Kansas Criteria for National Animal Enhancement Activity—ANM29

On-farm forage-based grazing system

2. In the situation that an unplanned climatic event prevents the removal of forage by the grazing animal, supplementation of forage is permissible for the length of period the climatic event exists. Once climatic conditions improve, forage removal, as a part of the planned forage-based grazing system, once again continues (e.g., ice or snow, which makes the harvest of forage impossible).
3. If supplementing forage or hay, in the case of an unplanned climatic event, do so away from sensitive areas such as riparian areas or water bodies.
4. If repeated supplementation occurs, select different locations of the grazing area with each supplementation event.
