558 - ROOF RUNOFF STRUCTURE

Alberto Atienza Civil Engineer - Arecibo FO

- ► Define practice 558 Roof Runoff Structure
- Where the practice applies
- ► Data gathering
- ► How to design a roof runoff structure
- Certification of the practice

OBJECTIVES

DEFINITION

A structure that will collect, control, and convey precipitation runoff from a roof.

PURPOSE

This practice is used to accomplish one or more of the following purposes:

- Protect surface water quality by excluding roof runoff from contaminated areas
- Protect a structure foundation from water damage or soil erosion from excess water runoff
- Increase infiltration of runoff water
- Capture water for other uses

STANDARD – 558 ROOF RUNOFF STRUCTURE

CONDITIONS WHERE PRACTICE APPLIES

Where roof runoff from precipitation needs to be-

- Diverted away from a contaminated area or the foundation of a structure;
- · Collected and conveyed to a stable outlet or infiltration area; or
- Collected and captured for other uses such as evaporative cooling systems, livestock water, and irrigation.

STANDARD – 558 ROOF RUNOFF STRUCTURE

558	Roof Runoff Structure	Concrete Curb	Ft	\$9.27
558	Roof Runoff Structure	HU-Concrete Curb	Ft	\$11.12
558	Roof Runoff Structure	Roof Gutter	Ft	\$13.77

Caribbean Area - Fiscal Year 2021

EXISTING SCENARIOS

CPS- 558 – ROOF RUNOFF STRUCTURE

- ► Scenario #1: Roof Gutter
- A roof runoff structure, consisting of gutter(s), downspout(s), and appropriate outlet facilities.
- Used to keep roof clean water runoff uncontaminated and provide a stable outlet to ground surface.
- Facilitates waste management and protects environment by minimizing clean water additions to waste systems and addresses water quality concerns.
- Scenario #3 Roof Gutter with Fascia
- Existing roof does not have adequate fascia material to support the required roof gutter for a roof runoff structure

Lifespan: 15 Yr.

Design based on intensity of rainfall

Lifespan: 15 Yr.

CPS- 558 – ROOF RUNOFF STRUCTURE

- Scenario #11: Roof Gutter, 6 inches wide with runoff storage tank
- A roof runoff structure, consisting of gutter(s), downspout(s), and storage tank.
- Used to keep roof clean water runoff uncontaminated and provide a stable outlet to ground surface.
- Facilitates waste management and protects environment by minimizing clean water additions to waste systems and addresses water quality concerns.
- This scenario considers a typical 1,500gal tank
- ► DO NOT CONTRACT TANK AS A SEPARATE CPS

Lifespan: 15 Yr.

CPS- 558 – ROOF RUNOFF STRUCTURE

- ► Scenario #5: Concrete Curb
- Concrete curb or parabolic channel installed on existing impervious surface or the ground with appropriate outlet facilities.
- Scenario #7 Trench Drain
- Trench filled with rock, with a polyethylene, corrugated, perforated drain tile installed in trench bottom.
- Environmental/design considerations, for example –a building without proper structural support needed for gutters.
- Used to keep roof clean water runoff uncontaminated and provide a stable outlet to ground surface

CPS- 558 – ROOF RUNOFF STRUCTURE

- Field Data Requirements –
- CB-ENG-PLNG-1 Roof Dimensions Width and Length. Note, if the roof is divided in different planes (zones), <u>measure each</u> plane independently because each plane will drain to different sides of the <u>structure.</u>
- 1. Structure HEIGHT to design the downspouts.
- 2. Outlet Verify if there is any protected side in the floor to be used as an outlet. If there is not protected outlet, you will need to provide a concrete slab or rock revetment in the floor to avoid erosion.
- Identify if a tank will be installed with this CPS - collected water in tanks for other uses in the farm.

CB-ENG-PLNG-1 PAGE 11

- ► Tank 500 gallons or more.
 - ► This scenario is to collect waster from an existing roof runoff structure.
 - Considers a poly tank with a concrete slab.
 - The purpose of this water can be use for
 - ► Livestock watering facilities,
 - ► Irrigation
 - Other conservation practices

NEW SCENARIO 2022

Feature Measure:	Gallons of water
Scenario Unit:: Ga	llons
Scenario Typical Si	ze: 1000
Total Scenario Cos	t: \$1,839.93
Cost Per Unit:	\$1.84

ANOTHER EXAMPLE WITH UNDERGROUND OUTLET

- 1) Evaluate condition of roof and area that the gutter will catch.
- 2) Look for where downspouts could be place.
- 3) Ground gutter design could be used, if needed.
- 4) Protect roof runoff structure from damage by livestock or equipment

EVALUATION

1. EVALUATE CONDITION OF THE ROOF AND AREA THAT THE GUTTER WILL CATCH. LOOK IF FASCIA IS NEEDED

FOLLOW ALL MANUFACTURER INSTALLATION RECOMMENDATIONS

Typically, The downspouts are attached to a column with steel braces.

2. LOOK FOR WHERE DOWNSPOUTS COULD BE PLACED.

3. GROUND GUTTER DESIGN COULD BE USED, IF NEEDED.

Alternatives

- 1. Roof Gutter
- 2. Typical downspouts
- 3. Overhead downspouts
- 4. Concrete Gutter

4. PROTECT ROOF RUNOFF STRUCTURE FROM DAMAGE BY LIVESTOCK OR EQUIPMENT

- Associated practices:
 - ► Underground outlet 620
 - ▶ Diversion 632
 - Watering facility 614
 - Roof and Covers 367
 - Any relevant irrigation practices
- ► Materials:
 - Aluminum gutters 0.027in and Aluminum downspouts 0.020in.
 - Galvanized steel, gutters and downspouts: 28 gauge.

Additional Criteria to Increase Infiltration

Increase runoff infiltration by directing flow to existing landscapes (e.g., lawns, mass planting areas, infiltration trenches, rain gardens, or natural areas). Ensure these areas have the capacity to infiltrate the runoff without adversely affecting the desired plant species and without creating a soil erosion problem.

MINIMUM THICKNESS

Alumi

Steel Dowr

Aluminun

- When a roof runoff structure is used to protect roof runoff from contamination by manure, design the roof runoff structure to convey the flow rate generated from a <u>25-year, 5-minute rainfall</u> event. National Engineering Handbook (NEH) (Title 210), Part 651, "Agricultural Waste Management Field Handbook," Chapter 10, Appendix 10B.
- For other applications, design the roof runoff structure to convey the flow rate generated from a <u>10-year, 5- minute rainfall</u> event.
- Rainfall data from NOAA <u>https://hdsc.nws.noaa.gov/hdsc/pfds/pfds_map_pr.html</u>

GUTTER DESIGN CAPACITY

- Tool calculates gutter discharge and flow area. Also calculates the size and number of downspouts.
- Flow area is in square inches. Meaning, Depth x Width = Area
- For this example, a 25 in². The area can be bigger.

This could be a 8in round pipe or 5" x 5" = 25 in² square section. Or 6" x5" = 30in² rectangular section
The same is true for the downspouts.
This could be a 4in round pipe or 4" x 4" = 16 in² square section. Or 3" x4" = 12 in² rectangular section

and downspout number (from above table)

Slope	0.005 💌
Pipe Size	8 in
Gutter Discharge	226.6 gpm
Flow Area	25.13 sq.in
Downspouts	1 required

Step 5: Compute downspout size

Head 4 in
Rea Area 11.48 sa.in
Req. Diameter 3.8 in

- 1. Area of the roof (width and length).
- 2. Roof is 1-slope, 2 slopes or more.
- 3. Downspouts where to locate them.
- 4. Look for a stable outlet.
- 5. Survey.

FIELD DATA GATHERING

Differential Leveling

Sample D-4 Engineering notes for a diversion—Sheet 1 of 3

Engineering notes for a diversion

The format and information illustrated by these notes are satisfactory for small diversions when drainage areas are small, topography is reasonably uniform, elevations with respect to other structures are not important, and where approved design tables are available.

Notes similar to the format shown in sample D–8 should be recorded for the larger diversions where considerable cut and fill are required and where vertical control is important.

EXAMPLES

► Waste Pond overfilling – Why?

- Waste Pond overfilling. How do we fix this?
 1. Install roof
 - 2. Install Gutters
 - 3. Install Downspouts
 - 4. Is water out of the
 - waste pond?
 - 5. Use diversions, curbs or pipe to keep roof runoff from entering the waste pond.

Waste Pond

3. GROUND GUTTER DESIGN COULD BE USED, IF NEEDED.

► Needs roof and gutters.

- Measure the length of the gutter.
- Verify the dimensions of the cross section of the gutter is in accordance with design.
- Verify the number, location and dimensions of downspouts accordance with design.
- Check that the outlet of the runoff is in a stable area.
- ► Take pictures.
- Deliver O&M form to farmer

CHECK OUT AND PRACTICE CERTIFICATION

- 1. Determine the slope
- 2. Use the total discharge flow from the spreadsheet
 - Convert the capacity from gpm to cfs
- 3. Select manning's n
- 4. Use USDA-NRCS Hydraulics Formula Tool (app)
 - Trapezoidal section
 - Use 0.1 bottom for a triangular section channel

CONCRETE GUTTER DESIGN

EXAMPLE CONCRETE GUTTER DESIGN

EXAMPLE CONCRETE GUTTER DESIGN

Determine the size of the gutter and downspouts. The roof is single slope located in Arecibo

EXERCISE. ROOF NEEDS A RUNOFF STRUCTURE.
