**Cereal Rye (Secale cereale)** is a cool-season annual grass that is the most popular cover crop for Iowa farmers due to its ability to suppress weeds, fight disease, establish in the fall, and help reduce soil compaction. *(Photo by Lynn Betts)*

### Identifying Features
- Hairs on leaf sheath
- Small, stubby auricles without hairs
- Ligule is short and flat

### Cultural Traits
- Cool-season annual grass
- Minimum germination soil temperature: 34°F
- Cold tolerance temperature: -30°F
- Seeding date: Mid August to Late October*

### Planting Information*
- **Drill/Plant** at ¾ - 1½ inches (45 lbs./acre PLS**)
- **Broadcast** (50 lbs./acre PLS)
- **Aerial** (55 lbs./acre PLS)

### Additional planting information:
- ~18,200 seeds/lb. (1 bushel = 56 pounds)
- If grazing or weed suppression is desired, increase seeding rate.
- Broadcasting without incorporation is usually less dependable than drilling or broadcasting with incorporation.
- Use a low seeding rate for areas with sandy soil or that are prone to dry periods in early spring.

### C:N (Carbon:Nitrogen) Ratios
- Rye cover crop (Vegetative) 26:1
- Rye cover crop (Anthesis) 37:1
- Rye straw 82:1

*Refer to Midwest Cover Crop Council (midwestcovercrops.org), local NRCS office recommendations, and/or pertinent financial assistance program requirements for location specific seeding dates and rates.

**Pure Live Seed**
CEREAL RYE COVER CROP FACT SHEET

Performance
Dry matter = 2,500 - 6,000 lbs./acre per year
(Biomass quantity is dependent on planting and termination dates and precipitation.)

Performance Ratings
» Cash crop interseed (early vegetative) Good
» Cash crop overseed (late seed fill) Excellent
» Grazing quality Excellent
» Mechanical forage harvest Very good
» Nitrogen fixer NA
» Nitrogen scavenger Excellent
» Weed suppression Excellent
» Compaction fighter Very good
» Erosion control Excellent
» Lasting residue Excellent
» Quick grower Excellent
» Drought tolerance Very good
» Low fertility tolerance Excellent
» Shade tolerance Very good

Additional Considerations
» Increased pest pressure: Could increase the risk of black cutworm and armyworm; risk of green bridge increasing pythium seedling disease; and is a host for penetrans root lesion nematode.
» Termination: Time cover crop termination based on goals and experience level. To reduce potential negative impacts on cash crops, consider terminating earlier in the season when conditions are dry or when green bridge or nitrogen tie-up are a concern. For crop insurance compliance, follow NRCS cover crop termination guidelines.
