Basin Outlook Reports And Federal – State – Private Cooperative Snow Surveys

How forecasts are made

Most of the annual streamflow in Arizona originates as snowfall that has accumulated in the mountains during the winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Measurements of snow water equivalent at selected manual snow courses and automated Snow Telemetry (SNOTEL) sites, along with precipitation and streamflow values, are used in statistical and simulation models to prepare runoff forecasts. These forecasts are coordinated between hydrologists in the Natural Resources Conservation Service (NRCS) the National Weather Service, and the Salt River Project.

Forecasts of any kind are not perfect. Streamflow forecast uncertainty arises from three primary sources: (1) uncertainty of future weather conditions, (2) uncertainty in the forecasting procedure, and (3) errors in the data. The forecast, therefore, must be interpreted not as a single value but rather as a range of values with specific probabilities of occurrence. The middle of the range is expressed by the 50% exceedance probability forecast, for which there is a 50% chance that the actual flow will be above, and a 50% chance that the actual flow will be below, this value. To describe the expected range around this 50% value, four other forecasts are provided, two smaller values (90% and 70% exceedance probability) and two larger values (30%, and 10% exceedance probability). For example, there is a 90% chance that the actual flow will be more than the 90% exceedance probability forecast.

The wider the spread among these values, the more uncertain the forecast. As the season progresses, forecasts become more accurate, primarily because a greater portion of the future weather conditions become known. This is reflected by a narrowing of the range around the 50% exceedance probability forecast. Users should take this uncertainty into consideration when making operational decisions by selecting forecasts corresponding to the level of risk they are willing to assume about the amount of water to be expected. If users anticipate receiving a lesser supply of water, or are concerned about having an adequate water supply, they may want to base their decisions on the 90% or 70% exceedance probability forecasts. On the other hand, if users anticipate receiving too much water, or are concerned about the threat of flooding, they may want to base their decisions on the 30% or 10% exceedance probability forecasts. Regardless of the forecast value users choose, they should be prepared to deal with either more or less water.

ARIZONA Basin Outlook Report as of March 15, 2021

SUMMARY

As of March 15, snowpack levels are below normal to well below normal throughout the major basins of the state. Precipitation for the first half of March was well below normal to normal in the major river basins. The Salt and Verde River reservoir system stands at 76 percent of capacity, while San Carlos Reservoir is at 1 percent of capacity. The mid-month forecast calls for well below normal runoff for the major basins during the spring runoff period.

SNOWPACK

Snow water equivalent levels in the state's major river basins are below normal to well below normal, ranging from 70 percent of median in the Verde River Basin, to 22 percent of median in the Salt River Basin. The statewide snowpack is well below normal at 52 percent of median.

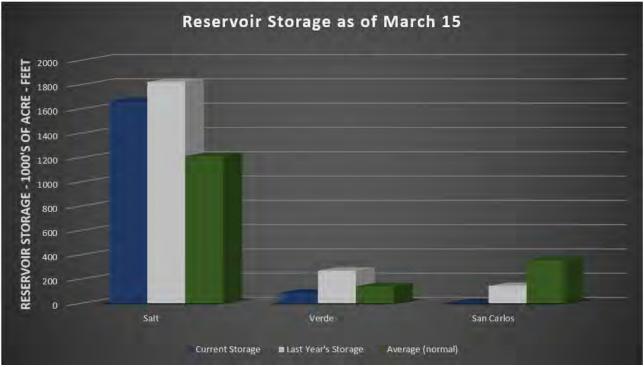

PRECIPITATION

Mountain data from NRCS SNOTEL sites and NWS Cooperator gages show that precipitation for the first half of March was well below average to average in the major river basins. Despite the recent storms, cumulative precipitation since October 1 remains well below normal throughout the basins. Please refer to the precipitation bar graphs found in this report for more information on precipitation levels in the basins.

RESERVOIR STORAGE

As of March 15, the Salt and Verde River reservoir system stands at 76 percent of capacity. San Carlos Reservoir is currently at 1 percent of capacity.

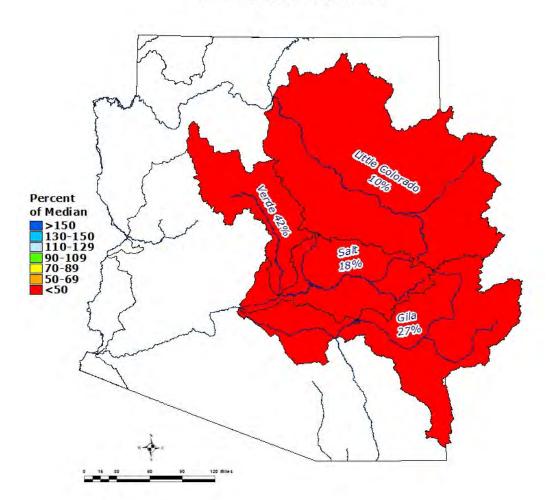

Key storage volumes displayed in thousands of acre-feet (x1000):

Reservoir	Current <u>Storage</u>	Last Year <u>Storage</u>	30-Year <u>Average</u>	Storage <u>Capacity</u>
Salt River System	1663.9	1822.4	1212.0	2025.8
Verde River System	87.4	268.6	140.2	287.4
San Carlos Reservoir	8.4	143.5	355.0	875.0
Lyman Lake	7.3	11.3	12.0	30.0
Lake Havasu	571.3	605.5	561.2	619.0
Lake Mohave	1688.0	1759.3	1659.0	1810.0
Lake Mead	10519.0	11417.0	20361.0	26159.0
Lake Powell	9043.4	11901.0	17553.0	24322.0

STREAMFLOW

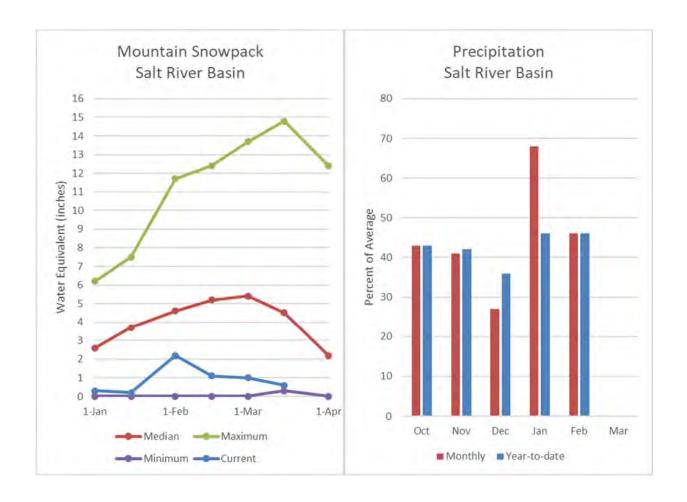

As of March 15, the forecast calls for well below normal streamflow for the spring runoff period, ranging from 10 percent of median in the Little Colorado River above Lyman Lake to 42 percent of median in the Verde River above Horseshoe Dam. Total precipitation since the beginning of the water year has been well below normal, leaving soils dry and resulting in less than ideal conditions for runoff. Please refer to the basin forecast tables found in this report for more information regarding water supply forecasts.

Arizona Spring Streamflow Forecasts as of March 15, 2021

SALT RIVER BASIN as of March 15, 2021

Well below normal streamflow levels are forecast for the basin. In the Salt River, near Roosevelt, the forecast calls for 18% of median streamflow through May, while at Tonto Creek, the forecast calls for 16% of median streamflow through May. Snow survey measurements show the Salt snowpack to be at 22% of median.

SAN FRANCISCO-UPPER GILA RIVER BASIN as of March 15, 2021

Well below streamflow levels are forecast for the basin. In the San Francisco River, at Clifton, the forecast calls for 32% of median streamflow levels through May. In the Gila River, near Solomon, the forecast calls for 27% of median streamflow levels through May. At San Carlos Reservoir, inflow to the lake is forecast at 27% of median through May. Snow survey measurements show the snowpack for this basin to be at 30% of median.

LITTLE COLORADO RIVER BASIN as of March 15, 2021

Well below normal streamflow levels are forecast for the basin. In the Little Colorado River, above Lyman Lake, the forecast calls for 10% of median streamflow through June. At Blue Ridge (C.C. Cragin) Reservoir, inflow to the lake is forecast at 17% of median through May. Snowpacks along the southern headwaters of the Little Colorado River, and along the central Mogollon Rim, were measured at 51% and 56% of median, respectively.

Little Colorado Streamflow Forecasts - March 16, 2021
