

Environmental Quality Incentives Program

The Environmental Quality Incentives Program (EQIP) is a voluntary, conservation program administered by NRCS that can provide financial and technical assistance to install conservation practices that address natural resource concerns. The purpose of EQIP is to promote agricultural production, forest management, and environmental quality as compatible goals; to optimize environmental benefits; and to help farmers and ranchers meet Federal, State, Tribal, and local environmental regulations.

EQIP Application Sign-up and Cut-off Dates

NRCS accepts EQIP applications year-round, but establishes cutoff dates to make funding selections for eligible, screened, and ranked applications.

To be ready for EQIP funding consideration, interested applicants will need to: (1) Develop a conservation plan, (2) Submit an application, (3) Meet program eligibility requirements, and (4) Approve their 'EQIP schedule of operations'.

The time needed to complete a conservation plan and process eligibility can vary, from a few weeks to more than a month, depending on the complexity of the farming operation.

Develop a Conservation Plan

A conservation plan includes all practices, regardless of the program's financial assistance, that a producer or landowner has agreed to adopt for the agricultural operation and/or associated agricultural lands. Interested applicants are encouraged to request conservation planning and technical assistance from a local NRCS field office to help with the development of a conservation plan.

Submitting an Application

Interested applicants may apply for EQIP by completing and submitting the application, Form NRCS-CPA-1200, Conservation Program Application, to the NRCS field office in person, by phone, email, or fax in the county which you own land or where you have an agricultural operation.

Program Eligibility Requirements

In order to be considered eligible for EQIP the applicant must have a vested interest in production agricultural and meet other program eligibility requirements.

'EQIP schedule of operations'

The basis for an application is the 'EQIP schedule of operations' and is derived from the applicant's conservation plan. The EQIP 'schedule of operations' identifies the conservation practices to be implemented, timing of the implementation, practice location, and payment rates.

EQIP Screening, Ranking and Funding

EQIP funding decisions are based on an application evaluation process that includes screening tools and ranking criteria. Screening tools are worksheets used to prioritize an application based on factors such as: a completed conservation plan; readiness to implement practices; history of contract compliance; and resource priorities addressed in the 'EQIP schedule of operations'. Ranking criteria considers the anticipated benefit of a conservation system, or practice, in the 'EQIP schedule of operations' to a natural resource concern.

About the National Certified Organic Initiative

Authorized by the 2014 Farm Bill, EQIP includes provisions to provide opportunities for organic producers to address natural resource concerns related to organic production as well as requirements related to the National Organic Program (NOP) requirements. Some highlights of the organic provisions in the 2014 Farm Bill and associated regulatory changes include:

- Financial assistance is limited to \$20,000 per year and \$80,000 during a six year period.
- Assistance for conservation practices and planning related to addressing resource concerns as part of organic production.

The purpose of the National Certified Organic Initiative is to assist certified organic producers plan and implement conservation practices to allow their organic operations to be environmentally sustainable. These practices must be consistent with an Organic System Plan.

Eligible applicants for the National Certified Organic Initiative must meet the criteria below for certified organic producers.

- **Certified Organic Producers:** Certified organic producers must provide NRCS with a copy of their USDA NOP organic certificate or proof of good standing from a USDA-accredited certifying agent; certification must be maintained for the life of the contract.

Interested owners and/or operators of land managed for agricultural production in California that meet the criteria of a certified organic producer may be eligible for the National Certified Organic EQIP Initiative.

For producers transitioning to organic or producers exempt from organic certification please refer to program information for the [Organic Transition EQIP Initiative](#).

Land Uses for the Certified Organic EQIP Initiative Fund Pool

Only applications for agricultural operations that address resource concerns on at least one land use type listed below will be considered for financial assistance from this EQIP Fund Pool. The descriptions below are the general NRCS land use definitions - applications should fit within, but do not need to exactly match, these descriptions.

- **Crop:** Land used primarily for the production and harvest of annual or perennial field, forage, food, fiber, horticultural, orchard, vineyard, or energy crops.
- **Pasture:** Land composed of introduced or domesticated native forage species that is used primarily for the production of livestock. Pastures receive periodic renovation and cultural treatments, such as tillage, fertilization, mowing, weed control, and may be irrigated. Pastures are not in rotation with crops.
- **Farmstead:** Land used for facilities and supporting infrastructure where farming, forestry, animal husbandry, and ranching activities are often initiated. This may include dwellings, equipment storage, plus farm input and output storage and handling facilities.
- **Associated Agricultural Lands:** Land associated with farms and ranches that are not purposefully managed for food, forage, or fiber and are typically associated with nearby production or conservation lands. This could include incidental areas, such as odd areas, ditches and watercourses, riparian areas, field edges, seasonal and permanent wetlands, and other similar areas.

- **Irrigated:** Where an operational irrigation system is present and managed to supply irrigation water.
- **Grazed:** Where grazing animals impact how land is managed.
- **Wildlife:** Where the applicant is actively managing for wildlife.

Resource Concerns the Certified Organic EQIP Initiative Fund Pool

Only applications for agricultural operations that address at least one resource concern listed below will be considered for financial assistance through this EQIP Fund Pool. The descriptions below are general NRCS natural resource definitions, applications should fit within, but do not need to exactly match, these descriptions.

- ❖ **SOIL EROSION** – Erosion removes topsoil, reduces levels of soil organic matter, and contributes to the breakdown of soil structure.
 - **Sheet and Rill:** Sheet and rill erosion is the detachment and transportation of soil particles caused by rainfall runoff/splash and/or irrigation events. Symptoms of soil erosion by water include: small rills and channels on the soil surface, soil deposited at the base of slopes, sediment in streams, lakes, and reservoirs, and pedestals of soil supporting pebbles and plant material.
 - **Wind:** Wind erosion is the detachment and transportation of soil particles caused by wind. Symptoms of wind erosion may be identified by dust clouds, soil accumulation along fence lines or snowbanks, and a drifted appearance of the soil surface.
 - **Ephemeral Gullies:** Ephemeral gullies are forms of erosion created by the concentrated flow of water. Ephemeral gullies usually appear on cultivated fields during the planting or growing season, but are temporarily removed by cultivation. Ephemeral gullies can reappear at or near the same location on a yearly basis.
 - **Classic Gullies:** Classic gullies are forms of erosion created by the concentrated flow of water. Classic gully erosion generally occurs in well-defined drainage ways and generally is not obliterated by tillage. Untreated classic gullies may enlarge progressively by head cutting and/or lateral widening.
 - **Excessive Bank Erosion from Streams, Shorelines or Water Conveyance Channels:** Stream stability is an active process, and while streambank erosion is a natural part of this process, it is often accelerated when land use management alters the stream system. When a stream's sediment load increases, the shape and function of the stream change, and the normal transport of sediment to downstream bottomlands is affected and the quality of wildlife habitat, both on land and in-stream, can be impacted.
- ❖ **SOIL QUALITY DEGRADATION** – Soil quality degradation effects rooting depths, plant growth, animal habitat and soil biological activity.
 - **Compaction:** Management-induced soil compaction results in decreased rooting depth that reduces plant growth, animal habitat and soil biological activity. Compaction can lead to increased runoff and erosion from sloping land or waterlogged soils in flatter areas by reducing water infiltration into the soil.

- **Organic Matter Depletion:** Soil organic matter is carbon-rich material that includes plant, animal, and microbial residue in various stages of decomposition. Managing for soil carbon can enhance soil productivity and environmental quality. Increasing soil organic matter levels can reduce atmospheric carbon dioxide (CO₂) levels. Ground and surface water quality can improve too because better structure, infiltration, and biological activity make soil a more effective filter.
 - **Concentration of Salts or Other Chemicals:** Concentration of salts leads to salinity and/or sodicity. Saline soils are indicative of inadequate drainage to leach salts from the soil or upward migration of salt from shallow groundwater. Sodic soils are high in sodium relative to concentrations of calcium and magnesium. Salinity or sodicity occurs naturally from parent materials high in salts, such as marine deposits, or may result from the addition of fertilizers, soil amendments (gypsum, lime), manure or saline/sodic irrigation water.
- ❖ **INSUFFICIENT WATER** – Water resources are not optimally managed to support ecological processes, land use objectives and/or water conservation goals.
- **Inefficient Use of Irrigation Water:** Irrigation water is not stored, delivered, scheduled and/or applied efficiently. Aquifer or surface water withdrawals threaten sustained availability of ground or surface water. Available irrigation water supplies have been reduced due to aquifer depletion, competition, regulation and/or drought.
- ❖ **WATER QUALITY DEGRADATION** – Water quality degradation impacts the beneficial use of the receiving waters.
- **Excess Nutrients in Surface Water:** Nutrients, organic and inorganic, are transported to receiving surface waters through runoff in quantities that degrade water quality. Increased nitrogen and phosphorus levels in water can produce excessive aquatic vegetation and algal blooms resulting in reduced dissolved oxygen, harmful toxins, and increased water temperature.
 - **Excess Nutrients in Groundwater:** Nutrients, organic and inorganic, are leached into groundwater in quantities that degrade water quality and limit uses for other purposes, for example, public drinking water systems from shallow domestic wells.
 - **Excessive Sediment in Surface Water:** Off-site transport of sediment to surface water can impact water quality and aquatic habitat. Not only does sediment carry nutrients and pesticides that can negatively impact water quality, but the physical characteristics of sediment can clog stream channels, silt in reservoirs, cover fish spawning grounds, and reduce downstream water quality.
- ❖ **AIR QUALITY IMPACTS** – Direct or indirect emissions of compounds to the atmosphere that impact air quality.
- **Emission of Particulate Matter (PM) and PM Precursors:** Particulate matter is classified by its size, as PM_{2.5} and PM₁₀. PM_{2.5} is directly emitted from combustion and as dust from roads or tillage. PM_{2.5} is also formed by chemical reaction of PM precursor gases; oxides of nitrogen (NO_x), volatile organic compounds (VOCs) and ammonia (NH₃). Sources of PM precursor gases can be engines, fertilizer application, and animal operations. PM₁₀ is typically mechanically generated and directly emitted from tillage operations, road and field travel, animal movement and harvesting operations.

- ❖ **DEGRADED PLANT CONDITION** – Plant condition degradation can result in stress, disease, insect damage and result in changes to the structure and composition of plant communities.
 - **Undesirable Plant Productivity and Health:** Plants must be adapted to the site and provided with appropriate amounts of nutrients, water, and sunshine, and protected from unchecked animal, weed, insect, and disease pests. Plants established in the wrong climate or soil may be under stress and may never thrive, no matter how much fertilizer or water supplied. Natural events, such as drought, or mismanagement can cause plant stress. Plants under stress are more susceptible to disease and insect damage.
- ❖ **INADEQUATE HABITAT FOR FISH AND WILDLIFE** – Quantity, quality or connectivity of food, water, cover/shelter, habitat continuity and/or space is inadequate to meet requirements of identified fish, wildlife or invertebrate species.
 - **Habitat Degradation:** Conserving existing habitat and restoring habitat improves the odds that fish and wildlife communities will thrive. The availability and arrangement of food, water, cover, shelter, habitat continuity and space determine the number of organisms that a region can support, also known as carrying capacity. Increasing carrying capacity is critical to attaining long-term population stability.
- ❖ **LIVESTOCK PRODUCTION LIMITATION** – Livestock require five major classes of nutrients: energy, protein, minerals, vitamins, and water. All five are essential for normal health and production.
 - **Inadequate Livestock Water:** Water quantity and distribution of suitable water sources can affect livestock based on the basic need to meet daily intake requirements and issues related to grazing patterns. Livestock travel distance to water can result in surplus/deficient forage availability and excessive/insufficient plant utilization.
- ❖ **INEFFICIENT ENERGY USE** – The inefficient use of energy increases costs and dependence on non-renewable energy sources.
 - **Equipment and Facilities:** Inefficient energy use occurs whenever facilities, equipment, or machinery operate more hours than needed to meet management goals. It may also occur when facilities, equipment, or machinery become worn out, outdated, or are poorly controlled or maintained.
 - **Farming and Ranching Practices and Field Operations:** Inefficient energy use occurs whenever equipment or machinery operates more hours than needed to meet management goals. It may also occur when equipment or machinery becomes worn out, outdated, or poorly controlled.

Eligible NRCS Conservation Activity Plans

Only applications for NRCS conservation activity plans listed in the table below are eligible for financial assistance through this EQIP Fund Pool. A Conservation Activity Plan (CAP) can be developed for an applicant to identify conservation practices needed to address a specific natural resource need.

Information about CAP services from Technical Service Providers (TSP), including how to find a certified TSP in your State, can be found on the NRCS national TSP website:

<http://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/programs/technical/tsp/?cid=stelprdb1042981>

Table 1. Eligible Conservation Activity Plans

Practice Code	Conservation Activity Plan Name	Practice Units	Lifespan (Years)
104	Nutrient Management Plan - Written	no	1
110	Grazing Management Plan - Written	no	1
118	Irrigation Water Management Plan - Written	no	1
146	Pollinator Habitat Enhancement Plan - Written	no	1

Eligible NRCS Conservation Practices

All conservation practices planned for financial assistance must be included in the 'EQIP schedule of operations' and address a resource concern identified in this EQIP Fund Pool. NRCS conservation practices eligible for financial assistance through this EQIP Fund Pool are listed in the below table.

For more information about NRCS conservation practices visit the following website link for NRCS conservation practice standards:

http://www.nrcs.usda.gov/wps/portal/nrcs/detail/national/technical/?cid=NRCSDEV11_001020

Table 2. Eligible Conservation Practices

Practice Code	Conservation Practice Name	Practice Units	Lifespan (Years)
309	Agrichemical Handling Facility	no	15
311	Alley Cropping	ac	15

¹Conservation practice, 447 – Irrigation System, Tailwater Recovery, is an irrigation tailwater recovery system and practice payment rates will be based on eligible conservation practices included in the system.

Practice Payment Rate Caps

For certain conservation practices a limit to the amount of financial assistance has been established. Practice payment caps are established in consultation with local partners and to allow limited financial assistance support to reach more participants. Please contact your local field office if you have questions. A maximum payment amount per contract or practice is not allowable. Payment rate caps are applicable per contract item number.

Table 3. Practice Payment Rate Caps

Conservation Practice Code and Name	Regular Payment Rate Cap	Historically Underserved Payment Rate Cap
325 - High Tunnel System	\$7500	\$13,500

NRCS Field Office Contact Information

For more information about EQIP, how to apply and program eligibility, interested applicants should contact a NRCS field office in the county which you own land or where you have an agricultural operation.
