July 2005

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, sexual orientation, or marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA’s TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326W, Whitten Building, 14th and Independence Avenue, SW, Washington, DC 20250-9410 or call (202) 720-5964 (voice and TDD). USDA is an equal opportunity provider and employer.
Cottle County Germplasm
sand bluestem
*Andropogon hallii*

Cottle County Germplasm is released as a select class of certified seed (naturally selected track).

**Origin**

Cottle County Germplasm was originally collected in 1982 from native plants located along US Highway 62/70 in western Cottle County approximately 14 miles west of Paducah, TX. Elevation at the collection site is approximately 1900 feet; the soil at the collection site is classified as a Miles fine sandy loam. Average precipitation for the area is around 24 inches. The collection site is located in MLRA 78B - Rolling Plains, Western Part.

**Potential Uses**

Cottle County Germplasm may be used in pure stands for pasture and hay plantings or as a component in seed mixtures for range seeding. Its forage value is fair to good while young and tender. After seed heads mature, forage is fair for livestock. Wildlife can utilize the plants and seed for food. The plants provide good ground nesting cover for quail.

Cottle County Germplasm may be utilized for filter strips, field borders, contour buffer strips, and erosion control plantings on sandy soils.

**Plant Description**

Cottle County Germplasm is a native, perennial, warm-season, long-lived bunchgrass. Cottle County Germplasm resembles big bluestem but has creeping rhizomes. Sand bluestem has a deep fibrous root system. Cottle County Germplasm like other native bluestems takes two years to establish and produce seed. Sand bluestem will occur with big bluestem on tighter soils, but sand bluestem is usually the predominate species on sandier soils especially deep sand sites.

**Area of Adaptation**

Cottle County Germplasm is adapted in Texas and Oklahoma where sand bluestem is commonly found. Cottle County sand bluestem grows well on deep, sandy, and fine-textured soils. Cottle County is not adapted to saline sites or wet bottomlands.

**Establishment**

Seedbed preparation should begin the year prior to a scheduled spring seeding. This will greatly increase your chances of not having severe weed problems the first year. Work should be completed in the fall to allow time for the site to settle and accumulate moisture.

**Management**

Plantings should be well established before livestock grazing is permitted. Established stands of Cottle County should not be grazed or cut lower than 10 inches.

Prior to planting, soil fertility should be brought up to a medium level with the addition of P and K. Do not add more than 10 Lbs. of N per acre until the stand is established.

**Availability of Plant Materials**

Generation 0 seed (equivalent to Breeder seed) will be maintained by the Plant Materials Center at Knox City. Field production (G1) seed for grower increase is available through the Texas Foundation Seed Service, Vernon, TX (940) 552-6226.
