| E528133Z2                                                                                                                                                                 | Grazing management for improving quantity and quality of plant structure and composition for wildlife | Degraded Plant Condition             | Managing the harvest of vegetation with grazing and/or browsing animals for the purpose of improving or maintaining the structure and composition of the plant community that is available for wildlife.                                                                                                                                                                                                                                                                                      |
| <b>PICK THREE FROM THIS GROUP (must ensure at least 1 additional unique resource concern will be addressed by a component selection to complement requirements above)</b> |                                                                                                       |                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| E314134Z                                                                                                                                                                  | Brush management that maintains or enhances wildlife or fish habitat                                  | Degraded Plant Condition             | Brush management is employed to create a desired plant community, consistent with the related ecological site steady state, which will maintain or enhance the wildlife habitat desired for the identified wildlife species. It will be designed to provide plant structure, density and diversity needed to meet those habitat objectives. This enhancement does not apply to removal of woody vegetation by prescribed fire or removal of woody vegetation to facilitate a land use change. |
| E315133Z                                                                                                                                                                  | Herbaceous weed control (for inadequate structure and composition) that helps create                  | Degraded Plant Condition             | Mechanical, chemical, or biological, herbaceous weed control will be employed to control targeted, herbaceous weeds so as to create, release, or restore desired plant communities that are consistent with achievable, ecological site, steady state descriptions.                                                                                                                                                                                                                           |

| E391136Z                                       | Increase riparian forest buffer width to enhance wildlife habitat                            | Fish & Wildlife – Inadequate Habitat | Where an existing riparian forest buffer is located along a river, stream, pond, lake, or other waterbody, increase the diversity of native species, control invasive species, install fencing and relocate equipment operations, trails, and livestock to increase the functional width of the buffer.                                                                                                                                                                                                                                                                                                                                               |
| E550106Z                                       | Range planting for increasing/maintaining organic matter                                     | Soil Quality Degradation             | Establishment of adapted perennial or self-sustaining vegetation such as grasses, forbs, legumes, shrubs and trees for the purpose of increasing or maintaining organic matter levels in the soil.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| E645137Z                                       | Reduction of attractants to human-subsidized predators in sensitive wildlife species habitat | Fish & Wildlife – Inadequate Habitat | Reduction of artificial perching sites, nest sites, food, and water available to subsidized predators in areas where human-subsidized predators are a threat to sensitive wildlife species. Human-subsidized predators may include ravens, crows, magpies, coyotes, foxes, skunks, raccoons, and other species. Activities under this enhancement may include removal of non- native or invasive trees; removal of unused power poles, corrals, windmills, buildings, and other vertical structures; and/or removal or management of watering facilities, dead livestock, road kill, garbage, animal feed, dumps, and other non-natural food sources. |
