SOUTH ZONE
This drawing is intended for the following Illinois counties:
Jackson, Franklin, Williamson, Hamilton, White, Saline, Gallatin, Union,
Johnson, Pope, Hardin, Alexander, Pulaski, and Massac.

DESIGN ASSUMPTIONS
1. Meets ACI-318-14 and NDM Part 536
2. Concrete mix must be designed to yield a 28 day compressive
   strength of 4000 psi. All rebar must be Grade 60.
3. Lateral pressure from manure = 65 psi (per CPS 313, unprotected
   from precipitation)
4. Soil Density = 130pcf
5. Allowable Soil Bearing Pressure = 2000 psf

DESIGN USES
7. This standard design can be used with 0 to 8 foot soil backfill.
8. Vehicular traffic is allowed next to the wall.
9. The wall is designed as a freestanding wall - HOWEVER, if the wall
   is not restrained by an opposing wall with the same backfill
   height, minimum 5 inch floor slab length must be at least 65 feet
   (not including footing). See IL AWMF Supplement IL 651.10-17 for
   more details.

CONSTRUCTION NOTES
10. All reinforcing steel must have a minimum concrete cover over
    reinforcement 3 inches, except the cover at the top of slab is 2
    inches.
11. Lap splices of reinforcing steel must have a minimum lapped
    length of: Mark B, C, D, & E #4 bars-33", all other #4 bars-25",
    all #6 bars-32".
12. Place concrete on top of 3 inch layer on approved base course
    material. Approved base course materials includes IDOT Grad No CA
    7, 8, 11, 12, 13, 14, 15, 16 or FA 1, 2, 4
13. The 5 inch floor slab will have #4 bars at 15 inch spacing each
    way.
14. Where ever the floor slab exceeds 30 feet in length or width,
    install watertight contraction joints with dowel bars. See page 4
    for details of contraction joints.
15. The wall will be built with contraction and expansion joints. No
    section of wall will be over 30 feet long between contraction
    joints, and no more than 80' between expansion joints. See page
    4 for details of contraction joint. See page 2 for details of
    expansion joint.
16. Place a construction joint anywhere the concrete placement is not
    continuous and the joint will have concrete against concrete
    with no filler material. See Construction Joint Notes on page 3.
17. Connect and seal all watertop splices and intersections according
    to manufacturers instructions.
18. Fill expansion joints with preformed expansion joint filler with
    a minimum thickness of 3 inch. Joint filler must conform to ASTM
    D 1752 Type I, II, or III; D 994; or D 1751.

PLAN
**DRAINAGE NOTES:**
1. Provide perimeter drain if water table can rise above floor level.
2. Perimeter drain pipe and gravel/geotextile filter is to be routed around all sides of the tank and drain freely to a surface water outlet or other subsurface drainage outlet.
3. Perimeter drain pipe and fittings must be perforated, corrugated polyethylene (CPT) meeting ASTM specifications listed below:

<table>
<thead>
<tr>
<th>CPT</th>
<th>ASTM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dual Wall CPT</td>
<td>F40S, F667</td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>

4. Drain fill will consist of sand, gravel or concrete aggregate mixture with a maximum size of 3" and not more than 5% passing a #200 sieve. Qualifying IDOT gradations for drain fill include:
- CA-1, CA-3, CA-5, CA-7, CA-8, CA-11, CA-12, CA-13, CA-14, CA-15, CA-16
- CA-18

5. Geotextile (non-woven, needle punched) minimum criteria:
- Grab tensile strength (lb) ASTM D 4632 _____________ 202
- Elongation at failure (%) ASTM D 4632 _____________ 50
- Trapezoidal tear strength (lb) ASTM D 4533 ___________ 79
- Puncture strength (lb) ASTM D 6241 _____________ 433
- Ultraviolet light (% retained strength) ASTM D 4355 __________ min 50
- Apparent opening size (AOS) ASTM D 4751 __________ max 0.22 mm (US sieve size 70)

6. Permeability sec^-1 ASTM D 4491 ____________ min 0.70

7. Overlap any geotextile splice a minimum of 18 inches.

8. Encase all drain fill with geotextile.

**Construction Joint Notes:**
1. A construction joint must be prepared when the concrete pour is not continuous, typically between the floor and wall.
2. Prepare all surfaces that will be in contact with new concrete as per note 5.
3. Let concrete cure at least 12 hours prior to steel tying and form construction for the next pour.
4. New concrete must not be placed until the hardened concrete has cured at least 12 hours.
5. Construction joints must be prepared using one of the following two methods:
   - **Method 1 – Water-Air or Sandblasting:** Clean the joint surface of all unsatisfactory concrete, laitance, coatings, stains, and debris by sandblasting or high-pressure air-water cutting, or both. Sandblasting can be used after the concrete has gained sufficient strength to resist excessive cutting, and high-pressure air-water cutting can be used as soon as the concrete has hardened sufficiently to prevent the jet from displacing the coarse aggregates. The surface of the concrete in place must be cut to expose clean, sound aggregate, but not so deep as to undercut the edges of larger particles of the aggregate. Cut the surface to at least 1/4" depth. Thoroughly wash the surface to remove all material after cutting.
   - **Method 2 – Mechanical:** Clean the joint surface of all unsatisfactory concrete, laitance, coatings, stains, and debris by washing and scrubbing with a wire brush, wire broom, or other means approved by the engineer to expose coarse aggregate without displacing it. The surface must be roughened to at least 1/4" depth.

6. All construction joints must be wetted and standing water removed immediately before new concrete is placed.
7. New concrete must be sufficiently vibrated to ensure good contact into the prepared joint.
8. Keyways or steel plates cannot be substituted for the construction joint methods above.
SECTION @ DOWEL CENTERLINE
FLOOR SLAB CONTRACTION JOINT
Scale: 1" = 1'-0"

Note: Dowel sleeve for contraction joints may be manufactured plastic sleeve, PVC sleeve, grease, or any other means to prevent a bond between half of the dowel and the concrete. Place a Dowel Sleeve One End Of Each Dowel.
