# Performance of FRM PM Samplers in Rural Environments – An Update

#### Brock Faulkner, Ph.D., P.E. Center for Agriculture Air Quality Engineering and Science Texas A&M University

February 7, 2012

#### **Rural v. Urban Environments**

#### • Urban

- Largely secondary PM
- Two primary modes (USEPA, 1996)
  - Coarse: MMD ~ 5.7  $\mu m;$  GSD ~ 2.25
  - Accumulation: MMD ~ 0.32  $\mu m;$  GSD ~ 2.16

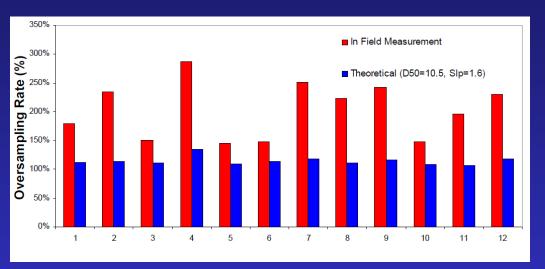

#### Rural

Largely primary/crustal PM

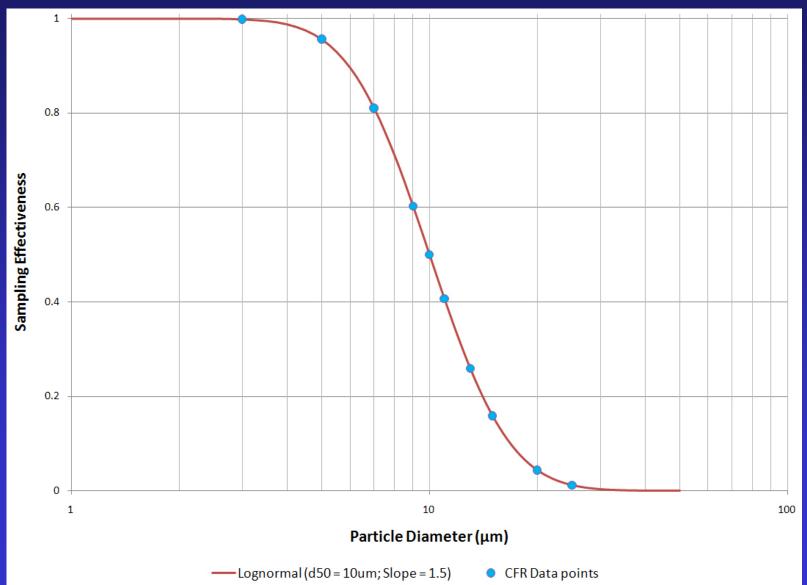

### **Observed Oversampling**

- Beef feedyards
- Dairies
- Poultry houses
- Swine houses
- Almond harvest
- Cotton harvest
- Cotton gins

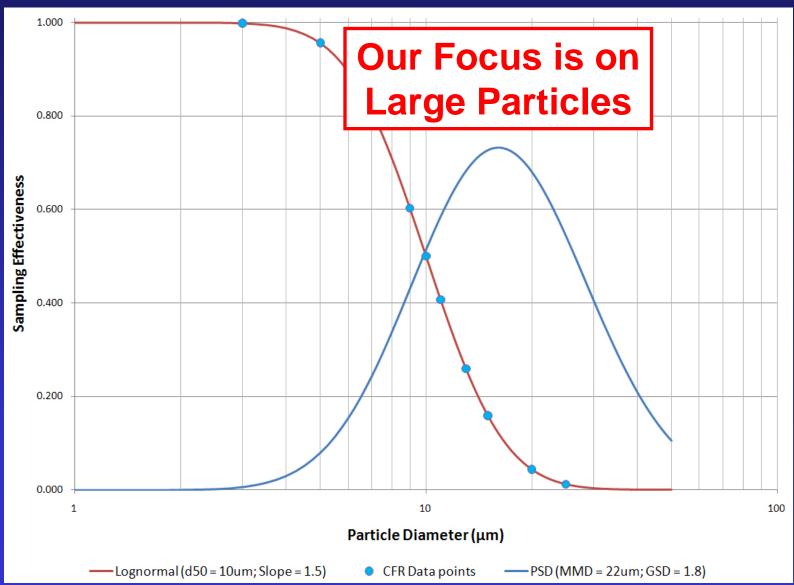

Samplers are not performing as intended in rural environments.

#### **Potential Causes**

#### **Potential Causes**

### **Cooperative Efforts with EPA**

Research Plan

 Testing of PM<sub>10</sub> inlet with emphasis on reducing uncertainty in large particle measurements

- Testing of low-volume TSP inlet

### **Cooperative Efforts with EPA**

Research Plan

- Sharing of resources
  - Equipment
  - SOPs and QAQC Procedures
  - Data

## Next Steps (from Sept.)

- Finalize wind tunnel performance validation (September 2011)
  - Velocity uniformity
  - Concentration uniformity
    - Temporal
    - Spatial

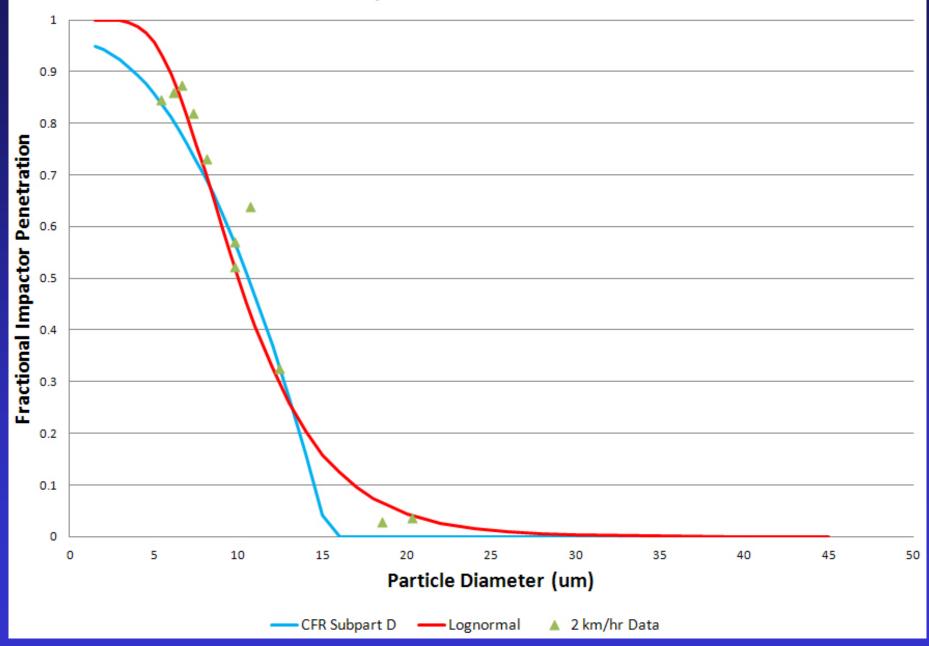

## Next Steps (from Sept.)

• Finalize wind tunnel performance validation (September 2011)

 Collect first round of data for PM<sub>10</sub> and LVTSP samplers using liquid aerosols (December 2011)

# In Process

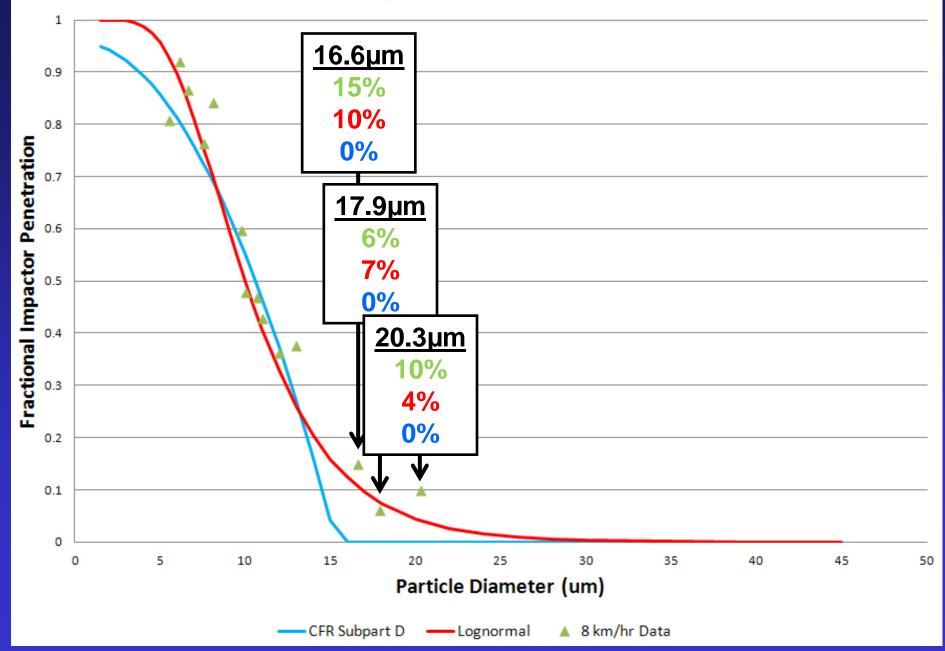

#### 2 km/hr Penetration Curve

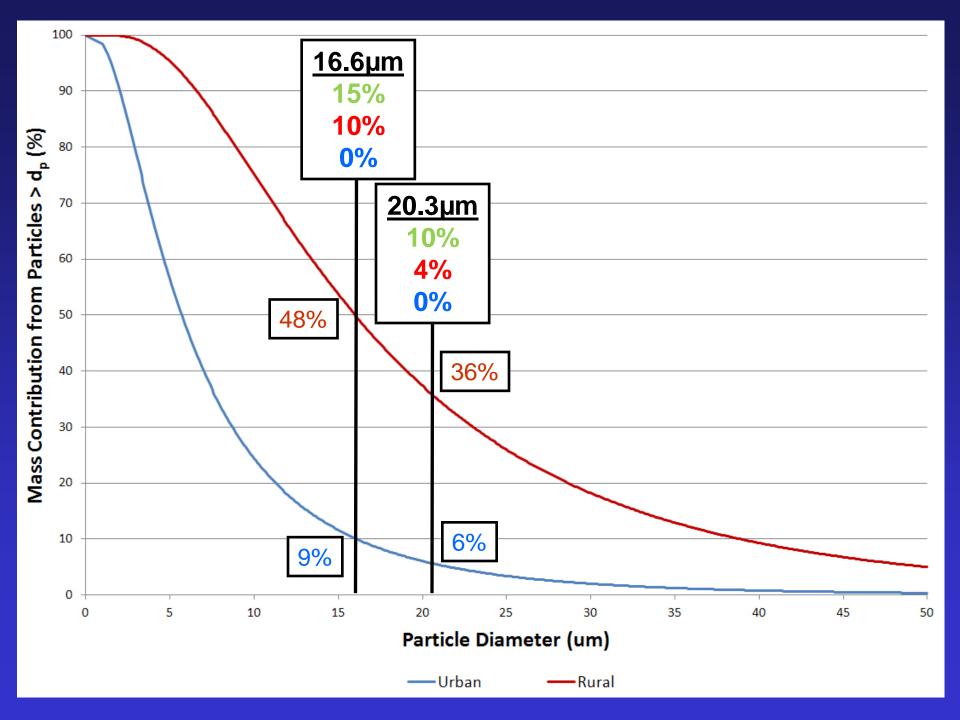

#### 24 km/hr Penetration Curve

#### 8 km/hr Penetration Curve

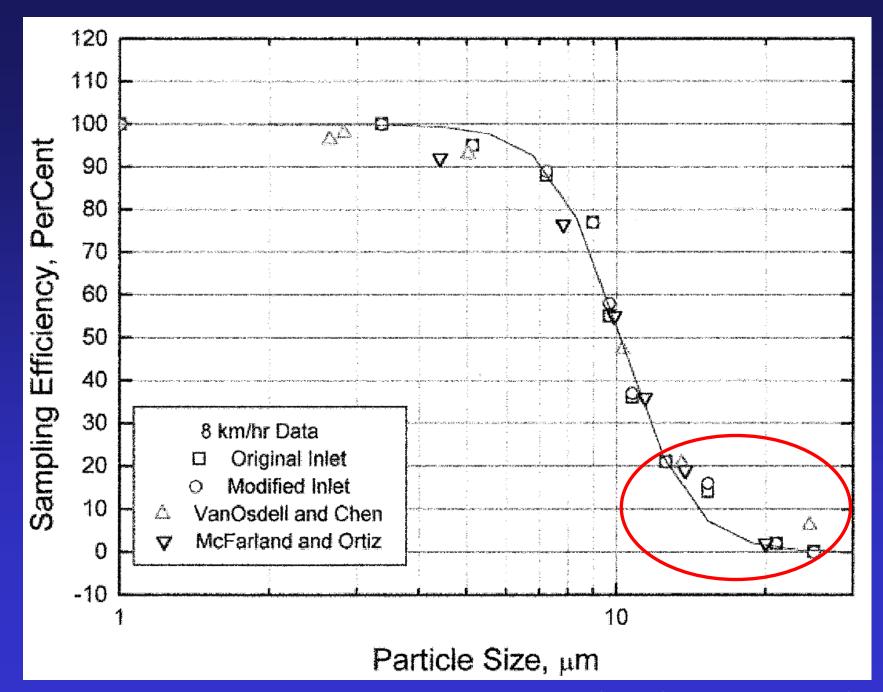

Figure 5 (8 kph) – Tolocka et al. (2001)

### Next Steps (from Sept.)

• Finalize wind tunnel performance validation (September 2011)

 Collect first round of data for PM<sub>10</sub> and LVTSP samplers using liquid aerosols (December 2011) Now April 2012

 Collect data with solid aerosols (February 2012) Now May 2012
