

Soil Series

There are 117 major types of soils in Connecticut identified and named. Each type (or series) is named for the geographical area where it was first described. Each soil series has specific relationships to landscapes, regional geology, and parent materials.

Soil Catena Chart

Related soils of about the same age, derived from similar parent material and occurring under similar climatic conditions, can be arranged into a sequence of increasing wetness. This sequence is called a ***soil catena***. A catena chart is useful in identifying the relationship of one series to another.

The chart uses the catena concept by matching parent material, geology, and drainage for each series mapped in the Soil Survey of the State of Connecticut. Each horizontal line in the chart represents an individual soil catena and each catena is, in turn, arranged vertically by differences in surficial deposits, lithology, and soil texture. There are 9 very poorly drained soil series formed in organic deposits and 9 subaqueous soil series that have been organized differently at the bottom of the chart.

- *The diagram above shows a drainage sequence in which wetness increases at lower elevations on the landscape.*
- *The block diagram on the front page shows a drainage catena on till parent materials of drumlins.*

The simple yet powerful way to access and use soil data.

Soil Survey of the State of Connecticut
The Soil Survey of the State of Connecticut is a modern soil survey, uniting the separate eight county soil legends to a single statewide legend, incorporating current soil taxonomy and standards, addressing land use changes and urbanization, and compiled onto planimetric orthophoto base. The soils were mapped at a scale of 1:12000 with a minimum size delineation of approximately 1.5 acres. Copies of the published county soil survey reports dated prior to July 2005 are no longer the official soil survey information and should only be used as historical reference.
The Web Soil Survey
Official digital soil survey information is located on the Web Soil Survey at <http://websoilsurvey.nrcs.usda.gov>. It is a simple yet powerful way to access and use soil data. The site is updated and maintained online as the single authoritative source of soil survey information.

Historical Soil Series
Since the publication of the soil surveys for all eight Connecticut counties, the classification of soils has continued to evolve. When using the historical published soil surveys, one will encounter a variety of soil series names not currently in use. These series, noted above, are referenced by number to the most current name available at the time of this publication. For example, the soil mapped as *Acton*, if classified by today’s standards, may be named *Sutton*.

Charts on this page supplement all Connecticut soil surveys by referring to both current and previously used soil series names. However, since there are some major differences in map units and soil series interpretations from survey to survey, it is necessary to refer to the narrative descriptions within the appropriate archived survey to obtain complete information concerning a particular soil.

Official Soil Series Descriptions
More detailed information about each soil series is located on the USDA-NRCS soils webpage under Official Soil Series Descriptions (OSDs). This site is updated and maintained online as the official source of tentative and established soil series.

+ Indicates soils underlain by compact till.

* Indicates shallow soils less than 20 inches (< 50 cm) to bedrock.

** Indicates moderately deep soils 20 to 40 inches (50-100 cm) to bedrock.

Indicates soils with mean annual soil temperature less than 8°C or 46.4°F (elevations of >1,300 feet/396 meters in Litchfield County) in frigid soils.

++ Subaqueous soils are covered with water for more than 21 hours per day.

1-33 Annotations to referenced soil series no longer used in CT.
