Barnstable County, Massachusetts – also known as Cape Cod – is a coastal area where ecosystems have been compromised by urban development. Water quality is a major concern on Cape Cod, particularly as it affects the salt marshes, shellfish beds and herring runs.

Is there a plan to solve these problems?

Federal, state and local agencies have partnered to identify problems and formulate solutions. The costs and benefits of various alternatives have been evaluated and sponsors’ decisions are contained in a watershed plan.

The plan, updated in 2022, identifies 98 sites throughout Cape Cod for possible restoration:
- 53 storm water discharge sites
- 17 tidal-restricted salt marshes
- 28 fish passages

The watershed plan describes the work to be done, the responsibilities of each agency, financing and maintenance provisions.

HOW WILL THE PROJECT BE PAID FOR?

Federal funds..................................................75%
Non-federal funds ........................................ 25%

PROJECT WILL BENEFIT THREATENED SPECIES OF

Fish
Amphibians
Reptiles
Birds
Marine mammals
Segmented worms
Freshwater mussels
Crustaceans
Insects
Plants

The U.S. Department of Agriculture’s Natural Resources Conservation Service (NRCS) is working in partnership with the Cape Cod Conservation District and the Barnstable County Commissioners on this project that will:
- Restore 1,500 acres of degraded salt marsh
- Improve fish access to 4,200 acres of spawning habitat
- Improve water quality for 7,300 acres of shellfish beds

Short-term economic benefits are expected, as well, from the creation of construction jobs.
What work will be done?

The USDA Natural Resources Conservation Service can provide technical and federal financial assistance for the following measures that will improve water quality and restore critical ecosystems in the watershed. Local sponsors will share in the cost and other partners will provide additional technical assistance.

**Larger culverts**

**Goal:** Restore tidally-restricted salt marshes by removing barriers that interfere with normal daily tidal flow. This improves hydrology (the movement of water) through the area. Fish and wildlife that depend on this type of ecosystem will benefit.

![Image of larger culverts](image)

**SOLUTION**

Installing larger culverts will restore normal tidal flow to salt marsh ecosystems.

**Fish ladders**

**Goal:** Restore fish passage on existing anadromous fish runs. River herring are just one of the many fish species that migrate from the ocean to fresh water to spawn. Ladders and passages allow fish to by-pass man-made barriers.

![Image of fish ladder](image)

**SOLUTION**

Restoring fish passages will allow many species of fish to migrate and reproduce.

**Dry wells and sand filters**

**Goal:** Restore and protect shellfish beds by treating stormwater runoff. These systems use vegetation or sand to filter contaminants from the runoff before it reaches shellfish beds.

![Image of dry wells and sand filters](image)

**SOLUTION**

Dry wells and sand filters protect shellfish beds from polluted stormwater runoff.
