Las Vegas Buckwheat
Eriogonum corymbosum var. nilesii Reveal
Plant Symbol = ERCON

Contributed by: USDA NRCS Idaho Plant Materials Program

Please consult the PLANTS Web site and your State Department of Natural Resources for this plant’s current status (e.g., threatened or endangered species, state noxious status, and wetland indicator values).

Description
Buckwheat family (Polygonaceae). Las Vegas buckwheat is a woody perennial shrub up to 1.2 m (4 ft) high with an open rounded profile. The leaves are densely elliptic to oblong, 0.8 to 2.5 cm (0.3 to 1.0 in) long and 0.4 to 0.8 cm (0.16 to 0.3 in) wide and densely hairy. The inflorescence is a cyme or corymb of yellow flowers (Holmgren et al 2012). Flowering occurs in September and early October (Mrowka 2008).

Distribution:
In 2008 there were nine populations known from 15 sites, totaling approximately 1,145 acres in Clark and Lincoln Counties, Nevada (Mrowka 2008). Populations in Kane and Washington Counties, Utah have recently been discovered (UTDNR 2012). For current distribution, please consult the Plant Profile page for this species on the PLANTS Web site.

Habitat:
Las Vegas buckwheat is found in sparsely vegetated gypsum outcappings in the Mojave Desert. It is associated with other gypsophiles (adapted to gypsum-based soils) including Las Vegas bearpoppy (Arctomecon californica), Parry sandpaper plant (Petalonyx parryi), Palmer’s phacelia (Phacelia palmeri), wingseed blazing star (Mentzelia pterosperma) and froststem suncup (Camissonia multijuga) (Mrowka 2008).

Adaptation
Las Vegas buckwheat is found on gypsum based soils, clay beds and high-boron shale soils (Mrowka 2008). Known populations occur between 200 and 850 m (650 to 2,800 ft) elevation in areas receiving an average of 110 mm (4.5 in) annual precipitation (Holmgren et al 2012).

Management
To date, little has been done at Federal, State or County level to protect Las Vegas buckwheat (Mrowka 2008). Conservation measures are being developed to protect the sensitive habitat; however these are not viewed as sufficient to remove the threats to the species (USDI 2011).

Pests and Potential Problems
The primary threat to Las Vegas buckwheat is reduction of habitat due to the development and urbanization in the Las Vegas, Nevada area. Other notable threats include
off-road vehicle use and gypsum mining in Las Vegas buckwheat habitat (Mrowka 2008).

**Environmental Concerns**
Changes to habitat and precipitation due to global climate change have been cited as a potential threat to Las Vegas buckwheat (Mrowka 2008).

**Seeds and Plant Production**
There is no available information on the propagation and establishment of Las Vegas buckwheat in the strict sense. Meyer and Paulsen (2000) reported that seed of *E. corymbosum* (in the broad sense) from low elevation, warm sites near Moab and Saint George, Utah required 4 weeks of cold/moist pretreatment at 2°C (36°F) in the dark, while seed from a higher elevation collection on the San Rafael Swell, Utah required 8 weeks of cold/moist treatment to break dormancy.

**Cultivars, Improved, and Selected Materials (and area of origin)**
None
