REINFORCING STEEL SCHEDULE

- **Concrete (28 Days, 4000 PSI)**: Cu. Yd.
- **Reinforcing Steel #4 Rebars**: Lbs.
- **Reinforcing Steel #5 Rebars**: Lbs.
- **3/4" Dowel Bar**: Lin. Ft.
- **6" Nonmetallic Water Stop**: Lin. Ft.
- **1/2" Preformed Joint Filler**: Lin. Ft.
- **Base Course Material**: Tons
- **Perimeter Drain Fill**: Tons
- **4" Perforated CPT**: Lin. Ft.
- **Geotextile**: Sq. Yd.

**SOUTH ZONE**

This drawing is intended for the following Illinois counties: Jackson, Franklin, Williamson, Hamilton, White, Saline, Gallatin, Union, Johnson, Pope, Hardin, Alexander, Pulaski, and Massac.

**DESIGN ASSUMPTIONS**

1. Meets ACI 318–14 and NDC Part 536
2. Concrete mix must be designed to yield a 28 day compressive strength of 4000 psi. All rebar must be Grade 60.
3. Lateral pressure from manure = 65 psi (per CPS 313, unprotected from precipitation)
4. Soil Density = 130pcf
5. Allowable Soil Bearing Pressure = 2000 psf

**DESIGN USES**

- This standard design can be used with 0 to 6 foot soil backfill.
- Vehicular traffic is allowed next to the wall.
- The wall is designed as a freestanding wall - HOWEVER, if the wall is not restrained by an opposing wall with the same backfill height, minimum 5 inch floor slab thickness must be at least 39 feet (not including footing). See AMFH Supplement IL 651.10-17 for more details.

**CONSTRUCTION NOTES**

10. All reinforcing steel must have a minimum concrete cover over reinforcement 3 inches, except the cover at the top of slab is 2 inches.
11. Lap splices of reinforcing steel must have a minimum lapped length of: Mark B & C - #4 bars ~ 33", all other #4 bars ~ 25" all #5 bars ~ 32"
12. Place concrete on top of 3 inch layer on approved base course material. Approved base course material includes IDOT Grad No CA 7, 8, 11, 12, 13, 14, 15, 16 or FA 1, 2, 4.
13. The 5 inch floor slab will have #4 bars at 15 inch spacing each way.
14. Where ever the floor slab exceeds 30 feet in length or width, install watertight contraction joints with dowel bars. See page 4 for details of contraction joints.
15. The wall will be built with contraction and expansion joints. No section of wall will be over 30 feet long between contraction joints, and no more than 90’ between expansion joints. See page 4 for details of contraction joint. See page 2 for details of expansion joint.
16. Place a construction joint anywhere the concrete placement is not continuous and the joint will have concrete against concrete with no filler material. See Construction Joint Notes on page 3.
17. Connect and weld all waterstop splices and intersections according to manufacturer's instructions.
18. Fill expansion joints with preformed expansion joint filler with a minimum thickness of 1/2 inch. Joint filler must conform to ASTM D 1752 Type I, II, or III; D 994; or D 1751.

Not To Scale
**Drainage Notes:**
1. Provide perimeter drain if water table can rise above floor level.
2. Perimeter drain pipe and gravel/geotextile filter is to be routed around all sides of the tank and drain freely to a surface water outlet or other subsurface drainage outlet.
3. Perimeter drain pipe and fittings must be perforated, corrugated polyethylene (CPT) meeting ASTM specifications listed below:

<table>
<thead>
<tr>
<th>CPT</th>
<th>ASTM F405, F667</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dual Wall CPT</td>
<td>ASTM F2306, F2648, F405, F667</td>
</tr>
</tbody>
</table>

4. Drain fill will consist of sand, gravel or concrete aggregate mixture with a maximum size of 3" and not more than 5% passing a 200 sieve. Qualifying IDOT gradations for drain fill include:
   - CA-1, CA-3, CA-5, CA-7, CA-8, CA-11,
   - CA-12, CA-13, CA-14, CA-15, CA-16, CA-18

5. Geotextile (non-woven, needle punched) minimum criteria:
   - Grab tensile strength (lb) ASTM D 4632 ____________202
   - Elongation at failure (%) ASTM D 4632 ____________50
   - Tensile strength (lb) ASTM D 4533 ____________79
   - Puncture strength (lb) ASTM D 6241 ____________433
   - Ultraviolet light (% retained strength) ASTM D 4355 ____________min 50
   - Apparent opening size (AOS) ASTM D 4491 ____________max 0.22 mm (US sieve size 70)

6. Geotextile is to overlap any geotextile splice a minimum of 18 inches.
7. Encase all drain fill with geotextile.

**Construction Joint Notes**
1. A construction joint must be prepared when the concrete pour is not continuous, typically between the floor and wall.
2. Prepare all surfaces that will be in contact with new concrete as per note 5.
3. Let concrete cure at least 12 hours prior to steel tying and form construction for the next pour.
4. New concrete must not be placed until the hardened concrete has cured at least 12 hours.
5. Construction joints must be prepared using one of the following two methods:
   - **Method 1:** Water-Air or Sandblasting. Clean the joint surface of all unsatisfactory concrete, laitance, coatings, stains, and debris by sandblasting or high-pressure air-water cutting, or both. Sandblasting can be used after the concrete has gained sufficient strength to resist excessive cutting, and high-pressure air-water cutting can be used as soon as the concrete has hardened sufficiently to prevent the jet from displacing the coarse aggregates. The surface of the concrete in place must be cut to expose clean, sound aggregate, but not so deep as to undercut the edges of larger particles of the aggregate. Cut the surface to at least 1/4" depth. Thoroughly wash the surface to remove all material after cutting.
   - **Method 2:** Mechanical. Clean the joint surface of all unsatisfactory concrete, laitance, coatings, stains, and debris by washing and scrubbing with a wire brush, wire broom, or other means approved by the engineer to expose coarse aggregate without displacing it. The surface must be roughened to at least 1/4" depth.
6. All construction joints must be wetted and standing water removed immediately before new concrete is placed.
7. New concrete must be sufficiently vibrated to ensure good contact into the prepared joint.
8. Keyways or steel plates cannot be substituted for the construction joint methods above.

SECTION @ DOWEL CENTERLINE

FLOOR SLAB CONTRACTION JOINT

Scale: 1" = 1'-0"

Note: Dowel sleeve for contraction joints may be manufactured plastic sleeve, PVC sleeve, grease, or any other means to prevent bond between half of the dowel and the concrete. Place A Dowel Sleeve On One End Of Each Dowel.

WALL CONTRACTION JOINT

SCALE: 3/4" = 1'-0"
