

Water and Climate Update

May 02, 2024

The Natural Resources Conservation Service produces this weekly report using data and products from the [National Water and Climate Center](#) and other agencies. The report focuses on seasonal snowpack, precipitation, temperature, and drought conditions in the U.S.

Snow	2	Drought	10
Precipitation	4	Other Climatic and Water Supply Indicators	13
Temperature	8	More Information	19

Numerous tornadoes hit the Midwest

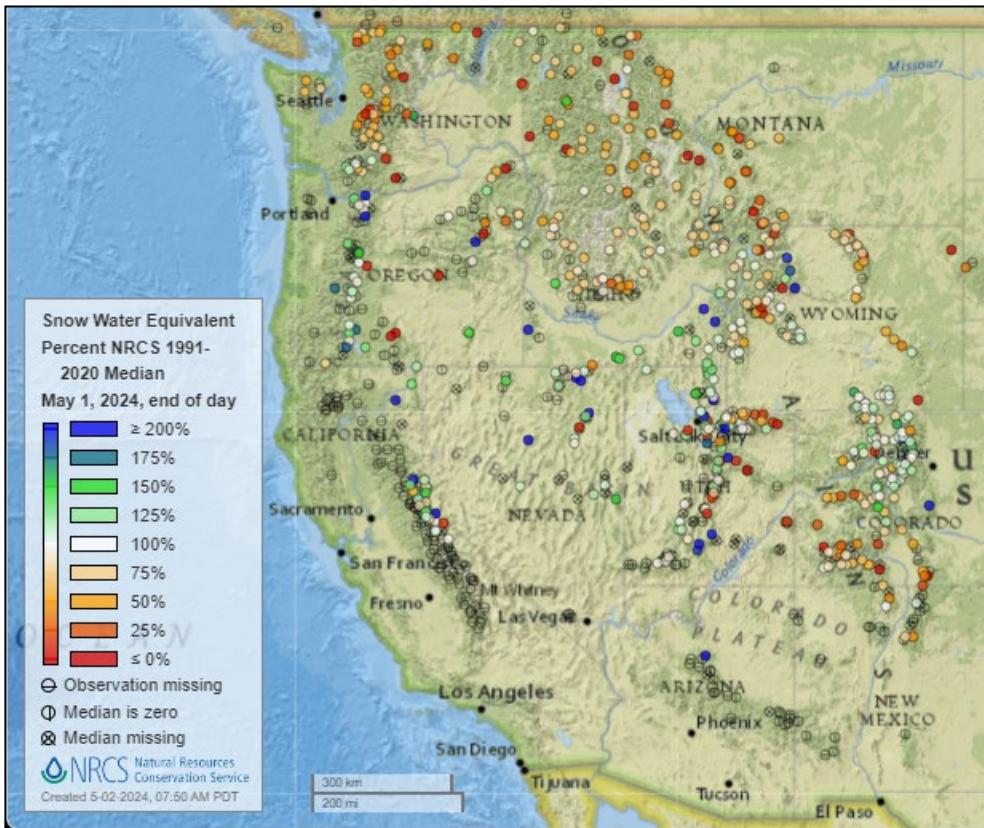

The final weekend in April brought severe weather to the Midwest and Great Plains, causing fatalities and extensive destruction. Over 100 confirmed tornadoes impacted the region between April 26-28, with winds exceeding 100 mph recorded during some of the events. On April 27 alone, the Storm Prediction Center reported 51 tornadoes with excessive rainfall, hail, and flash flooding throughout the region. As of May 2, the National Weather Service is forecasting potential additional bouts of severe weather and flash flooding to affect parts of the same region on the heels of the recent storms.

[Current National Drought Summary, April 30, 2024](#)

Source: National Drought Mitigation Center

"During the late week and weekend, a large severe weather outbreak brought large hail, damaging winds and numerous intense tornadoes to parts of the central and southern Great Plains and Midwest. The storm systems responsible for the severe weather outbreak also brought widespread moderate and heavy rain amounts to the central U.S., leading to widespread improvements in drought and abnormally dry conditions. To the southwest of the heavy rainfall, in northwest Oklahoma and southwest and central Kansas, severe drought expanded as flash drought continued to take hold during a very dry late winter and early-mid spring, leading to reports of very poor wheat conditions and dust storms. Recent dry weather over the last month, combined with a mostly dry week, led to the development of more areas of abnormal dryness and moderate drought over scattered parts of the Southeast, Tennessee and southeast Kentucky. Conditions mostly remained unchanged in the western U.S., though a few improvements occurred in Colorado and Utah after recent precipitation, while conditions worsened in parts of southeast Montana and the Black Hills region of South Dakota and adjacent northeast Wyoming amid recent dry weather. Heavy rains in the northeast part of Puerto Rico eased drought and abnormal dryness there as streamflows improved and crop stress lessened."

This chart shows the precipitation and soil moisture for the last 30 days at the [Abrams](#) SCAN site in Kansas. Soil moisture levels steadily declined between April 03-16 according to the shallower soil sensors two, four, and eight inches beneath land surface. After the site received over an inch of precipitation on April 27 and 30, soil moisture levels can be seen increasing at these same sensor depths. Total precipitation for the 30-day period was 4.84 inches.

Agricultural Weather Highlights

Author: Brad Rippey, Agricultural Meteorologist, USDA/OCE/WAOB

National Outlook, Thursday May 02, 2024: "Active weather will continue into next week, as multiple weather systems cross the country. A cold front currently approaching the Mississippi Valley will drift eastward and weaken, reaching the Atlantic Coast States during the weekend. A secondary cold front will follow, eventually merging with the initial front. Finally, a potent spring storm will arrive along the Pacific Coast on Saturday before pushing eastward toward the northern Plains by early next week. The threat of widespread severe thunderstorms will diminish during the weekend, only to return across the Plains by Monday. Five-day rainfall totals should exceed an inch in parts of the Northwest and many areas from the Plains eastward, with much higher amounts possible from the southern Plains into the lower Mississippi Valley. In contrast, rain will bypass the Southwest and most areas along and near the Gulf Coast. The NWS 6- to 10-day outlook for May 7 – 11 calls for the likelihood of below-normal temperatures across the northern High Plains and the West, while warmer-than-normal weather will prevail east of a line from the southern Rockies into the upper Great Lakes region. Meanwhile, near- or below-normal precipitation across the Deep South and along the Pacific Coast should contrast with wetter-than-normal conditions in much of the northern two-thirds of the U.S."
