# Basin Outlook Reports And Federal – State – Private Cooperative Snow Surveys

### How forecasts are made

Most of the annual streamflow in Arizona originates as snowfall that has accumulated in the mountains during the winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Measurements of snow water equivalent at selected manual snow courses and automated Snow Telemetry (SNOTEL) sites, along with precipitation and streamflow values, are used in statistical and simulation models to prepare runoff forecasts. These forecasts are coordinated between hydrologists in the Natural Resources Conservation Service (NRCS) the National Weather Service, and the Salt River Project.

Forecasts of any kind are not perfect. Streamflow forecast uncertainty arises from three primary sources: (1) uncertainty of future weather conditions, (2) uncertainty in the forecasting procedure, and (3) errors in the data. The forecast, therefore, must be interpreted not as a single value but rather as a range of values with specific probabilities of occurrence. The middle of the range is expressed by the 50% exceedance probability forecast, for which there is a 50% chance that the actual flow will be above, and a 50% chance that the actual flow will be below, this value. To describe the expected range around this 50% value, four other forecasts are provided, two smaller values (90% and 70% exceedance probability) and two larger values (30%, and 10% exceedance probability). For example, there is a 90% chance that the actual flow will be more than the 90% exceedance probability forecast.

The wider the spread among these values, the more uncertain the forecast. As the season progresses, forecasts become more accurate, primarily because a greater portion of the future weather conditions become known. This is reflected by a narrowing of the range around the 50% exceedance probability forecast. Users should take this uncertainty into consideration when making operational decisions by selecting forecasts corresponding to the level of risk they are willing to assume about the amount of water to be expected. If users anticipate receiving a lesser supply of water, or are concerned about having an adequate water supply, they may want to base their decisions on the 90% or 70% exceedance probability forecasts. On the other hand, if users anticipate receiving too much water, or are concerned about the threat of flooding, they may want to base their decisions on the 30% or 10% exceedance probability forecasts. Regardless of the forecast value users choose, they should be prepared to deal with either more or less water.

# ARIZONA Basin Outlook Report as of February 15, 2018

### **SUMMARY**

As of February 15, snowpack levels are well below normal throughout the major basins of the state. Precipitation for the first half of February was also well below normal in the major river basins. The Salt and Verde River reservoir system stands at 60 percent of capacity, while San Carlos Reservoir is at 7 percent of capacity. The mid-month forecast calls for well below normal runoff in all basins for the spring runoff period.

### **SNOWPACK**

Snow water equivalent levels in the state's major river basins are well below normal, ranging from 24 percent of median in the Verde River Basin, to 9 percent of median in the Gila River Basin. The statewide snowpack is well below normal at 22 percent of median.

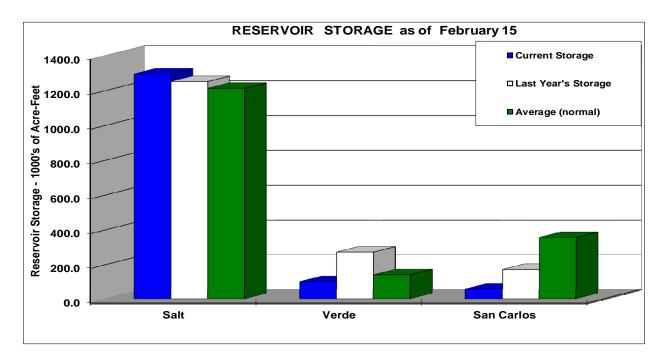

### **PRECIPITATION**

Mountain data from NRCS SNOTEL sites and NWS Cooperator gages show that precipitation for the first half of February was well below average in the major river basins. Cumulative precipitation since October 1 remains well below normal throughout the basins. Please refer to the precipitation bar graphs found in this report for more information on precipitation levels in the basins.

### **RESERVOIR STORAGE**

As of February 15, the Salt and Verde River reservoir system stands at 60 percent of capacity. San Carlos Reservoir is currently at 7 percent of capacity.

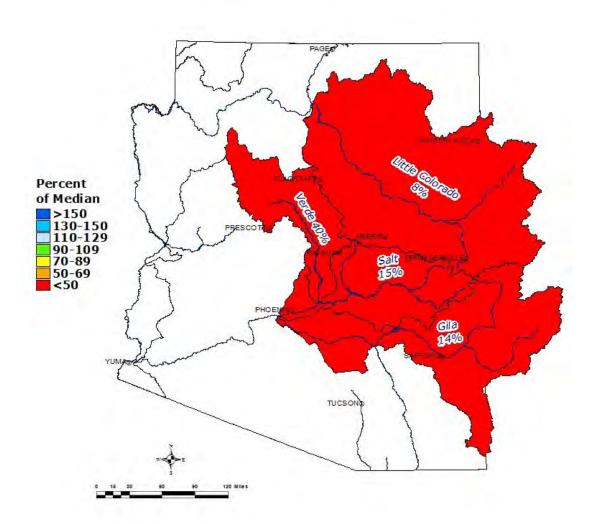

Key storage volumes displayed in thousands of acre-feet (x1000):

Reservoir	Current <u>Storage</u>	Last Year <u>Storage</u>	30-Year <u>Average</u>	Storage <u>Capacity</u>
Salt River System	1294.0	1251.0	1212.0	2025.8
Verde River System	101.0	270.8	140.2	287.4
San Carlos Reservoir	58.8	170.8	355.0	875.0
Lyman Lake	11.1	8.5	12.0	30.0
Lake Havasu	564.7	570.9	561.2	619.0
Lake Mohave	1689.9	1692.0	1659.0	1810.0
Lake Mead	10673.0	10681.0	20361.0	26159.0
Lake Powell	13515.0	11229.0	17553.0	24322.0

### **STREAMFLOW**

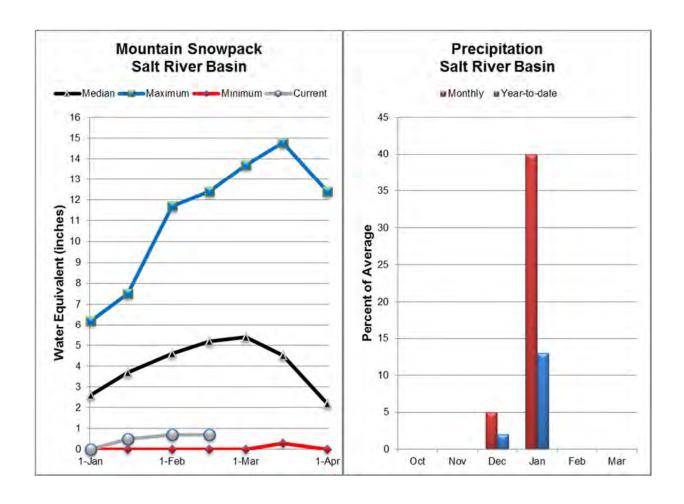

As of February 15, the forecast calls for well below normal streamflow for the spring runoff period, ranging from 8 percent of median in the Little Colorado River above Lyman Lake to 40 percent of median in the Verde River above Horseshoe Dam. Total precipitation since the beginning of the water year has been well below average, leaving dry soils, and producing less than ideal conditions for runoff. Please refer to the basin forecast tables found in this report for more information regarding water supply forecasts.

# Arizona Spring Streamflow Forecasts as of February 15, 2018

# SALT RIVER BASIN as of February 15, 2018

Well below normal streamflow levels are forecast for the basin. In the Salt River, near Roosevelt, the forecast calls for 15% of median streamflow through May, while at Tonto Creek, the forecast calls for 20% of median streamflow through May. Snow survey measurements show the Salt snowpack to be at 13% of median. Note that there was no measurable precipitation during the months of October and November.

#### Salt River Basin

# SAN FRANCISCO-UPPER GILA RIVER BASIN as of February 15, 2018

Well below normal streamflow levels are forecast for the basin. In the San Francisco River, at Clifton, the forecast calls for 23% of median streamflow levels through May. In the Gila River, near Solomon, the forecast calls for 14% of median streamflow levels through May. At San Carlos Reservoir, inflow to the lake is forecast at 6% of median through May. Snow survey measurements show the snowpack for this basin to be at 9% of median.

<sup>2)</sup> Forecasts are for unimpaired flows. Actual flow will be dependent on management of upstream reservoirs and diversions

## LITTLE COLORADO RIVER BASIN as of February 15, 2018

Well below normal streamflow levels are forecast for the basin. In the Little Colorado River, above Lyman Lake, the forecast calls for 8% of median streamflow through June. At Blue Ridge (C.C. Cragin) Reservoir, inflow to the lake is forecast at 12% of median through May. Snowpacks along the southern headwaters of the Little Colorado River, and along the central Mogollon Rim, were measured at 23% and 24% of median, respectively. Note that there was no measurable precipitation during the months of October, November, and December.

# Little Colorado River Basin Streamflow Forecasts - February 16, 2018 Forecast Exceedance Probabilities for Risk Assessment

# NORTHWESTERN ARIZONA as of February 15, 2018

On the Colorado River, well below normal inflow to Lake Powell is forecast at 43% of the 30-year average for the forecast period April-July. At the Grand Canyon, measurements conducted by park rangers show the snowpack to be at 30% of median.
