is not adequate to control erosion until the next crop in the rotation is established. These crops return little organic matter to the soil.

**Low strength.** The soil is not strong enough to support loads.

**Marble.** A metamorphic rock consisting mainly of calcite or dolomite, or a combination of both.

**Masses.** Concentrations of substances in the soil matrix that do not have a clearly defined boundary with the surrounding soil material and cannot be

removed as a discrete unit. Common compounds making up masses are calcium carbonate, gypsum or other soluble salts, iron oxide, and manganese oxide. Masses consisting of iron oxide or manganese oxide generally are considered a type of redoximorphic concentration.

**Mature forest stage.** A successional stage in which the most shade-tolerant adapted tree species are well represented (more than 50 percent composition) and are dominant in the middle to upper canopy layers. Trees generally are more than 9 inches in diameter at breast height, and the canopy cover is more than 25 percent.

**Mean.** The average of a collection of pieces of data obtained by adding all the pieces and dividing by the total number of pieces.

**Mechanical treatment.** Use of mechanical equipment for seeding, brush management, and other management practices.

**Medium textured soil.** Very fine sandy loam, loam, silt loam, or silt.

**Mesic** (soil taxonomy). A soil temperature regime in which the mean annual temperature at a depth of 20 inches ranges from 47 to 58 degrees F. The difference between the mean winter soil temperature and the mean summer soil temperature is more than 9 degrees.

**Mesozoic.** The era of geologic time from approximately 63 to 255 million years ago (radiometric dates). The era between the Paleozoic and Cenozoic eras.

**Metamorphic rock.** Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement. Nearly all such rocks are crystalline.

**Metasedimentary rock.** Partially metamorphosed sedimentary rock.

**Mineral soil.** Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

**Minimum tillage.** Only the tillage essential to crop production and prevention of soil damage.

**Miscellaneous area.** An area that has little or no natural soil and supports little or no vegetation.

**Moderately coarse textured soil.** Coarse sandy loam, sandy loam, or fine sandy loam.

**Moderately fine textured soil.** Clay loam, sandy clay loam, or silty clay loam.

**Moisture control section** (soil taxonomy). The layer within a soil profile used to determine the soil moisture regime. The upper boundary is the depth to which a dry soil is moistened by 1 inch of water in 24 hours. The lower boundary is the depth to

which a dry soil is moistened by 3 inches of water in 48 hours.

**Mollic epipedon** (soil taxonomy). A surface horizon that is dark colored and relatively thick, contains at least 0.6 percent organic carbon (1 percent organic matter), and has a base saturation of more than 50 percent when measured at pH 7. It is not massive and hard or very hard when dry.

**Moraine.** An accumulation of earth, stones, and other debris deposited by a glacier. Some types are terminal, lateral, medial, and ground.

**Morphology, soil.** The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

**Mottling, soil.** Irregular spots of different colors that vary in number and size. Descriptive terms are as follows: abundance—*few*, *common*, and *many*; size—*fine*, *medium*, and *coarse*; and contrast—*faint*, *distinct*, and *prominent*. The size measurements are of the diameter along the greatest dimension. *Fine* indicates less than 5 millimeters (about 0.2 inch); *medium*, from 5 to 15 millimeters (about 0.2 to 0.6 inch); and *coarse*, more than 15 millimeters (about 0.6 inch).

**Mountain.** A natural elevation of the land surface, rising more than 1,000 feet above surrounding lowlands, commonly of restricted summit area (relative to a plateau) and generally having steep sides. A mountain can occur as a single, isolated mass or in a group forming a chain or range.

**Muck.** Dark, finely divided, well decomposed organic soil material. (See Sapric soil material.)

**Mulching.** The application of any material, such as straw, sawdust, leaves, or plastic film, on the soil surface to protect the soil from risks such as erosion, crusting, freezing, and evaporation.

**Munsell notation.** A designation of color by degrees of three simple variables—hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

**Natric horizon.** A special kind of argillic horizon that contains enough exchangeable sodium to have an adverse effect on the physical condition of the subsoil.

**Neutral soil.** A soil having a pH value of 6.6 to 7.3. (See Reaction, soil.)

**Nodules.** Cemented bodies lacking visible internal structure. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up nodules. If formed in

place, nodules of iron oxide or manganese oxide are considered types of redoximorphic concentrations.

**Nose slope.** A geomorphic component of hills consisting of the projecting end (laterally convex area) of a hillside. The overland waterflow is predominantly divergent.

**Nutrient, plant.** Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.

**Ochric epipedon** (soil taxonomy). A surface horizon of mineral soil that is too light in color, too high in chroma, too low in organic carbon, or too thin to be a mollic or histic epipedon.

**Organic matter.** Plant and animal residue in the soil in various stages of decomposition. The content of organic matter in the surface layer is described as follows:

Very low .....	less than 0.5 percent
Low .....	0.5 to 1.0 percent
Moderately low .....	1.0 to 2.0 percent
Moderate .....	2.0 to 4.0 percent
High .....	4.0 to 8.0 percent
Very high .....	more than 8.0 percent

**Outwash plain.** A landform of mainly sandy or coarse textured material of glaciofluvial origin. An outwash plain is commonly smooth; where pitted, it generally is low in relief.

**Overstory.** The trees in a forest stand that form the upper crown cover. (See Understory.)

**Paleoterrace.** An erosional remnant of a terrace that retains the surface form and alluvial deposits of its origin but was not emplaced by, and commonly does not grade to, a present-day stream or drainage network.

**Paleozoic.** The era of geologic time from approximately 255 to 580 million years ago (radiometric dates). The era between the Precambrian and Mesozoic eras.

**Pan.** A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For example, *hardpan*, *duripan*, *fragipan*, *claypan*, *plowpan*, and *traffic pan*.

**Paralithic contact** (soil taxonomy). A boundary between soil and coherent underlying material that can be dug with difficulty with a spade. It is referred to as weathered bedrock.

**Parent material.** The unconsolidated organic and mineral material in which soil forms.

**Peat.** Unconsolidated material, largely undecomposed organic matter, that has accumulated under excess moisture. (See Fibric soil material.)

**Ped.** An individual natural soil aggregate, such as a granule, a prism, or a block.

**Pedisediment.** A thin layer of alluvial material that mantles an erosion surface and has been transported to its present position from higher lying areas of the erosion surface.

**Pedon.** The smallest volume that can be called "a soil." A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 square meter to 10 square meters), depending on the variability of the soil.

**Percolation.** The movement of water through the soil.

**Permeability.** The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as "saturated hydraulic conductivity," which is defined in the "Soil Survey Manual." In line with conventional usage in the engineering profession and with traditional usage in published soil surveys, this rate of flow continues to be expressed as "permeability." Terms describing permeability, measured in inches per hour, are as follows:

Impermeable .....	less than 0.0015 inch
Very slow .....	0.0015 to 0.06 inch
Slow .....	0.06 to 0.2 inch
Moderately slow .....	0.2 to 0.6 inch
Moderate .....	0.6 inch to 2.0 inches
Moderately rapid .....	2.0 to 6.0 inches
Rapid .....	6.0 to 20 inches
Very rapid .....	more than 20 inches

**Phase, soil.** A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

**pH value.** A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)

**Phyllite.** A fine-textured, foliated metamorphic rock that is intermediate in metamorphic grade between slate and schist. Mica crystals impart a silky sheen to the cleavage surfaces.

**Piping** (in tables). Formation of subsurface tunnels or pipelike cavities by water moving through the soil.

**Pitting** (in tables). Pits caused by melting around ice. They form on the soil after plant cover is removed.

**Plant association.** A plant community that has reached the culmination of plant succession; a climax plant community.

- Plant community.** An assemblage of plants living together, reflecting no particular ecological status; a vegetative complex unique in its combination of plants.
- Plasticity index.** The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.
- Plastic limit.** The moisture content at which a soil changes from semisolid to plastic.
- Plateau.** An extensive upland mass with relatively flat summit area that is considerably elevated (more than 100 meters) above adjacent lowlands and separated from them on one or more sides by escarpments.
- Playa.** The generally dry and nearly level lake plain that occupies the lowest parts of closed depressional areas, such as those on intermontane basin floors. Temporary flooding occurs primarily in response to precipitation and runoff.
- Pleistocene.** The epoch of geologic time from approximately 10,000 to 2 million years ago. The earlier of the two epochs comprising the Quaternary period. Also called the Glacial epoch.
- Plowpan.** A compacted layer formed in the soil directly below the plowed layer.
- Pole stage.** A forest successional stage in which the vegetation of a stand is dominantly a moderately dense to very dense overstory of trees that have minimal vertical crown depth. The trees generally range from about 5 to 9 inches in diameter at breast height, and the canopy cover normally exceeds 35 percent.
- Ponding.** Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.
- Poorly graded.** Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.
- Potential native plant community.** See Historic climax plant community.
- Potential rooting depth (effective rooting depth).** Depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.
- Prescribed burning.** Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.
- Productivity, soil.** The capability of a soil for producing a specified plant or sequence of plants under specific management.
- Profile, soil.** A vertical section of the soil extending through all its horizons and into the parent material.
- Proper grazing use.** Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.
- Puddling.** The mechanical destruction of soil structure under wet soil conditions by compression and shearing. It results in the total deformation of soil particle arrangement to a massive or structureless state.
- Quartz diorite.** A coarse-grained igneous rock consisting mainly of plagioclase with smaller amounts of quartz, hornblende, and biotite. (See Granodiorite.)
- Quartzite.** A nonfoliated metamorphic rock consisting mainly of quartz sand cemented with quartz.
- Quartz latite.** A fine-grained volcanic rock consisting mainly of quartz, plagioclase, and orthoclase with minor amounts of biotite and hornblende. Phenocrysts are common. This rock is the extrusive equivalent of quartz monzonite.
- Quartz monzonite.** A coarse-grained igneous rock consisting mainly of plagioclase, orthoclase, and quartz with minor amounts of biotite and hornblende. (See Granite and Granodiorite.)
- Rangeland.** Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs suitable for grazing or browsing. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.
- Ravel.** Dry, unconsolidated rock and soil material that when exposed in a cutback will move downslope seeking a stable angle of repose.
- Reaction, soil.** A measure of acidity or alkalinity of a soil, expressed in pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The

degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid .....	less than 3.5
Extremely acid .....	3.5 to 4.4
Very strongly acid .....	4.5 to 5.0
Strongly acid .....	5.1 to 5.5
Medium acid .....	5.6 to 6.0
Slightly acid .....	6.1 to 6.5
Neutral .....	6.6 to 7.3
Mildly alkaline .....	7.4 to 7.8
Moderately alkaline .....	7.9 to 8.4
Strongly alkaline .....	8.5 to 9.0
Very strongly alkaline .....	9.1 and higher

**Red beds.** Sedimentary strata that are mainly red and are made up largely of sandstone and shale.

**Relief.** The elevations or inequalities of a land surface, considered collectively.

**Residuum** (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as consolidated rock disintegrated in place.

**Rhyodacite.** A fine-grained volcanic rock consisting mainly of quartz and feldspar, with more plagioclase than orthoclase. Phenocrysts are common. Ryodacite is the extrusive equivalent of granodiorite.

**Rill.** A steep-sided channel resulting from accelerated erosion. A rill generally is a few inches deep and not wide enough to be an obstacle to farm machinery.

**Road cut.** A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

**Rock fragments.** Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.

**Root zone.** The part of the soil that can be penetrated by plant roots.

**Runoff.** The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called ground-water runoff or seepage flow from ground water.

**Saline soil.** A soil containing soluble salts in an amount that impairs growth of plants. A saline soil does not contain excess exchangeable sodium.

**Sand.** As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a

soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

**Sandstone.** Sedimentary rock containing dominantly sand-sized particles.

**Sandy** (soil taxonomy). A particle-size class in which the texture of the fine-earth fraction is sand or loamy sand but not loamy very fine sand or very fine sand; it is less than 35 percent rock fragments by volume.

**Sandy-skeletal** (soil taxonomy). A particle-size class that is 35 percent or more by volume rock fragments 2 millimeters in diameter or larger. The fine-earth fraction is sandy.

**Sapling/pole stage.** A forest successional stage in which the vegetation of a stand is dominantly saplings and pole-sized trees (generally 2 to 9 inches in diameter at breast height). The canopy cover and understory production are intermediate between the herbaceous or shrub stage and the pole stage.

**Sapric soil material (muck).** The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

**Saturation.** Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

**Scarification.** The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

**Schist.** A medium- to coarse-grained, foliated metamorphic rock in which the platy minerals are clearly visible. Micaceous minerals commonly are present.

**Second bottom.** The first terrace above the normal flood plain (or first bottom) of a river.

**Sedimentary rock.** Rock made up of particles deposited from suspension in water. The chief kinds of sedimentary rock are conglomerate, formed from gravel; sandstone, formed from sand; shale, formed from clay; and limestone, formed from soft masses of calcium carbonate. There are many intermediate types. Some wind-deposited sand is consolidated into sandstone.

**Sequum.** A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

**Series, soil.** A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have

horizons that are similar in composition, thickness, and arrangement.

**Shale.** Sedimentary rock formed by the hardening of a clay deposit.

**Shoulder.** The position that forms the uppermost inclined surface near the top of a hillslope. It is a transition from backslope to summit. The surface is dominantly convex in profile and erosional in origin.

**Shrink-swell** (in tables). The shrinking of soil when dry and the swelling when wet. Shrinking and swelling can damage roads, dams, building foundations, and other structures. It can also damage plant roots.

**Shrub stage.** A forest successional stage in which the vegetation is dominantly shrubs and/or tree seedlings. The overstory canopy cover normally ranges from 0 to 20 percent.

**Side slope.** A geomorphic component of hills consisting of a laterally planar area of a hillside. The overland waterflow is predominantly parallel.

**Silica.** A combination of silicon and oxygen. The mineral form is called quartz.

**Silica-sesquioxide ratio.** The ratio of the number of molecules of silica to the number of molecules of alumina and iron oxide. The more highly weathered soils or their clay fractions in warm-temperate, humid regions, and especially those in the tropics, generally have a low ratio.

**Silt.** As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

**Siltstone.** Sedimentary rock made up of dominantly silt-sized particles.

**Similar soils.** Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.

**Site index.** A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height attained by dominant and codominant trees in a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.

**Slate.** A fine-grained metamorphic rock that exhibits strong cleavage or layering.

**Slickensides.** Polished and grooved surfaces produced by one mass sliding past another. In soils, slickensides may occur at the bases of slip surfaces on the steeper slopes; on faces of

blocks, prisms, and columns; and in swelling clayey soils, where there is marked change in moisture content.

**Slick spot.** A small area of soil having a puddled, crusted, or smooth surface and an excess of exchangeable sodium. The soil generally is silty or clayey, is slippery when wet, and is low in productivity.

**Slope.** The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance. In this survey, classes for simple slopes are as follows:

Nearly level .....	0 to 3 percent
Gently sloping .....	1 to 8 percent
Moderately sloping .....	3 to 8 percent
Strongly sloping .....	4 to 16 percent
Moderately steep .....	10 to 30 percent
Steep .....	20 to 60 percent
Very steep .....	45 percent and higher

**Slough.** Fragmentary material that when moist can crumble and fall away from cutbanks.

**Slump.** A mass movement process characterized by a landslide involving shearing and rotary movement of a generally independent mass of rock or earth along a curved slip surface. The mass (slump) has its axis parallel to the slope from which it descends. A slump surface commonly exhibits a reversed slope facing uphill.

**Sodic (alkali) soil.** A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

**Sodicity.** The degree to which a soil is affected by exchangeable sodium. Sodicity is expressed as a sodium adsorption ratio (SAR) of a saturation extract, or the ratio of  $\text{Na}^+$  to  $\text{Ca}^{++} + \text{Mg}^{++}$ . The degrees of sodicity and their respective ratios are:

Slight .....	less than 13:1
Moderate .....	13-30:1
Strong .....	more than 30:1

**Sodium adsorption ratio (SAR).** A measure of the amount of sodium (Na) relative to calcium (Ca) and magnesium (Mg) in the water extract from saturated soil paste. It is the ratio of the Na concentration divided by the square root of one-half of the Ca + Mg concentration.

**Soft bedrock.** Bedrock that can be excavated with trenching machines, backhoes, small rippers,

and other equipment commonly used in construction.

**Soil.** A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief over periods of time.

**Soil creep.** Slow mass movement of soil and soil material down relatively steep slopes, primarily under the influence of gravity but facilitated by saturation with water and alternate freezing and thawing.

**Soil depth.** Refers to the potential rooting depth. The soil depth classes, in inches, are:

Very shallow .....	less than 10
Shallow .....	10 to 20
Moderately deep .....	20 to 40
Deep .....	40 to 60
Very deep .....	more than 60

**Soil separates.** Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand .....	2.0 to 1.0
Coarse sand .....	1.0 to 0.5
Medium sand .....	0.5 to 0.25
Fine sand .....	0.25 to 0.10
Very fine sand .....	0.10 to 0.05
Silt .....	0.05 to 0.002
Clay .....	less than 0.002

**Solum.** The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

**Stand.** An aggregation of trees or other growth in a specific area that is sufficiently uniform in species composition, age arrangement, and condition to be distinguishable from the forest or other growth in adjoining areas.

**Steppe.** An extensive area covered dominantly with grass, shrubs, and herbaceous vegetation and few, if any, trees.

**Stone line.** A concentration of coarse fragments in a soil. Generally, it is indicative of an old weathered surface. In a cross section, the line may be one fragment or more thick. It generally overlies

material that weathered in place and is overlain by recent sediment of variable thickness.

**Stones.** Rock fragments 10 to 24 inches (25 to 60 centimeters) in diameter if rounded or 15 to 24 inches (38 to 60 centimeters) in length if flat.

**Stony.** Refers to a soil containing stones in numbers that interfere with or prevent tillage.

**Strip tillage.** Tillage operations performed in narrow bands separated by bands of soil essentially undisturbed by the tillage equipment.

**Strippcropping.** Growing crops in a systematic arrangement of strips or bands that provide vegetative barriers to wind erosion and water erosion.

**Structure, soil.** The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are—*platy* (laminated), *prismatic* (vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grained* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).

**Stubble mulch.** Stubble or other crop residue left on the soil or partly worked into the soil. It protects the soil from wind erosion and water erosion after harvest, during preparation of a seedbed for the next crop, and during the early growing period of the new crop.

**Subbase.** A layer of material laid on the natural soil surface under a road base for strengthening purposes.

**Subgrade.** The soil surface or native rock prepared and compacted to support a road or structure; the top surface of a roadbed upon which subbase, base, or surface course is constructed.

**Subsoil.** Technically, the B horizon; roughly, the part of the solum below plow depth.

**Subsoiling.** Tilling a soil below normal plow depth, ordinarily to shatter a hardpan or claypan.

**Substratum.** The part of the soil below the solum.

**Subsurface layer.** Technically, the E horizon. Generally refers to a leached horizon lighter in color and lower in content of organic matter than the overlying surface layer.

**Succession.** The progressive development of vegetation toward its highest ecological expression, the climax; replacement of one plant community by another.

**Successional stage.** Stage or recognizable condition of a plant community that occurs during its development from bare soil to climax.

**Summer fallow.** The tillage of uncropped land during the summer to control weeds and allow storage of moisture in the soil for the growth of a later crop. A practice common in semiarid regions, where annual precipitation is not enough to produce a crop every year. Summer fallow is frequently practiced before planting winter grain.

**Summit.** The topographically highest position of a hillslope. It has a nearly level (planar or only slightly convex) surface.

**Surface layer.** The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the "plow layer," or the "Ap horizon."

**Surface soil.** The A and AB horizons.

**Talus.** Fragments of rock and other soil material accumulated by gravity at the foot of cliffs or steep slopes.

**Taxadjuncts.** Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.

**Terminal moraine.** A belt of thick glacial drift that generally marks the termination of important glacial advances.

**Terrace.** An embankment, or ridge, constructed across sloping soils on the contour or at a slight angle to the contour. The terrace intercepts surface runoff so that water soaks into the soil or flows slowly to a prepared outlet. A terrace in a field generally is built so that the field can be farmed. A terrace intended mainly for drainage has a deep channel that is maintained in permanent sod.

**Terrace (geologic).** An old alluvial plain, ordinarily flat or undulating, bordering a river, a lake, or the sea.

**Tertiary.** The period of geologic time from approximately 2 to 63 million years ago (radiometric dates). The earlier of the two geologic periods comprising the Cenozoic era.

**Texture, soil.** The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand*, *loamy sand*, *sandy loam*, *loam*, *silt loam*, *silt*, *sandy clay loam*, *clay*

*loam*, *silty clay loam*, *sandy clay*, *silty clay*, and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."

**Thin layer** (in tables). Otherwise suitable soil material that is too thin for the specified use.

**Till plain.** An extensive area of nearly level to undulating soils underlain by glacial till.

**Tillage operation.** The act of applying one or more tillage actions by a distinct mechanical force to all or part of the soil mass.

**Tillage pan.** A compacted soil layer resulting from the downward pressure from tillage implements and vehicles. Synonym: plowpan.

**Tilth, soil.** The physical condition of the soil as related to tillage, seedbed preparation, seedling emergence, and root penetration.

**Toeslope.** The position that forms the gently inclined surface at the base of a hillslope. Toeslopes in profile are commonly gentle and linear and are constructional surfaces forming the lower part of a hillslope continuum that grades to valley or closed-depression floors.

**Topography.** The relative positions and elevations of the physical features of an area. The configuration of the land surface. (See Relief.)

**Topsoil.** The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

**Trace elements.** Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.

**Tuff.** A compacted deposit that is 50 percent or more volcanic ash and dust.

**Udic** (soil taxonomy). A soil moisture regime in which the moisture control section is not dry for 90 cumulative days in most years. Also, the soils are not dry for more than 45 consecutive days during the four months following the summer solstice.

**Understory.** The portion of vegetation beneath the overstory up to a height of about 4.5 feet. (See Overstory.)

**Upland.** Land at a higher elevation, in general, than the alluvial plain or stream terrace; land above the lowlands along streams.

**Valley fill.** In glaciated regions, material deposited in stream valleys by glacial meltwater. In nonglaciated regions, alluvium deposited by heavily loaded streams.

**Value, color.** The relative lightness or intensity of color. (See Munsell notation.)

**Varve.** A sedimentary layer or a lamina or sequence of

laminae deposited in a body of still water within a year. Specifically, a thin pair of graded glaciolacustrine layers seasonally deposited, usually by meltwater streams, in a glacial lake or other body of still water in front of a glacier.

**Volcanic ash.** Uncemented material consisting of fragments less than 4 millimeters in diameter that has been ejected from a volcanic vent.

**Volcanic rock.** Igneous rock that is in molten form or has been ejected from vents at the earth's surface. Synonym: extrusive rock.

**Water bars.** Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.

**Weathering.** All physical and chemical changes produced in rocks or other deposits at or near the earth's surface by atmospheric agents. These changes result in disintegration and decomposition of the material.

**Well graded.** Refers to soil material consisting of coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be easily increased in density and

bearing properties by compaction. Contrasts with poorly graded soil.

**Wilting point (or permanent wilting point).** The moisture content of soil, on an oven-dry basis, at which a plant (specifically a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.

**Wind strips.** Wind-resistant crops grown in strips alternating with row crops or fallow and arranged at angles to minimize adverse effects of wind (includes any herbaceous vegetative wind barrier that reduces wind velocity).

**Xeric** (soil taxonomy). A soil moisture regime common to a climate with cool, moist winters and warm, dry summers. The soils are dry in the moisture control section for more than 45 consecutive days during the four months following the summer solstice and are moist for more than 45 consecutive days during the four months following the winter solstice.

**Young forest stage.** A successional stage in which the overstory vegetation of a stand is dominantly shade-intolerant successional trees. Trees generally are more than 9 inches in diameter at breast height, and the canopy cover exceeds 25 percent. Shade-tolerant climax tree species can be absent to nearly well represented (less than 50 percent).

\* A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2, and subtracting the temperature below which growth is minimal for the principal crops in the area (40 degrees F).

Table 2.--Freeze Dates in Spring and Fall  
(Recorded in the period 1961-90 at Nespalem, WA)

Probability	Temperature		
	24 °F or lower	28 °F or lower	32 °F or lower
Last freezing temperature in spring:			
1 year in 10 later than--	May 11	May 25	June 23
2 years in 10 later than--	May 3	May 19	June 14
5 years in 10 later than--	April 18	May 8	May 28
First freezing temperature in fall:			
1 year in 10 earlier than--	September 26	September 18	September 3
2 years in 10 earlier than--	October 2	September 23	September 8
5 years in 10 earlier than--	October 5	October 3	September 18

Table 3.--Growing Season  
(Recorded in the period 1961-90 at Nespalem, WA)

Probability	Daily minimum temperature during growing season		
	Higher than 24 °F Days	Higher than 28 °F Days	Higher than 32 °F Days
9 years in 10	147	132	86
8 years in 10	157	138	98
5 years in 10	176	150	121
2 years in 10	195	162	144
1 year in 10	205	168	156

Table 13.--Building Site Development

(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the limitation. See text for further explanation of ratings in this table.)

Map symbol and soil name	Pct. of map unit	Dwellings without basements	Dwellings with basements	Small commercial buildings		
		Rating class and limiting features	Rating class and limiting features	Rating class and limiting features

Table 22.--Classification of the Soils

(An asterisk in the first column indicates a taxadjunct to the series. See text for a description of those characteristics that are outside the range of the series.)

Soil name	Family or higher taxonomic class
Achimín	Fine, mixed, mesic Typic Palexerolls
Aeneas	Coarse-loamy over sandy or sandy-skeletal, mixed, mesic Aridic Haploxerolls
Ahtanum	Coarse-silty, mixed (calcareous), mesic Typic Duraquolls
Aits	Coarse-loamy, mixed, frigid Andic Xerochrepts
Anders	Coarse-loamy, mixed, mesic Typic Haploxerolls
Andic Cryaquepts	Andic Cryaquepts
Annum	Fine-loamy, mixed, mesic Ultic Argixerolls
Apex	Coarse-loamy, mixed, frigid Andic Xerochrepts
Aquic Xerofluvents	Aquic Xerofluvents
Badge	Loamy-skeletal, mixed, mesic Typic Argixerolls
Bakeoven	Loamy-skeletal, mixed, mesic Lithic Haploxerolls
Baldknob	Loamy-skeletal, mixed, frigid Lithic Ultic Haploxerolls
Barnellcreek	Ashy over loamy, mixed, frigid Mollic Vitrandepts
Bearspring	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Bernhill	Fine-loamy, mixed, mesic Ultic Haploxeralfs
Beverly	Sandy-skeletal, mixed, mesic Xeric Torrifluvents
Bisbee	Mixed, mesic Typic Xeropsamments
Boesel	Coarse-loamy over sandy or sandy-skeletal, mixed, frigid Cumulic Haploxerolls
Bong	Sandy, mixed, mesic Ultic Haploxerolls
Borgeau	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Borosaprists	Borosaprists
Bosburg	Ashy, nonacid, mesic Mollic Andaquepts
Broadax	Fine-silty, mixed, mesic Calcic Argixerolls
Brusher	Fine-loamy, mixed, frigid Ultic Haploxeralfs
Buhrig	Loamy-skeletal, mixed Andic Cryochrepts
Calcic Pachic Haploxerolls	Calcic Pachic Haploxerolls
Canteen	Coarse-loamy, mixed, frigid Andic Xerochrepts
Capoose	Ashy over loamy-skeletal, mixed, frigid Typic Vitrandepts
Cashmere	Coarse-loamy, mixed, mesic Aridic Haploxerolls
Cashmont	Coarse-loamy, mixed, mesic Aridic Haploxerolls
Cedonia	Fine-silty, mixed, mesic Typic Xerochrepts
Centralpeak	Coarse-loamy, mixed, frigid Andic Xerochrepts
Chumstick	Loamy-skeletal, mixed, frigid Lithic Ultic Haploxerolls
Codylake	Ashy over loamy, mixed Entic Cryandepts
Colockum	Fine-loamy, mixed, mesic Calcic Argixerolls
Conconully	Coarse-loamy, mixed, mesic Ultic Haploxerolls
Couledam	Loamy-skeletal, mixed, mesic Lithic Haploxerolls
Coxlake	Coarse-loamy, mixed, mesic Cumulic Haploxerolls
Cryofluvents	Cryofluvents
Cubcreek	Coarse-loamy, mixed, frigid Fluvaquentic Haploxerolls
Cumulic Haploxerolls	Cumulic Haploxerolls
Dart	Mixed, mesic Typic Xeropsamments
Dehart	Loamy-skeletal, mixed, mesic Typic Xerochrepts
Dinkelman	Coarse-loamy, mixed, frigid Ultic Haploxerolls
Disautel	Coarse-loamy, mixed, mesic Calcic Haploxerolls
Donavan	Coarse-loamy, mixed, mesic Ultic Haploxerolls
Duleylake	Fine-loamy, mixed, mesic Aquic Argixerolls
Elbowlake	Ashy over loamy-skeletal, mixed, frigid Typic Vitrandepts
Ellisforde	Coarse-silty, mixed, mesic Calciorthidic Haploxerolls
Elvedere	Fine, mixed, mesic Xerollic Paleargids
Emdent	Ashy, calcareous, mesic Mollic Halaquepts
Ewall	Mixed, mesic Typic Xeropsamments
Farrell	Coarse-loamy, mixed, mesic Calciorthidic Haploxerolls
Fivelakes	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Friedlander	Fine, mixed, frigid Ultic Palexeralfs
Garrison	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Georgecreek	Fine-loamy, mixed, mesic Ultic Argixerolls
Ginnis	Coarse-loamy, mixed, mesic Ultic Haploxerolls
Glenrose	Fine-loamy, mixed, mesic Ultic Argixerolls

Table 22.--Classification of the Soils--Continued

Soil name	Family or higher taxonomic class
Goddard-----	Sandy-skeletal, mixed, frigid Andic Xerochrepts
Goldlake-----	Coarse-loamy, mixed, mesic Pachic Ultic Haploxerolls
Gooseflats-----	Sandy, mixed (calcareous), mesic Aeric Halaquepts
Growden-----	Loamy-skeletal, mixed Andic Cryumbrepts
Hadencreek-----	Fine-silty, mixed, frigid Calcic Haploxerolls
Haley-----	Coarse-loamy over sandy or sandy-skeletal, mixed, mesic Ultic Haploxerolls
Hallcreek-----	Sandy-skeletal, mixed, mesic Andic Xerochrepts
Haploxerolls-----	Haploxerolls
Hartill-----	Loamy-skeletal, mixed, frigid Andic Xerochrepts
Hellgate-----	Coarse-loamy, mixed, mesic Ultic Haploxerolls
Henneway-----	Fine-loamy, mixed, frigid Ultic Haploxeralfs
Heytou-----	Loamy-skeletal, mixed, mesic Calciorthidic Haploxerolls
Histosols-----	Histosols
Hobohill-----	Sandy, mixed, mesic Ultic Haploxerolls
Hodgson-----	Fine, mixed, mesic Mollic Palexeralfs
Hudnut-----	Coarse-loamy, mixed, mesic Typic Xerochrepts
Hunters-----	Fine-silty, mixed, mesic Calcic Haploxerolls
Inchelum-----	Coarse-silty, mixed, mesic Pachic Ultic Haploxerolls
Inkler-----	Loamy-skeletal, mixed, frigid Andic Xerochrepts
Jimcreek-----	Fine-silty, mixed, frigid Typic Argiaquolls
Johntom-----	Loamy-skeletal, mixed, mesic Lithic Haploxerolls
Karamin-----	Sandy, mixed, frigid Typic Xerochrepts
Kartar-----	Coarse-loamy, mixed, mesic Typic Xerochrepts
Kellerbutte-----	Ashy over loamy-skeletal, mixed, frigid Typic Vitrandepts
Kenotrail-----	Fine-loamy, serpentinitic, frigid Mollic Haploxeralfs
Kewach-----	Fine, mixed, frigid Mollic Palexeralfs
Kiehl-----	Sandy-skeletal, mixed, frigid Andic Xerochrepts
Koepke-----	Ashy over loamy, mixed, frigid Mollic Vitrandepts
Lakesol-----	Coarse-silty, mixed, frigid Ultic Haploxerolls
Leahy-----	Fine, mixed, mesic Typic Natrargids
Lithic Xerorthents-----	Lithic Xerorthents
Logy-----	Loamy-skeletal, mixed, mesic Torrifluventic Haploxerolls
Loony-----	Ashy over loamy, mixed, frigid Typic Vitrandepts
Lostcreek-----	Coarse-loamy, mixed, frigid Ultic Haploxerolls
Louiecreek-----	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Louplop-----	Ashy over loamy, mixed, frigid Typic Vitrandepts
Lynxcreek-----	Fine-silty, mixed Andeptic Cryoboralfs
Malott-----	Coarse-loamy, mixed, mesic Calciorthidic Haploxerolls
Manley-----	Ashy over loamy-skeletal, mixed, frigid Entic Cryandepts
Martella-----	Fine-silty, mixed, frigid Ultic Haploxeralfs
Medisaprists-----	Medisaprists
Merkel-----	Loamy-skeletal, mixed, frigid Andic Xerochrepts
Mineral-----	Loamy-skeletal, mixed, frigid Ultic Haploxerolls
Mitchellpoint-----	Fine-loamy over sandy or sandy-skeletal, mixed, mesic Ultic Haploxeralfs
Monse-----	Fine-silty, mixed, mesic Aquic Haploxerolls
Morical-----	Fine-loamy, mixed, mesic Ultic Argixerolls
Moscow-----	Coarse-loamy, mixed, frigid Andic Xerochrepts
Moses-----	Loamy-skeletal, mixed Andic Cryochrepts
Narcisse-----	Coarse-loamy, mixed, mesic Cumulic Haploxerolls
Nespelem-----	Coarse-silty, mixed, mesic Entic Durixerolls
Neuske-----	Fine-loamy, mixed, frigid Mollic Haploxeralfs
Nevine-----	Ashy over loamy-skeletal, mixed, frigid Typic Vitrandepts
Newbell-----	Loamy-skeletal, mixed, frigid Andic Xerochrepts
Northstar-----	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Ohscow-----	Loamy-skeletal, mixed, frigid Andic Xerochrepts
Okanogan-----	Coarse-loamy, mixed, mesic Cumulic Haploxerolls
*Olical-----	Coarse-silty, mixed, mesic Calcic Haploxerolls
Omak-----	Fine, mixed, mesic Typic Durixerolls
Owhi-----	Sandy-skeletal, mixed, mesic Ultic Haploxerolls
Oxerine-----	Loamy-skeletal, mixed, frigid Andic Xerochrepts
Parmenter-----	Medial over sandy or sandy-skeletal, mixed, frigid Typic Vitrandepts
Peshastin-----	Loamy-skeletal, mixed, mesic Calciorthidic Haploxerolls
Phoebe-----	Coarse-loamy, mixed, mesic Pachic Ultic Haploxerolls
Picard-----	Coarse-loamy, mixed, mesic Ultic Haploxerolls
Pogue-----	Coarse-loamy over sandy or sandy-skeletal, mixed, mesic Aridic Haploxerolls

Table 22.--Classification of the Soils--Continued

Soil name	Family or higher taxonomic class
Poween-----	Coarse-loamy, mixed, mesic Cumulic Haploxerolls
Quincy-----	Mixed, mesic Xeric Torripsamments
*Raisio-----	Loamy-skeletal, mixed, mesic Entic Ultic Haploxerolls
Ralsen-----	Coarse-loamy, mixed, mesic Fluvaquentic Haplaquolls
Ratlake-----	Loamy, mixed (calcareous), mesic, shallow Typic Halaquepts
*Reardan-----	Fine, mixed, mesic Calcic Argixerolls
Rebecca-----	Coarse-loamy, mixed, mesic Ultic Haploxerolls
Renha-----	Fine, mixed, frigid Ultic Haploxeralfs
Republic-----	Coarse-loamy, mixed, frigid Ultic Haploxerolls
Resner-----	Medial over sandy or sandy-skeletal, mixed Entic Cryandepts
Ret-----	Coarse-loamy, mixed, frigid Cumulic Haploxerolls
Roosevelt-----	Coarse-loamy, mixed, mesic Aridic Haploxerolls
Rufus-----	Loamy-skeletal, mixed, mesic Lithic Ultic Haploxerolls
Sacheen-----	Mixed, frigid Typic Xeropsamments
Sanpoil-----	Coarse-loamy, mixed, frigid Cumulic Haplaquolls
Scala-----	Coarse-loamy, mixed, mesic Typic Xerochrepts
Sclome-----	Fine-loamy, mixed, frigid Fluvaquentic Haplaquolls
Scoop-----	Loamy-skeletal, mixed, frigid Pachic Ultic Haploxerolls
Scrabblers-----	Sandy, mixed, frigid Andic Xerochrepts
Sitdown-----	Sandy-skeletal, mixed Andic Cryochrepts
Skaha-----	Sandy-skeletal, mixed, mesic Xeric Torriorthents
Skanid-----	Loamy-skeletal, mixed, mesic, shallow Entic Ultic Haploxerolls
Soaplake-----	Loamy, mixed, mesic Lithic Haploxerolls
Spens-----	Sandy-skeletal, mixed, mesic Typic Xerorthents
Spokane-----	Coarse-loamy, mixed, mesic Ultic Haploxerolls
Springdale-----	Sandy-skeletal, mixed, mesic Typic Xerochrepts
Stapaloop-----	Coarse-loamy, mixed, frigid Typic Xerochrepts
Stepstone-----	Medial over sandy or sandy-skeletal, mixed, frigid Typic Vitrandepts
Stevens-----	Coarse-loamy, mixed, mesic Pachic Ultic Haploxerolls
Strat-----	Loamy-skeletal, mixed, mesic Aridic Haploxerolls
Stubblefield-----	Loamy-skeletal, mixed, mesic Orthidic Durixerolls
Swakane-----	Loamy-skeletal, mixed, mesic Lithic Ultic Haploxerolls
Swipkin-----	Coarse-silty, mixed, mesic Ultic Haploxerolls
Thout-----	Loamy-skeletal, mixed, frigid Typic Xerochrepts
Timentwa-----	Coarse-loamy, mixed, mesic Calcic Pachic Haploxerolls
Togo-----	Ashy over loamy-skeletal, mixed Entic Cryandepts
Torboy-----	Sandy, mixed, frigid Typic Xerochrepts
Torrifluventic Haploxerolls-----	Torrifluventic Haploxerolls
Torriorthents-----	Torriorthents
Tunkcreek-----	Coarse-loamy over sandy or sandy-skeletal, mixed Andic Cryochrepts
Tyee-----	Loamy, mixed, mesic, shallow Ultic Haploxerolls
Typic Haplaquolls-----	Typic Haplaquolls
Typic Xerochrepts-----	Typic Xerochrepts
Typic Xerorthents-----	Typic Xerorthents
Ultic Haploxerolls-----	Ultic Haploxerolls
Uncas-----	Ashy, nonacid, frigid Mollic Andaquepts
Vanbrunt-----	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Wannacott-----	Fine-silty, mixed, mesic Calcic Argixerolls
Wapal-----	Sandy-skeletal, mixed, frigid Typic Xerochrepts
Wells creek-----	Loamy-skeletal, mixed, frigid Ultic Haploxerolls
Whitestone-----	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Wilmont-----	Loamy-skeletal, mixed, frigid Andic Xerochrepts
Winchester-----	Mixed, mesic Xeric Torripsamments
Winthrop-----	Sandy-skeletal, mixed, mesic Entic Ultic Haploxerolls
Wynhoff-----	Loamy-skeletal, mixed, mesic Ultic Haploxerolls
Xeric Torriorthents-----	Xeric Torriorthents
Xerochrepts-----	Xerochrepts
