

**CONSERVATION ENHANCEMENT ACTIVITY  
E384A**

**CONSERVATION  
STEWARDSHIP  
PROGRAM**

**Biochar production from woody residue**

**Conservation Practice 384: Woody Residue Treatment**

**APPLICABLE LAND USE: Forest, Associated Ag Land**

**RESOURCE CONCERN: Plants; Soil**

**ENHANCEMENT LIFE SPAN: 10 years**

**Enhancement Description**

Uses woody debris remaining after fuel reduction harvests or wildfires to create biochar. Biochar stores carbon and is a useful soil amendment that improves Soil Organic Matter (SOM) and water-holding capacity.

**Criteria**

- States will apply general criteria from the NRCS National Conservation Practice Standard Woody Residue Treatment (Code 384) as listed below, and additional criteria as required by the NRCS State Office.
- The enhancement will be applied to sites where woody debris presents a fire risk or interferes with land management objectives or planned activities (e.g., impedes regeneration, limits access, interferes with livestock movement, etc.).
- Woody debris that does not have a commercial use is suitable for biochar creation.
- Where this enhancement can be coordinated with a fuel reduction treatment, woody debris should be separated by size classes if possible.
- Biochar will be created on site in kilns designed for the purpose.
- Kiln operators shall be properly trained in procedures for creating biochar and shall adhere to state safety precautions. A plan for quenching biochar will be in place prior

## CONSERVATION STEWARDSHIP PROGRAM

to lighting kilns, and the capability for quenching will be maintained during firing and while the char is cooling.

- Biochar may be spread in the forest to enrich soils or used elsewhere on the operation.
  - Biochar may be spread in forests using equipment such as a bucket loader on a tractor, or a manure spreader. It is best to spread biochar just before the start of a moist season. Incorporate biochar into the forest floor or mix with an organic material (e.g., manure, compost, etc.) before spreading, where possible.
  - If applying biochar to agricultural fields, apply in appropriate amounts based on soil analyses of the fields, and an analysis of typical biochar produced within the geographic area and forest type.
  - Biochar may be used in manure treatment (e.g., to reduce odors in barns, as an amendment in manure composting, etc.).
- Care shall be taken to minimize impacts on residual plant communities during biochar creation.
- Timing of biochar creation shall coincide with periods of low fire risk.
- Any residual woody material left on the site after treatment will not present an unacceptable fire, safety, environmental, or pest hazard. Such remaining material will not interfere with the intended purpose or other planned management activities.
- The use of woody material to create biochar shall not be detrimental to the site. Soil and water resources will be protected during the activity. Adequate woody material will be left to maintain wildlife habitat. Activities will be consistent with established regulations and guidelines for Woody Biomass Retention and Harvesting, if available.
- Activities will be consistent with established regulations and guidelines for PM10 and PM2.5 emissions, ozone precursors (NOx and VOCs), as well as smoke and fugitive dust, and state and local permit requirements.
- Secure all necessary approvals and permits prior to conducting biochar creation. Burning permits may be required.
- Access by vehicles or people will be controlled during biochar creation for safety.

# CONSERVATION STEWARDSHIP PROGRAM

## Documentation and Implementation Requirements:

Participant will:

- Prior to implementation, identify a suitable location for producing biochar, away from flammable vegetation, livestock, structures, and any desirable vegetation.
- Prior to implementation, arrange to have equipment on-site that is specially designed for biochar production meeting state or NRCS requirements, if any.
- Prior to implementation, complete a biochar site safety plan. Arrange to have enough water on-site to quench the biochar. Ensure that persons managing the biochar operation are properly trained. Have biochar site safety plan documentation available for NRCS review.
- Prior to implementation, acquire all necessary approvals and permits (i.e. local, state, or federal, as applicable).
- Prior to implementation, develop a plan for using the biochar. If the biochar is intended to be used on agricultural fields, consult a technical specialist about chemical properties of the biochar. Amend the biochar with additives as needed to ensure proper soil chemistry.
- During implementation, restrict access to the biochar production site so that only trained operators are present.
- During implementation, and prior to ignition of biochar fuels, acquire a current fire weather forecast and ensure all weather conditions are appropriate. If conditions are not suitable, postpone burning. Only produce biochar when fire danger is low.
- During implementation, maintain all safety procedures during biochar production and until biochar is fully quenched and cooled.
- After implementation, use the biochar on the operation as planned.

NRCS will:

- Prior to implementation, verify the enhancement is planned for the appropriate land use, and woody residue is not suitable for other uses.
- Prior to implementation, verify the safety plan and training meets the enhancement criteria and state or NRCS requirements.

# CONSERVATION STEWARDSHIP PROGRAM

- As needed, prior to implementation, NRCS will provide technical assistance in:
  - Selecting suitable locations for biochar production.
  - Advising on tests for biochar chemistry, and on biochar amendments for field application.
  - Preparing specifications for applying this enhancement for each site using approved specification sheets, job sheets, technical notes, and narrative statements in the conservation plan, or other acceptable documentation.
- Prior to implementation, as needed, provide explanation and technical assistance to the following conservation practice standard as related to implementing this enhancement.
  - NRCS Conservation Practice Standard Woody Residue Treatment (Code 384)
- During implementation, evaluate any planned changes to verify they meet the enhancement criteria.
- After implementation, verify the biochar is being used as planned.

**NRCS Documentation Review:**

I have reviewed all required participant documentation and have determined the participant has implemented the enhancement and met all criteria and requirements.

## WASHINGTON SUPPLEMENT TO CONSERVATION ENHANCEMENT ACTIVITY

## CONSERVATION STEWARDSHIP PROGRAM

### E384A

#### Additional Criteria for Washington

- In addition to the criteria specified in the National job sheet E384A the following additional criteria apply in Washington:
  - **Washington NRCS does not provide Technical or Financial Assistance for prescribed burning.** For prescribed burning information or guidance, the participant will contact their local WA DNR for information on prescribed burning, burn plans and required burn permits.
  - This Enhancement may be applied to units, where the abundance of slash exceeds the parameters for lop and scatter (usually >9 tons per acre) and/or fall into the WA DNR Extreme Fire Hazard sites WAC 332- 24-650-652.
  - For soil health purposes clients are expected to leave up to two tons per acres on site for nutrient cycling aggregate stability, soil organism habitat and other soil health functions.
  - It is encouraged to leave Large Woody Debris (down logs) for wildlife habitat. According to WA Biological Technical Note 14, the minimum size for LWD is 12" in Diameter and 20' long. Refer to WA Biological Technical Note 14 for more information (FOTG, section I). These down logs equate to about ½ to to 1 ½ tons of material.
  - When forest pest habitat is not a concern, it is also acceptable to leave enough woody debris to create at least 1 Habitat pile (brush pile) every 5 acres. At a minimum, Habitat piles (brush piles) are 10' in diameter and 6' in height. Refer to WA Biological Technical Note 14 for more information (FOTG, section I).

### **Additional Documentation Requirements for Washington**

- In addition to the documentation requirements specified in the National job sheet E384A the following additional documentation requirements apply in Washington:
  - Proof of compliance with WA DNR burn plan and permit requirements will be available for review by NRCS. Include Fire Precaution Class <https://www.dnr.wa.gov/ifpl> and weather forecast for day of burning.
  - Within 384 Implementation requirements document Biochar protocols for production and spreading on site or off. Include all considerations and mitigations for wildlife, wildfire risk, air quality, and safety.
